(b). It is the duty of the miner and loaders to clean their coal in their working places and load it as nearly as possible free from slate, sulphur, and other impurities, and if any miner be docked for sending out dirty coal, he shall be notified by the mine foreman; if he be docked a second time, he shall be fined 50c.; if he be docked a third time within 15 days from the time of the first offense, or if he at any time sends out large quantities of impurities, in any one car, he shall be fined $1 or discharged at the option of the operator. But before discharge the pit committee and superintendent shall investigate such case, and if found guilty the discharge penalty may be enforced. It is understood local agreements shall govern the amount that constitutes a dock or large quantity at each mine. When there is no local agreement the local officers and superintendent of the company shall make such an agreement.

(c). It is hereby agreed that the local officers shall cooperate with the coal company to insure clean coal.

Mr. White is unwilling to believe that there is any foundation in fact for many claims that are being made that the equivalent of thousands of cars is being used monthly to transport the noncombustible matter loaded with the coal. If it is the case, he says that it means that the operators are not exercising their well-established right to insist on receiving a reasonably clean product from their mines.

Mr. White has just returned to Washington after the Indianapolis convention. He is very proud of the 19,135 stars in the United Mine Workers service flag. He is proud of the fact that nowhere in America is there a coal strike. He says the mine workers are ready to flood the country with coal if someone will arrange to furnish them with all the cars they can load.

Some Convention Decisions

The United Mine Workers at their biennial convention provided that no member of the Industrial Workers of the World should be allowed membership in the United Mine Workers of America. The resolution was as follows:

Any member accepting membership in the Industrial Workers of the World, the Working Class Union, or any other dual labor organization not affiliated with the American Federation of Labor shall be expelled from membership in the United Mine Workers of America, and no members of any such organization shall be permitted to have membership in our union unless they forfeit their membership in the dual organization immediately upon securing membership in the United Mine Workers of America.

They declared that they approved of the taking over of the coal mines by the Government so long as their right to the making of collective bargains was not impaired.

They asked no special privilege in the selective draft unless "it should be demonstrated that the members of our organization can render greater service to the country by remaining in the mines than they would be able to render by being drafted into the military service of the Government." The mine workers also passed an amendment permitting boy scouts to become members of the union.

The per capita tax was increased from 25c. to 50c. per month. The salary of the president of the union was made $5000 a year, the vice president is given $4125, the secretary-treasurer the same. The editor of *United Mine Workers' Journal* will receive $2500 a year, and international executive board members $175 a month when employed; tellers, auditors and the delegates to the American Federation of Labor will receive $7 per day when in service. All will receive in addition to their salaries all legitimate expenses when employed by the organization away from their places of residence.

Central Illinois Fills National Coal Bin

In contrast to the action of the Pana miners in causing a loss of two days' output for a trivial reason is that of the 375 miners employed at the mine of the Woodside Coal Co., at Springfield, in working on Sunday, for the first time in the history of the central Illinois coal industry. Without persuasion from the company officials or the fuel administration the men had a meeting on Saturday night and voted to make it seven straight by working the next day. They so notified President William B. Jess and were all on hand when the whistle blew Sunday morning. There were enough cars on hand and 1400 tons were hoisted. Besides filling the cars the Sunday workers supplied coal to teamsters, who also worked on Sunday making urgent deliveries.

Miners of St. Clair and Madison counties are considering Sunday work. In some cases operators have discussed it with union officials and asked them to take it up at their meetings. It is expected that action will be taken at the monthly meetings of the locals. The suggestion of the operators is that the miners agree to work on Sunday when cars are available and lay off some other day in the week when there is a scarcity of cars.

Two hundred and fifty miners employed by the Pana Coal Co. are the first in the central Illinois field to feel the weight of the automatic penalty clause. From each $4 was withheld on the last payday because they violated their agreement by refusing to work on two consecutive days. The men claimed that the wash house at mine No. 1 was cold and damp, and for that reason they refused to work. Officials of the company say that they warned the men that they would be fined but they persisted nevertheless. They grumbled when $3 was deducted for the first day and $1 for the second, but as their only recourse was another strike which would have brought more fines they finally submitted.

Coal teamsters of Springfield, Ill., have applied to Fuel Administrator Converse for permission to charge from 80c. to $1 a ton for delivering coal. Converse informed them that an inquiry into present costs and conditions would be made before he would give his decision.

Operators claim that miners are badly needed in central Illinois. The Central Illinois Coal Operators' Association has sent a letter to all the exemption boards in the six counties of the Springfield district, requesting that no more of their employees be taken into the army. The letter, which bears the signatures of President H. C. Adams and Secretary W. J. Walsh, says in part: "The mines of this district as a whole are now operating short-handed and could use advantageously 20 per cent. more skilled laborers than they now have, thus increasing the output of the much-needed coal in corresponding measure. Any further reduction in the number of skilled laborers available for coal mining will seriously reduce the output, not only by the loss of the individual tonnage of the men who leave, but also by cutting down the manpower of the mine below the point of most effective production for each man employed.

"In this situation we feel it is our duty to urge upon the exemption boards of this territory that the needs of the country demand that skilled workmen in mines, including diggers, drivers, clerks, engineers and bosses be in all cases given the deferred classification that has been provided for necessary skilled labor, such as these individuals can perform. In order to produce coal effectively it is absolutely necessary that all the classes of skilled labor engaged in mining shall be left in the mines." The letter states that there are 25 mines in the organization, producing 3,000,000 tons a year.

When the North Mine No. 2 at Pana, Ill., resumed work the other morning, $50,000 having been spent in overhauling it and in installing new equipment during the shutdown, only 50 miners reported for work, whereas 300 could have been accommodated.

Right of Aliens In Union Restricted

On Jan. 10 the Ohio district of the United Mine Workers in session at Columbus voted that "any unnaturalized miner in Ohio not a subject of a country at war with the United States will forfeit his membership in the United Mine Workers of America if he does not declare his intention to become an American citizen as soon as he has been here the required time to make the declaration." The Ohio men urged government ownership of railroads in a resolution.

Hist! The Bogie Man

Miners in the bituminous coal mines of the Newcastle Coal Co., near Newcastle, in Young County, Texas, have resumed operations after remaining out of the mines for several days because they declared that German spies and German sympathizers were planning to blow up the mines. Last Monday the miners poured from the mouths of the shafts declaring that a strange man carrying a light had been seen in the mine and that he ran and disappeared when followed. Guards were stationed at all the mine openings, and searching parties were sent into the tunnels to explore them and search for the strange person. The search that lasted several days and extended to the remotest parts of the mines failed to locate anything, and the miners were induced to return to work.

EDITORIALS

Quit Attacking the Coal Industry

THE railroad company officials sadly need efficient leaders for publicity purposes. The transportation companies have shown a large sense of their obligation to the public since the war began, and the public is beginning to realize that the failure of the railroads is the result of the public's persecution.

We, as a nation, are beginning to learn that we are being punished for the sins perpetrated against the transportation companies. They have not lacked locomotives, cars, sidetracks and what not without there being a reason. That reason has been lack of profit. The anthracite railroads, which have made profits, until the present cold spell supplied their subsidiary mines with the needed cars and had the locomotives to move them, even though the tonnage had increased heavily.

As the condition of the railroads is chargeable to the public, and as the railroads are now in the hands of the Government and need not fear therefore to acknowledge their utter failure under stress, why do they not admit it and demand generous consideration of their needs? Instead they attack the coal producers, declaring them avaricious, incapable and unpatriotic.

In their plight the railroads should not deliberately go out of their way to make enemies of those who have not injured them. They are very ready to be vocal against the coal men who have not hurt them and cannot help them, and silent about those who have injured them and who can, by better treatment, reëstablish them in their rights.

The railroad men need publicity, for not even the greatest of their wrongs has yet been righted. The Interstate Commerce Commission, which by its restraining action ruined the railroads of the country, still maintains its existence. That commission, and the public which has supported it with unanimity in the past, is to blame for the situation. With the evidences of its work so painfully manifest, why is it not done away?

It is said that it is retained to advise the National Railroad Administration. We would think that Railroad Director W. G. McAdoo would look for advice elsewhere. It seems entirely unnecessary to keep a commission—and such a commission—for that purpose. Let the public show its good will to the railroads by lifting this Old Man of the Sea from the shoulders of the transportation interests. The United States Federal Courts would still remain with us and would furnish a sufficient corrective and, when the war is over, if they would not serve the purpose, another commission with another name and no unfortunate precedents should take the place of the Interstate Commerce Commission. There are some good men on that commission. Those on that body whose clarity of vision foresaw the failure of the railroads and whose good judgment pleaded that a more generous treatment be given them, might well be appointed to the new organization with the approval, we hope, of every reasonable man.

But, meanwhile, let the railroads show a little good sense and quit attacking the coal industry. It is shown by the United States Geological Survey returns that the railroads have been inadequate to perform their duties as coal carriers. Even though strikes laid a few of the mines idle, the railroads could not have supplied the cars needed had the mines been working, or hauled the coal had it been loaded. So there was little coal lost from this cause.

And if we grant, what is not true, that every mine laid idle by a strike or a breakdown caused a reduction in tonnage at the market, the failure to supply cars was shown by the Geological Survey to be a far more important cause of shortage than the failure to operate the mines. That is, more days were lost from lack of cars than from the combined causes—strikes, other labor troubles and mine disability.

Again, the report of the Geological Survey, while made from information furnished by operators, is not really favorable enough to the coal industry. Many mines get a miserable quota of cars and report a run. The statistics based on such meager runs, though they convict the railroads of inadequacy, do not do it as convincingly as one might wish.

Should the same basis be taken by Teutonic statisticians, there could be found no shortage of food in Germany at present and with the same manner of reckoning there never will be any shortage conceded as long as every man has a meal or a part of a meal every day in the year. Statistically the Germans may starve to death and yet be accounted well fed.

The railroads, being wronged, have suffered; in consequence, they have been unable to take care of the coal industry. They deserve commiseration and assistance, but they will not get it if they deny the facts and assail the coal industry. Was ever so large an industry as ill advised as is the railroad business?

Anthracite Committee Promises Action

IT IS well that, at last, action has been asked of the anthracite operators. They have stood back for fear of prosecution and persecution, for fear their activity would arouse suspicion; but it was not because they did not understand the needs of the nation nor because they did not desire to alleviate them.

They are not pleased to see culm shoveled into cars as coal and paid for as if it were a superior article. They are going to see hereafter that the quality of coal delivered at the market is kept up to a reasonable level. We can see hard times ahead for those who want to ship all the rejects of old washeries as if they were good coal that needed no preparation. The bigger companies which use these "tailings" of former operation submit them to a further washing process that removes the rock with which they are mixed.

The committee also intends to try to discourage the use of anthracite where it is displacing bituminous coal. That is a good measure of the larger patriotism of the anthracite companies. They are putting an obstruction in the way of their own trade. It is to be hoped that, as a result of their activity, anthracite will not be shipped to regions where bituminous coal is more easily obtained. We trust that the army officer at a camp near a Kentucky mine, of whom we recently read, will not continue to get shipments of anthracite to satisfy his acquired taste for that smokeless fuel.

We may trust the anthracite operators to take a patriotic course in all they do. We wish they could do something for the straightening out of crooked retailing. It seems unnecessary that prices should be so high at local coal yards. It seems a right cause for suspicion when we find that local dealers refuse to sell to some of their customers, but will sell to ice men who peddle the coal around to those same customers at a high figure.

It seems unnecessary that long lines of shivering men, women and children with bags, baby carriages, go-carts and sleds should be lined up at the yards of almost every coal dealer. Even if coal is short why cannot orders be taken and coal be delivered at the house? A limitation on orders is always possible.

Unfortunately, the anthracite operators are setting bounds to their activity. They leave these retailing problems to the local fuel administrators, who seem to be neglecting them. Meantime the victimized public blames the big companies and overlooks as beneath contempt the peculators who carry away a money sack almost as large as the sack the poor man puts on his go-cart.

Who Is It Loads the Dirt?

JOHN P. WHITE, in a recent statement, has carried the modern doctrine of responsibility to its limit. The tendency of modernists has been to look entirely for the remote cause of wrong and to ignore the direct agent of that wrong, to condemn society and not the murderer, to exonerate the thief and condemn his employer.

Mr. White blames the operator for the bad coal in the market. He says, in effect, the operator is divinely appointed to see that the mine worker puts out clean coal. If the coal miner evades his contracted obligation, then it is due to the negligence of the wicked, careless and negligent mine owner. Such rascals should be held responsible for the poor coal the workingman is producing.

It is somewhat pitiful that Mr. White should deliver himself of such a statement; for if we were to reason after his manner in regard to his performance of his duties as head of the Labor Department of the Fuel Administration we could readily come to the conclusion that he is to blame for the bad coal now furnished. As head of that department it is his task to make the mine workers keep their contract, which includes the loading of clean coal. If they are not producing clean coal then he, himself, is the remoter cause of that delinquency. The more remote, the more reprehensible, is the modern doctrine to which Mr. White seems to subscribe. So Mr. White appears as the most reprehensible cause of the whole shortcoming of the coal industry.

Everybody knows that if the coal companies were to endeavor to enforce the clean-coal, or any of the clauses of its contract with the miners, it would have a strike or at least a heavy loss in its mining forces. All that can be done is to appeal to patriotism. With most men that is a remarkably strong plea, but with a few it is worse than useless. There are men who do not care for the interests of the nation. They do not favor John P. White, but they are members of the union, and many of them are strong enough, as Mr. White well knows, to make much trouble for any operator who would hold them to their contract.

It seems to us that the union, wherever there is a union, has a wonderful chance to create a wholesome spirit on the dirty-coal question. The union is surely more clearly responsible for the observance of the contract by its members than is the coal operator. It is the union which should stop the loading of dirty coal. The union's notices and the union's pressure should be active in suppressing the evil of which complaint is so general.

Producing clean coal is the work of the union and the work of the men. The contract proves it clearly. Let the union prove hereby that it is a national asset, that it is not established merely to filch a higher wage from consumers of all kinds—rich and poor—and to profiteer, but to secure essential justice between coal-mine worker, operator and public. Let it be well advised. On the road of good product and high ideals dwell esteem, progress and happiness, and on the road of irresponsibility and low aims will be found nothing but the contempt of the public, retrogression and regret.

Why the Wilsons and Garfield Did Not Go to Indianapolis

SOME people are disposed to think that British labor, and labor in general, is honored by Lloyd George's visits to labor councils. But it is a doubtful honor. Lloyd George was compelled to neglect his proper duties to conciliate men who were disposed to put their special interest above the interest of the nation.

The President of the United States, the chief of the Department of Labor and the United States Fuel Administrator did not go to Indianapolis, because they knew that the United Mine Workers of America was dominated by patriotic and intelligent men who could be relied upon to support the nation in its crisis. It is to the lasting credit of the mine workers that the Administration could address short letters to the workingmen in council and leave the whole matter in their hands without trepidation.

It is fortunately not necessary, though often it might be expedient, for the head officials of the nation to go touring the country to plead with any class of people, capitalists or workingmen. Their time can be given to the war and to the needs of the whole nation rather than to the demands of any particular trade. We have had a few strikes, it is true, but we are pulling together and we will pull together indefinitely if the truth, the whole truth and nothing but the truth is told by the press and the leaders on both sides.

Demurrage

(The crime of holding a railroad car idle)

THE war makes new crimes. A manufacturer or mine owner who holds a car a long time without unloading it has to pay a $10 per day fine. He is a criminal. After a while the Government may even provide a jail sentence for such people.

It's as bad an offense today to hold a car idle as it is to steal a pocketbook. No matter how hard it is to get the car unloaded or to get it loaded, and no matter how slow the railroad may be in hauling the cars, the man who is loaned a car by the nation must not keep it.

The miners are not required to pay any such fines. Anyway, they are going to do their level best to load cars as promptly as they can. No demurrage for theirs.

For this reason you will see the miners hustle to their work as soon as cars appear

DISCUSSION BY READERS

First Aid to the Uninjured

Letter No. 2—I read the letter in *Coal Age*, Jan. 19, p. 156, entitled "First Aid to the Uninjured," by Charles Arnold, and want to say it should call forth a hearty response from a goodly number of mine foremen. It is a topic on which much can be said, and the opinions of these men may help to reduce the number of accidents in our mines.

As first aid to the uninjured, in my opinion, we need the following: Safe haulage roads; all machinery suitably safeguarded; sufficient pure air in circulation in the mine; miners' houses well built and equipped; educational facilities; and strict discipline in the mine.

To make the haulage roads safe requires rails of a size capable of carrying the loads that will be hauled over them; good ties spaced close enough to hold the rails firmly in their place and well ballasted. In short, the roads must be built in a good substantial manner. There must be plenty of headroom and at least three feet of clear space on one side of the entry, and this must be kept free of all loose material, as rock or timber, on which a man could trip and fall. Where there is danger of cars running away on a grade a suitable derailer or safety switch should be installed and kept in such shape that cars could not possibly cross it without being derailed. In this way, many serious accidents may be prevented.

The mine law compels operators to have a specified amount of air in circulation, for each man employed in the mine, but sometimes abandoned parts of a mine or portions temporarily idle do not receive the attention they should and the lives and safety of a large number of men are endangered. Too much care cannot be given to the ventilation of a mine.

The problem of housing miners and their families is receiving more attention today than it has in the past, and this certainly goes a long way toward aiding the uninjured. A good house with clean yards does quite a bit toward reducing accidents and sickness. We sometimes see mining towns with all sorts of rubbish lying about, pig pens in a filthy condition and no sanitary measures taken to keep filth and germs away. As a consequence, sickness and disease abound in those places.

Much can be done to make conditions in such communities better, by having lectures on the subject of sanitation and health, or by offering a prize to the family having the cleanest yard and neatest appearing home.

All men should be taught how to avoid accidents to themselves. Much can be done by posting safety bulletins with illustrations showing the different dangers men continually encounter, and giving instructions how to avoid them. A list of rules for the mine should be prepared and posted in several conspicuous places. These should be in different languages so all the miners could read them and know the requirements.

Last, but by no means least, a strict enforcement of the mine rules must be maintained if any good is to come from them. I feel sure that discipline is one of the most essential requirements to prevent accidents and avoid sickness. I do not wish to be understood as saying that all miners are careless and stubborn in respect to obeying the rules of a mine, which are made for their own safety; but too many of them are and their disobedience is often the cause of injury to themselves or to some other miner who is obeying the rules.

It is far better to discharge one reckless man than to have a dozen or more killed or injured by his recklessness and disobedience.

If every man would consider himself his brother's keeper there would not be as many armless and legless men in the coal districts, nor so many widows and orphans in hard circumstances. We should all make it our duty to prevent injury to a fellow workman in any way that the circumstances may demand.

J. H. TIPTON,
Hooversville, Penn. Mine Foreman.

Relative Size of Intake and Return Airways

Letter No. 4—In answering the examination question, "Which, if either, should be the larger, the main intake or the return airway? Explain why," *Coal Age*, Dec. 15, p. 1033, the editor stated that, under the conditions common to coal mining, the return airway of a mine should have a larger sectional area than the intake, giving as a reason for this statement, the expansion of the return current owing to its higher temperature, and the increase in its volume because of the presence of mine gases. It was further explained that the larger area was necessary in order to avoid an increase in the velocity of the current and an increased mine resistance.

In his letter, Jan. 5, p. 32, F. E. Schroyer says he does not agree with *Coal Age's* answer, and gives as a reason for his disagreement that the main haulage road of a mine should be the larger, on account of the cars passing in and out and obstructing the air currents. It seems to me that Mr. Schroyer is laboring under the supposition that the main haulageway is necessarily the main intake air-course, which is not always the case. As I understand the question asked and the answer given, such was not the case in this instance, and consequently the answer given in *Coal Age* is unquestionably the correct one.

Where the main haulway, in a mine, is also the intake airway, especially where there is a rope or motor system of haulage, it is true, as contended by Mr. Schroyer, that the passing trips of cars will obstruct the circulation of air more or less. The extent of this increased resistance will depend upon the speed of the traveling trips and the relative size of cars and entries. The empty trip going in with the current increases

the velocity of the current, while the loaded trip coming out against the current, decreases its velocity. I have often had occasion to observe this in taking air readings on an entry while the trip was in motion.

Assuming the haulageway is also the intake airway in a mine, I would be glad if *Coal Age*, or some one else who is able, would figure out and tell us whether or not the intake haulway should really be larger than the return air-course, as claimed by Mr. Schroyer and, if so, how much larger. JOHN ROSE.

Dayton, Tenn.

Coal Production and Booze

Letter No. 4—I am glad to see that attention is being given to the booze question in its relation to coal mining. It would seem that some way should be found by which intoxicating liquor can be kept away from coal-mining camps and towns, especially at this time, when the Government is asking that every coal miner do his best to increase the output of coal from the mines.

It would surprise almost anyone, except those who by long acquaintance with miners have come to know their habits, to go into a mining camp and see how many of these men are out of the mine one or more days following payday. They would be inclined to ask the question, Is this patriotism? Some might even be inclined to wonder if there was not a pro-German spirit prevailing among some of the men. Their staying out of the mine certainly does not exhibit a spirit of patriotism and devotion to the cause or loyalty to the flag.

In its efforts for conservation why is it not possible for the Government to limit the shipment of liquors to mining districts, so that each district would receive a weekly or monthly allowance, which should be a prescribed percentage of their accustomed consumption? This would give but a small amount that each man could receive, and prevent drunkenness.

A PRACTICAL SUGGESTION WORTH CONSIDERING

Orders could be issued requiring saloonkeepers and bartenders to issue tickets to their regular customers that would restrict the number of drinks they could obtain in a given time. Such a practice was adopted and carried out by the food administrator during the recent sugar famine, when customers were only able to obtain a limited supply of sugar each week, on presentation of a ticket given to them by the store where they traded regularly.

If the same scheme could be put into effect in respect to the sale of liquor over the bar, in mining districts, it would go far toward keeping men in their places in the mine and in fit condition for work. The temptation to remain out of the mine a few days or a week, following payday, would be removed. Then with a little persuasion, not to say compulsion, on the part of the mine foreman and other mine officials, the production of coal would not fall off in the days immediately after the men receive their regular pay.

In the little town where I am living there is a population of 375 persons, and it is safe to say that there is shipped and brought into this place 200 gal. of intoxicating drink a week. All the men in the place are not confirmed drinkers, and this amount of liquor consumed by the remaining portion should be and is sufficient to greatly impair their work in the mine.

While I am not a temperance crank, I am fully convinced that to limit the supply of intoxicating drink is a good policy to pursue, at this critical time when our country needs the services of miners working in coal mines just as much as it needs men in the trenches. In order to win the war, for our benefit at home and for the generation to come, the soldier at the front is rated at $30 a day, 30 days in the month, and 24 hours a day. When these restrictions are forced on men of the draft age, why should not we be governed by similar restrictions that would make our efforts in the winning of the war as effective as those of the men called to the front?

To the man who is an habitual drinker, let me say in closing, Look around among your friends and near neighbors. One and another have sent their sons to the front to take your part and fight your battles. Then, ask yourself what are you doing to share this burden? Are you doing right when you stay out of the mine a day and fail to send to the top your share of the coal that is required to make the war a success and give these men at the front the support they should have from home?

I hope this matter of the supply of drink to the mining districts of the country will be so brought to the attention of the Government that they will take the necessary action to limit its effect on the production of coal.

JOHN BUGGY,
Mine Foreman.

Chambersville, Penn.

Shotfiring re Explosion

Letter No. 2—This subject of shotfiring and explosions, it seems to me, is worthy of more than passing comment, particularly since "Gas Inspector," who writes in *Coal Age*, Jan. 12, p. 71, cites an explosion that he states was "an explosion of powder smoke, intensified and propagated by coal dust," in which two shotlighters lost their lives.

This citation is given to refute the claim of Mine Inspector John Verner, that powder smoke produced in blasting contains so much carbon dioxide as to reduce the liability of an explosion being started.

In this connection I recall that Mr. Verner, in discussing "Shotfiring in Mines," Jan. 5, p. 33, advocates "a reduced circulation of air in the workings of a mine at the time of firing." This, he claims, lessens the liability of an explosion taking place. My own experience in the blasting of coal causes me to favor strongly increasing the volume of air in circulation at the time of firing rather than reducing it.

Considering the large number of shots that two men can fire in a mine, in a short period of time, it is clear that much carbon dioxide will be produced. But, on the other hand, if we consider the overheated atmosphere, charged with a considerable quantity of fine coal dust, there is presented just the conditions that favor the development of an explosion.

To depend on a reduced current of air to avoid such an occurrence appears to me as inviting disaster. Is it not true that, in a limited supply of air, a larger quantity of carbon monoxide will be produced, which will increase the explosive condition of the mine air? If that is the case, does it not follow that the cure suggested by Mr. Verner would seem to be worse than the

disease? My opinion is that no chance should be taken in this regard.

The use of a safety lamp by the rescuers, as described in the citation to which I have referred, would seem to indicate the importance of shotfirers working in a pure atmosphere. This would not be the case if the circulation is decreased before firing. The work of firing shots should start on the end of the air. If the circulation is slack, the shotfirers will then be compelled to work in an unhealthful atmosphere.

My conclusion is that in order to properly and safely perform this work it should be done in an abundance of pure, fresh air. All places where shots are to be fired should be sprinkled carefully with water before shooting, and a reasonable time be allowed to elapse between the firing of the shots. This, I believe, is the only safe practice in blasting coal. R. W. LIGHTBURN.

West Leisenring, Penn.

Letter No. 3—The incident given by "Gas Inspector," regarding an explosion in which two shotlighters lost their lives, *Coal Age*, Jan. 12, p. 71, calls to mind a similar instance in my own experience. For 24 years I have studied carefully the nature of gas and dust explosions, and want to say that the gases produced in the explosion of black powder, assisted by the presence of more or less gas issuing from the coal under the influence of the heat due to the explosion, form a very inflammable mixture.

In one instance, I remember firing a shot on the loose end of a crossheading in longwall work. The shot had been mined at the top. After firing it, I returned too quickly to ascertain the result and, sticking my light in behind the coal, was surprised by the gas igniting on the lamp. A considerable volume of flame was produced.

When working at Urpeth, in the "Busty seam," County of Durham, England, I recall that three or four men were killed in a local explosion that, according to the evidence given at the inquest, was due to the gases produced in the firing of the first shot being ignited by the flame of the second shot. As is usually the case, the force of the explosion was intensified by some marsh gas being present and by the coal dust blown into the air by the first shot. W. H. LUXTON,

Linton, Ind. Mine Foreman.

Letter No. 4—It is my opinion that the present-day methods of mining and blasting coal are responsible for the explosions that occur so frequently in blasting. Formerly, when this work was performed by experienced miners, more care was taken in placing shots; and the amount of powder in a charge was well gaged.

The use of squibs and the needle made it necessary to tamp the hole more thoroughly in order to be sure that the shot would go off. The working places were not as well ventilated then as they are today; more coal was broken by a single shot, and fewer shots were fired per man, each one doing his own shooting. The result was that the coal was properly mined, and a windy or blownout shot practically never occurred.

Comparing these conditions with those that exist today in relation to the blasting of coal in mines, it is not difficult to determine the real cause of the frequent explosions that now occur at firing time, and which cause the death of so many shotfirers. The majority of these shots are improperly placed, poorly prepared and frequently overcharged. Fuse is generally used to fire the charge, which is often tamped with paper dummies filled with coal dust or other poor material and but loosely rammed into the hole. To add to the danger, the shots are fired in quick succession. It cannot be denied that these conditions favor the occurrence of a dust or hot-smoke explosion.

It has fallen to my lot to investigate five cases where explosions occurred as a result of blasting and which caused the death of three men and severely injured two others. They were all windy shots and dust explosions. It is worthy of note that these never occurred at the face of a deep room where there was ample space for the expansion of the gases, even though the rooms were poorly ventilated.

All the explosions to which I refer occurred in tight places at the head of entries and close to the intake, where a fairly good air current was passing. In addition to these experiences, allow me to cite a few instances that have come within my observation. The first of these is proof, to my mind, that poor tamping, or lack of sufficient tamping, will generally cause a blownout shot.

LACK OF TAMPING CAUSES BLOWNOUT SHOT

A miner, in charging a hole in the face of an entry, chanced to ignite the fuse when he had but one dummy rammed in the hole as tamping. Finding that he was unable to extinguish the lighted fuse, he ran to notify the men in the other entry, and all escaped; but the shot blew out and tore up the entry for a distance of 200 ft. back from the face, knocking out crossbars and timbers, and throwing cars and tool boxes about in great confusion.

An hour and a half later one man was found overcome with the afterdamp and was taken out for dead, but artificial respiration revived him. Investigation showed that the shot was well prepared and would have done good work had it been properly tamped. It cracked the coal through the line of the hole; but the force of the blast was expended through the hole, and the coal was not broken down. Had these entries been filled with dust or hot smoke from a preceding shot, there is hardly a doubt but the result would have been much worse.

Another instance in which a shotfirer lost his life occurred as follows: A pair of entries were being driven on the strike of the seam and the rooms turned to the rise of the upper entry, the lower entry being the intake. All the shots were fired at one time, those in the upper entry being timed to go off first. There were but two shots in the face of the lower entry, and these were the last to explode.

UNBALANCED SHOT AND "DEAD HOLE" BLOW TAMPING

One of the shots in the lower entry was very heavy, measuring about 7 ft. at the point and 2 ft. at the heel, the hole being 7 ft. deep. This shot blew its tamping and slightly cracked the coal. The blast blew out the stoppings for a distance of 200 ft. back from the face, throwing great masses of rock and gob into the upper entry. The shotfirer was found dead at a point 300 or 400 ft. back from the face, his death being caused by the afterdamp.

Another instance was where four shots of dynamite were exploded, two being located in the face of each of a pair of entries. Two shots were placed in the center of each face, the holes being drilled straight in and 6 ft. deep, starting 18 in. from the floor and one shot being 18 in. above the other. Eight sticks of 40 per cent. dynamite were used, the intention being to make an easy place to put in a 6- or 8-ft. cutting. There is little doubt but the last of these shots to explode ignited the fine dust raised by the other shots, as the timbers, cars and tool boxes were badly burned, and charred coal and coke dust was in abundance everywhere.

Seven Shots Fired at One Time Cause Explosion

I will mention but one more case where an explosion occurred in which two men lost their lives and others were severely burned. Seven miners were driving a slope on a pitch of from 8 to 12 deg. An intake air-course was driven on each side of the slope and four new entries had been started, two being driven off each air-course, near to the face.

The new entries were each in from 20 to 30 ft. Seven shots were fired, all of which were charged with 40 per cent. dynamite, which it was the custom to use in tight shots, black powder being used only in open shots. The explosion occurred on the night shift, and set fire to the timbers and shifted the trapdoors for a considerable distance up the slope.

These incidents lead me to believe that a poorly placed shot, an overcharged shot, or one that is tamped improperly, will cause an explosion that will be greatly intensified in the presence of hot powder smoke or fine coal dust, especially if a fresh-air current is passing the place.

R. J. Pickett,
Shelburn, Ind. Mine Foreman.

Clearing a Heading of Gas

Letter No. 6—Having had considerable experience in moving gas, I have been interested in this discussion and would like to add a few words in addition to what has been said by others.

When making my rounds as mine examiner, a few mornings since, I proceeded with unusual caution as the fan had been stopped for two hours to make necessary repairs, and I expected to find trouble at some point in the mine, which was a very gassy one requiring the exclusive use of safety lamps.

On reaching a certain point in a cross-heading, I found, as I had expected, that the face of the heading was full of gas for a distance of 60 ft. back from the face. Fencing the place off with the usual danger board, I returned to the surface and reported the case, whereupon I was told to get a man to help me and move the gas.

It was my first experience in attempting to move a large body of gas and, entering the mine with my helper, I began to study how it was best to proceed. My first step was to throw all the air possible into that heading, and I arranged the doors and curtains accordingly. After a short time, my observations convinced me that this produced little effect and that other means would have to be adopted to move the gas, which was too strong for the air.

Therefore, starting from the outby rib of the last crosscut, I began setting a row of posts with a string of 2 x 4's above them against the roof, to enable me to hang the canvas to form a brattice. Having extended this brattice along the rib a short distance, I went back to the mouth of the heading to watch the result on the return side.

I found that the return air was a very explosive mixture and, in order to relieve this condition, returned to the crosscut and opened the curtain at that point for a short time. This had the desired effect of diluting the return current. By repeating the method of alternately opening and closing this curtain and extending the brattice by degrees toward the face, I was able to move the entire body of gas from that entry.

Moving a Large Body of Gas

My experience is that one should never attempt to move a large body of gas at once, but proceed to do this a little at a time. Another point that should be carefully borne in mind when moving a large body of gas is to carry it out of the mine by the shortest route possible. Never permit it to pass around the mine or through the working places when it is possible to give it another course. Get it to the shaft or slope bottom as quickly as possible. Then, after the gas has been removed, restore the ventilation to its proper course and examine the mine thoroughly to see that it is safe for work.

I agree fully with what Samuel Jones said in his letter, *Coal Age*, Jan. 5, p. 31, advising that the brattice should be set a sufficient distance from the rib of the entry to provide enough air space for the current to travel. As he explains, too small a space behind the brattice will choke the air current and reduce the quantity of air circulating in that split.

In my opinion it will have the same effect as a large roof fall on an entry if the attempt is made to force the air through a narrow space at the face. To move gas successfully one must have good ventilation, and this requires good air-courses and ventilating equipment.

Jacob Riley,
Bicknell, Ind. Mine Examiner.

Blacklisting To Prevent Accident

Letter No. 9—Permit me to say that I am strictly against the idea of "blacklisting" a man who has been careless or reckless in his work. The only condition that would induce me to put a man on the blacklist would be drunkenness, which cannot be tolerated in coal mining.

Because a man is careless, at times, is not to say that he is a hard man to work with, or that he is inclined to disobey the orders of the mine boss. The man is not always lazy; he may be inclined to take a chance, which is common with most miners. They put the longed-for dollar before safety, but the same thing can be said of a large majority of mine officials and operators.

My belief is that many mine bosses (foremen) fail to realize that they hold their position because they are supposed to have a superior knowledge of mining, and it is their duty to give their best to the workmen in their charge. Especially is this true with regard to the prevention of mine accidents.

A mine boss should strive in every way to prevent the occurrence of accidents, not because the law demands it, but because of the loss to the operator and the injury to workmen. When a miner neglects to make his place safe by setting the necessary timbers as ordered, the easiest way to bring him to time is to stop his turn. He will not delay long, then, to set the timbers required.

Since coming to this country, eight years ago, I have worked in one mine six years, for the reason that I concluded the mine was fairly safe, although my place was not visited by the mine boss as often as was the custom in England, where the deputy (fireboss) visited each working place daily. When employed as deputy, in the old country, I would often visit a man's place three times a day.

Machine Men Fail to Reset Post Under Bad Top

An instance that occurred not long since illustrates the need of more frequent supervision of miners' places to avoid accidents. I had set a good timber to protect me while loading some machine-cut coal, in a room where the roof showed a very distinct slip. The coal was hauled away and a fresh cut made with the machine. On returning to the place, I found that the timber had been removed to operate the machine and had not been reset.

Seeing the post lying where it had been thrown, I remarked to my buddy, "Now, George, it has gone well this time, but that won't always be the way"; and my words proved true, for a few months later, one of the machine men was caught by a fall of slate and killed. Yet it would be hard to find a more careful, steady and industrious man, although he was somewhat venturesome. The thought came to me, then, very forcibly, that the only way to prevent such accidents is to inspect the working places more frequently. It was the first fatal accident in that mine.

Accident Impresses Need of Closer Supervision

The second fatal accident occurred not long after, when a close friend of mine was caught and killed by a fall of slate in his room. At the time I was one of the mine committee. Our committee and the mine inspector had considered the place well timbered, and I could not help thinking that the accident might have been avoided by a more frequent inspection of the place, as danger may often develop in a short time at the working face.

So deeply was I impressed with the thought that more frequent inspection was needed, that my contention in this regard angered the mine boss, and I might have been blacklisted if that method had been in use at that time. At each of the fatal accidents mentioned it so happened that the room boss for the section was away at the time, and his duties were supposed to be performed by the boss of another section, who was thus compelled to do double work.

While room-bossing at one time, I started the practice, in the mine where I am now employed as a miner, of making more frequent visits to the working places. I am glad to say that this practice is still continued and there has been but one fatal accident in this mine in eight years.

The remark is frequently heard that "a mine boss is expected to do as much as two ordinary men." It is my opinion that, when this is the case, the operator is the loser in the end. My advice is to give mine bosses more opportunity to visit the working places and instruct the men and see that they keep their places safe for work. In this way good results are sure to follow.

Linton, Ind. MINE FOREMAN.

Letter No. 10—Having worked about the mines during the last 25 years, mostly as a miner, I was somewhat surprised to read the article advocating the blacklisting of miners for carelessness, neglect or disobedience to orders, which has been under discussion in *Coal Age*.

It is strange that blacklisting should be considered for any purpose whatever, and least of all for the purpose of promoting safety and getting men to work more steadily.

The book system for keeping a man's record, as suggested by Gaston Libiez, in his letter, Jan. 5, p. 29, in my opinion is only another method that is calculated to do much harm, not only to the workmen but to mine foremen as well. It is stated that the method proved successful in France, but I believe it would not work in this country.

An Obstacle to Blacklisting

Every man has his friends, and all men are not of the same mind or temperament. For this reason, a man may work well under one foreman, while he fails to suit another foreman. In time a good miner will work for a large number of foremen, good, bad and indifferent. He may quit a place of his own accord or he may be fired for some slight cause or because of prejudice. The record entered in the book may be just or unjust, according to the relation of the man to his boss and, for this, the workman is not always responsible. There was a time when I would have scorned to ask a foreman to fix my book so that I could secure employment elsewhere.

In reading different letters on this subject, that of Robert A. Marshall, Jan. 12, p. 74, appeals to me as setting forth the more sensible method of procedure in the management of men. Mr. Marshall advocates showing appreciation of a miner's efforts to make his place safe and says that this is "a big incentive to him to continue so doing." In my opinion a word of commendation when merited, as well as a deserved rebuke, comes closer to the mark than keeping a man's record or blacklisting him. My motto is, Treat men as though they were human.

Many times, when instructing a miner or his laborer to do or not to do a certain thing, a little explanation of the why and the wherefore will prove a great help, as the man then sees the reason why he should do as he is told and is more inclined to obey.

Most men can be brought to the place where they will do what you want them to do if judgment and tact is used in instructing them. Driving men under the lash was abolished more than half a century ago. Our fathers fought to free the slaves, and this is reason enough to make our blood boil at the mere mention of serfdom. Fairness will accomplish more than force.

Bolivar, Penn. W. H. CLARK.

[This letter will close the discussion of blacklisting to prevent mine accidents.—Editor.]

INQUIRIES OF GENERAL INTEREST

Dynamos and Motors

Kindly explain the difference between a dynamo and a motor. Can a dynamo be changed into a motor, or a motor be made into a dynamo? I am referring now to direct-current machines. I have heard these terms used so indifferently that I am much confused in regard to their proper application. MINE MECHANIC.

Johnstown, Penn.

It is true that the two terms, dynamo and motor, are used very indiscriminately in practice. The word "dynamo" is an abbreviated form of "dynamo-electric machine" and originally referred to a device by means of which mechanical energy can be converted into electrical power.

The dynamo consists of a series of coils of wire forming a conductor and mounted on a shaft in such a manner that they can be rotated in a magnetic field. Briefly stated, the principle of the dynamo is that when an electrical conductor is made to cut the lines of magnetic force an electromotive force is generated, which causes a current to flow in the conductor when the circuit is closed. The coils mounted on the shaft are called the "armature" of the machine.

It was found, however, that this machine, familiarly called a "dynamo," was capable of being operated in two ways: For example, when the armature was rotated by power applied to the armature shaft an electromotive force was generated that caused a current to flow through the conductor whenever the circuit was closed. On the other hand, it was found that when connection was made, allowing a current to pass through the conductor, the same reaction took place between the live conductor and the magnetic field of the machine and the armature was again rotated.

It is important to notice that, in the first instance, mechanical power was applied to turn the armature and the electromotive force generated then makes the dynamo, properly speaking, a "generator." In other words, a *generator* is a dynamo-electric machine, or simply a dynamo, operated by mechanical power and producing electrical energy.

In the second instance, on the contrary, the electric current sent through the conductor that composed the armature windings made the dynamo a prime mover, thereby converting electrical energy into mechanical power. In this case, therefore, properly speaking, the dynamo is a *motor*.

It is evident, therefore, replying to the question of whether a dynamo can be changed into a motor, or a motor into a dynamo, that a dynamo may be employed either as a generator or as a motor, according to the manner of its operation. As a generator, the input is mechanical power and the output electrical; while, as a motor the input is electrical and the output mechanical. In either case tne dynamo is not an independent source of power but a means of converting one form of power into another. It is this fact that gives the word a broad application, which is sometimes mistaken for a misuse of the term. To be specific, a dynamo should be spoken of either as a generator or a motor, which would designate its use.

Flow of Water in a Ditch

I have been working over what seems to be a simple question and yet have not been able to satisfy myself as to the correct answer. I have submitted the question to others and their results vary from 14,000 gal. to almost 5,000,000 gal. in 24 hours. Kindly show what quantity of water will flow in a ditch 20 in. wide on top, 10 in. at the bottom and 8 in. deep, in 24 hours.

Renton, Wash. STUDENT.

The question is incomplete, as it does not state the mean velocity of the water flowing in the ditch. In a small ditch of the kind here mentioned the mean velocity of the flow for the entire cross-section of the ditch may be taken as approximately 0.9 of the observed surface velocity.

For example, assuming that a surface float, in this ditch, was observed to pass over a distance of, say 100 ft. in 30 sec., the observed surface velocity would be $60/30 \times 100 = 200$ ft. per min. and the mean velocity of the flow can be estimated as $0.9 \times 200 = 180$ ft. per min.

Again, assuming the ditch is running full of water or that the surface of the water is 20 in. wide and its depth 8 in., the wetted cross-section of the ditch is then $8 \times \frac{1}{2}(10 + 20) = 120$ sq.in. On this basis the quantity of water flowing in the ditch in 24 hours is

$$24 \times \frac{60(180 \cdot 12)120}{231} = 1{,}615{,}790\ gal.$$

The estimated quantity of the flow will vary with the assumed mean velocity, which is here taken as 200 ft. per min.

Handling a Gob Fire

Please state if water should be used to extinguish a gob fire that has gained much headway.

McAlester, Okla. MINE FOREMAN.

Assuming that the fire has spread over a considerable area in the gob, it will be impracticable to load out the burning material and, in order to extinguish the fire under these conditions, it will be necessary to seal off the places so as to exclude air from the fire. Having done this, time must be given for the fire to die out, which will be when all the available oxygen supporting the combustion has been consumed. The use of water for extinguishing a fire in the gob will generally only make matters worse, as the moist material will heat and the trouble be extended.

EXAMINATION QUESTIONS

Alabama First-Class Examination, Birmingham, Jan. 21-24, 1918

(Selected Questions)

Ques.—Describe the continuous-current system of ventilation.

Ans.—Where a mine is ventilated by a single current of air that is not divided at any point of its passage from the intake to the return opening of a mine, the system is called a "continuous-current system" of ventilation. This system is only adapted to the ventilation of small mines having but few working places.

The efficient ventilation of larger mines requires that the air current be split one or more times in its passage through the mine, the purpose being to prevent the gases generated in one section of the mine from being carried into other sections of the mine. Also, a larger quantity of air is circulated by the same power. This is called the split system of ventilation.

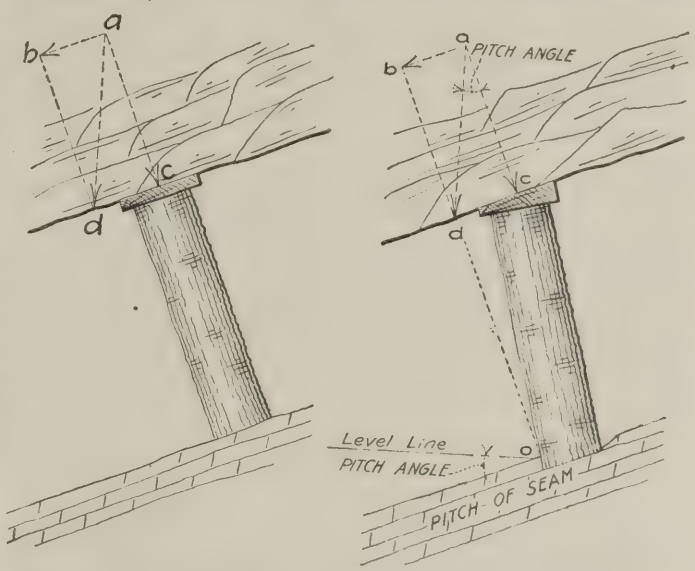
Ques.—What are the advantages and disadvantages of the split-current system?

Ans.—The advantages of splitting the air current in a mine, are that less power is required to circulate a given volume of air; fresher air is supplied to the working places and the circulation is under better control, as the quantity of air supplied to each section of the mine can be proportioned to the needs in that section; the velocity of the air current passing the working places is reduced and causes less inconvenience to the workmen; an explosion occurring in one section of the mine is less apt to be carried into another section; and, finally, splitting the air current avoids the necessity of doors on the main haulage roads.

The only disadvantage, if such it can be called, of splitting the air current in mines is the necessity of building air bridges or air-crossings at points where the air is split and where it is required to conduct the current over the parallel entry.

Ques.—How would you proceed to reënter a heading with safety, after an explosion has occurred therein?

Ans.—The first step is to withdraw all the men from the mine before any attempt is made to enter the heading in which an explosion has occurred. Only safety lamps of an approved type must be used. The circulation must be increased and the mine entered by following the intake air, making frequent tests with the safety lamp to ascertain the presence of afterdamp or any remaining firedamp, which often drains out of the rooms, after an explosion has occurred in other rooms or at the face of the heading.



Proceed slowly, taking every precaution to avoid being entrapped in gas issuing from the rooms. The fresh air current should be conducted by brattices, if necessary, and made to sweep the working faces and other void places where gas may have accumulated. Continue in this manner until all the gas has been removed from the rooms and the heading.

Ques.—What proportion of firedamp in an air current forms an explosive mixture of the least dangerous character?

Ans.—The least dangerous explosive mixture is that where the proportion of gas to air is 1: 13, which is the lower explosive limit of marsh gas. As the proportion of gas to air is increased, the danger increases. Firedamp mixtures above the maximum explosive point are more dangerous than those below that point, because the addition of any air to those mixtures renders them more explosive. On the other hand, the addition of air to firedamp mixtures below the maximum explosive point renders the mixture less explosive.

Ques.—Show by sketch the difference between properly and improperly set timbers on a 30-deg. pitch.

Ans.—The accompanying figure shows two posts set on a steep inclination. The post on the left is set normal

RIGHT AND WRONG METHODS OF SETTING POSTS ON AN INCLINE

in the seam and, in this position, the slightest movement of the roof, by which it tends to slip down the pitch, will loosen the post. This is the improper method of setting a timber on a pitch.

The post shown on the right of the figure is "underset"; that is to say, the head of the post is inclined up the pitch at a slight angle from the normal in the seam. In this position, it is evident that any movement of the roof downward in the direction of the pitch will tighten the post. The foot of the post is set in a shallow foothold cut in the floor of the seam.

Ques.—Is it safe to pass a current of intake air through the abandoned portions of a mine and then conduct it to the face of the workings?

Ans.—This should never be done, for the reason that the abandoned portions of a mine are liable to contain accumulations of blackdamp or firedamp, which would be absorbed by the current and carried past the working faces, making the mine unhealthy or dangerous.

COAL AND COKE NEWS

What Happened in January

Jan. 10—M. L. Requa is given full charge, under the direction of Dr. H. A. Garfield, of the activities of the Fuel Administration in connection with oil.—To save fuel, manufacturers of boxboard, paperboard, strawboard, pulpboard, binder board, tag board and other like boards agree to close down from 7 a.m. on Saturdays till 7 a.m. on the following Monday.

Jan. 12—Dr. H. A. Garfield demands that the Alabama Coal Operators' Association accept the Fuel Administrator's decision, already approved by the mine workers Dec. 21 of last year.

Jan. 14—Authority to divert coal and coke to meet emergency demands was conferred on State Administrators by Dr. H. A. Garfield, United States Fuel Administrator.—Senate passes Walsh-Pittman coal and oil-lands leasing bill for the general leasing of coal, phosphate, oil and gas, and sodium lands.

Jan. 14—Frank S. Hayes and nine other officials cited to show cause why they should not be declared in contempt for violating an injunction restraining representatives of the union from attempting to organize the employees of the Hitchman Coal and Coke Co., in West Virginia.

Jan. 15—United Mine Workers of America convene at Indianapolis, Ind., in biennial convention.

Jan. 17—"Workless" five days commence under order of Dr. H. A. Garfield.—M. L. Requa announces that the drilling and operating of oil or gas wells and the transporting, manufacturing or distributing of petroleum and its products or of natural gas is not to be restricted on the days appointed for suspending operation in other forms of industry.—H. A. Garfield telegraphs J. P. White, saying that the mines would not be shut down on the "workless" days. A long list of exemptions was published.—Francis S. Peabody testifies before the Senate Investigating Committee urging the necessity for clean coal, the need for the zoning of the coal industry and suggesting a price for coal based on coal thickness.

Jan. 18—Garfield adds another long list of firms exempted from the "Workless Days" order.

Jan. 21—First "Workless Monday."—United Mine Workers of America approve by vote of convention the Washington agreement signed on their behalf by the International officials of the union, Oct. 6 of the last year.—Interstate Commerce Commission approves under certain conditions refusal of the Baltimore & Ohio Ry. to supply coal cars to wagon mines.

Jan. 23—Explosion at Stellarton, N. S., at the Allan shaft of the Acadia Coal Co. Eighty-seven men are said to have been killed.

Jan. 24—J. D. A. Morrow appointed commissioner with the title of Manager of Apportionment and Distribution for the zoning of all fuel except petroleum.—Anthracite operators pool all coal at New York City.—The Fuel Administration reduces the prices for run-of-mine coal and prepared sizes produced in the Deerfield or Palmyra fields and the Massillon and Jackson fields in Ohio, 5c. per ton. (It would have been 50c. had the price not been offset by the 45c. increase.) However, the price of screenings is raised 45c.

Jan. 25—Fuel Administrator Garfield announces his coal distribution plan.—E. R. Stettinius appointed Surveyor General to the Army. He will make all purchases for military purposes.

Jan. 26—Mine Workers Convention comes to an end after having given the mine workers of all the states a word in the making of the contract of the Central Competitive Region.—Fuel Administrator forbids all unusual hours of labor introduced to evade the law relating to workless days and prescribes exceptions to the workless day provisions.

Jan. 29—Alabama operators agree to comply with the terms of the agreement proposed by the Fuel Administration through Rembrandt Peale and declare they will not recognize the union but will increase wages if necessary.

Harrisburg, Penn.

During the week Mr. Potter, state fuel administrator, seized many cars of coal destined to points outside of the state, among the cars being 1300 tons for the Weller Coal Co., at Jacksonville, Fla. That Mr. Potter's seizure of the Florida coal will "start something" in Washington, is held by virtually all interests close to the coal trade. It is known that such a move has been in contemplation by the fuel administration for some time, on advice of coal men called in as consultants. The need for drastic action, it has been pointed out, existed from the moment Dr. Garfield gave ear to the needs of New England, at the same time openly disregarding the situation in Pennsylvania.

Since the normal methods of distribution have been superseded by instructions from Washington, coal shippers do not know where they are at. Shippers contend that the way things are going at the present time there is no way of knowing, apparently, whether coal is stuck away in some railroad congestion or whether it has been confiscated for railroad or Government use.

On Jan. 29, Mr. Potter sent telegrams to all Pennsylvania representatives and senators and A. Mitchell Palmer, alien property custodian, and Vance McCormick, chairman of the War Trade Board, charging that the orders of Dr. Garfield giving priority to coal for New England has caused the present acute situation in Pennsylvania.

Pennsylvania members of the House held a meeting after receiving Mr. Potter's telegram and appointed a committee headed by Representative J. Hampton Moore, of Philadelphia, to confer with Dr. Garfield and William G. McAdoo, director general of railroads.

Dr. Garfield was interviewed by the committee and entered into a lengthy explanation of the fuel situation. He said the so-called priority for the benefit of New England did not prejudice Pennsylvania, and produced statistics showing that Pennsylvania's supply of anthracite had increased in larger proportion than that of New England or New York. In the course of the interview with Dr. Garfield, it was learned that preparations were being made for a systematic all-the-year distribution of coal during the period of the war. As to immediate relief for Pennsylvania, however, Dr. Garfield declared that the situation was being given close attention, and that conferences were being held and would continue, looking to some alleviation of the situation, which had been presented by the protestants from this state.

At a meeting of the Anthracite Board of Miners' Examiners on Feb. 1, it was decided that the members use their own discretion in giving miners' certificates to those applicants who qualify, whether they are natives of countries now at war with the United States or not. During the session certificates were issued to a number of Austrians and others, officially classed as alien enemies, who declared that they were not enemies but loyal and supporters of this country, although not as yet naturalized citizens.

Since the judges refused citizenship to natives of countries at war with the United States the members of the examining board have questioned the advisability of granting miners' certificates to such aliens.

Little or no seditious talk has been heard from mine workers in the anthracite region. Most of the employees seem content and satisfied with wages and conditions, and while a big majority of the workers are natives of alien countries, they are giving no trouble and are getting out as much coal as possible.

A movement has been inaugurated to reopen the Schuylkill Canal on a large scale. Petitions will be presented to the Government asking to have this waterway opened for transportation. The plan is to have the canal open to transportation of coal between Port Clinton and Philadelphia. It is believed that were the canal open the coal problem would be taken care of with ease. Thousands of tons could be moved cheaply, when ice did not obstruct navigation.

The canal is owned by the Schuylkill Navigation Co., and its purchase by the Reading Railway Co. and the virtual closing down of these water transportation facilities greatly increased the freight for the railroads. At one time 800 boats used the canal. Last year there were twenty-five.

Men connected with the state government are giving their help to the movement to have the National Government revive the canal. State engineers have made surveys and will tender their assistance. The Atlantic Deeper Waterways Association is also urging the reopening of the canal.

A ruling that "no employer or insurer has a right to stop payment of compensation until he has fully complied with the provisions of the act and the rules of the board" was announced by the Board of Compensation Commissioners in the case of Betzer vs. Gluck. The claim was made for compensation for death of a driver kicked by a mule when the former was in a tubercular condition, the injury hastening death. An agreement was entered into for payment of compensation and the employer paid it for a time and then stopped. The board orders full compensation payments made and the defendant also to pay the costs.

PITTSBURGH, PENN.

The thaw the latter part of last week started the ice to breaking in parts of the western Pennsylvania rivers, resulting in several ice jams and gorges, which did considerable damage to coal property. A number of barges and several towboats were sunk. The river end of the Diamond mine of the Diamond Coal Co., in the fifth pool of the Monongahela River, just above Brownsville, was carried away when the ice in that pool broke and gorged at the dam. The Hecla mine, of the Hecla Coal and Coke Co., suffered a similar fate and the Isabella-Connellsville mine, of the same company, had their big steel tipple moved three feet out of line.

The cold snap this week checked the breaking up of the ice and prevented serious floods and worse damage from the ice. Since the middle of the week every available towboat has been working up the Monongahela River, breaking up the ice and allowing it to move slowly out to give a clear way for the big gorge in number five pool above Brownsville, when it breaks and moves. The way is now clear to that point, and river men are considering using dynamite to start that gorge moving gradually before the river falls enough to allow it to settle.

PENNSYLVANIA

Anthracite

Plains—Scotch Hill and North Main St. sections continue to suffer from the effects of settling caused by mine caves in the workings of the Madera-Hill Coal Co. Residents of houses endangered by the settlings report that they are unable to find suitable vacant houses in other parts of the township and are, therefore, in imminent peril of being forced out of their homes at any hour of the day or night, and in any kind of weather.

Edwardsville—With officials of the coal-mining department of the Delaware, Lackawanna & Western Railroad Co. as guests of honor, a dinner was given by the officials of the Woodward colliery of the Lackawanna company. The dinner was held in celebration of the record output, a trifle over 1,200,000 tons of coal being mined at the Woodward during the year 1917. The output was the greatest in the history of the colliery.

Mount Carmel—To aid in breaking the coal blockade, the Philadelphia & Reading Coal and Iron Co., on Jan. 29, suspended operations at four of its largest collieries in this district and assigned about 1000 laborers to the Reading Railway Co. to aid in releasing long trains of coal from snow and ice-bound sidings. Railroad officials stated that as a result of the suspension at the mines and the opening of the sidings, coal shipments were moving with satisfactory regularity.

Carbondale—Fire destroyed a building near an air shaft leading into the workings of the Rackett Brook Coal Co. on the East Mountain on Jan. 28. Employees of the company tipped the building over from the shaft, so that none of the smoke could descend and cause disorder among the men who were working on the night shift in the mine.

Scranton—In suits filed in the county and federal courts on Jan. 31, damages to the amount of $72,000 are asked from the Clearview and People's Coal companies, over whose workings occurred settlings that have wrecked numerous homes. Attorneys who filed suits for the Scranton Surface Protective Association believe the cases will establish the illegality of the so-called waiver clause on deeds held by persons who purchased ground from the operators.

Oneida—Lehigh Valley Coal Co. detectives are investigating an attempt to fire the double dwelling occupied by Mine Superintendents Thomas Burns and James Ulshafer. The attempt was made during the night of Jan. 30, and but for the timely observation of the blaze by the watchman disaster would have resulted. After the blaze had been extinguished, investigation revealed the presence of a quantity of cotton waste and an empty bottle that had been filled with kerosene oil.

Lattimer—It cost $400,000 for the firm of Coxe Brothers & Co., Ind., to open the big strippings here. These are now showing signs of exhaustion and can only be operated about three years by the Lehigh Valley Coal Co. The strippings were started in 1900 and finished in 1904, while the Coxes still operated the chain of collieries now run by the Lehigh Valley Coal Co. When the first ten cars of coal were hoisted up the planes from the exposed veins, the late Edgar Kudlich, then general manager of the Coxe interests, remarked to an associate engineer that each car had cost the Coxe company $40,000. That the outlay paid is shown by the fact that the Lehigh Valley Coal Co. has taken 1,800,000 tons of coal out of the excavations so far. Lattimer strippings are among the show places of the Lehigh region, exposing veins of fuel 80 ft. thick and through which tunnels have been driven.

Bituminous

Connellsville—Removal of rib coal from under homes in Crawford Ave. by the H. C. Frick Coke Co., has resulted in the collapse of a number of foundations and damage to the houses otherwise. The purchase of the coal by the coke company antedated that of the surface by the householders, and there is apparently no redress. Notice was served on the property holders when the company began its final drive in that portion of the Davidson mine, as a precautionary measure.

Brownsville—Virtually every tipple of any importance, from Masontown to California, has either been swept away or greatly damaged by three enormous ice gorges in the Monongahela River. The damage done will mount up to many hundred thousand dollars.

Johnstown—Six men had their lives crushed out and traffic on the Pennsylvania R.R. was embargoed for hours on Feb. 1, when an overhead carrier used for conveying coal at the Cambria Steel Co.'s plant at Conemaugh, together with a bridge, fell. Freight traffic on the Pittsburgh division of the Pennsylvania was paralyzed for hours. Thousands of tons of coal consigned to points on the Atlantic seaboard were stalled as train after train was held up west of the wreck.

Nant-y-Glo—Ten families were made homeless and some of them destitute on Jan. 30, by a blaze of five double dwellings, along with a small store building, in which the fire started from an overheated stove. The houses were owned by the Warren Collieries Co. Owing to the snow-drifts and a shortage of water, the firemen were helpless.

Somerset—Forty miles of track on the Berlin, Salisburg and Boswell branches of the Baltimore & Ohio R.R., which have been blocked with snow for almost a week, were cleared on Jan. 29 by more than 1000 coal miners, who rallied to a call issued by the Somerset Coal Operators' Association. The miners were assisted by several hundred men furnished by the railroad company. The tracks were buried for a depth of six feet in many places.

Brownsville—Nearly 200 miners were removed from the shafts of the Fifth Pool Coal Co. near here on Jan. 30, when the rapidly rising waters of the Monongahela River approached within several feet of the openings. The shafts are 1200 ft. from the river, but the water, backed up by an ice gorge, quickly covered the lowlands.

WEST VIRGINIA

Newburg—The Virginia-Maryland Coal Co., of Adamston, W. Va., is closing down and abandoning its Newburg shaft. This operation is located in Harrison County, on the Baltimore & Ohio Railroad.

Elkins—A great ice gorge in the Tygarts Valley River, just below Junior, has backed up the water to such a depth that the fires of the West Virginia Coal and Coke Co. ovens have been drowned out. Several residences and stores have been flooded, and if efforts now being made to dynamite the gorge are not successful, heavy property loss is likely to result. At Belington a gorge is said to have formed just below the town, causing all the lower portion to be flooded.

Charleston—The West Virginia Coal and Coke Co. has furnished service flags to each of its plants, and one for its general office located in Elkins. Records show 47 employees having reported to the colors, and at least that many more awaiting orders.

ALABAMA

Birmingham—At the regular semi-annual examination of applicants for certificates as first- and second-grade mine foremen, and fireboss, recently held in the office of Chief Mine Inspector C. H. Nesbitt, sixty-nine applicants were successful in standing the tests. There were eight failures out of the total of 77 in the class.

OHIO

Byesville—Fire which is believed to have been caused by the explosion of a bomb, practically destroyed the tipple of Little Kate mine No. 1 of the National Coal Co., on Jan. 30, with a loss conservatively estimated at $50,000. The first intimation of trouble came when a muffled explosion was heard in the top of the building, and an instant later the huge structure was enveloped in flames.

Crooksville—Zanesville Coal Co. mine No. 6 was idle on Jan. 29, on account of the icy condition of the railroad tracks, making it impossible for the Pennsylvania work train to reach the mine. Several Crooksville mines are badly handicapped on account of lack of water for boiler use, and others have been idle on account of lack of cars for freight shipments.

ILLINOIS

Benton—The cage at the Benton Coal Co.'s mine here dropped 200 ft. with 11 miners on it, caused by failure of the engine to work properly. It is astounding in that no one was killed, but all suffered broken limbs and internal injuries.

B. F. Foster, J. W. Boyle, Dr. W. T. Short and William White, all Stonington men, have purchased the Blue Mound coal mine and intend to be ready for business soon. The work of pumping water from the mine has already been started. There is considerable rebuilding to be done before operations can be resumed.

Stonington—An explosion in Mine No. 21, owned by the Peabody Coal Co., on Feb. 1, killed three men. It was caused by escaping gas from an entry in which fire had broken out the day before and which had been walled up. The men who were killed, Jack McLaughlin and William Barker, of Stonington, and Walter Crouch, of Blue Mound, were in a working party that was making repairs. Thirty men who entered the mine after the explosion in an attempt to reach the bodies were driven back by the gas. Dick Clements, another member of the working party, was found an hour after the explosion wandering about the mine in a dazed condition. The bodies were finally recovered by a squad from the Springfield rescue station.

Lincoln—The Lincoln Coal and Mining Co. is renewing its efforts to reach and extinguish the fire which has necessitated sealing the mine for several months. Openings have been made to secure a freer circulation of air when the fan is again started and an effort is being made to locate the spot where the fire is still smoldering.

WYOMING

Kemmerer—No. 1 mine of the Union Pacific Co. at Cumberland, which some time ago had a squeeze, causing the company to allow the lower levels to flood, is to be pumped out. The new pump has already arrived and it is expected that from 50 to 100 more men will eventually be accommodated.

Casper—A meeting was held last week to organize a branch of the American Mining Congress. About 100 delegates attended from different points in Wyoming. The next meeting will be held at Cheyenne.

Foreign News

Amsterdam—It is announced that the Dutch government has stopped the importation of coal from Belgium, on the ground that Holland does not consider herself justified in accepting coal mined by compulsory labor.

Calgary, Alta., Can.—Miners in Alberta coal mines will be given exemption from military service so long as they work, Mr. Justice Simmons, of the military tribunal, has announced. If they strike or take holidays, the exemption ceases.

London, Ont.—The coal shortage here has raised the price of coal from $12 to $16 a ton. Many of the citizens are complaining against the dealers for charging $16 a ton for coal in quarter-ton lots, but the latter argue that owing to the shortage they have to bring in the aid of brokers and have to use other than ordinary channels to procure the coal, which makes the cost much greater.

New Glasgow, N. S.—Coroner Kennedy of New Glasgow has been empaneled to inquire into the deaths in the Allan mine explosion. As the jury did not have at least three miners in its panel, R. H. Murray, who represents the men, asked for an adjournment and a new jury. On Jan. 31 there was 4 ft. of water at the 1200 ft. level and three pumps had been installed to remove the water. Up to that date 43 men had been taken out of the mine.

Harbin, Siberia — The Tehermovo coal mining district, 70 miles from Irkutsk, Siberia, has been laid waste by order of the local Bolsheviki authorities. The district produces 2,000,000 tons of coal a year, supplying the Siberian Ry. The damage is estimated at 10,000,000 rubles. Many Austrian and German prisoners were working at the mines.

Personals

J. G. Vaughan has been made general superintendent for all the Beury mines in the New River coal field, of West Virginia. His headquarters will be at Nuttallburg, Fayette County.

Fred H. Smythe has resigned his position with the Richland Coal Co., of Moundsville, W. Va., to accept a position as superintendent at the Conklin Coal Co., at Coshocton, Ohio.

John McGregor has resigned his position as manager of the Rutland, Ill., mine of the United States Coal and Coke Corporation, and is succeeded by G. W. Harley, whose former home is in California.

Herman V. Hesse, for ten years manager of the Maryland district of the Consolidation Coal Co., has resigned, effective Mar. 1, to become manager of the coal operations of the Monongahela Traction Co., with headquarters at Fairmont, West Virginia.

Harry Phillips, formerly a mine foreman in the employ of the Consolidation Coal Co., which has mines in Maryland, West Virginia, Pennsylvania and Kentucky, has been appointed superintendent of the Hartland Colliery Co., whose operations are in Clay County, W. Va.

P. M. McClanahan, formerly president of the Milburn Coal Co., operating in the Paint Creek field of Kanawha County, West Virginia, has organized the Caudil Branch Coal Co., to develop a lease on Caudil's branch in the Hazard field, Kentucky. The company controls about 2000 acres and is capitalized at $400,000.

J. B. White, general manager of the West Virginia Standard Coal Co., of Huntington, W. Va., regarded as one of the best authorities on traffic in the country, has resigned his position, effective Feb. 1, as general manager of the West Virginia Standard Coal Co. to take charge of the traffic department of the Cleveland Furnace Co., of Cleveland, Ohio

Major O. B. Perry, of the 27th Engineers, the mining regiment, has been promoted to the rank of lieutenant colonel. He now is at Camp Meade and as the ranking officer is in command of the portion of the regiment which is being trained. Before the regiment leaves for France, it is expected that a colonel of the regular army engineer corps will be assigned to the regiment.

Obituary

J. D. Peters, of Carbondale, Ill., a few years ago general manager of the Chicago & Carterville Coal Co., with mines at Herrin, Ill., died in a hospital in New York City, where he had been for about five months. He was one of the pioneers in the southern Illinois fields. Born in Ohio, he drifted to Illinois and was with a coke and foundry firm at Grand Tower when the Big Muddy field was at its height. He later helped build the railroads that cover southern Illinois, and about 25 years ago began as an operator in the Carterville field. He retired a few years ago on account of ill health. He was a veteran of the Civil War and leaves a wife and grown family.

James E. Roderick, Chief of the Department of Mines of Pennsylvania for the last 20 years, died at his home in Hazleton, at 6 a.m., Feb. 4, from bronchial trouble, which became acute, due to a severe cold contracted on Jan. 20, at Okmulgee, Okla., where Mr. Roderick had gone for a few days to look after some personal interests in the oil fields.

Mr. Roderick was born in South Wales, January, 1842. He attended school until the death of his father, when, at the age of 13 years, he entered the mines. He continued his studies, however, attending night school until he came to this country, in the early sixties. Mr. Roderick then located, first at Pittston, Luzerne County, where he was engaged as a miner's laborer. Afterward he worked as a miner, doing all kinds of labor in the mines around Pittston and Wilkes-Barre, until Jan. 1, 1866, when he was appointed mine foreman of the Empire shaft, operated then by the Wilkes-Barre Coal and Iron Company.

On the first day of June, 1870, he resigned that position to accept the superintendency of coal mines for the Warrior Run Mining Co. In July, 1881, he went before the board appointed to examine applicants for the position of mine inspector; and,

JAMES E. RODERICK

having answered over 90 per cent. of the questions asked, he was appointed inspector of mines, with headquarters at Hazleton. He served as mine inspector until June 1, 1889, when he resigned that position to become the general superintendent of the coal interests of Linderman & Skeer. At the expiration of the lease of Linderman & Skeer, June 1, 1896, Mr. Roderick became general superintendent and manager for A. S. Van Wickle's extensive coal interests.

Mr. Van Wickle, having died, Mr. Roderick resigned his position June 1, 1899, to accept the appointment to the office of Chief of Bureau of Mines, under Governor Stone. He served in that position until Apr. 15, 1903, when he was appointed by Governor Pennypacker, as chief of the newly established Department of Mines, for a term of four years. In 1907, he was reappointed by Governor Stuart for a third term of four years, and, in 1911, was reappointed by Governor Tener for a fourth term of four years. In 1916, Mr. Roderick was reappointed by Governor Brumbaugh for a further term of four years.

Mr. Roderick was chairman of the Commission which drew up the bituminous code in 1911 and was chairman of the subcommittee appointed to draw up a new code for anthracite mines in 1913, but which was defeated in the Legislature.

Since July, 1881, he has lived in Hazleton, where he was a member of the First Presbyterian Church, a director of the First National Bank and President of the Middle Coal Field State Hospital. He has served as a school director, and as select councilman.

Mr. Roderick is survived by his widow and three children: Edward R., a prominent physician, James E., Jr., an attorney-at-law, and Mrs. Nellie E. Jones, all of Wilkes-Barre.

New Patents

Keeper for Mine Cars. A. W. Spaht and G. R. Jacobs, Christopher, Ill., 1,249,231. Dec. 4, 1917. Filed Aug. 9, 1917. Serial No. 185,389.

Coal Producing and Byproduct Recovering Method. M. Marshall, Port Coquitlam, British Columbia, 1,248,883. Dec. 4, 1917. Filed Aug. 14, 1917. Serial No. 186,211.

Furnace. D. S. Jacobus, assignor to Babcock & Wilcox Co., Bayonne, N. J., 1,248,661. Dec. 4, 1917. Filed June 30, 1914. Serial No. 848,139.

Dump Car. H. R. Keithley, Michigan City, Ind., 1,248,666. Dec. 4, 1917. Filed Apr. 23, 1917. Serial No. 163,956.

Coaling Tank or Hopper. V. Z. Caracristi, Bronxville, N. Y., 1,248,610. Dec. 4, 1917. Filed June 2, 1916. Serial No. 101,315.

Automatic Stoker. B. V. Edwards, Newark, N. J., 1,249,048. Dec. 4, 1917. Filed Jan. 17, 1916. Serial No. 72,397.

Combined Coal and Gas Water Heater. H. A. Becker and A. D. Dukelow, assignors to Sill Stove Works, Rochester, N. Y., 1,248,793. Dec. 4, 1917. Filed Nov. 10, 1916. Serial No. 130,538.

Mining Machine. C. A. Pratt, assignor to Goodman Manufacturing Co., Chicago, Ill., 1,249,823. Dec. 11, 1917. Filed Oct. 31, 1910. Serial No. 589,836.

Apparatus for Lifting Furnace Doors. S. Dillon, Edgewood, Penn., 1,249,605. Dec. 11, 1917. Filed Apr. 15, 1914. Serial No. 832,402.

Grate for Furnaces. A. W. Finlayson, Detroit, Mich., 1,249,365. Dec. 11, 1917. Filed May 22, 1916. Serial No. 99,034.

Coal Gas, Manufacture of. A. Waddell, Dumfermline, Scotland, 1,249,864. Dec. 11, 1917. Filed Feb. 29, 1916. Serial No. 81,108.

Mining Machine. E. L. Hopkins, assignor to Jeffrey Manufacturing Co., Columbus, Ohio, 1,249,400. Dec. 11, 1917. Filed Sept. 9, 1913. Serial No. 788,853.

Chain for Mining Machines. C. E. Davis, assignor to Goodman Manufacturing Co., Chicago, Ill., 1,249,904. Dec. 11, 1917. Filed Sept. 9, 1913. Serial No. 788,853.

Safety Supporting Device for Mine Cages. G. H. Schofield, Leigh, Eng., 1,253,633. Jan. 15, 1918. Filed Apr. 11, 1917. Serial No. 161,330.

Trade Catalogs

"'Rimco' Rubber Insulated Pliers." Rubber Insulated Metals Corporation, Plainfield, N. J. Folder. Pp. 4; 3¼ x 6¼ in.; illustrated. Describes a rubber insulated plier that has been tested and passed for 10,000 volts. Insulation will not crack or break when dropped on a hard surface or from the arm of a pole.

"C-H Electric Air Heaters." The Cutler-Hammer Manufacturing Co., Milwaukee, Wis. Folder. Pp. 6; 3¼ x 6 in.; illustrated. The heaters described are divided into a number of groups, several being for industrial or mill use, and are made in capacities of from 2 to 10 kw. Other heaters desirable for offices, bedrooms, bathrooms, etc., are also shown, and the dimensions, ratings and prices given.

"C-H Electric Space Heater Unit." The Cutler-Hammer Manufacturing Co., Milwaukee, Wis. Folder. Pp. 6; 3¼ x 6 in.; illustrated. Describes a steel-jacketed unit which is approximately the size of a 2-ft. rule. A number of applications of this unit are also described and several ways of mounting are suggested. These units are put up in standard packages of 10 units each. Capacity of each unit is 500 watts and they may be used on either alternating or direct current circuits.

Industrial News

St. Louis, Mo.—Since the municipal coal stations opened Dec. 7, they have sold 2571 tons, or approximately 64 cars. The revenue to Feb. 1 was $10,283.89.

Albany, N. Y.—The Albany Clay Products and Crucible Coal Co., Inc., has filed notice with the Public Service Commission of an increase in its capitalization from $1500 to $10,000 to provide for expansion.

Frankfort, Ky.—A bill has been introduced in the Kentucky Legislature, now in session, which would permit coal companies and manufacturing plants to operate on Sundays during the war.

Memphis, Tenn.—Local coal consumers have been advised on various occasions recently by coal shippers that the reason for failure of coal to arrive has been that the railroads took most of the output.

Chicago, Ill.—The Wolff Coal Saver Co. has filed notice with the Public Service Commission of an amendment to its charter increasing its capital from $2,250,000 to $2,700,000 to provide for extensions, etc.

Nicholasville, Ky.—On account of the difficulties in the way of obtaining coal, the municipal light and power plant of Nicholasville has gone on a reduced period schedule and is operating only from 5 to 11 P.M.

Dover, Del.—The Coxe Stoker Sales Co. has been incorporated here with a capital of $60,950, to manufacture stokers and fire grates. The incorporators are William Lloyd, G. W. Wilmot and L. O. Emmerlich, of Hazleton, Penn.

Plymouth, Penn.—Several hundred employees in the Powell Squib factory have been granted an increase in wages from 10 to 25 per cent. A strike was threatened at this plant, but the offer of the Federal mediation board was accepted.

Shawnee, Ohio—The White Oak Coal Co has been incorporated with a capital of $4000 to mine and sell coal. The incorporators are W. E. White, Theodore Schubert, Roy White, Frank White, Charles E. White and William G. Bartrow.

Sutton, W. Va.—The Pittsburg Summit Coal Co., which recently increased its capital from $25,000 to $75,000 for expansion, is planning for the immediate development of 98 acres of coal lands, to have a capacity of 250 tons daily. C. C. Davis is president.

Knoxville, Tenn.—The Knoxville Gas Co. is circulating petitions among its customers, asking them to agree to an increase of 20c. on the 1000 cu.ft. The rate is now $1. Increased coal costs and increased labor costs are set forth as the reason for the advance.

New York, N. Y.—J. D. Barnhill, Inc., of 110 W. 34th St., advertising and service agency, announces a change of officers, as follows: Philip S. Dodd, president; Clayton Du Bosque, vice president and treasurer; William T. Andrews, secretary and art director.

Chillicothe, Ohio—As a carload of coal was being dumped for use at Camp Sherman, 18 sticks of dynamite were discovered in the car. Opinion is divided as to whether it was in an attempt on the part of pro-Germans to blow up the camp or the result of carelessness.

Marion, Ill.—The St. Louis Coal Co. has taken over the shaft on the Goddard farm northeast of here and is sinking an air shaft and getting ready to develop and operate this property as fast as materials can be secured. It will have a capacity of 3000 tons per day.

Jackson, Ky.—The Breathitt Coal Fields Exchange, with capital of $10,000, has been organized and will buy coal from operators and sell in the market, operating under Government price regulations. H. C. Musick, of Jackson, is interested. E. B. Cardwell is manager.

Berryburg, W. Va.—The Berryburg Coal Co. is having plans prepared for the construction of 42 two-story miners' residences, about 26 x 30 ft., as the initial work on 60 residences to be built ultimately. A. B. Crichton, Farmers Trust Building, Johnstown, Penn., is engineer.

Columbus, Ohio—John J. Roberts, 1177 Leonard Ave., fell into the hands of police on a charge of having sold coal by short weight. The arrest was made on an affidavit sworn to by Edgar Watts, Shepard, who alleges Roberts sold him 530 lb. of coal for a half ton—1000 pounds.

New Baden, Ill.—There is no immediate prospect of the reopening of the New Baden mine here of the Southern Coal, Coke and Mining Co., of St. Louis, the main shaft of which has been caved in for the last couple of months. This means a loss of between 2000 to 3000 tons of coal per day.

Allentown, Penn.—Engineering and Auditing department of the Harwood Electric Co. will be removed to this city, which will mean that about 15 of the employees of the company will be transferred from Hazleton. Only the field corps of the engineering department will remain at Hazleton.

Cleveland, Ohio—Fifteen cents a ton increase in coal prices was allowed to the retailers by the local fuel committee. This advance to the consumer, however, is only for the month of February. A committee of the retail merchants presented a request to the committee for a 42c. raise on each ton sold.

Marysville, Ohio—A 50-ton carload of coal shipped here and consigned to the Marysville Board of Education for the West School Building was seized by the local fuel administrator and distributed to homes in half-ton lots, where families were entirely out of coal, through the coal clearing house.

Logan, Ohio—The Spencer-Hollow Coal Co. has leased from the Buckeye Coal & Railway Co. 300 acres, located on the Hocking Valley, upon which a 600-ton mine will be opened shortly. No. 7 vein will be mined at that place. Electrical power will be secured from the Hocking Power Co., at Floodwood.

Marion, Ohio — George Whysall, county fuel administrator of Marion County, has issued an order for all coal cellars and bins to be inspected. He claims that there is sufficient coal in cellars to supply all domestic and steam users for more than a week. It is planned to distribute all surplus coal so hoarded.

Perth Amboy, N. J.—New York Harbor police and Government employees began the task, Jan. 29, in coöperation with the owners, of raising 11 coal barges sunk by the ice during the recent cold wave, in Staten Island Sound. The barges, containing a total of 40,000 tons of coal, are blocking the channel.

St. Charles, Ky.—The C. M. Riker Coal Co., Paducah, has completed all organization plans, and is planning for the early development of about 972 acres of coal lands to have a capacity of from 750 to 1000 tons daily. The company is planning for the immediate installation of air compressor and cutting machines. C. M. Riker is president.

Stockton, Penn.—Announcement was made Jan. 29 by officials of the Bethlehem Steel Co. that the entire East End department, including the frog and switch department and bridge shop, would be closed because of the lack of fuel. Approximately 1000 men were thrown out of work. Coal is enroute to the plant, but the storms tied up traffic.

Columbus, Ohio—Robert Lake, president of the Michigan-Ohio-Indiana Coal Association, who resides at Jackson, Mich., was in Columbus last week in conference with B. F. Nigh, secretary of the association, relative to the mid-winter meeting of the directors. The meeting will be held some time during February, the exact date to be announced later.

Columbus, Ohio—Plans for handling the municipal coal yard, recently authorized by the city council, has been announced by city officials. Each of the fire-engine houses in the city will be made a retail point where coal is to be sold to consumers at the rate of 30c. per bushel. The limit to be sold to each customer is two bushels. Customers must come after the coal.

Orient, Ohio—The Orient Coal Co., recently organized at Columbus with a capital of $25,000, has taken over the working coal mine of William Crowe, located in Vinton County on the Hocking Valley, which will be enlarged by the installation of electrical equipment. There are 80 acres in the property. The present capacity is 50 tons daily, which will be increased to 300 tons. George W. Moss is president and E. H. Alton secretary and treasurer.

St. Louis, Mo.—Fuel Administrator Crossley has announced that within a few days, unless there is a decided change for the worse in weather conditions, the early closing order, under which nearly all branches of business have been closed at 7 p.m., will be rescinded. The rescinding of the order will not, however, extend to the electric signs and illuminated advertising devices, which will continue dark.

Columbus, Ohio—President Westlake, of the Columbus City Council, has offered a resolution calling on Homer H. Johnson, Ohio Fuel Administrator, to investigate the alleged action of certain railroads entering Columbus in permitting miles of coal cars filled with slag to stand on sidetracks while Columbus is suffering from lack of fuel. Mr. Westlake claims that he counted 300 cars on the Hocking Valley Ry. so loaded.

Nelsonville, Ohio—The Keystone Coal Co., of Nelsonville, has leased from the Buckeye Coal & Railway Co. a large acreage which will result in two new mines. The company will build two miles of railroad to connect with the Hocking Valley. The property is located in York township, and it is planned to have each mine produce 100 tons daily. No. 6 vein, which is 6 ft. thick, will be mined.

Paducah, Ky.—C. M. Riker, general manager of the Carbondale Coal and Coke Co., of St. Charles, Ky., and of the Eureka Coal and Coke Co., of Paducah, Ky., has purchased a tract of coal and timber land, embracing 972 acres, near Hamby, Ky., and has incorporated the C. M. Riker Coal Co. to develop it. Borings show deposits of 11,000,000 tons, and Mr. Riker proposed a development to produce 1000 tons daily in the near future.

Nelsonville, Ohio—The North Hocking Coal Co. has leased from the Buckeye Coal & Railway Co., of Columbus, 320 acres in Trimball township, Athens County, located on the Hocking Valley. An opening will be made just north of Murray City and a mine with a capacity of 600 to 700 tons daily will be opened soon. A modern tipple will be erected. The mine taps the No. 4 vein, which is 4 ft. 6 in. thick.

Columbus, Ohio—A feature of "Farmers' Week" at Ohio State University was coal conservation demonstrations by E. A. Frothingham, of the United States Forest Service, who came to instruct woodland owners in the best methods by which firewood can be "harvested." It is hoped to interest farmers in the project of woodyards, where not only fuel from woodlands, but refuse from sawmills and woodworking plants may be utilized as fuel.

Tulsa, Okla.—Opening of virgin coal lands in Tulsa and adjoining counties is urged by the Tulsa County Council of National Defense as a means of meeting the situation growing out of the coal shortage. Several thousand acres of rich coal lands lie undeveloped in Tulsa County, the coal veins being near the surface and easily mined. Several new coal mines have been opened recently, but still the possibilities of the county as a coal producer have not been touched.

Columbus, Ohio—Chief Inspector Dugan, of the Public Utilities Commission, claims that there are now 12,000 loaded coal cars on Ohio roads awaiting movement, a big per cent. consigned to points outside the state. It is estimated that this would furnish a ton to each of the 600,000 homes in Ohio. Administrator Johnson is making an effort to secure from Washington an understanding as to just how far his authority extends in confiscating this idle coal for the needy Ohio consumers.

Woodlawn, Penn.—Owing to lack of fuel several of the departments of the Jones & Laughlin Steel Co., the largest steel plant in the Ohio Valley, have been closed for several days. Officials of the company were of the opinion that it would be possible to obtain shipments of coal by river with the ice cleared from the Ohio. Only limited rail shipments of fuel have been received by the company for several weeks. As a result of the shutdown it is declared that several thousand men are idle.

Morgantown, W. Va.—The holdings of the Empire Coal Co., controlled by the Elkins estate, and consisting of 4000 acres of coal in the Grant district, Monongahela County, and the Pawpaw district, Marion County, W. Va., have been purchased by the New England Fuel and Transportation Co., a subsidiary of the Massachusetts Gas Co., of Boston, for $4,000,000. It is understood that the company intends to break up the tract by selling parts of it to other companies, with a view to securing as extensive a development of the land as possible without delay.

Harrisburg, Penn.—The Gamble Fuel Briquette Co. has given a lease to the Gamble Briquette Co. to operate its plant. The deal was closed by Hord & Co., of New York, and represents an investment of $75,000. Those interested in the deal are Israel H. Supplee and C. B. Johnston, of Wheeling, W. Va., both of whom have had wide experience in the fuel business. The new company intends to commence operating within about two weeks. The company will be under the management of the most expert briquetters in the country and expects within a short time to turn out 100 tons of briquettes a day.

Louisville, Ky.—The city's fuel difficulties have been increased by the washing out of one of the three feed lines leading to the compressor station of the Louisville Gas and Electric Co., whence the gas is directed into the main 180-mile pipe line. This has reduced still further an already inadequate supply of natural gas for the city and has increased the demand for coal. The last of January saw a total of 70 per cent. penalty discount against the bills of the company to its domestic consumers, making a total discount of 110 per cent. for the two months, or an average of 55 per cent. a month.

Birmingham, Ala.—The following coal companies have filed articles of incorporation in the office of Probate Court of Jefferson County: Atlas Coal Co., with a capital stock of $100,000, will develop properties in Walker County, near Dora, Ala. The officers of the company are G. H. Garmany, president; B. M. Hobson, vice president; J. C. Grant, secretary-treasurer. Head offices will be in Birmingham. Green River Coal Co., of Birmingham and Sebree, Ky., capital stock $10,000. N. O. Tyler, of Birmingham, is president; Ernest V. Moore, of Atlanta, vice president, and J. M. Anderson, of Birmingham, secretary. Ida H. Taylor is one of the incorporators.

Sunbury, Penn.—Record of a deed of trust for 22 parcels of land bordering on and in some cases reaching to the center of Shamokin and Mahanoy Creek, in Northumberland and Schuylkill Counties, made on Feb. 1, show what is apparently a plan to reclaim and sell coal that has been turned into these streams from the mines in the Shamokin district on a large scale. The deed shows that the property was secured by purchase or option at a total cost of almost $100,000 by a corporation known as the Eastern Coal Co. It is made in favor of Edwin S. Meade, of Doylestown, Penn.; Charles J. Farrell, of Mt. Vernon, N. Y., and Donald C. Mulman, East Orange, N. J., and the Central Trust Co. of New York is the grantor.

St. Louis, Mo.—The question whether the Illinois Fuel Administration or the Missouri Fuel Administration shall control the Illinois coal field adjacent to St. Louis has been brought to a head by a protest sent to Administrator Garfield by Administrator Williams, of Chicago, against diversion by the St. Louis Fuel Committee of coal requested by Gen. William H. Bixby, Chairman of the Mississippi River Commission, for coaling Government boats in an effort to save barges containing $3,000,000 worth of Government supplies, carried away by the ice at Memphis. The protest was made in spite of the fact that the St. Louis committee obtained the assent of one of Administrator Williams' assistants before ordering the diversion. Missouri Administrator Crossley has asked Administrator Garfield for an early decision on the question of control, which he has under advisement. The contention of the Missouri administration is that the Fifth and Ninth Illinois districts are operated from St. Louis and are the natural supply for Missouri and that the output should be assigned to the Missouri Administration.

Cincinnati, Ohio—The Monongahela Consolidated Coal and Coke Co.'s towboat "Charles Brown," with a number of barges, was sunk in the recent ice jam in the Ohio River, causing a loss of $60,000; the entire fleet of the Campbell's Creek Coal Co., at Ludlow, Ky., just across the river from Cincinnati, consisting of 40 empty barges, two fuel flats and a pumpboat, was lost, with damage of about $40,000; the Hatfield Coal Co.'s towboat "Rebe Reeves" was sunk, a loss of $15,000; the Marmet-Halm Coal and Coke Co.'s fleet at North Bend, Ind., near Cincinnati, 12 barges, was carried down the river and probably lost, with danger of further losses to the company's vessels; the towboat "Hattie Brown," with 20 barges, was caught in the ice and badly damaged. Besides these losses at Cincinnati, many barges carried down from unknown points up the river, loaded with coal, were observed floating down, some of them being crushed against bridge piers and sunk. The total damage done by the sudden breaking of the freeze-up and the movement of the ice has been estimated at $3,000,000.

MARKET DEPARTMENT

GENERAL REVIEW

The country again approaches a coal crisis. This is occasioned by inadequate motive power and bad weather conditions.

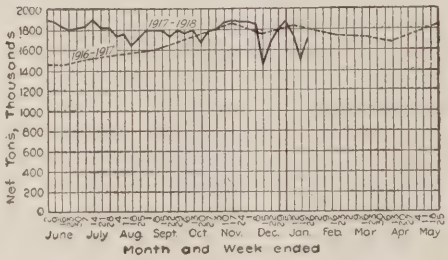
Again the "Weather Man" appears to evince a friendly spirit toward the Kaiser. The cold wave which descended upon the country the first part of the week was in many instances, with one or two exceptions, the coldest weather which had been encountered for years. This, of course, greatly interfered with railroad transportation and undid in large measure the good work which had been accomplished up to that time. Throughout New England the fuel situation is acute, both as regards manufacturing and domestic consumption. A short temporary priority order secured at Hampton Roads in favor of this territory helped to a certain extent. Railroads in many instances have but a scant supply of fuel, and in a few cases are enabled to operate only through the coöperation of connecting lines. In New York City and vicinity, due largely to adverse weather conditions, coal is extremely difficult to obtain, and practically no stocks are on hand, particularly in the yards of retail dealers. The severe weather has greatly hampered the dumping of cars at the various terminals on the Jersey shore. In Philadelphia receipts are by no means equalling requirements, and quite a quantity of bituminous coal has been commandeered and turned over to the retail trade for distribution. The people receiving this coal, not being accustomed to its use, are having their troubles, but these are doubtless less severe than would be occasioned if no coal could be had. Efforts to secure river coal at Pittsburgh were temporarily successful, and it was thought that a large part of the city's difficulties had been surmounted, when a new cold wave struck that region and undid the work which had been accomplished in the shape of opening the lower pools of the Monongahela. The warm weather which had preceded the cold wave had, however, loosened up the car situation to a considerable extent and car supplies the first day or two of this week were better than formerly. The coal trade in the Middle West is still operating under great difficulties imposed by the excessive snow-fall in the past few weeks. Traffic conditions are extremely bad, and mine operation is likewise. From all over the country come reports of industries cleaning their bins of fuel, and in many cases being down to bare boards. Certain plants have been forced to shut down, while others are only able to keep running on a hand-to-mouth basis through special orders of the local fuel administrators. The domestic situation is scarcely less serious, and the suffering in many homes is intense. It is not believed that these conditions will permanently and entirely right themselves until warmer weather has relieved the adverse conditions under which the transportation of the country is now laboring.

A Year Ago—Anthracite quiet but prices continue firm. Foreign complications upset the bituminous market at tidewater. Movement slow and supplies very short at some interior points. Shortage very acute in some sections of the Middle West.

BUSINESS OPINIONS

The Iron Age—The pig-iron statistics for January give a measure of what the steel industry has suffered from the unparalled weather and transportation conditions of the past month. Output fell to 2,411,768 tons, or 77,799 tons a day, against 2,882,918 tons in December, or 92,997 tons a day. January production was thus the smallest since May, 1915.

Bradstreets—Business in an industrial as well as a commercial sense is hobbled, either because of scarcity of goods, enforced weekly shut-downs, adverse weather conditions, paucity of fuel, insufficient production, or freight congestion, and after seven weeks of cold, stormy weather little headway has been made in working out of blockades



The Dry Goods Economist—Freight congestion continues to be the order of the day, efforts to relieve the situation having been largely nullified by the latest snowstorms. To the retailer this means delays in the delivery of goods needed for early spring selling, while to the manufacturer it carriers a threat of idle plants through lack of fuel and raw materials.

The American Wool and Cotton Reporter—The cotton goods market appears stronger than it has been. The relative supply of goods available for ordinary distribution is becoming smaller, the cost of production is increasing and the influence of supply and demand more apparent than it has been up to the present.

Marshall Field & Co.—The current wholesale distribution of dry goods is ahead of the heavy volume of the corresponding period a year ago. The volume of road sales for both immediate and future delivery is considerably larger than in the same week of 1917. Customers have been in to market in about the normal number. The market on domestic cotton continues strong. Collections are fully as good as a year ago.

COAL PRODUCTION

A recovery from the depression of the week before left production during the week of Jan. 26 still far short of normal. The weather was cold but the snow falling over most of the fields was not heavy enough further to impede transportation. The total bituminous production (including lignite and coal made into coke) was 10,018,000 net tons, or 1,670,000 tons per working day. The rate approximates that of a fortnight ago during the first week of the depression, when the daily average was 1,689,000 tons. The production of beehive coke did not share in the recovery made by the bituminous industry as a whole. The total production for the week ended Jan. 26 is estimated at 491,000 net tons, an average per working day of 82,000 tons. The estimated rate of production subject, of course, to revision, is the lowest recorded since these bulletins were begun.

Shipments of anthracite by the nine principal carriers amounted to 33,406 cars, as compared with 31,861 cars during the preceding week.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Jan. 5	Jan. 12	Jan. 19	Jan. 26
Bituminous shipments, 121 roads	168,936	180,411	130,865*	180,362†
Anthracite shipments, 9 roads	25,604	36,178	31,861*	33,406†
Beehive coke shipments, 4 roads	9,348	11,560	10,826*	10,078†

* Revised from last report. † Subject to revision.

Atlantic Seaboard

BOSTON

Slender stocks on hand in cities doled out under supervision of fuel committees, although rules are relaxed to include plants working on war orders that have license to operate on Monday holidays. Factories continue to close down, but in many cases emergency supplies are found and industrials have not yet ceased to the extent that was feared. New England in a precarious state. Railroads in certain cases are next door to fuel starvation and only through special provision by connecting lines are enabled to operate. Priority for New England cargoes secured at Hampton Roads for 72 hours. Anthracite receipts so light as to be negligible.

Bituminous—From present appearances "fuel tickets" are a possibility in the near future, especially in the cities. In Boston, Portland, Providence and other New England centers, deliveries of coal, except for governmental purposes, for public utilities, dwellings, and other uses on the preferred list, have been discontinued for more or less indefinite periods. The time originally prescribed in Boston was 48 hours, but this has since been extended 12 hours, and probably will be extended again. A large number of office buildings are heatless and elevator-less; others are made so after 10 A.M. The restrictions are being carefully observed and people generally show a remarkably fine spirit of coöperation. Their anxiety usually is to find out exactly what is prescribed.

In view of the marked decrease in output for January, and the unprecedented conditions at the loading ports there is no chance of decided improvement for weeks to come. At Hampton Roads an ice storm followed three weeks of the worst weather in the history of the piers. The latter, together with the coal in cars, were covered with ice and early in the week dumping was extremely slow. A day of rain helped in handling coal and more ships were cleared on Jan. 31 and Feb. 1 than in any similar period for several weeks. Car movement showed no improvement, however, and at the end of January the total of coal cars in transit was less than half normal.

These are some of the conditions that lead the fuel authorities to scrutinize every application for coal, whether from railroads or householders. The rules for observing preference fall hard in a great many cases and it is difficult to deal equitably with them all. Plants that are classed as "unessential" are often the only industries in towns where a large population is dependent and where there is no supply of fuel to distribute. There are colleges whose bins are fast getting down to bare boards, and the extent not only of inconvenience, but of actual privation, will soon be immeasurable. There are indignant protests at alleged "hoarding" by railroads and other utilities, but there is also less complaint of unfairness in distribution than might have been looked for. The public is learning to what extent the coal they get is dependent upon the operation of railroads and that the "stocking-up" of 20 to 30 days' reserve is only a necessary precaution. A pile of coal seems enormous until it is realized what a great utility requires, even on a daily basis, and that the movement of coal at all is largely dependent upon the effective operation of railroads.

Through emergency cargoes and the limited shipment of coal all-rail on the New England order the hospitals and pumping stations are gradually accumulating 30-day reserves, and already the Fuel Administration is allowing "Storrow" coal to reach munition plants and other industrials that are working 100 per cent. on Government orders. For a time only the most important, even on this classification, can be considered, but it is hoped that shipments in better volume from the various loading ports will increase the supply through the usual channels. Ice in Long Island and Vineyard Sounds still interferes with shipping and is only one of the difficulties that have arisen from the prolonged cold weather.

The Panama Railroad transport "Achilles" is secured for a fourth trip and helped a little to relieve the gloom that had settled upon industrial circles when it was feared no other ships were in prospect to help satisfy some urgent demands. A large part of the third cargo was forwarded for distribution through retail coal dealers for domestic use. A large number of communities are destitute of either hard or soft coal and even a relatively small supply of the latter is a godsend. Such shipments have gone forward as far as Rockland, Maine, and St. Johnsbury, Vt., while points 100 mi. nearer the mines from Boston were sent small shipments to tide them over for a few days. Notwithstanding such measures as the loan of the "Achilles" there is little optimism here over the outlook for February and March. Other ships are in line to load emergency cargoes, but in the aggregate, the tonnage is so relatively small that the relief given is extremely limited.

There is confusion, too, over the priority

in which different war industries should be served, and soon there will be wide-spread dissatisfaction unless a more careful supervision is exercised over distribution. Volunteer workers under the fuel administrators are doing what they can under hard conditions: for the most part they have been swamped with work, and find it difficult to get accurate information as to the really deserving cases. Applications are so apt to be "colored" through individual anxiety that should the present posture of affairs continue some plan of inspection and check will have to be put into operation.

A lot of apprehension is focussed on Feb. 15, so large a number of plants are certain to be bare of fuel by that date, unless something providential, like mild weather, should intervene. How important textile mills that burn coal by the thousands of tons weekly can possibly be kept supplied is a question no one seems able to answer.

The Maine Central R.R. was again within two days of being out of fuel early this week and the only relief in sight was the diversion of a steamer en route from Louisburg, C. B., to the New Haven R.R. at Boston. The southern division of the Central Vermont Ry. was also on the narrowest of fuel margins when relief came at the hands of a retail coal dealer! Scores of trolley and light plants have been in a similar predicament.

J. J. Storrow, New England Fuel Administrator, secured through Washington an order granting priority to bottoms wanting to load for New England, this to continue 72 hours from Jan. 31. On Feb. 1 the order was shown to be effective, and several ships, including a 7200-ton steamer for the Edison plant in Boston, on which the latter was dependent for an arrival by Feb. 4, were cleared. No doubt this order was the means of saving the situation in many instances. The difficulty is that all the emergency means thus far put through are only temporary and as such they may simply postpone what many are calling "the inevitable."

NEW YORK

Local conditions remain serious. Receipts are small, while demand continues heavy. Retail dealers establish zoning system. Bunker situation nearly normal but free coals are scarce. Storms impede deliveries. Too much coal going to Canada.

Anthracite—There has been no improvement in the anthracite situation. Supplies are no more plentiful although a few days of higher temperatures helped to alleviate conditions. The demand continues to be as heavy as at any time since the shortage of coal became acute and there are dealers who have practically retired from business so far as making deliveries are concerned. Any improvement that might have resulted as a result of warmer weather was dispelled by a sudden wave of low temperatures which rapidly extinguished any bright hopes that might have existed.

The pooling of anthracite at the various terminals which is now general, has aided the situation insofar as quicker deliveries go, but receipts have not been sufficient to overcome the shortage which is growing daily, now that the reserve stocks in the household bins are being gradually wiped out.

The saving of fuel accomplished as a result of Dr. Garfield's order for a coalless Monday has been variously estimated at from 15,000 to 20,000 tons but no actual figures are available. The report that Dr. Garfield might cancel all other coalless Mondays did not meet with the entire approval of the Fuel Administration officials here, it being contended that the situation did not warrant the rescinding of the order. It was said that not enough coal was coming into the city to supply all demands and that conservation must continue in order to prevent a greater closing down of business.

Local Administration officials attended a conference called by Dr. Garfield in Washington on Monday of this week at which the proposal to cancel all other coalless Mondays was to be considered.

A statement issued by C. E. Robertson, deputy state fuel administrator, calling attention to the shipments of coal to Canada attracted considerable attention. Mr. Robertson said that the seriousness of the anthracite situation in Greater New York and New York state has been aggravated by a wretched distribution of coal made by some shippers and some producers to retail coal dealers. After stating that anthracite production in 1917 increased 15 per cent. over that of 1916, Mr. Robertson says the dealers in Manhattan and the Bronx should have received several hundred thousand tons more than they did for the year 1917, while the reports of the County Administrators for Brooklyn, Queens, Richmond and Long Island show that these places did not even receive the tonnage for the year 1917 which was delivered in 1916. He then shows by figures furnished by the Department of Commerce that in the year 1916, from Jan. 1 to Dec. 1, there was delivered by shippers to Canada 3,776,427 tons; while in the same period of 1917 there was delivered 47,575,824 tons, an increase of 991,397 tons, or 26¼ per cent.

In calling attention to these figures Mr. Robertson says:

"As an instance of the flagrant violation of the law of equity and fair distribution, I will cite the case of the anthracite shipments of coal to Canada. No one wishes to deny Canada her proportionate supply of coal. We are willing to endure with her the sacrifices and sufferings occasioned by war, but we feel she has received a larger increased tonnage than she is justly entitled to, caused by the discrimination of some shippers of coal."

Mr. Robertson also says:

"When we bear in mind there has been an increase in the general anthracite production of only 15 per cent. we know that shippers have delivered to Canada 11¼ per cent. more than they should. In other words, an over-delivery of approximately 425,000 tons."

Efforts to provide for a better distribution of coal among consumers are under way following a conference between the local retail dealers and a representative of County Fuel Administrator Schley. It is intended to divide Manhattan and the Bronx into zones under the direction of a committee consisting of M. F. Burns, Thomas F. Farrell and George Eltz. It is proposed that where a dealer who has all his customers in what is known as Class One which consists of apartments and private houses, supplied, that whatever surplus coal he may have left over shall be pooled, if necessary, to supply the customers of another dealer or dealers who may not have been as fortunate in taking care of their customers. The coal shortage in apartment houses is causing much worry, it being estimated that there are between 400 and 500 such places in Manhattan and the Bronx without fuel.

Retail dealers complain bitterly of the lack of protection afforded them by the police when a boatload of coal is tied up at the unloading docks. Frequently, they say, much of the coal is stolen before the dealer has the time or opportunity to unload the boat. Instead of sending several policemen as is necessary because of the size of the crowd surrounding the boat, one patrolman is sent.

Complaint had been made that certain retail dealers had entered into competion with the peddlers and hucksters, but this trouble has been ended. The Mayor during the week issued an order that coal wagons be given the right of way like ambulances and Fire Department vehicles, in order to make quick deliveries.

It is reported that during the month of January there was received into the Bronx 41,000 tons of anthracite, while 155,000 tons were needed.

Buyers are not now asking for any particular size but are willing to take anything that is black and looks as if it will burn. Dealers are making deliveries in the same way and frequently broken coal is put into a bin instead of one of the smaller sizes, the consumer gladly breaking the chunks into the size he wants. The outcome of the investigation about to be started in the mining regions as to the quality of the coal shipped to market will be closely watched here, numerous complaints having been made as to the quantity of slate and rock received.

Rice and barley are about the only sizes to be picked up quickly.

Current quotations, per gross tons, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buck	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—Heavy snowstorms in the mining regions have naturally impeded shipments and the situation is extremely critical. The bunkering situation in this harbor has improved considerably and there are very few above the normal number of vessels here awaiting fuel supplies.

The shortage of fuel and the bad rail transportation, intensified by the weather, has seriously interfered with industrial conditions. Many plants are in a bad way for fuel and some of the corporations supplying power for factories in New Jersey have scarcely more than a couple of days' supply on hand.

The piers are handling the coal just about as quickly as it is received but the receipts are small and uncertain. Much trouble has been had with frozen coal. The roads leading to the mines have been covered with heavy snow and when it has been impossible to induce the mine employees to go out and remove the snow the railroads have found it necessary to take their employees from the railroad shops to do the work.

The question of contracts is being brought forward now that the time for renewal is drawing close. No word has been heard as to what the railroads might do as to obtaining next year's coal supply, and the operators have not made any announcement as to what they might do with regard to renewing their individual contracts.

The appointment of J. P. Cameron, of Altoona, to be the district representative of the Fuel Administration to control distribution in the central Pennsylvania fields under the zone system, was welcomed by the operators and shippers, many of whom are personally acquainted with Mr. Cameron. He will be assisted by John Lloyd, Jr., of Altoona; Harry B. Scott, of Phillipsburg, Penn., and Samuel A. Rinn, of Punxsutawney.

Mine employees are much dissatisfied with the poor car supply and are leaving for other industries where the work is more regular and wages as high if not higher.

In his statement calling attention to the shipments of anthracite coal to Canada, C. E. Robertson, Deputy State fuel Administrator, says that the shipments of bituminous to Canada for the 11 months, Jan. 1 to Dec. 1, 1917, were 14,912,698 tons, as against 11,078,665 tons shipped in the same period of 1916, an increase of 3,834,033 tons.

Representatives of several of the larger independent operators shipping to Port Reading and Port Richmond held a meeting on Tuesday of this week for the purpose of putting into effect the pooling of anthracite coal. A report was received from a committee appointed at a previous meeting to devise a plan for such pooling.

Thomas F. Farrell, of William Farrell & Son, has been chosen by County Fuel Administrator Schley to look after the retail trade as a result of the conference held last Saturday between the retail dealers and Mr. Schley's representative at which time the pooling of coal was discussed, with special reference to providing coal for apartments and domestic consumers.

The situation early this week was extremely serious. Coal supplies were scarce and rail transportation was in bad shape on account of heavy snow storms and the extreme cold weather.

The committee of operators appointed a few weeks ago to work out a plan of distribution for anthracite coal for this year, held a meeting in Philadelphia on Monday of this week. The plan or scheme adopted aims at complete coöperation of all anthracite producers, working through a central organization. The scheme will be in full operation by Apr. 1 it is expected.

PHILADELPHIA

Anthracite continues to be held back by weather. Bituminous coal seized to help family trade. Coal thefts alarm dealers. Retailers hard hit by labor shortage. Yard deliveries growing. Congressmen call on National Administrator. Complaints about culm. Steam sizes sold up. Bituminous situation grows worse. Essential plants on close margin. Soft coal for domestic use. Heavy bunkering, with new regulations.

Anthracite—The operating companies, in conjunction with the railroads, made a concerted effort this week to relieve the acute shortage existing. Plans had been laid to consign approximately 60,000 tons for family use to this market. Heavy shipments were at once gotten under way, but more snow came and in addition another severe spell of cold weather, sending the thermometer below zero. This locked rails and switches, and entirely upset calculations. According to those who made a survey of the situation the only remedy now is to wait for a thaw, and the hopes of the railroads may yet be realized as there are indications that the weather will loosen up.

This week the State Fuel Administration confiscated about 300 tons of bituminous coal, which were turned over to the dealers for domestic fuel. Members of the fuel committee have given assurance that they will, under their orders from Washington, confiscate all soft coal needed to keep the homes of the people warm. All this, of course, depends on the willingness of the people to accept it, which perhaps needs not to be reckoned with so much as their ability to use it.

With the first consignment of this coal to the retail men they adopted the practice of picking out the lumps for the family trade and disposing of the slack for smithing purposes, for which there is a heavy demand. Owing to the heavy seizures of soft coal for the anthracite trade it was reported that in this section of the state over 70 large manufacturing plants were closed for the lack of fuel.

A promise of relief from the critical conditions prevailing here was given by National Fuel Administrator Garfield, following the action of Pennsylvania congressmen this week, when at the urgent request of State Administrator Potter they called upon Dr. Garfield in Washington. Dr. Garfield personally informed the congressmen that the presidents of the largest producing companies fully realize Philadelphia's condition and are making unusual efforts to supply the coal. Their efforts to have the New England priority order cancelled in favor of this city were not successful.

In the meantime there is little change in the conditions of the local coal yards. What coal is received goes out almost as soon as it comes in. The several heavy snowstorms greatly hampered the dealers in the delivery of their small receipts. Motor-trucks became stalled and at no time this winter has labor become so scarce. On this account particularly the practice is growing among the smaller dealers of selling their entire receipts in small lots to buyers who will carry the fuel away themselves.

One unfortunate phase of the situation in the outlying sections is that many dealers being unable to secure enough coal to make the business profitable have gone out of the trade entirely leaving their customers dependent upon dealers from whom they have not purchased heretofore and who are reluctant to serve them while endeavoring to dole out their meager supplies to their regular clientele.

The wholesale thefts of coal from cars on railroad sidings has once more grown to an alarming extent. This pilfering has become a business with many, who peddle the coal by the bucket. Members of the Coal Exchange realizing that some immediate and drastic action must be taken called a special meeting to consider the matter. A committee was appointed, and it called upon the Director of Public Safety, who promised better police protection. Later 32 men were arrested and brought before a magistrate. He listened to many moving but fictitious tales of woe and discharged the whole crowd with a reprimand and threats of punishment for repeated offenses. The retailers still hope that they will be able to secure enough convictions to discourage the practice.

The trade is in a turmoil and the nerves of every one connected with coal seem to be on edge. However, it now begins to look as if the Fuel Administration has adopted a new policy, one that will take advantage of the services of operators and distributors who have had years of close study of their business and have built up efficient organizations. The latest evidence of this new policy is the appointment of John Edmonds, sales manager of Madeira, Hill & Co., as anthracite distributor for Pennsylvania. Mr. Edmonds assumed his new duties this week in a quiet but thorough manner. His ability is indisputable and his requests to the shippers are received with confidence and prompt attention. Improved conditions are expected as a result.

Dealers with water-front yards are much interested in agitation to open the old Schuylkill canal this summer under Government subsidy. A number of congressmen have already taken the matter under consideration. At present the canal is but nominally operated, with only 18 barges in use last summer, while years ago the fleet amounted to as many as 800.

Altogether State Chairman Potter has seized during the past week 14,800 tons of anthracite, which have been turned over to retailers for sale to the domestic trade. Mr. Potter has also again cautioned the coal dealers that they must strictly observe the rule not to sell any anthracite family coal to manufacturing plants, either for heating or steam use.

Large shipments of culm have lately been reaching this market. The market on steam coals is entirely sold up and it is hard to obtain a price even from the individual operators, several of whom say they cannot take any more orders even for culm until they are able to clear up some of the orders on their books.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—The soft coal situation has grown more critical and the stage is rapidly being reached where only the absolutely essential plants and institutions are receiving any fuel. From many of the mines the bulk of the production is taken for Government orders and railway fuel and in the Pennsylvania region numerous operations have not received any cars for commercial loading for over four weeks or more.

The railway lines continue badly congested and the frequent snowstorms have prevented any progress from being made. Nothing but several weeks of moderate weather can help the situation. Public utility plants hereabouts are running on a margin of from a week to ten days and in a number of the outlying sections the local fuel commissions have been compelled to seize coal in transit to prevent an entire shut-down. Most of this seized coal has been taken from stocks that had been stored on sidings by the railroads for engine fuel.

The non-essential manufacturing plants are gradually being eliminated simply because hardly any plants are receiving coal except by direction of the fuel authorities and the natural result is that the fuel is only going to those plants that must be kept going at all hazards. Another feature that is affecting the manufacturing industry is the heavy tonnage recently seized for domestic consumption and distributed to retail coal yards which heretofore have only handled anthracite. The coal is quickly taken by the public, but all sorts of complants are heard of inability to use it. If the bituminous shippers were not so engrossed at this time in the endeavor to preserve their industry it would be a good time to conduct a campaign of education in the proper use of soft coal for home use.

The various operators' organizations have been holding meetings all week endeavoring to formulate some plan whereby production can be increased and transportation facilitated. Unfortunately some of the newspapers have placed a misconstruction on these meetings, intimating an ulterior purpose on the part of the shippers.

The bunkering of vessels goes on actively under the priority orders which are in effect covering this business. This week a regulation was put in force requiring the masters of all ships bunkering coal to make a declaration at the Custom House of the exact amount of fuel taken on board. The master is also required upon reaching his destination to report to the custom officer, if an American port, or to the American consul in a foreign port, the exact amount of coal used since leaving port. The idea is to hold the vessels down to the exact quantity needed and no more.

As has been frequently stated here the entire situation is dependent upon the car supply. This has really grown worse of late principally due to the extraordinary weather conditions to which the railroads have been subjected. There still continues to be much difference of opinion as to the value of the closing orders of the Fuel Administration, but at this time there appears a likelihood of even more extensive periods of idleness without even official order, unless some way is found to increase the supply of coal coming to this district.

BALTIMORE

Fuelless days and railroad embargoes fail to bring relief needed, and many industries are desperately short of coal and thousands of homes are without fuel.

Bituminous—While it may be stated that there is a slight improvement in the number of arrivals of loaded bituminous cars here, the increase is mainly for tide and bunker loadings that do not reach local consumers, and hundreds of small and large industries are now so desperately short of fuel for even emergency operation that only the closest distribution has prevented many shut-downs. Curtailment of service has been noted in many quarters. A considerable part of the soft coal arriving here for other than ship loading is being diverted for domestic use, as it is now estimated that there are between 20,000 and 25,000 homes in Baltimore entirely out of coal of all kinds.

The average unloadings of soft coal here daily for local use do not run over 75 cars, and frequently drop below 50. This is scarcely a drop in the bucket. Transportation is still badly crippled, and cars marked for the fuel administrator at Brunswick and other points days ago have failed to arrive.

Anthracite—The hard coal situation is sadly mixed. A little better movement is noted, but it is counted a good day when from 25 to 30 cars of anthracite are unloaded here. This against a normal consumption of over 100 cars per day when thousands of bins in homes that are now empty are carrying stocks enough to last until spring.

The turning of hard coal consumers to soft coal, when they can get that commodity, has been the only source of relief which the hard pressed dealer had to offer. The recent jump of 75 cents a ton here under the Fuel Administration schedule hardly created a ripple because there was so little coal to sell. No one seems to worry about price just now; its merely a question of getting coal at any price.

Lake Markets

PITTSBURGH

Cold weather follows improvement in car supplies. No river coal movement now in prospect.

Car supplies at most of the mines showed a slight improvement last week, but there was no particular improvement in the dispatch and receipts at consuming points were about the same as formerly. The movement of byproduct coal continues better than that of other coal, but still is not adequate, the byproduct plants from Pittsburgh to Cleveland operating at about 75 per cent. capacity. The Fuel Administration lays particular stress upon the movement of byproduct coke, on account of the byproducts being used in the manufacture of high explosives.

Sunday saw a remarkable spell of warm weather for a few hours, the thermometer rising above 40 degrees and there was rather good movement in consequence, car supplies for Monday being rather good, but Sunday night the temperature suddenly dropped to the neighborhood of zero and the predictions are for continued cold, so that car supplies for the remainder of the week are likely to be poor.

As a result of strenuous efforts by the river steamboats the ice in the third and fourth pools of the Monongahela was either broken up entirely or a channel was cut through it, so that beginning Monday the fourth pool was able to load coal. The temperature went below zero Monday night, continuing Tuesday and forcing abandonment of effort to maintain the channel in four lower pools of the Monongahela River. No river coal movement is now in prospect until weather moderates somewhat. Rail movement was reduced Tuesday by extreme cold.

Zone representatives are being appointed by the Fuel Administration for the coal districts centering in Pittsburgh, but no definite action of importance has yet been put into practice under the new zone system.

Regular open market transactions continue to be of insignificant proportions, but the volume of coal that technically is sold at the set prices, under various instructions of the Fuel Administration, now amounts to a large tonngae. The set prices remain at $2.20 for slack, $2.45 for mine-run and $2.70 for prepared sizes per net ton at mine, Pittsburgh district, with 15c. additional permitted to be charged in sales made by brokers. Under the circumstances, however, the brokers have scarcely any opportunity to do business.

BUFFALO

Coal about as scarce as formerly, but not now said to be on account of lack of mining. Scarcity of cars and locomotives appears to be the reason. Thus shut downs may cease and efforts be made to hurry cars forward.

Bituminous—As the car situation is now said to be to blame for the scarcity of coal, especially bituminous, the authorities are going to take hold of that phase of the problem, as they should have done at the start and see if something cannot be done from this angle. The shippers all along said that it was cars and not production that was wanting and they now say that the mines are full of coal ready mined, waiting for transportation.

While the temper of the coal shippers is not of the best, it is not proper to say that dissatisfaction has been what it might have been if the orders, so many and vexatious, had led to real disaster. The idea is that we have got off so far better than was expected and with the return of mild weather, which cannot now be far away, the situation ought to right itself slowly. It will be some time before it is normal again.

The Government prices of coal prevail more generally as the weeks proceed and April ought to see everything selling at these figures which are as follows, f.o.b. Buffalo:

	Slack	Lump
Pittsburgh	$3.75	$4.25
Bessemer	3.70	4.20
Allegheny Valley	3.60	4.10

Anthracite—The complaints of no coal are heard everywhere, but it is always a hard matter to say how genuine they are. Men who put coal into cellars are saying that if the authorities knew how much coal they often find there the distribution would be different. In spite of all possible effort to prevent hoarding it goes on and will continue to do so till it is known that the supply is adequate, and that may be some months hence.

The local anthracite prices are now about 40 cents higher than they were last fall, on account of the need of distributing singleton orders and it is held that the retailers have no reason to complain, especially as the Fuel Administration really sells the coal for the most part and collects the pay for it.

DETROIT

Floods in Ohio further curtail scanty coal movement to Detroit. Lack of coal and oil threatens to force suspension of Detroit City Gas Company.

Bituminous—New curtailment of the inadequate shipments of bituminous coal from Pennsylvania and West Virginia, is to be experienced by Detroit, as a result of the floods along the Ohio river. The assertion is made by some of the jobbers that information received from the south indicates almost no coal is likely to get through for several days and possibly weeks, with the exception of shipments already enroute this side of the flood district and such coal as may be available from some of the Ohio fields.

With the supply already so low that suspension of operation is confronting hundreds of Detroit industrial plants, the new obstacle seems to render the situation almost hopeless. Efforts are being made to increase the movement of coal from Ohio, Illinois and Indiana fields but the available supply is small in proportion to the needs of Detroit and Michigan consumers.

The Detroit fuel administration announces it will confiscate any coal available for the gas company. It is unable to provide oil; and presidents of several railroad lines who have been trying to locate missing oil shipments, have found none near enough to insure prompt delivery.

Should the gas company stop operation, hundreds of manufacturing plants using gas in various processes, including a number manufacturing war supplies would have to close in part or altogether, throwing about 200,000 workers out of employment.

The Detroit Edison Co. is but little better off than the gas company and is daily reducing its scanty reserve of coal.

As regards domestic consumers, the situation is even more gloomy than a week ago. Low temperatures nearly all last week caused heavy home consumption, while receipts were cut off by snow and traffic blockades. Nearly 5000 applications were on the records of the police department Saturday morning. The Fuel Administration was unable to supply needs of these consumers.

Anthracite—Very few cars of anthracite are coming into Detroit. Retail dealers say they are unable to fill orders or form any idea of when they will get coal. Mayor Marx is arranging to have large shipments of wood sent to Detroit from interior points of the state.

COLUMBUS

Continued zero weather has further hindered railroad transportation. This is reflected in bad service for the mining industry. Production is reduced and the demand is exceedingly strong.

What changes have taken place in the coal trade in Ohio during the past week have been for the worse. With low temperatures continuing and with railroad congestion and traffic conditions as bad as at any previous time, coal has been distributed with difficulty. Some cases of actual suffering have been reported, although they are not as numerous as might be expected. Taking it all in all, the conditions are quite strenuous and there is little hope of immediate improvement.

Domestic trade has been attracting more attention than any other branch of the business. The county and state fuel administrations have been devoting their efforts to relieve the suffering of the householder. As a result, considerable coal, consigned to steam users, has been diverted to domestic consumers. This is especially true of school coal, which has been diverted and schools have been closed. Hospitals and charitable institutions are fairly well supplied for the time being. Domestic prices are firm at the levels which have maintained for some time. Pocahontas is quite scarce because a large proportion of the production is going East. Anthracite is also practically out of the local market.

The steam trade is strong in every way. The efforts of purchasing agents are now devoted to getting coal to keep the plants in operation. In some instances, outside of fuelless days ordered by the Federal Fuel Administration, manufacturing plants have been able to keep up production. Others have been forced to curtail their activities because of fuel shortage. Public utilities have been the hardest hit and have been often without sufficient fuel. The efforts of the fuel administrators have been devoted to getting coal for various utilities upon which the activities of certain communities depend.

CINCINNATI

Scarcity of coal for all purposes is pronounced. Transportation conditions have never been more difficult, and the weather remains unfavorable.

Such change in conditions as has occurred during the past week has been for the worse, if anything, although there has been some movement of coal toward the North which has tended slightly to reduce congestion. The difficulty is moving cars, growing out of the repeated snows and the icy sleet which was the latest variety of precipitation, has not been overcome, however, and returns of empties to the mines are negligible.

Severe weather has also returned, after a slight period of comparatively mild temperatures, and the domestic and industrial demand for coal has therefore been virtually at the top. Many manufacturing plants have been compelled to close down on account of inability to secure fuel, this being especially true on Friday and Saturday, following a sudden flood stage of the Ohio River on account of damming by ice. Many coal companies with plants on the river front were thus put out of business for the time being, and in some instances cars of coal on railroad tracks were also caught by the river.

LOUISVILLE

Marked improvement in Kentucky field and market due to better weather conditions. Industrial demand large and offerings few, but trade making progress and outlook encouraging.

A week of fair weather, with temperatures either mild or moderating, has been of invaluable assistance to the Kentucky coal producers and distributors. Temperatures have been below normal for the season, and the demand for all kinds proportionately increased, but, for all that, settled conditions of the railway lines, grounds about the mines and the roads and streets have done a great deal. This in the face of the fact that a larger volume of business is being done than usual for the season.

The disturbing feature of the immediate outlook is threatening flood-water. This may even inundate some of the workings, to say nothing of interrupting rail service through washouts and wreckage of bridges, while it has already put much of the river craft out of commission by sinking or damage. A slow, gradual thaw is all that will prevent serious floods, the river coal movement from western Kentucky points southward already having been affected.

There is considerable skeptical comment about the "heatless Monday" gains. However, most emergency needs are being taken care of and there are no reports of industrial plants in this section closing down for lack of fuel, while most of the coal concerns report that they have been able to take fairly good care of their customers. The retail coal situation throughout the section is also improved, in spite of the fact that high water has further reduced the supply of natural gas, and emergency measures are being discontinued.

BIRMINGHAM

Domestic trade conditions much easier as a result of continued mild weather and decreased consumption. Much steam coal goes to New Orleans for bunker use under orders of fuel administrator. Output affected by heavy rains and flooding of mines.

The domestic situation is now well in hand (thanks to the past two weeks of moderated temperatures) and with a continuation of favorable weather the yards will be able to stock against any future emergency conditions. Almost all the larger yards now have several hundred tons on hand for the first time in several weeks, and are filling all orders normally with the exception of the one-ton limit to each customer. Inventory of coal on hand in the yards of the Birmingham district at the close of the week showed 2536 tons as against 800 tons ten days ago. Also a much larger tonnage was reported in transit.

Restricted consumers of steam coal have felt the pinch in supply for the past 12 days on account of the order of district representative Holmes, of the fuel board, directing a large tonnage of Cahaba, Pratt and Black Creek steam coal to the port of New Orleans for bunkering ships at that point. This order had priority over all shipments of this grade of coal not consigned to public utilities and other preferred classes of consumers. The fact that the mines netted $1.35 per short ton over mine prices on all coal supplied for ship bunkerage rendered a more cheerful compliance with the priority order possible. The shortage in steam grades was accentuated to some extent during the severe cold weather on account of much mine-run coal being diverted to domestic channels.

Coke

CONNELLSVILLE

Coke shipments reach new low level. Additional transportation difficulties.

Coke shipments last week were the poorest thus far, probably running considerably under 200,000 tons. On account of a brief spell of moderate weather on Sunday the car supply for Monday loading averaged slightly above 40 per cent., but while the temperature passed above 40 degrees on Sunday it dropped to the neighborhood of zero in the night and the prediction is for continued cold, which, of course, means light car supplies for the remainder of the week.

Apart from car supply there are fresh transportation difficulties. The heavy snow storm in the East last Sunday week further retarded coke movement on the main line of the Pennsylvania and after four days' shipments had accumulated the Pennsylvania refused, beginning Friday of last week, to take any coke on the main line through the Pittsburgh and Latrobe gateways. The particularly unpleasant aspect of this development is that it was only two or three weeks earlier that an interchange of coke had been effected to avoid certain cross movements, whereby coke reaching Greensburg and formerly passing to Pittsburgh had been exchanged so as to be shipped East on the main line. This arrangement had been expected to produce a general improvement, as it had had difficulty in getting through west of Greensburg. Now it is not even permitted to go East. There is an accumulation of at least 1000 cars on the Monongahela R.R., which the Pennsylvania cannot accept, at West Brownsville, and the Redstone branch is about equally congested.

The blast furnaces of the Central West that depend upon Connellsville coke are producing pig iron at about 25 per cent. of normal, though their coke consumption is greater than this, on account of banking, irregular operation and poor quality of coke. The byproduct ovens are operating at about 75 per cent., every effort being made, at the instance of the authorities at Washington, to get coal to them, Washington being interested in the byproducts. The blast furnaces as a whole are operating at about 50 per cent.

There are practically no open market transactions, but considerable tonnages of coke are changing hands at the set prices, by reason of various redistributions arranged by the Fuel Administration, the set prices remaining at $6 for furnace, $7 for 72-hour selected foundry and $7.30 for crushed, over 1-in. per net ton at ovens.

The Connellsville "Courier" was unable to report shipments for the week ended Jan. 19. Production showed a decrease of about 10,000 tons, to 221,000 tons.

Birmingham — Considerable tonnage of foundry coke continues to move from this district to the shipbuilding plants working on Government orders and to the railroads for foundry use at their shops—virtually priority business. As a result regular customers of district coke manufacturers are suffering some inconvenience by having their supply restricted. Transportation difficulties have been minimized to some extent by more liberal rulings on consignment of equipment placed for loading. Coke manufacture has suffered some the past week or so on account of the decreased output of coal due to excessive water in the mines.

Buffalo—Complaint from the direction of the coke trade is seldom heard. This is mainly on account of the fact that the bituminous shippers, who used to handle a great part of the output, have gone almost entirely out of that part of the trade, leaving the consumers to buy from the ovens direct. This is no doubt a better way of conducting the trade in such an emergency and it appears that it is fairly satisfactory, for the furnaces keep running on practically full time. The supply of ore is adequate and the coke finds its way to proper destination somehow.

Middle Western

GENERAL REVIEW

More snow tangles up rail traffic. Deliveries slow and uncertain. Many trains cancelled.

The latest heavy snow struck the Mid-West the first part of the week, and continued cold weather caused rail traffic to again become badly disorganized. It was also responsible for the annullment of many trains throughout this territory. The only fortunate feature about the latest storm was that it did not snow heavily in the coal-mining districts. This allowed mines to continue to hoist and load coal where equipment was to be had. Northern Illinois and southern Wisconsin suffered severely, as a result of the tieup of all kinds of transportation, including passenger trains.

Monday was observed as "fuelless day" with patriotic spirit and few complaints of violations have been noted. Saloons and cigar stands were the chief violators. The large industries did their bit manfully—hardly a wheel turning, according to reports received by the State Fuel Administrator's office, excepting in those plants that had been granted exemption. In most large towns, Monday appeared as Sunday, the only places open being hotels and drug stores.

The continued cry throughout the country for relief has had the effect of a concerted movement by the Fuel Administrators and coal operators of Illinois. At a meeting of the Fuel Administration and representatives of the Illinois operators, it was mutually agreed that the Fuel Administration would withdraw its order requiring 10 per cent. of the daily production and that the operators through a committee, would undertake to supply industries and dealers needs through the usual channels.

In order that there would not be any duplication of shipments the Distribution Committee urges that a report be made by all shippers of coal within the State of Illinois to the committee each day, giving the number of cars shipped, grade and to whom consigned. Such an arrangement, it is contended, will more nearly equalize distribution and prevent any one dealer or industry securing more than their share of the available shipments. The result of recent pooling is still tangled because of the different prices of coal that found its way into the pool. Some coal, shipped direct by the producers to their trade on contract, the price of which was in excess of that fixed by the Government, was taken. In many instances dealers contended that the Government price should be charged. However, the ruling of the Fuel Administrator allowed contract price to prevail, plus 15c. per ton, to cover cost of rebilling and replacement.

Production throughout Illinois and Indiana is still far below normal. However, a marked improvement over the previous week is noticed during the present week. In Williamson County, Illinois, it is learned from association secretary's report that mines worked approximately 69 per cent., while in Franklin County, 54 per cent. working time was recorded. This difference is no doubt occasioned by a large number of mines in the former county loading railroad coal, with a full car supply.

The seriousness of the fuel situation in Illinois would seem to warrant, at least temporarily, the application of all coal produced in the state to Illinois points exclusively. Regardless of this situation, an attempt was made Thursday by Fuel Administrators of Indiana and Ohio to confiscate 565 cars of coal that was delayed at Danville, Ill., because of the failure of the railroads to provide motive power. The coal was mostly billed to steel plants near Chicago.

The railroads claim that they would, if left alone, clear this situation up in 24 hr. State Fuel Administrator Williams immediately got into communication with Dr. Garfield, in an effort to prevent the raiding of Illinois, by neighbor states. It is understood that the request of Mr. Williams was not granted, and the 565 loads from the Danville district were allowed to move East to points along the Big Four R.R., where the needs are most urgent.

The labor situation throughout this section is in good shape. Operators say they are in a position to provide the coal if they can be furnished sufficient equipment.

CHICAGO

Chicago coal famine continues. Zero weather prevails.

There is little prospect for relief in sight. The fact that daily receipts are not of sufficient volume to take care of the distressing need, is evidenced by the increasing requests made on the City Fuel Administrators office for coal. Most retail yards are absolutely bare of coal, and the incoming shipments are quickly unloaded from the car and distributed to the most needy in small lots.

Although Monday was observed as a fuelless day, little or no change was noted so far as getting any coal ahead is concerned.

The board of education held a session during the week with a group of coal dealers who urged the further suspension of schools but the school board declined to listen to any proposition that would close the schools and permit saloons and poolrooms to remain open. The schools use 1200 tons per day and have only 6000 tons left in storage—five days supply.

State Fuel Administrator Williams has demanded of the coal operators a daily statement of the tonnage produced, giving the car numbers, kind of coal, to whom billed and the destination. The request is made through the Illinois operators distributing committee, which meets daily with some part of the fuel administration forces.

The Chicago Association of Railway Managers announced that Thursday 210 cars of anthracite, 1789 cars of bituminous and 114 cars of coke arrived at Chicago. Two hundred and twenty seven cars were delivered to industries, 350 to team tracks 330 to yards and 692 cars of coal were unloaded, while 1587 cars were held for consignment.

Outside of hard coal and Illinois bituminous, this market is receiving but little fuel. It is now the conviction of the producers particularly those that have their head offices in Chicago that there is no remedy that can relieve the present situation except warm weather.

Prices are as given in the table below.

MILWAUKEE

Transportation and delivery the chief problems. City well supplied, but interior communities are hard up for fuel. Price schedule continues unchanged.

Transportation and delivery are about the only problems which face Milwaukee coalmen at this time. There is coal sufficient to last until spring, if proper care is taken. Hard coal is nearly gone, however, and more soft coal is being used by private consumers than ever before. There has been no change in the price schedule since the increase of 75c. ordered on Jan. 20 to cover growing delivery expenses due to the one-ton allotment and snow blockaded streets.

The coal supply in some Wisconsin cities and towns is practically exhausted because of inability of Milwaukee shippers to get cars enough to meet the demands upon them. Madison was a sufferer, but Gov. Philipp took a hand in the matter and secured thirty carloads of coal from Superior, Wis., by special train. La Crosse is in a bad way for fuel and it is said no more hard coal will be shipped to that point this winter. Emergency shipments were made to Watertown, Waterloo, Sun Prairie and Marshall. At these places coal was being doled out to consumers in bushel-basket lots. The Milwaukee road had not sufficient coal to run all of its freight engines on the Madison division. Milder weather and a let-up in the rail congestion will result in prompt replenishment of fuel supplies all over the state.

The University of Wisconsin is now saving 161 tons of coal each week as a result of fuel conservation rules it has put into practice.

ST. LOUIS

Current needs about taken care of, but St. Louis is 95 cars per day short of requirements. Railroad service extremely poor, especially on the Illinois Central. Terminal unable to cope with conditions. Country situation acute. This cannot be relieved unless weather becomes warmer.

The St. Louis situation, while a trifle better, is still somewhat acute. Extremely cold weather and the continued storms have kept the railroads in a precarious condition, and the Terminal situation is extremely bad.

The Terminal contrary to instructions has placed temporary embargoes against the Wabash, C. & A. and Rock Island, on lines west of the river. When this was brought to the attention of the Fuel Administration it was ordered raised.

If coal was moved in and around St. Louis by the Terminal as it should be, the situation would be from 10 to 20 per cent. better than it is, but the utter demoralization of the Terminal and some of its connecting lines is the principal cause of the coal shortage in this city.

Steam plants are receiving enough to get along on by the closest kind of economy, but a survey of the coal requirements of the city show that the daily shortage here is 95 cars. Eight hundred and sixty-four firms in St. Louis show requirements of 1450 cars a week, but the requirements for St. Louis including steam and domestic are about 550 cars per day and about 450 cars per day have been coming in.

Essential industries manufacturing food stuffs and working on war contracts number 243 and use 12,360 tons of coal a week. Firms claiming to be essential number 227 and use 14,550 tons a week.

The dealer demand in St. Louis is between 250 and 300 cars per day. There has been considerable trouble here on account of dealers and others violating the priority rule in the distribution of coal. The Union Electric Light and Power Co. investigation developed the fact that it was heating about 140 plants and that 8 of these had generators but the remainder were straight heating plants and were getting coal in preference to domestic users, although most of these plants were in wholesale houses and office buildings.

The situation in the Carterville district continues to be a serious one as far as this market is concerned. The Fuel Administration for Illinois, or rather the assistants therein, are draining the Carterville district in favor of Chicago and are neglecting contracts and trade in the territory west of the river. For that reason practically no Williamson or Franklin County coal is coming in. The same condition applies to the Duquoin district to some extent.

Working conditions in these fields are not good, one big mine getting 34 hr. work on commercial coal in a period of one week. The railroads seem to be getting most of this coal, and the Government requirements come next.

In the country districts the situation has been most acute in southeast Missouri and northeast Arkansas, which sections have in the past depended upon the Carterville field. Many of these places have no rates from the Standard field and are entirely without fuel. Sections that can be reached by Standard coal are being taken care of under the direction of Fuel Administrator Crossley, who in three days shipped 73 cars of coal to these points and coal is going forward now at the rate of from 15 to 20 cars per day to sections that in the past have never used Standard coal.

On the Iron Mt. lines in Arkansas and Louisiana there is much actual suffering as well as in some isolated places in Missouri.

The prevailing market per net ton f.o.b. mine is:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard

COAL AGE

Vol. 13 NEW YORK, FEBRUARY 16, 1918 No. 7

ENEMIES WITHIN

BY FLOYD W. PARSONS

IT IS unfortunate that there can be no powerful government or great industry without its traitors. Often such enemies are fanatics who believe they are right while all others are wrong. The anarchist who plants a bomb to correct a seeming injustice risks his neck and is an honest gentleman compared to that Judas in the coal industry who today is allowing the shipment of dirty coal, and accepting record prices for a product he couldn't possibly sell in normal times.

"That's strong language," you say; and I reply, "It isn't strong enough to fit the case." Furthermore, let it be understood I wouldn't make such an accusation if I hadn't seen with my own eyes many times in many places instances of such a reprehensible practice. Yesterday I saw 60 tons of coal that cost a lot of money that couldn't even be burned without being mixed with real coal of decent quality.

The dishonest clerk who short-changes his customer is a thief, but he only hurts a few people and harms himself most. Here is what the dishonest coal shipper does today:

He is damning an industry that has developed through the exercise of greater individual courage and the endurance of more personal hardship than any other important business.

He is causing the finger of public condemnation to be pointed at honest, conscientious coal operators who have spent a lifetime in the organization and development of reputable mining companies.

He is wilfully and certainly bringing about a situation that can have no other outcome than to deprive efficient mining men of control of their own business, and to hasten government direction of mining, if not Federal ownership.

HOWEVER, these are only a few of the little things. Here is something more serious:

The very existence of this United States depends on our overthrowing German autocracy. The weak link in our entire war program is transportation. This deficiency in the last three weeks has caused our nation a billion-dollar loss through suspended effort.

HERE is what the dishonest coal shipper accomplishes.

The railroads of the United States haul about 1800 million tons of freight yearly; approximately 35 per cent. of this freight is coal. Some coal is sold locally and considerable is used at the mines. Assuming that 630 million tons will be shipped over the railroads this year, it will require 12,600,000 fifty-ton cars to move this output.

If numerous recent investigations are at all accurate, there is at least 9 per cent. additional adulteration in the coal now being shipped in America. It follows, therefore, that if the Nation's total coal output today carries 18 per cent. refuse, this same production has but 63 per cent. of the fuel value of coal carrying 6 per cent. ash, and requires the transportation of 37 per cent. more coal than is necessary. In certain localities the transportation facilities, due to dirty coal, are being taxed as much as 35 per cent. above normal requirements.

With coal carrying 6 per cent. ash, eight boilers are required to generate 300,000 lb. of steam per hour. With 20 per cent. ash, 19 boilers are required. A certain tonnage of coal running 6 per cent. in ash requires 11 cars to transport it; coal having the same fuel value, but running 20 per cent. ash, requires 17 cars to move it.

FOR every additional 1 per cent. of impurities in the Nation's annual coal production the railroads must haul more than five million tons of useless waste. Coal adulteration means more boilers, more firemen, increased fuel demand and more ash handlers. It is further true that as the percentage of ash in coal increases the percentage of combustible matter lost in the ashes increases.

It is physically impossible to mine and market coal that contains no noncombustible matter, but when the impurities in our total production average more than 10 per cent., a despicable crime is being perpetrated. The coal industry must rid itself of the pirates that would destroy it, and it is urgent that effective action be taken at once.

IDEAS AND SUGGESTIONS

Motor Troubles with Undercutters

BY FRANK HUSKINSON
Trinidad, Colo.

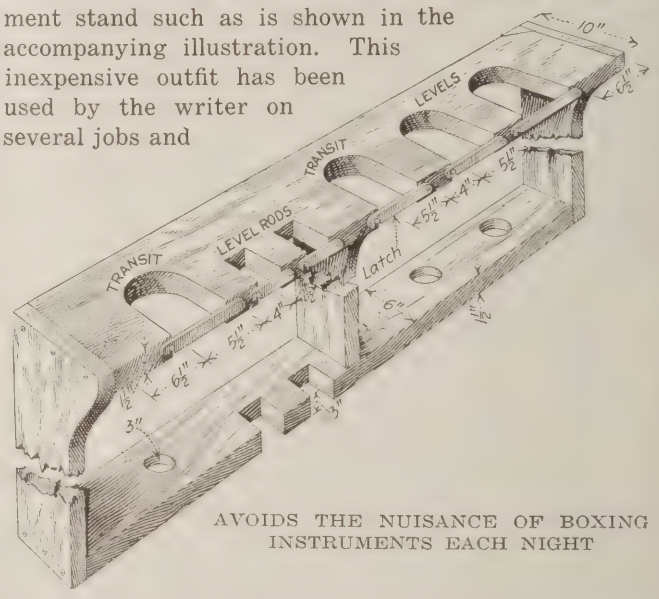
Recently I had two odd cases of trouble with the motors of two new coal undercutting machines that had just arrived from the factory.

One of the undercutters gave considerable trouble with the armature and bearings. The bearings would heat unduly, and the brushes would spark. The motor in general did not operate properly. Tests were made, and everything seemed to be all right. The armature was taken out and tested for a sprung shaft; the electrical connections were all gone over and traced out; all with the same result—everything was O. K. Finally a new armature was put in, but the result was no better. New fields were also put in, but no improvement in operation was obtained.

I was upon the point of referring the trouble to the factory, when I thought I would take the motor apart once more and thoroughly examine everything to make sure that nothing had been overlooked. This I did, and among other things I calipered the distance between the center line of the motor and the pole-pieces. I found that one of the pole-pieces was approximately $\frac{3}{16}$ in. closer to the center line than the other. I took out this pole-piece and removed $\frac{3}{16}$ in. from the flat side. On putting it back in the motor frame and calipering again, I found that both pole-pieces were the same distance from the center line of the shaft. The motor was then reassembled and tried out. It worked satisfactorily and never gave any more trouble.

The trouble resulting from the one pole-piece being so much closer to the armature than the other, made itself evident in the shape of a strong pull on one side of the armature and a considerably weaker one on the other side. In fact the longer pole-piece barely cleared the armature, while the opposite pole-piece had slightly more than $\frac{3}{16}$ in. of air gap. This caused the armature to be out of balance magnetically, and when the current was applied to the motor it had a tendency to drag the armature closer to the large pole-piece than to the small one, causing an undue pressure upon the bearings and making them heat. Also, on account of the armature being so much out of balance magnetically, the brushes sparked and the motor did not work properly under a load. Under no load the trouble was not so noticeable. The air gap between the pole-pieces and the armature was not visible in this motor, it being of the inclosed type.

Another odd case of trouble with a new machine that had just been put in operation was one where the motor would not run without excessive heating of the armature bearings. Upon a thorough examination it was found that the front endplate that contained the armature bearing and brush frame was not properly planed and fitted to the motor casing. It was out of true approximately $\frac{1}{8}$ in. on one side, so that when assembled the front armature bearing was not in line with the armature shaft. The result was that the shaft was practically clamped tight in the bearings when the motor was assembled. This caused excessive friction, resulting in the bearings becoming unduly heated in a short time.



After properly lining up the front plate with the armature and motor casing, the motor gave good service and satisfaction.

The foregoing two cases of trouble with machines of the latest type and of a standard and reliable make are unusual, especially in a new machine. They evidently show that the best of us are liable to make mistakes.

Why Box Instruments Every Night?

BY GEORGE W. MCALPIN

All the trouble and waste of time in removing surveying instruments from their tripods and placing them in their boxes at the end of the day's work can be avoided if an office is provided with an instrument stand such as is shown in the accompanying illustration. This inexpensive outfit has been used by the writer on several jobs and has been found satisfactory in every case. The construction is simple. Slots cut into a 1½ x 10-in. plank provide recesses into which the tripods and levels may be set. The tripods are then held in the slots by metal latches hinged at one side and fitting over a nail at the other. The feet of tripods and the lower ends of level rods fit into holes cut in another plank set lower.—*Engineering News-Record.*

AVOIDS THE NUISANCE OF BOXING INSTRUMENTS EACH NIGHT

The hardening of concrete is not a drying process as some suppose. If concrete, after being placed, is left exposed to sun and wind, much of the water necessary to its hardening is lost by evaporation. Protection, says "The Ransome Book," is especially necessary on walls and floors, where a large surface area is exposed. It is not so necessary on mass work.

Concrete and Tile Lining for Headings

The Clearfield Bituminous Coal Corporation, at its coal operations in Pennsylvania, has a number of slopes and main headings which will be used for a number of years. As fast as the old timbering in these slopes and headings decays, the company replaces them with permanent linings of concrete and tile.

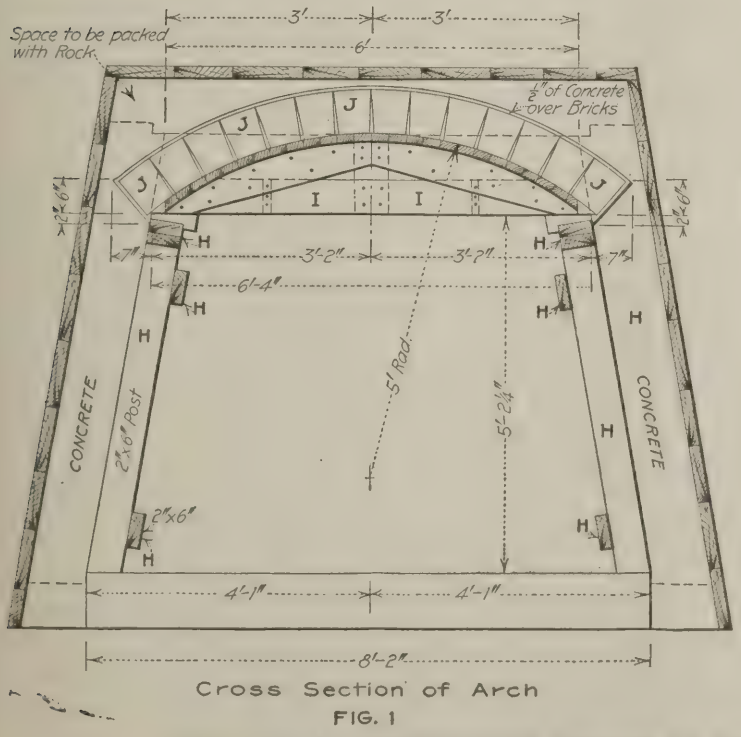
The old timbers *A*, in Fig. 2, are set on 4-ft. centers. The space between these timbers is filled with concrete

ENTRANCE TO HEADING, LINED WITH CONCRETE AND TILE

to a height of 5 ft. 8 in. from the top of the old mudsill *B* in Fig. 2. When the concrete has set the small post *C* is placed on top of the concrete and the 35-lb. T-rail *D* is placed across the heading from this post to a corresponding post on the other side. This T-rail supports the lagging when the cap piece *F* is removed, and as the work progresses is moved forward to catch the next set of lagging at *E*, and so forth. When the lagging is supported by the T-rail, the cap piece *F* and the post *A* as far as the top of the concrete *G* are removed. The support *H*, as in Figs. 1 and 2, is then set in place and the form *I*, as in Figs. 1, 2 and 3, is placed on top of this support.

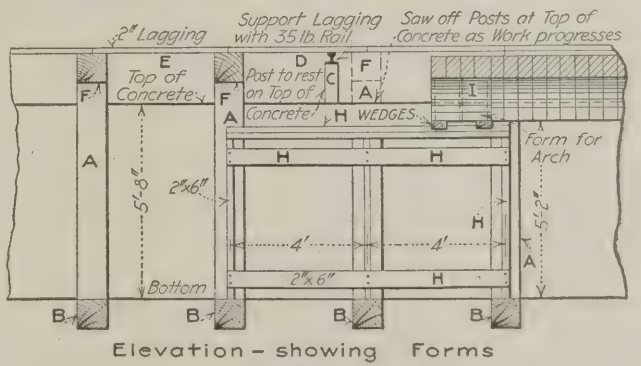
On this form chimney bricks are placed in the position shown at *J*, in Fig. 1. These bricks are made of tile and are $6\frac{5}{8}$ x $5\frac{3}{4}$ x 9 in., and are so designed that they make a perfect arch of a radius of 5 ft. Over the top of the brick a covering of $\frac{1}{2}$ in. of concrete is placed. The space between the top of the arch and the lagging is carefully packed with rock.

When the arch is set the form is moved up and a new set of brick is put in place. Every time the form *I*, in Fig. 3, is moved up an advance of 20 in. has been made. The old timbers *A*, in Fig. 2, which were not removed are then taken out and the space filled with concrete.



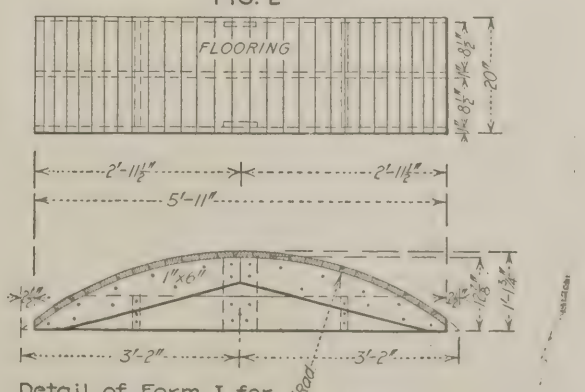
Power Loss in Coal Mines

By J. J. Nolan
Linton, Ind.



Here is a scheme I tried at one of the Vandalia Coal Co.'s mines near Linton, Ind., to increase the power in the bottom.

As is well known, the return is always more or less neglected, frequently containing bad bonding, poor connections, etc. I connected a 4/0 wire from the high-speed engine bedplate to the negative side of the switchboard. With a portable ammeter and with a 1600-amp. load on the switchboard, I got a reading from the bedplate to the negative side of the board of 550 amperes.



Since then similar connections have been made at six other mines, and readings have been taken in each case with portable ammeters. These showed from 275 to 550 amp. with normal load on the board. In one instance a 2/0 wire was used, but this became too hot to handle a few minutes after connecting.

Blacksmithing at Coal Mines

By J. F. SPRINGER
New York City

SYNOPSIS — Steel is structurally complicated, its structure and strength depending not only upon the percentage of carbon present but upon the working and the heat treatment to which it has been subjected. Steel loses its magnetic capacity at the temperature about right for hardening. Various molten baths may be advantageously used for tempering.

ALTHOUGH the various steels used in a coal mine are not subjected to the same service as is the rock-drill steel used in metal mines, still this is no real reason why more attention should not be given the former than is now customary. In most coal mines there is no system that requires the steel to be handled in the blacksmith shop in a really modern manner. That the owners lose money by this neglect can hardly be doubted. Because the ordinary blacksmithing operations suffice to produce good results when the tools are used in the coal is not a strong reason against getting still better results.

Only a small number of coal-mining blacksmiths really are familiar with the up-to-date methods of forging and hardening. I refer more particularly to the manner of using heat. The purpose of this article is to furnish the necessary information to two classes—the superintendents or foremen responsible for output and the cost of getting it, and the boss blacksmiths and their subordinates.

Should Know How Blacksmithing Work Is Done

A superintendent or a foreman should know exactly how certain blacksmithing work must be done and why it should be done in one way rather than in another. If he does not possess this information he will be at a serious disadvantage in discussing correct methods with the men who do the actual blacksmithing or have immediate control of those who do. The second class I referred to—the men in the blacksmith shop—obviously need the information for use in their daily work.

Some persons are of the opinion that to know how to do a thing is enough; and that to know why a thing is done is not especially important. This opinion, however, is most certainly wrong. The right way of doing a thing sometimes occasions more trouble than one of the wrong ways, and it is human nature to follow the easier road. If it is not explained to a workman why the longer road is the better, he is likely to lose his cheerfulness if urged to take it. If he understands just why he ought to do a thing one way rather than another, we can expect a greater readiness to follow directions based on these reasons.

Steel is a complicated material. During recent years the miscroscope has made this fact plain. It is now known—and it was not known formerly—where the carbon is located that exists in a piece of steel. In addition, the changes undergone by a piece of steel as it passes through different heats have also been studied. Furthermore, modern methods of testing steel for strength enable us to observe the effects of heating and cooling upon this valuable quality. A large part of this information has a direct bearing upon blacksmithing operations.

Steel is not homogeneous. It is built up of many layers, or particles. Some of these layers are practically pure iron, containing no carbon; other layers, or flakes, have carbon in them. The patches in which the carbon is found are true chemical compounds consisting of iron and carbon. That is, these patches are not mere mixtures of iron and carbon—a particle of iron and a particle of carbon—but combinations of such a character that both the carbon and the iron have lost their identities and a new substance has been formed. This new substance—this chemical compound—is carbide of iron. The metallurgists call it "cementite."

Heat Treatment Differs With Carbon Content

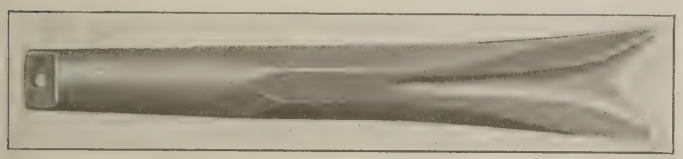
If the steel is in an ordinary annealed state and contains, say, 0.90 per cent. of carbon, it will usually be found that the entire mass will be made up of grains or crystals, each of which will consist of alternate layers of iron and cementite. The layers may be more or less crumpled. The material of which the grains are composed is called "pearlite."

The proper heat treatment of steel differs somewhat with the carbon content; that is, it depends on whether the steel contains more or less than 0.90 per cent. of carbon. This means, therefore, that in this percentage we have a dividing point. If the steel contains more than 0.90 per cent. of carbon then the grains will still be formed of pearlite, but they will be separated from one another by the walls of a honeycomb of cementite. If the steel has less than 0.90 per cent. of carbon there will still be a honeycomb, with grains of pearlite filling its spaces, only now the walls of the honeycomb will be of iron. It is with this quality of steel that we have most to do in coal mines.

Suppose we have a sample of bar steel of 0.90 per cent. carbon or higher. If we take an ordinary horseshoe magnet and apply it to this bar, the two will cling together. Let us now heat the steel, and every now and then apply the magnet. At first the magnetic action will continue to take place, and the magnet will grip the steel; but, as the heating goes on, we reach a point at which the steel loses its magnetic quality. The magnet will then no longer adhere. In fact, the magnetic action has been lost for this and all higher temperatures.

When the steel is cooled it will, after a time, again be attracted by the magnet. The temperature at which the change takes place is about 1275 deg. F. This is an important fact for a blacksmith to know, as he can use it to good purpose when hardening steel.

If the steel contains 0.90 per cent. (or more) of carbon, it can be hardened by heating it to just a little higher than 1275 deg. and then plunging it into cold water. If it is merely heated to a point a little below 1275 deg., it will not harden when plunged into the water. Try it. Use the magnet to tell the temperature.



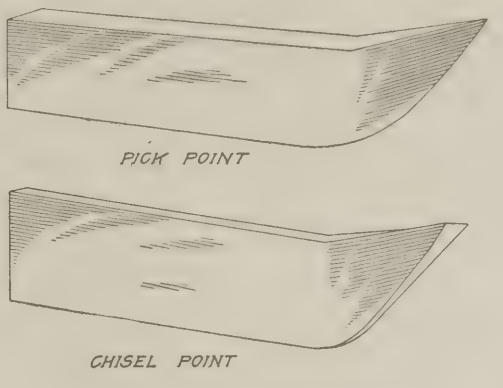
It so happens that the temperature at which magnetic activity disappears is just about what we want when we harden a piece of 0.90 per cent. carbon steel. As the magnet acts about the same on gloomy days as it does on sunny days, we have, for this particular kind of steel, something better than the color to go by.

In carrying out this procedure, go a little higher—but not much higher—than the point at which the magnet lets go. There are two reasons why we should go a little higher: (1) We want to be a trifle higher in order to be sure of an adequate heat for the hardening, and (2) we must allow something for the cooling that takes place before we can get the piece of steel into the water.

If the steel has less carbon than 0.90 per cent.—and this is the kind of steel the coal mine will rather likely be interested in—then we need to harden at a somewhat higher temperature. It is fortunate—for coal people—that the magnetic point of such a steel is also higher. In fact, the magnetic point and the hardening point are practically in agreement for all steels down to those having 0.50 (perhaps even 0.40) per cent. carbon. A 10c. horseshoe magnet is, accordingly, an excellent pyrometer for the coal-mine blacksmith. When he wants to harden cutter steel, puncher steel and the like, he heats it to the magnetic point and then goes a little higher, in order to be certain he has exceeded the magnetic point and to allow for loss of heat before getting the work into the quenching bath. He then chills the steel, and the hardening is done.

However, if the steel has a still lower carbon content than 0.40 or 0.50 per cent., then the temperature for hardening must be run up to a level higher than the magnetic point of this grade of steel. This kind of steel would be rather soft for cutting tools. What we are now concerned with is the steel used for the bits in chain-cutting machines, in punchers and the like.

Such tools should be made of carbon tool steel. Steel containing 0.75 to 0.90 per cent. of carbon is understood



TWO-PRONGED PUNCHER BIT

to be advantageous for this purpose. However, the practice varies. Steel containing no more than about 0.40 per cent. carbon seems to have been used. The best grade to employ under most conditions is probably that containing the higher carbon content just given. Such tool steel is not especially brittle, particularly if the temper is properly drawn. It will cost more money, but in all probability will give better service. The magnet may be used with any of these steels to determine the hardening temperature.

Let us return to the matter of the crystals, or grains. When annealed steel of any carbon percentage is heated beyond 1275 deg. F., the grains begin to grow just after the temperature exceeds the 1275-deg. mark and continue growing as the temperature rises. It is possible that growth does not stop until the melting point is just about reached, this growth probably being the union of small grains. How this takes place need not detain us, however, as the important thing for us to know just now is that they grow. It seems to be well established that the bigger the grains of any sample of steel the weaker the steel.

Suppose, for example, we heat a piece of 0.80 per cent. carbon tool steel to 1800 deg F. The grains have been growing for 525 deg. and will be good and large. Whether we chill this piece suddenly or allow it to cool slowly, the grains remain the same in size. Experts seem agreed on this. Consequently, this steel, which has been heated as high as 1800 deg., is damaged metal and is known as "overheated" steel. There is a technical distinction between overheated steel and burned steel. Overheated steel is simply steel whose grain size has suffered enlargement. Unless the grain size is reduced to normal, the steel will remain more or less damaged. But burned steel is steel which has been heated, presumably in contact with the air, until it scintillates. The oxygen of the air appears to unite with some of the carbon in the steel to form carbon monoxide or carbon dioxide. That is, some of the carbon is actually burned out of the metal. Probably this action would not take place if the air were excluded.

TWO TYPES OF CUTTER BITS

Burned steel should be thrown onto the scrap pile. However, the burning may not have extended far. It may, for example, have affected only the tip of a cutter bit. In such a case it may be possible to grind or cut away the part actually damaged.

In general overheated steel may be restored—perhaps not always to its full original condition. That is, the big grains may be made small again and the strength restored more or less perfectly. There are two methods of doing this. One is by hammering or otherwise working the steel. A two-pronged puncher bit is apt to break, if anywhere, diagonally across one of the prongs. Such a break is probably due in part to a failure to restore the quality of the steel by the hammering process that was carried out. The whole prong may have been heated to a high temperature and the grain size greatly enlarged. When the hammering took place, the smith may have given nearly all his attention to the tip, leaving the part back of the tip in its damaged condition or else doing only a little work on it.

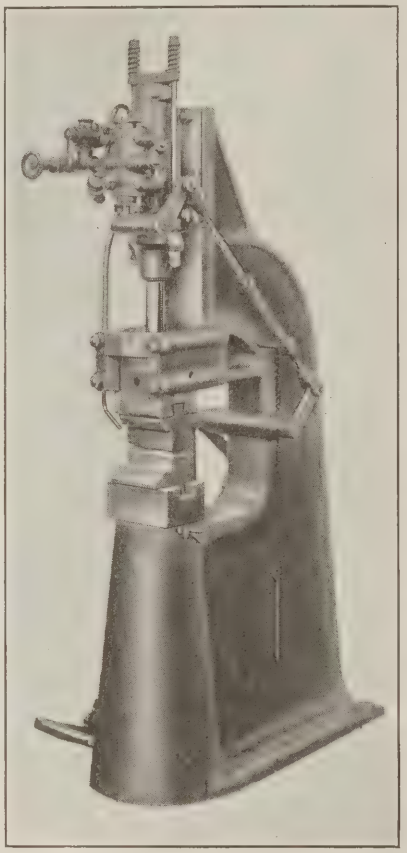
The prong would naturally break along a line marking the division between coarse and fine grains. However, the smith should not work steel after it has cooled to too low a point. I doubt whether investigation has gone far enough to warrant an exact temperature being given and insisted upon. At the same time, when

steel has cooled sufficiently to be attracted by the magnet, the smith may do well to be on his guard. Whatever blows are struck below the magnetic point should be light ones.

The second method of restoration is much more thorough and penetrating. This is restoration by annealing. It is a curious fact, but one that has been thoroughly ascertained, that a piece of overheated, big-grained steel will, if heated from below 1275 deg. to a level above that temperature, undergo a change in its grain size. This applies to steels of all carbon percentages.

While it is true that the size of the grain changes, we are not to jump to the conclusion that the size is uniform at any given temperature. For steels whose carbon percentages lie between 0.40 or 0.50 and 0.90, the rule is this: The grain-size changes are complete when the steel reaches the point where the magnet loses its grip. To anneal such steels we start with any temperature below 1275 deg. and heat the work until we are sure the magnet will not exercise its usual power.

Method of Annealing Steels



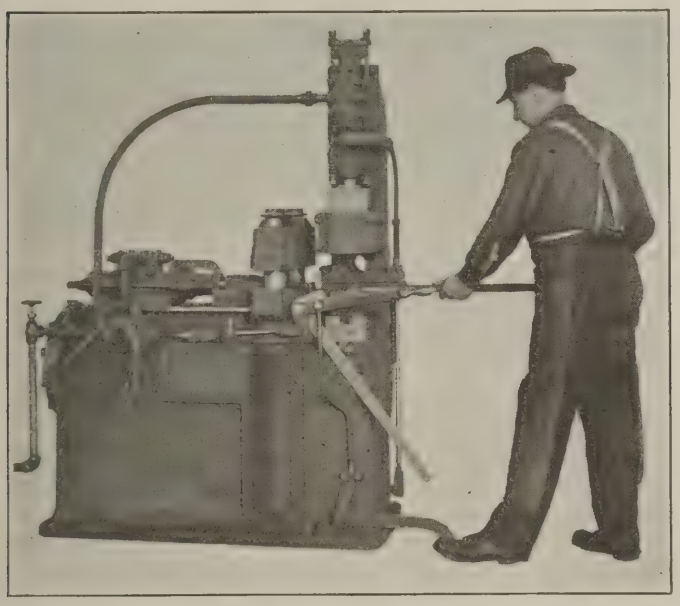
In order to be sure that we are below 1275 deg., which is approximately a full cherry red (perhaps somewhat below), we may let the work cool to a very dark red, to black, or even to the temperature of the shop. It makes no difference where we stop, provided we are below the 1275-deg. point. When we heat up from such a point to the magnetic limit, we will have a grain size corresponding to the temperature at which we stop; that is, the grain size will be small and the strength near its maximum. This is annealing.

A highly important lesson and one that will jolt a good many—not to say the big majority—of smiths is that we are forbidden by the foregoing from hardening the steel with the heat used for forging. It is quite easy and convenient for the smith to heat the work to a forging temperature, and when he has finished hammering to dip the tool into the quenching bath. This is all wrong. If we want the best results, we must get below 1275 deg. and then be on the rise in order to do the annealing. The thing to do is to reconcile one's self to heating the work twice. The first heat is used for forging, the second heating effects the annealing. We then dip the work and do the hardening.

A separate heating for each of the three operations would perhaps be the best procedure, but this is probably too much to expect. It is doubtful whether the additional benefit would be sufficient to warrant the full procedure. It so happens that the temperature at which we should halt the rise for annealing purposes is also the proper temperature for hardening. We take advantage of this and dip the work, thus avoiding the third heating.

The advantage of three heatings would be that the annealing heat could then be prolonged. The work might be packed and so on. It does not seem impossible to do the three heatings at a coal mine. The annealing and hardening operations can quite conveniently be done upon a considerable number of pieces simultaneously, particularly such small pieces as cutter bits.

The bits on a coal cutter may sometimes be purchased from the manufacturer of the cutting machine; but they also may be made in the mine's blacksmith shop from bar stock. The stock should be of the size required for the shank of the bit. Thus the stock may be rectangular bar $\frac{1}{2}$ x $\frac{3}{4}$ in. or $\frac{1}{2}$ x 1 in. in section. A belt-operated triphammer is a suitable forging tool. The bits will ordinarily be rather simple affairs. They may be given a chisel edge or a pick point. The chisel edge may be used to advantage in cutting sulphur sheets or blackjack, if either of these is present in any considerable quantity. But we may use chisel bits in the top and bottom blocks and put pick points in all the other places, provided the coal is fairly clean. The two forms are readily made with a triphammer or by hand. The bar is held in position and shifted until the proper point or edge has been secured and until the desired angle of bend is given to the bit. As bit after bit is forged, the smith should be on his guard lest he be using heavy blows on steel that has cooled to too low a point. There are one or two special forging machines on the market. A type manufactured by one of the leading companies is operated by compressed air. It is used to forge a brand new cutter or to reshape ("resharpen") an old one that has become dull from use. Where compressed air is available this machine is doubtless a fine thing. Steam may be used instead of compressed air, but the manufacturer should be notified of the intention to use steam at the time when the machine is ordered.



POPULAR TYPE OF MACHINE FOR SHARPENING OF CUTTER BITS

This machine differs from some of the drill bit sharpeners in that it is not necessary to upset the metal. The hammer operates vertically. Either a single blow may be struck or a succession of blows. The severity of the blow may be adjusted to suit the occasion, the operator having this matter under his control. Two swaging dies are employed, one serving as an anvil and the other as a hammer. The dies are of special form to suit the bits. Thus the form used for pick points will differ from that used for chisel edges. The dies are held in place by dovetail tongues which slip into similarly shaped slots. The special cutter-bit dies may be removed readily and ordinary forging dies substituted. The machine is then ready for general service in the blacksmith shop.

It is understood that a single machine can reforge as many as 200 bits an hour, chisel edges or pick points. Probably the bar has to be heated to a high point in

order to get this speed. In that case the job is done so quickly that the work is still highly heated when it is over. This is not good, for the reason that the grain size will naturally be about the size which corresponds to the temperature of the steel at the moment the work stopped.

As the point now under consideration is of importance —especially where only one heating is allowed—and is perfectly relevant whatever style of forging machine is employed, it will be well to have it fairly and squarely before us. The finishing temperature best for 0.50 per cent. carbon steel has been carefully investigated. The probabilities are that other steels behave similarly. Professor Bradley Stoughton cites William Campbell as having studied this type of steel. About 1908 Professor Stoughton, for the steels we are considering, expressed the matter in effect as follows: "Work below the magnetic limit greatly increases the brittleness of the material, while finishing the work at a higher temperature results in lower strength. Upon the evidence at hand, we may tentatively assume like conditions for these medium-carbon steels, and expect the best results if mechanical work is ended when steel is at a temperature which brings it exactly to the magnetic limit, but reserving the right to change this statement slightly when more data are obtained." It should be noted that Professor Stoughton in any event

REPRESENTATIVE FORGING MACHINE USUALLY EMPLOYED FOR ROCK DRILLS

only expects to make a "slight" change in this statement. I may add that in the 1911 edition of his work he allowed the statement to stand.[1]

Accepting this, we see that we will get the best results by not finishing the forging until the magnet takes hold or is about to take hold of the steel. If, however, we are not going to heat a second time, it will be impracticable for us to take full advantage of continuing to forge quite all the way down to the magnetic limit. The reason for this is that we must be above that limit when we harden. And, as already explained, we should see to it that we are allowing something for error and that we allow for the interval between stopping the heating and the plunge into the quenching bath. Consequently, if we forge with or without a machine and are going to omit a second heating, then we should begin with such a temperature as will bring us to the finishing point somewhat above the magnetic limit. With a power-driven machine this temperature of beginning should be lower than would be the case if we forge with a hand hammer on the anvil. In other words, the shorter the time of forging the lower the starting temperature should be.

However, if the work is afterward to be annealed, it would seem permissible to use high temperatures both with hand and machine forging; only we must be careful not to burn the metal. The ease and rapidity with which the work can be done at a high temperature would naturally result in a saving of time. This saving could then go to offset the extra time and trouble required to heat the second time. Let me recapitulate some of the foregoing results in the form of two rules:

Rule 1—If there is to be only a single heating, we heat to such a point as will allow just enough time to do the forging and still have the temperature distinctly above the magnetic point. We hardened instantly.

Rule 2—If there are to be two heatings, we heat to a point considerably higher than allowed by Rule 1 in order to get the advantage of easier forging, cool down to dull red or lower, reheat until distinctly above the magnetic point and then harden.

Tempering of Bits Reduces Brittleness

The tempering of cutter bits and other coal-cutting tools is done for the purpose of reducing the brittleness that exists after an ordinary hardening process. In many cases, perhaps the big majority, no tempering at all will be needed, especially if the hardening and quenching are done with intelligence. There are cases, however, where tempering may be the best solution of the particular problem in hand. Whatever the reason may be why it should be used in any particular case, the fact remains that tempering is a wonderfully successful method of adding to the toughness. There will be a decrease in hardness, but this may not necessarily mean a reduction in cutting ability.

Tempering consists in reheating a piece of hardened steel to a moderate temperature and a subsequent quenching. The hardening process seems to produce a strained condition in the mass of metal. A sudden shock may readily break a piece that has been highly hardened, even though the shock be quite mild. Thus a cutter point may strike a hard spot of some kind when at work and suffer fracture in consequence. If there is much trouble from such causes, tempering may cure it by appreciably reducing the internal stresses in the metal.

In general, the higher the temperature employed in tempering the greater the toughness and the more considerable the loss of hardness. A general rule can hardly be given for cutter points that will secure the best results under all circumstances. The cases will be different, and judgment should be based on the consideration I have just set forth. Some experimentation may be needed to get the cutters to the most efficient temper.

[1] I have changed the statement only to make it apply to the magnetic limit and the steels we have in hand. In Professor Stoughton's text ("Metallurgy of Iron and Steel," p. 377, ed. of 1908, p. 363f, ed. of 1911), the statement is unnecessarily technical for our present use, because he has in view all steels and refers to temperatures as given by degrees Centigrade and Fahrenheit.

After finding what is best, the next consideration is to secure the same result repeatedly. The man who settles the point of proper temperature, for example, may not do all the subsequent tempering.

Perhaps the simplest way to arrange a "foolproof" method of getting the right temperature is to use an alloy bath. An alloy of a given composition will melt at a fixed temperature. Lead and tin are melted together to form a molten bath and the hardened cutters or other tools dipped into it. The accompanying tables give various tempering colors, the corresponding pyrometer degrees and the composition of the suitable alloy.

LEAD-TIN TEMPERING BATHS

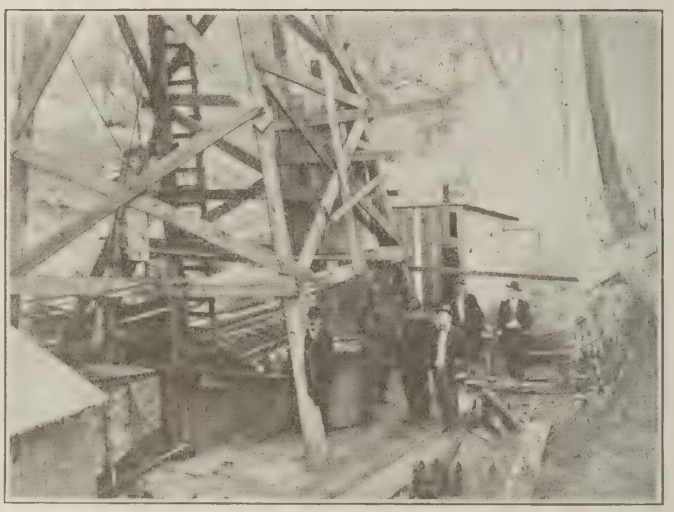
Color	Deg. F.	Tin Lb.	Tin Oz.	Lead Lb.	Lead Oz.
Faint straw	430	1	0	1	14
Straw	460	1	0	2	6
Light brown	490	1	0	3	8
Dark brown	500	1	0	4	2
Light purple	530	1	0	7	8
Dark purple	550	1	0	12	8

As antimony costs less than tin per pound, we may perhaps prefer to alloy the lead with it. The following table exhibits the fusion temperatures for various mixtures:

Deg. F.	Antimony, Per Cent.	Lead, Per Cent.
554	5	95
518	10	90
482	13	87

The question may properly be asked: How are we to keep these baths from getting too hot? After an alloy, or almost any metal, has been heated to the melting point, it is possible to go on raising the temperature. To meet this difficulty, we first find what alloy we are going to use. Suppose it is the one corresponding to the straw color. The alloy should contain the two metals in the proportions of 1 lb. of tin to 2 lb. 6 oz. of lead. We may prepare our alloy in the form of blocks or ingots. When a bath is wanted it will only be necessary to melt the ingots. At the time the ingots are got ready we cast a number of rods of small diameter, but in these we use somewhat more lead and not the relative amount used in the bath. This will have the effect of giving the rods a higher melting point. This may be seen by noting in the table how the temperature goes up with the increase in lead.

When the ingots have melted and the bath is thought to be just about ready, we test the temperature by dipping one of the rods into the bath. If the end of the rod melts, we regard the bath as too hot; if it refuses to melt, we regard the bath as at the proper temperature. All this is easy to carry out, both as to getting the ingots and rods ready and as to testing the bath afterward with one of the rods.



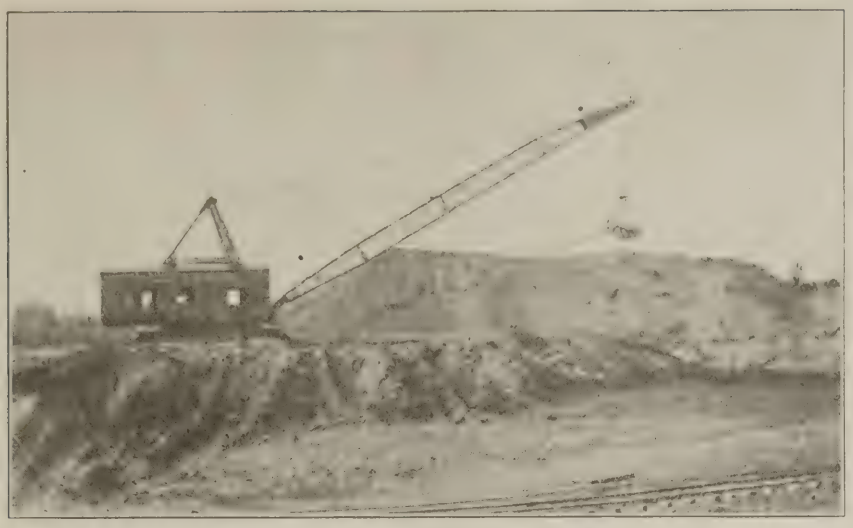
Record Shaft Sinking in West Virginia

The accompanying illustration shows the temporary headframe over the air shaft of the Rachel Coal Co., at Broomfield, W. Va., where a record was made in shaft sinking. The shaft is 370 ft. in depth to the bottom of the Pittsburgh No. 8 seam, which here attains a thickness of 8 ft. At a depth of 252 ft. the bottom of the Sewickley seam was reached. This was found to have a thickness of 5 ft. The Sewickley and Pittsburgh beds are separated in this shaft by 110 ft. of fireclay, limestone, sand-rock and various slates. The air shaft is 12 ft. in diameter.

The material encountered in sinking this shaft is shown in the following section, furnished by General Manager E. F. Miller:

	Feet		Feet
Surface and sand	27	Sandstone	18
Limestone	15	Fireclay	6
Fireclay	5	Brown slate	15
Limestone	7	Sewickley seam (bottom of seam 252 ft.)	5
Fireclay	22	Fireclay	36
Shale	16	Limestone	13
Limestone	5	Brown slate	4
Shale	15	Sandrock	22
Limestone	9	Brown slate	20
Blue shale	26	Black slate	15
Limestone	17	Pittsburgh No. 8 seam	8
Shale	2		
Limestone	2		
Fireclay	3	Total	370
Limestone	37		

Ground was broken for this shaft on June 11, 1917, and the first car of coal was loaded on Sept. 1, 1917—a fine record. Nine D. P. Sullivan No. 33 Jackhamer drills were used in sinking the shaft and the management—E. F. Miller, general manager, and J. C. Edwards,



TEMPORARY HEADFRAME OF RACHEL COAL CO., BROOMFIELD, W. VA.

superintendent—states that the work could not have been completed as quickly except for the Jackhamers. The average number of men working per shift was seven, 3 shifts being worked per day—all company work. Ventilation was effected by a 4-ft. Robinson fan, the air being carried down the shaft in a 12 x 15-in. tongued-and-grooved wooden compartment. Forty-five feet of the shaft was concreted; 5-ft. section wooden forms were used. The concreting was completed with the original forms, on which there were no repairs.

Screen Gravel for Concrete

Gravel as found in a natural bank, "bank-run gravel," as it is termed, is not suitable for concreting without being properly screened. It usually contains twice as much fine material as coarse, while the proportions should properly be reversed. The natural run-of-bank gravel, says "The Ransome Book," contains 45 per cent. of voids or air spaces. To fill these and make a dense concrete, the amount of sand should be about half the volume of pebbles. If more sand than this is used, as would be the case when the bank-run material is employed exactly as coming from the pit, it is necessary to use a much greater quantity of cement to fill up these voids or air spaces so as to give the concrete the desired strength, which is uneconomical of cement.

Electric Control of a Dragline Excavator

By L. W. NICKEL
Now Serving in the United States Navy

SYNOPSIS — *The dragline excavator possesses certain obvious advantages over the steam shovel. Electrical driving permits operation with fewer men and insures against delays arising from cold weather.*

ONE of the most interesting applications of electric control in a field where reliability is essential can be found in the control of a dragline excavator. A machine controlled in this manner has recently been installed at the works of the Locust Mountain Coal Co., Shenandoah, Penn., and is shown in the leading illustration. This excavator is used for stripping a coal bed, the stripping being from 14 to 30 ft. in depth. The rock encountered in the stripping process is drilled by steam drills and then shot. With the dragline in one position it is possible to take a cut 150 ft. in width. Spoil banks are always dropped on surface which does not contain coal; that is, the excavator is always placed directly over the vein and is followed by a steam or electric shovel. The dragline method of stripping has been found to be much cleaner than any other, as no rock or dirt is spilled on the coal when once it is cleaned. This is not the case where it is necessary to run locomotive track for disposing of rock and dirt taken off the surface.

With an electrically operated dragline no fireman, coal passer or pipe man is needed. Further, there are no steam or water pipes to freeze, and on the coldest mornings no delay is experienced in starting the stripping operation, it merely being necessary to close the main-line switch and commence work. The only labor required for the operation of this machine is the dragline operator, an oiler and a few men in the pit; whereas where stripping is being done by means of steam shovels and the dirt and rock is hauled away by locomotives, the amount of labor required is increased six or seven times.

The dragline excavator under discussion has a turntable 24 ft. in diameter, a 150-hp. hoist motor and a 75-hp. swing motor. The turntable consists of 40 openhearth steel rollers revolving between two 90-lb. rail circles, 24 ft. in diameter, one attached to the bottom of the revolving frame and one to the top of the base.

The main machinery is driven by a 150-hp., 440-volt, slip-ring-type motor, operating at a speed of 565 r.p.m. This motor drives two drums, one of which winds the rope that drags the bucket through the dirt while the other operates the rope by means of which the bucket is hoisted. There is also a small drum for raising and lowering the boom.

The swinging machinery is operated by a 75-hp., 440-volt, slip-ring-type motor, driving a vertical swinging shaft through three gear reductions. A pinion on the vertical shaft engages the circular swinging rack on the base. The master controllers, brake levers, etc., are mounted at the front of the machine so that the operator can manipulate the excavator without danger to the pitmen.

The bucket has a capacity of 3½ cu.yd. and is suspended by a three-part hoist. It is dumped by locking or holding the third, or single, part of the hoisting line. This is attached to the front end, or arch, of the bucket, after which continued hoisting dumps the contents. The brake, or holding device, consists of a drum, with a spring-actuated pawl and ratchet located near the front of the boom and controlled from the operator's platform on the revolving frame.

The magnetic control panel for this equipment was furnished by the Cutler-Hammer Manufacturing Co., of Milwaukee, Wis. It consists of double-pole magnetically operated switches equipped with series relays. The master drums, which are mounted over the operator's head, are of the bevel-gear type equipped with punched brass fingers having a forged copper tip so designed as to prevent stubbing of the finger. The main motor controller is equipped with jamming relays so operated

that the resistance is automatically cut into the rotor circuit when the motor is stalled. The maximum current taken by the motor under these conditions will not cause the circuit breakers to open. Thus the operator has control over the motor while it is stalled. This feature of stalling the motor and providing absolute protection makes it possible to obtain digging characteristics similar to those of a steam-actuated machine.

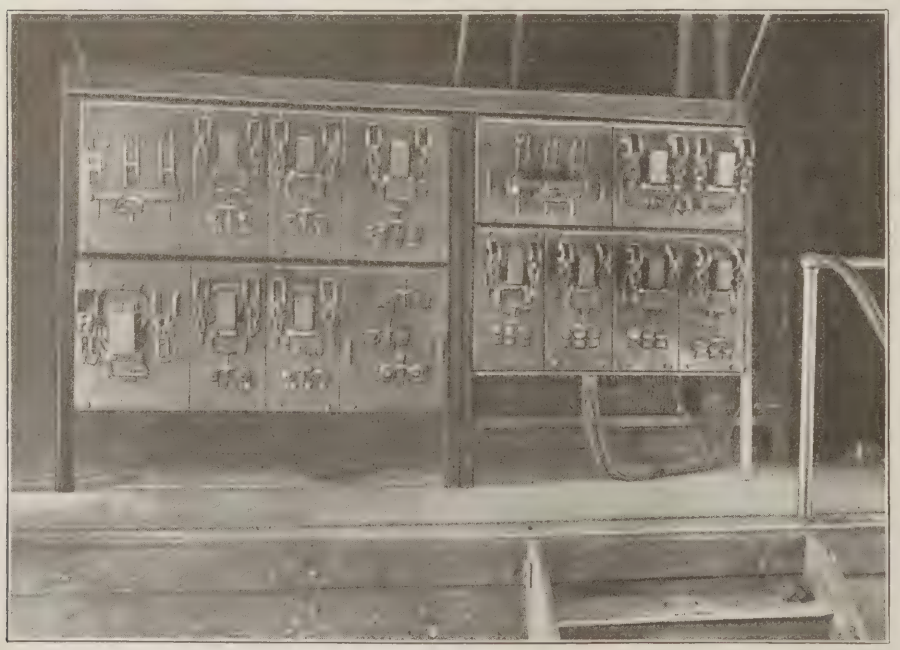
The controller for operating the swing motor is equipped with a plugging switch so that it is possible for the operator to throw the controller quickly to the maximum speed position and to reverse at full speed. The current inrush during this plugging period operates the series relay having control of the plugging switch, and in this way resistance is cut into the rotor circuit of the swing motor, so that the motor is fully protected during the plugging period. Because of the momentum of the boom on an equipment of this kind it is not necessary, under ordinary conditions, to reverse at full speed ahead, inasmuch as the operator often throws the controller to central position at approximately 20 deg. ahead of the dumping pile, the momentum carrying the boom to this point, at which time the motor is plugged. The grid resistance for the motors is mounted at the rear of the control boards in open frames thoroughly protected and ventilated.

The power for this installation is furnished by the Harwood Electric Co.'s plant at Hazleton, Penn., 22 miles distant. It is transmitted at 25,000 volts to Shenandoah, where it is stepped down to 4000 volts and is again stepped down to 440 volts by the Locust Mountain Coal Co., at its strippings, so that when brought to the dragline system it is three-phase, 440-volt, 60-cycle current. The transformers are mounted on a wagon.

The current is commutated to the machine by means of a collector-ring equipment consisting of three copper rings mounted concentric with the center casting of the machine and revolving with it. Heavy brass brushes to which the cable is attached are anchored onto the machine, there being two brushes for each phase. This makes a total of six brushes for the three rings, the brushes being mounted 180 deg. apart.

In Table I is given the cost of stripping 256,710 cu.yd. during the year of 1915. It will be noticed that the cost is 4.23c. per cu.yd. The writer has no figures available on the cost of stripping by means of locomotives and steam shovel, but feels assured that this figure will be far in excess of that secured by the method described in the foregoing paragraphs.

In Table II are given some figures covering the cost of stripping 56,565 cu.yd. during the month of October, 1915. It will be noticed that this cost is reduced to 4.19c. per cu.yd., there being considerable saving due to the absence of a blasting charge.



The control of this dragline excavator illustrates the tendency, on the part of mining operators, to adopt electrically driven machinery and thereby secure the advantages which it offers. The electric shovel is also finding its way into the mining field, one of these being used on the same stripping operation with the dragline described in this article. Frequently this equipment is operated day and night, stripping the dirt and rock from the coal beds and clearing the way for the shovels and locomotives that remove the coal to the breakers.

TABLE I. COST OF STRIPPING 256,710 CU.YD. DURING YEAR 1915

Classification	Labor Amount	Labor Per Yd.	Material Amount	Material Per Yd.	Total Cost Per Yd.

CONTROL PANELS FOR ELECTRIC DRAGLINE EXCAVATOR

THE DESIGNS OF TIPPLES and mine plants should be made a subject of competition among the bidders, and should be limited to a few responsible bidders. The best plan should be awarded the contract. Compensation should be made for all plans submitted, for although no charge is made, it must not be assumed that such work costs nothing. There is no such thing as free engineering.

Economical Generation of Thermal Power at Coal Mines—IV

By J. B. C. KERSHAW
91 Grosvenor Road, Colwyn Bay, Liverpool, England

SYNOPSIS—*The economical generation of steam requires an easy and exact control of boiler draft. This can be most easily accomplished by mechanical means. A boiler is designed as a vessel wherein steam is to be made; it is not a water purifier or heater. Best results are obtained when the feed water is raised to the boiler temperature before it enters the boiler proper.*

AN ADEQUATE supply of air has been shown (in Article III of this series) to be an essential requisite for good combustion. If this air can be preheated before entering the boiler furnace or the combustion chamber, the temperature attained and efficiency of the steam-raising process will be considerably increased.

The usual method of obtaining the necessary supply of air to the furnace and combustion chamber, in the past, has been that of relying upon the chimney which carries away the products of combustion. Chimney draft has, however, never been entirely satisfactory, even when aided by the use of steam jets; and in modern boiler plants either forced or induced draft apparatus is installed.

The assumption that chimney or natural draft costs nothing is quite fallacious, for not only is the capital outlay upon a chimney of 150 to 200 ft. high considerable, but its efficiency for producing draft depends upon the heat of the gases which pass up it. Thus to produce a suction equal to 1 in. on the water gage at the base of a chimney 150 ft. high, the temperature of the exit gases must be 600 deg. F., and below this limit the draft will fall off considerably. But with the exit gases at 600 deg. F., the heat lost will amount to between 17 and 33 per cent. of the fuel burned, according to the excess of air used for burning the fuel as measured by the CO_2 tests, the 33 per cent. loss corresponding to 6 per cent. CO_2 and the 17 per cent. loss to 12 per cent. CO_2 in the exit gases. The cost of chimney or natural draft with fuel at $2.50 per ton therefore varies from 43c. up to 83c. per ton of fuel consumed, over and above the interest and upkeep charges for the chimney.

Where new equipment is being installed, fan draft is in all cases the more economical and efficient; for not only can the fan be run at the speed best suited to the fuel being burned, but the draft can be altered according to the load on the boilers. With fans, also, the heat can be abstracted from the exit gases to the lowest possible limit without any fear of decreasing the draft, and the preheating of the air supply becomes a much more practicable and efficient proposition.

As regards the choice between the two systems of "forced" and "induced" draft, each method has its advantages, and the local conditions must be studied carefully in each case before deciding which to install. If the fan be placed behind the boilers at the foot of the chimney; that is, if the induced draft system be used, the heat losses by air leakage through the brickwork of the boilers and damper holes may be as high as with chimney draft, unless great care is taken to make the boiler and flue brickwork air-tight. For this reason, the "forced"-draft system is preferred by many engineers. In this case, if leakage occurs, the pressure is from within; and the smoke or flame that escapes from the crack calls attention to the loss at once.

As regards the draft required to burn ordinary lump coal or a well-screened slack, 0.33 in. on the water gage should be registered behind the bridge wall of the boiler furnace and 0.45 in. in the main flue behind the boiler, with either natural or induced draft. It is advisable to be able to increase these pulls to 0.50 and 0.70 in. respectively, when circumstances require it.

A fixed-draft gage, with the face dial marked in tenths of an inch, ought to be attached to every boiler furnace, so that the firemen may be able to judge of the pull on the furnaces and state of their fires without opening the furnace doors. Similar draft gages should also communicate with the main flues and the base of the chimney, in order that the engineer in charge may be kept informed as to the state of the draft on the whole steam-raising plant. With forced-draft apparatus the need for gages is just as urgent, but the places where they are installed must be altered to suit the system.

Advantages of the Fan-Draft

The following extract from a paper on "Fuel Economy," read by the writer in conjunction with W. H. Booth before the Institution of Electrical Engineers in London, summarizes the advantage of the fan-draft:

> Fan-draft must therefore be considered in the light of enabling an economy in chimney construction to be effected, and full use made of feed-heating apparatus. It is also useful as enabling boilers to be forced to rapid steam production, and presents itself as a safeguard against sudden load in lighting stations, and as a means of surmounting the load peak without excessive boiler plant. Fan-draft is thus useful as a means of reducing capital expenditure on chimneys and boilers, by promoting the rate of combustion of fuel at higher rates per unit of grate area. It enables the thickness of the fire to be regulated in better accordance with the fuel size and generally promotes elasticity. It is also useful in enabling the hot gases to be compelled to pass over all the heating surface, and baffles may be introduced that would otherwise be too great a hindrance. Its economy in other cases appears to demand the fullest practicable reduction of the calories in the exhaust gases by feed-water heaters, which in large stations may well be in two stages, and perhaps by air heaters for furnace supply.

The object of burning fuel under steam boilers is to produce "steam." The boiler itself, therefore, should be restricted as far as possible to this purpose, and

should not be used for purifying the water, or for preheating the water up to boiling temperature, both of which operations can be more efficiently carried out in other and specially designed forms of apparatus.

Fig. 1 shows, in the form of a diagram, the heat units absorbed in raising 1 lb. of solid steel and 1 lb.

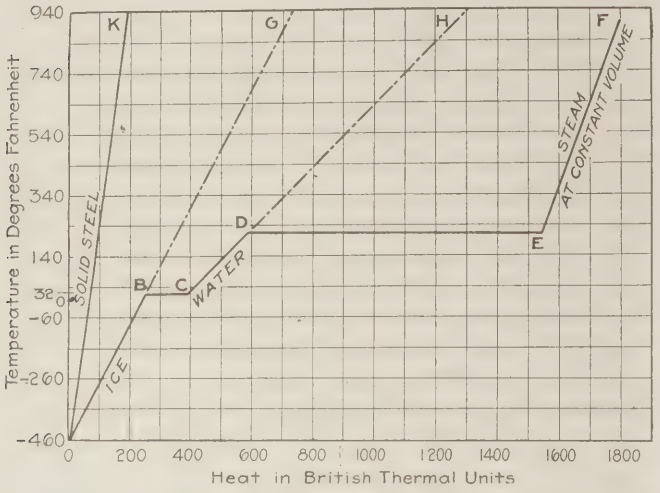

FIG. 1. DIAGRAM ILLUSTRATING HEAT TRANSFER TO WATER AND STEAM

of water respectively, from the absolute zero of temperature (—273 deg. C or —460 deg. F.) up to 940 deg. F. At 212 deg. F. a great absorption of heat occurs in the case of water, without any corresponding rise in temperature; and it is the great absorption of heat at this point which renders steam-raising different from many other processes of heat transfer. The vertical scale of the diagram represents the temperature in degrees Fahrenheit, while the horizontal scale represents the heat absorbed in British thermal units.

In the case of steel the heat absorption is indicated by a straight and continuous line (*AK*) and less than 200 heat units are required to raise the temperature from the absolute zero up to 940 deg. F. The heat absorption curve for water, on the other hand, shows that nearly as many heat units are required to raise it from the melting point of ice up to its boiling point (indicated by the line *CD*) and that at this temperature there is the disappearance of 966 heat units (indicated by the horizontal line *DE*) before any further increase in temperature occurs. These heat units in fact represent the energy required to convert the 1 lb. of water at 212 deg. F. into 1 lb. of steam at 212 deg. F., and are called the "latent heat" of steam.

From this point onward the temperature of the steam increases faster than that of the water for a given number of heat units, since 250 B.t.u. suffice to raise 1 lb. of steam from 212 deg. F. to 940 deg. F. (see line *EF* in diagram). The dotted lines *BG* and *DH* show the direction the heat absorption lines would have taken, had there been no internal molecular work required when the ice changed into water, and the water into steam, at the points *B* and *D* respectively, in the temperature curve of the diagram.

The lesson of this diagram is that 1300 B.t.u. are required to change 1 lb. of ice at 32 deg. F. into steam at 600 deg. F., or more than six times that required to raise 1 lb. of solid steel to the same temperature, and that had there been no change of state in the case of ice and water, this amount of heat would have produced a final temperature of over 2600 deg. F.

Conversely, the heat absorption of the water at this temperature, 212 deg. F., is exceptionally great, and the rate of the transfer of heat through the boiler plates is at its maximum.

In order to obtain the highest efficiency from steam boilers, therefore—that is, the greatest rate of heat transfer—the boilers should be fed with water at or near the boiling point, and the preliminary heating of this water should take place in accessory apparatus, such as feed-water heaters and economizers, using low temperature and other forms of waste heat which are inapplicable for steam-raising purposes.

Working under these conditions, with clean boiler plates, there is a wide margin for obtaining much higher evaporative results from steam boilers than are at present customary, without any loss of efficiency; since the danger of overheating the plates or tubes under these conditions of work is almost negligible.

The following extract from Bulletin 18 of the Bureau of Mines ("The Transmission of Heat Into Steam Boilers," by Henry Kreisinger and W. T. Ray) proves that this opinion is supported by the most advanced scientific workers on this subject in the United States:

> The results of the investigations described in this report indicate that the conductivity of the heating plates of steam boilers is so high that the present steaming capacities can be tripled or quadrupled by forcing over the heating surfaces three or four times the weight of gases now passed over them. With well-designed mechanical-draft apparatus this greater weight of gases can be forced through the boilers at a small operating cost. It is possible to increase the capacity of many of the present boilers in this way without reducing their efficiency much; in fact, by a proper arrangement of the heating surfaces the efficiency can be made higher than the present rating. The efficiency of any boiler can be increased by arranging its heating surfaces in series with respect to the path of hot gases. New boilers of high efficiency can be constructed by making the cross-section of the gas passages small, in comparison with the length.

Finally, the steam produced by the boiler should be superheated, in order to minimize the heat losses due to radiation during its passage through the steam pipes to the point where it is used, and also to insure that dry steam arrives in the engine cylinder or turbine drum, rather than a kind of Scotch mist, which too often has to do duty for steam in colliery plants.

Limits of space in this article will not permit the various types of feed-water heaters and economizers or superheaters to be discussed; but no up-to-date steam-raising plant can afford to be without these essential accessories to economical steam production, and at some later date I hope to return to this subject and deal with it more fully.

To summarize, however, what has been said; the production of steam from water should be carried out in several stages, beginning with the raising of the temperature of the purified feed water to 100 deg. F. by aid of exhaust steam. This warm water is then passed through one or more series of economizer tubes worked on the counter-current principle, and heated by the waste gases from the boiler. If still below the boiler temperature, the last degrees of heat are added, either by the use of live steam or by passing the feed water through the control apparatus which protects the superheaters from the direct heat of the furnace. The water

then enters the boiler at the critical temperature, and is at once ready for the absorption of the latent heat which converts it into steam.

The waste gases passing away from the boiler plant carry with them a large proportion (from one-fourth to one-third) of the heat of the original fuel, and if high efficiencies are to be attained for the whole power plant, it is imperative that the heat losses with these gases should be reduced to a minimum.

This reduction can be attained in three directions: (1) By cutting down the volume of the waste gases—that is, by working with a minimum excess of air. (2) By reducing the temperature of the gases by a skillful use of economizers and other forms of low-temperature heat-abstraction apparatus. (3) By substituting artificial for natural draft, and thus obviating the necessity of passing hot gases into the chimney shaft.

As regards the total amount of the heat losses through the exhaust steam and waste gases in a modern power plant, Fig. 2 is a diagram showing the whole of these losses. The large proportion of the heat which passes away in the waste gases and in the exhaust steam is at once apparent. In the case illustrated in Fig. 2, only 14.4 per cent. of the original heat value of the fuel is represented in the effective horsepower of the engines, over 80 per cent. of the heat energy of the fuel having been lost with the waste gases from the boilers and with the exhaust steam. As already stated, the heat of the exhaust steam can be most satisfactorily recovered by using it for the preliminary heating of the feed water for the boilers, and with a

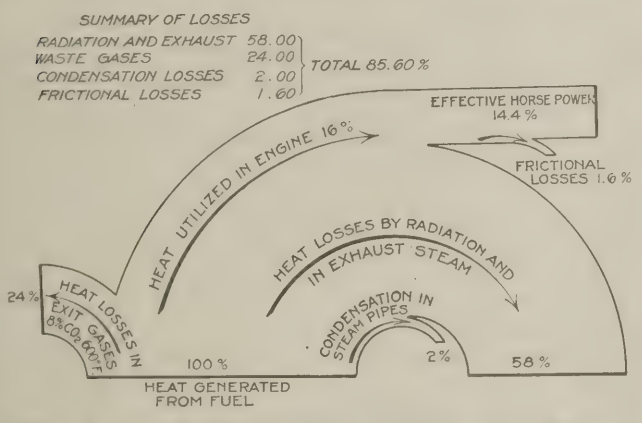

FIG. 2. HEAT EFFICIENCY DIAGRAM FOR STEAM BOILER AND ENGINE

well-planned and managed apparatus over 90 per cent. of this heat can be reclaimed.

The problem of the recovery of the heat of the waste gases is not so simple, since it is not possible, owing to the impurities which they carry, to abstract their heat by direct contact with the water intended for the feed. The usual plan is to abstract the heat by the aid of economizers—that is, a series of pipes placed in a special chamber at the rear of the boilers, through which the gases pass on their way to the chimney. As usually operated, the economizer system is capable of much improvement. Not only is the counter-current system of operating the flow of water and hot gases usually ignored, but the economizer tubes are not kept sufficiently clean, either outside or inside, to yield their highest efficiency. The number of tubes also is never sufficiently great to abstract all the heat of the gases, for the temperature at which the gases are allowed to escape to the chimney is usually between 550 and 650 deg. F., whereas with better equipment and management this might be reduced to 250 deg. F. Below this point the moisture contained in the gases would condense on the economizer pipes and would cause trouble owing to its acid constituents. But in time it is possible that even this difficulty will be surmounted, and that the whole of the heat contained in the exit gases from the boilers may be utilized.

Table I shows how rapidly the heat losses in the waste gases increase with their dilution, for while at

TABLE I. PERCENTAGES OF FUEL WASTED BY HEAT CARRIED AWAY BY EXIT GASES, AT VARIOUS TEMPERATURES AND PERCENTAGES OF CO_2

	Percentages of CO_2					
Temperature, Deg. F.	4%	6%	8%	10%	12%	14%
400	32.4	21.8	16.4	13.4	11.4	9.8
500	40.5	27.3	20.8	16.8	14.2	12.3
600	48.6	32.8	24.9	20.2	17.1	14.8

Adapted from "Smoke Prevention and Fuel Economy," by Booth and Kershaw.

12 per cent. CO_2 and 600 deg. F. the loss is 17.1 per cent., at 8 per cent. CO_2 and the same temperature the loss is 25 per cent.; and at 5 per cent. CO_2, 39.3 per cent. of the total fuel used is lost.

Turning now to the consideration of the customary methods of controlling the heat losses of the waste gases, temperature and chemical tests ought to be carried out regularly by the engineer or chemist in charge of the steam-raising plant. Even when automatic apparatus has been installed, it is still necessary to put a thoroughly skilled and well-qualified man in charge if the best results are to be obtained.

Limits of space will not allow a description in this article of the various forms of apparatus now on the market in the United States for checking and controlling boiler-house work, but a few general hints may be given upon their methods of use.

The temperature of the waste gases ought to be noted and recorded at frequent intervals—(1) at the exit from each boiler into the main flue, (2) at the inlet and exit of the economizers and (3) at the base of the chimney. Permanent and fixed thermometers may be placed at these points, or holes may be provided with 30-in. lengths of 1¾-in. wrought-iron pipe, the flanged top of which is kept closed with a tight-fitting wooden plug when it is not being used for making a test. Mercury thermometers filled with nitrogen are reliable for temperatures up to 1000 deg. F., but they must be mounted in a suitable carrier and must be left in the path of the flue gases long enough to attain the gas temperature—that is, 5 or 10 min., according to the thickness of the metal case surrounding the thermometer bulb.

The only point where the temperature of the gases may exceed the limit named above, as measurable by a mercury thermometer, is at the exit from each boiler into the main flue. But if the temperature here registers over 900 deg. F., it means that the boiler is dirty and badly scaled, and the sooner it is put out of use the better for the efficiency of the plant. The following are the temperatures which should be maintained in a well-managed plant: Temperature at exit from boilers into main flue, 650 deg. F.; temperature at exit from economizers, 350 deg. F.; temperature at base of chimney, 300 deg. F.

As already stated, with forced or induced draft the temperature of the gases that issue from the economizers may be reduced to the point at which condensation of the moisture commences to occur.

As regards the chemical tests which are necessary to determine the excess air and air-leakage of the boilers, it is obvious that only when these are made regularly and the records are studied by some competent person, can exact knowledge be obtained of the efficiency or otherwise of the firemen and furnaces. The waste gases contain carbon dioxide, moisture, nitrogen and unconsumed oxygen as regular constituents; and the percentages of carbon dioxide and oxygen respectively are the figures which enable one to say with what excess of air the combustion process is being maintained.

Excess of Air Necessary for Good Combustion

If it were possible to obtain good combustion of bituminous coal with the theoretical amount of air, the exit gases would contain 19½ to 19 per cent. of CO_2 and no free oxygen, and 12 lb. of dry air would be required to burn 1 lb. of coal. Since it is impossible to obtain good combustion of solid fuel with only the theoretical amount of air passing through the furnace, an excess of air is necessary, but the amount of this excess should not exceed 50 to 75 per cent. (corresponding to 12.6 and 10.9 per cent. of CO_2 respectively).

Tests showing percentages of CO_2 below the latter figure indicate that much more air is being passed through the furnaces than is required, and since all this air has to be raised to the combustion temperature, say 2500 deg. F., and carries off some portion of heat to the chimney, it is evident that the smaller the excess supply may be kept the better.

A CO_2 test showing 10 to 13 per cent. is therefore the best for obtaining high efficiency from the boilers. Above 13 per cent. of CO_2 there is grave danger of allowing carbon monoxide and hydrocarbon gases to escape unconsumed with the exit gases, and it is unwise to attempt to reduce the excess of air below the 50 per cent. margin represented by 12.9 per cent. CO_2. Where attempts are being made, however, to reach a still higher efficiency, it is necessary to test the exit gases regularly for carbon monoxide and for methane, as well as for carbon dioxide and oxygen, and this demands a more complicated form of gas-testing apparatus.

Composition of Exit Gases

In a future article I hope to return to this subject, and to give a full description of the gas-testing apparatus and methods of control best adapted for colliery use. Here, I can only indicate one short-cut method of arriving roughly at the composition of the exit gases.

Air contains 79 per cent. nitrogen and 20.8 per cent. oxygen, by volume. When burning a bituminous fuel of average quality, yielding 35 per cent. volatile matter on heating, about 1.8 per cent. of the oxygen of the air will be required to complete the combustion of the hydrogen contained in the coal, and therefore the air that remains will contain only 19 per cent. of free oxygen.

The tests for carbon dioxide and for oxygen when added together ought therefore to total 19 per cent.; and if there is a continued deficiency in the tests when dealt with in this manner, it indicates that carbon monoxide or hydrocarbon gases are also present in the exit gases. When burning coke or anthracite fuels which contain only a small percentage of hydrogen and volatile hydrocarbons, this disappearance of oxygen does not occur. The CO_2 and oxygen tests of the waste gases, in such cases, when added together should equal the original oxygen content of the air, namely 20.8 per cent.

In concluding this series of articles upon heat economy in coal-mining power plants, I must once again emphasize the fact that scientific management and control are necessary to obtain the highest efficiencies from steam boilers. It is useless to install complicated automatic apparatus in the boiler house, unless one is willing to provide skilled and properly trained men to take charge of it. In support of the view that there is plenty of work in the boiler house for the chemical engineer, the following extracts from a recent article by Joseph G. Worker, which were printed in an American journal,[1] may be quoted:

> Mechanical stoker equipment is not, and never can be, a substitute for intelligence and good judgment, and there are just as good reasons for intelligence in handling stoker-fired plants as in hand-fired plants. . . .
>
> A few years ago, a large plant in Chicago was using 7½ lb. of coal per kilowatt-hour, and at present it is using 2⅞ lb. of coal per kilowatt-hour, with the same kind of fuel. In 14 years this engineering progress in turbine, boiler and stoker equipment and methods of operation has been equivalent to a saving in one year of approximately 2½ million tons, or 58,000 carloads of coal. . . .
>
> When the statement is made, therefore, that the savings in a power-station must be made in the boiler room, this refers to operation and management and not to the design of the equipment used.
>
> Conditions in boiler-plants show that the operators must be trained in the combustion of fuel. The operation of boilers and stokers must be approached along more scientific lines. It is only necessary to examine the conditions of the plants in this country where coal is fired, in order to realize what is needed and how much it is needed. . . .
>
> Suitable instruments should be used for furnace operation, but with their installation should go training in their use. Too many instruments are now installed and inoperative, because the men in the boiler room have shown no real grasp of the subject of fuel combustion, nor do they know how to use the information indicated by them.

In Lighter Vein

Familiar Trait of the Mining Mule

W. B. Goldsmith, who is chief engineer of the South East Coal Co.'s plant at Seco, Ky., vouches for the truth of the following story. He relates that in the mines of the company there was a "balky," slow-going mule that the driver always put in front of an animal that moved along at a thoroughly satisfactory pace. On occasions when it became necessary to "back," says Mr. Goldsmith, this second mule would invariably grab the "balky" slow-going one with his teeth and pull him back, a feat which sometimes required the animal's whole energy and strength. The whole working force of the company are proud of the mule and would not part with him at any price.

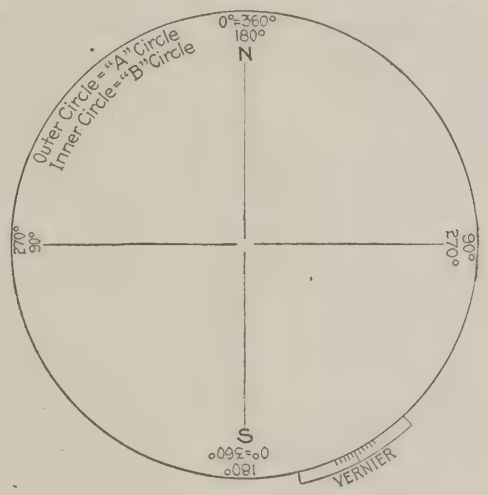
Deflection Angles and Azimuth

By MINING ENGINEER
Scottdale, Penn.

HAVING visited the engineering departments of many small coal-mining companies, I was surprised to find that more than 75 per cent. of them were using the system of deflection angles in their surveys instead of the continuous vernier or azimuth. I will admit that deflection angles are more suitable for city engineering and railroad work, but for surveys in connection with mining engineering such as stream and outcrop location, topography and the establishment of the hundreds of stations on which the mine maps are based, it cannot help but be evident to anyone acquainted with the azimuth system that deflection angles are not nearly so efficient as azimuth.

I inquired at every office as to why they preferred to use deflection angles and was given the following two reasons: First, the astonishing fact that they were not familiar with azimuth and did not know its advantages; second, that those acquainted with azimuth and who realized its usefulness were afraid of changing their system for fear of causing confusion in their records.

In this article I will try to show just how much work such a change will involve, and also give a comparison of the two systems, azimuth and deflection angles. In using the azimuth system, it is necessary to have a transit graduated as in the accompanying sketch; all angles are to be measured to the right of zero, which should be north. At each set-up the transit circle is clamped in such a position that zero on it points to north and each reading of the vernier reads an azimuth angle measured to the right of zero, or north. Therefore, an angle of 40 deg. equals N 40 deg. E; 80 deg. equals N 80 deg. E; 170 deg. equals S 10 deg. E; 190 deg. equals S 10 deg. W, and the azimuth is recorded in the notebook.



In making a survey the transit is leveled up, and when the backsight has been taken, zero on the instrument must always point to north; this is accomplished (the old notes showing the stations already established) in the following manner:

Station	Azimuth	Vert. Angle	Distance
149–150	86 deg.	0 deg. 00 min.	258.7

Stationed on 150, and before backsighting on 149, set the vernier on 86 deg. (the old azimuth from 149-150) + 180 deg. on account of looking in an opposite direction from what the old notes record; or another way is to set on 86 deg. on the *A* circle and when foresighting read the *B* circle, so that after the backsight has been taken, it is evident that zero on the transit circle is pointing to north, and any angle read to the right of zero will be the azimuth to the point being located. The azimuth for dozens of shots can be read because the transit circle is clamped in a position that makes zero point to north, and when changing the sight from one object to another the transit plate does not move from the position in which it is clamped, only the vernier moves.

When notes are sent in to the office the course is plotted with ease, as it can be seen by inspection that the course corresponds to the azimuth. There is absolutely no calculation necessary to plot the courses, which is certainly not the case with deflection angles. When the transitman makes a tie between two surveys he can compare his new azimuth with the old azimuth and see at a glance the closeness of the tie, without tracing back a lot of angles and then wondering if he has made an error in adding or subtracting.

In many mines headings are driven on a general course, but a heading is not always driven exactly on that line, and the survey will frequently vary from the projected course. If a line has been run up the haulage heading with deflection angles and the same method is used in the air-course or parallel heading, it is a job requiring accurate though not difficult figuring to know if the headings are driven parallel or not; and I can vouch right now that mistakes are plentiful. Whereas, if the survey is run on azimuth, the transit does all

HOW THE TRANSIT SHOULD BE GRADUATED

the figuring; and if the last azimuth in the haulage heading was 69 deg. and in the air course 69 deg., it is evident at once that the headings are parallel; and it is also evident that the course is north 69 deg. east in case the course is desired.

A good example of the roundabout calculations used in deflection angle work is given in the following illustration: The draftsman, in projecting some new work, decides that a new heading should be driven from a certain point to another fixed point; he takes the coördinate values and figures a course; in setting the sights, the transitman figures the deflection angle he must turn from the course; and finally in plotting the transit notes, the draftsman figures the course on which to plot the notes from the deflection turned by the transitman. The draftsman knew the course originally, and yet before he finally plots the notes it is necessary for both transitman and draftsman to transpose from course to deflection angle and vice versa; and I cannot see the necessity or advantage of a different system for the office than for the field work, and certainly most all office work is expressed in terms of courses. With the azimuth system, only one calculation is necessary to transpose from azimuth to course, and that calculation

is so simple an addition or subtraction that it is usually done mentally and can hardly be called a calculation.

In regard to changing the system, I think it safest to start in with some surface surveying, as it is much easier to break in a transitman to a new system if he is unhampered by the difficulties met with in underground work. For a short time continue to run surveys with deflections, but in addition, after having noted the deflection to the foresight, take a new backsight with the vernier set on the azimuth to that point, and then after sighting on the foresight read the azimuth to that point also. This will give the transitman a clearer understanding of azimuth than any written description will do.

After the transitman has a thorough understanding of the system, pick out some circuits that make close angle ties and write the azimuth from station to station in the notebooks. This can be done without disturbing the old notes in any manner, and if a dozen circuits are prepared in this manner in the different sections of the mine and on the surface, it becomes merely a matter of time until the whole field is in the same shape. The change in system will have been so gradual that I am sure there will be no confusion of records; and I am equally sure the results will be worth the effort.

The Storage Battery

By Electrical Engineer

Storage batteries are sometimes called secondary batteries. This is a term used to identify them from the ordinary type, which is called a primary battery. A secondary battery is one that is used as an accumulator or container wherein to store up electricity; it has to be charged with electric current before it is of any use. A primary battery is one that makes and delivers its own current, by the action of chemicals on plates of metal or other substances.

In the making and operating of the lead-acid type of storage battery, the positive plates are made of red lead mixed into a paste with sulphuric acid and pressed into lead grids, or frames. The negative plates are made up of metallic lead ground into a powder and mixed into a paste with sulphuric acid, and then pressed into a similar frame. The plates are then assembled into batteries, using wood and rubber separators to keep them insulated from each other. The battery is then filled with sulphuric acid and allowed to stand for 10 or 12 hours before being placed on charge. This gives a chance for all the sulphate in the acid to be absorbed by the plates, and if a hydrometer reading of the electrolyte were taken at this time, it would indicate water.

The batteries are then put on charge, one terminal being connected to the + or positive group, the other to the — or negative. The current is run through the battery, relying on the water or acid for a conductor to complete the circuit. As the current flows through the sulphate gradually comes out of the plates into the water, converting it into sulphuric acid. A battery is never fully charged until all the acid has been removed from the plates.

When the battery is put into use, a reverse action takes place, the sulphate leaving the water and going back into the plates until the battery is fully discharged.

A storage battery must be charged with direct current; never use alternating current for this purpose, as it will ruin the battery. If alternating current only is available, it will be necessary to provide apparatus for converting it into direct current. Several forms of apparatus are on the market for this purpose, either motor generators or rectifiers. Always connect the positive terminal of the battery to the positive wire of the charging current and the negative battery terminal to the negative wire of the circuit.

The charging rate of a storage battery varies with the different types. A current in excess of the regular rate, or too long a charge, will cause the plates to buckle and the cells to sulphate. It is important that a lead-acid type of battery have the best of care and attention. A battery charge is usually complete when, with charging current flowing at the normal rate, all cells are gassing (bubbling) freely and evenly, and the specific gravity and voltage of all cells have reached a maximum—that is, have shown no further rise during a period of 5 hours.

Once every week, or as often as may be found necessary, remove the filling plugs from the cells and add pure water until the level of the electrolyte rises to the proper height. It is necessary at all times to keep the plates and separators covered with electrolyte; water should be added to the cells before or during the early stages of a charge, as the electrolyte will then become mixed by the gassing, so that correct hydrometer readings can be taken and any danger from freezing in cold weather is avoided, as thoroughly mixed electrolyte will not freeze solid.

Seldom Necessary to Add Electrolyte

As only water evaporates from the electrolyte, there being no loss of acid, it is never necessary during normal service to add acid or electrolyte to a battery. If, however, a battery is upset and acid spilled, or if a jar is cracked and electrolyte leaks out, it should be replaced with electrolyte of the proper specific gravity. Positive plates in all types of batteries are usually dark brown in color; negative plates are usually gray in color. Separators usually consist of specially treated flat wooden veneers which are placed between adjacent plates of the element.

The fluid, or solution, in the cells, called the "electrolyte," is a mixture of pure sulphuric acid (oil of vitriol) of approximately 1.84 specific gravity and pure water. The specific gravity of the electrolyte in the average battery when fully charged should be between 1.250 and 1.280 at a temperature of approximately 70 deg. F. Decreasing specific gravity throughout the battery (when not due to insufficient charging) indicates that sediment is accumulating in the bottom of the jars. An inspection should be made when the specific gravity of the fully charged battery remains low.

Change in temperature of electrolyte affects the specific gravity, and where the change is considerable it should be allowed for when taking readings, as follows: For each 3 deg. in temperature above 70 deg. F. add one point to the hydrometer reading, and for each 3 deg. of temperature below 70 deg. F., subtract one point. Acid is usually furnished of 1.835 or 1.84

specific gravity, and may be broken down to a lower gravity by mixing with pure water. When mixing, always pour the acid into the water; and if it becomes warm allow it to cool before using.

The ampere-hour capacity of a battery, the cells of which are connected in one series, is the same as that of a single cell in the series. The ampere capacity of a cell depends upon the number of plates of a given type. The ampere-hour capacity of a plate depends upon the amount of available active material it contains.

Since acid and lead combine with each other in a definite proportion in producing current, it might seem possible to have acid and lead in a cell in such quantities that both would be completely exhausted. Toward the end of the discharge, however, the electrolyte would be so weak that it would not be capable of producing current at a sufficient rate for any practical purpose. For this reason, it is necessary to have electrolyte acid in excess of the amount actually used in the plates during discharge. Similarly, if all the active material were combined with acid, the plates would lose their porosity and conductivity, and an excess of active lead material is likewise provided. It is customary to make both outside plates in a cell negative. The cell contains, therefore, an odd number of plates and the capacity is fixed by the number of positives.

Batteries Should Be Carefully Charged

Since the current is produced by the action of sulphuric acid on the lead in the plates, the rate at which the acid can get to this material determines the maximum rate at which current can be produced. During any discharge of a battery, there is being formed sulphate of lead, without which there would be no production of current. If, however, charging is neglected, the sulphate reaches a condition which tends to fill the pores of the plates and make the active material dense and hard. It is this condition which is ordinarily referred to as "sulphated." The cause of this condition is some form of abuse, such as standing discharged for some length of time, habitual undercharging, neglecting evidence of trouble in individual cells, replacing evaporation with electrolyte, thereby restoring specific gravity by adding acid to the cell instead of bringing it out of the plates by proper charging. The lead sulphate formed in a normal discharge of a battery is in a form in which it absorbs the charge readily.

When a battery is sulphated, the sulphate is in a condition to absorb the charge with difficulty and the ordinary charge is insufficient. Continued and persistent charging at a low rate will restore any condition of sulphate, the time being in proportion to the degree to which the condition has been allowed to extend. It is a question of time; since a high rate will only produce gassing and high temperature, the low rate is all that a battery in this condition is capable of using.

A battery is sulphated only when acid is tied up in the plates. When the specific gravity of the electrolyte has reached a maximum, it shows that there is no more sulphate to be acted upon, since during charging the electrolyte receives acid from no other source. Hydrometer readings should therefore be taken at regular intervals during charging to determine if the specific gravity is rising or if it has reached its maximum. The charging should be continued until there has been no further rise in any cell during a period of 12 hours. The active material of sulphated negative plates is generally of light color, and either hard and dense or granular and gritty and easily disintegrated. It is the negative plates which require the prolonged charge necessary to restore a sulphated battery. Sulphated positives, unless physically disintegrated or badly buckled, are but little changed in general appearance and can be restored to operative condition, although their life will not be as great as if they had not been subjected to this abuse.

Sulphated plates should be handled as little as possible. Mining is rough, hard work, and mining apparatus must be exceptionally strong and rugged to stand the strain. Especially is this true of the storage batteries.

The Edison nickel-iron-alkaline storage battery consists of a combination of iron and nickel elements in a nonacid electrolyte. The characteristics of this battery are different from those of the lead-acid type. The elements—nickel hydrate and iron oxide—in an alkaline solution, are contained in a nickel-plated steel container. The gases evolved from this cell on charging do not carry with them any noxious fumes. No injury is done this cell by an overcharge nor if it is accidentally charged backward. It must be charged in the proper direction, however, to render service. Specific gravity readings on the electrolyte are not necessary. Many of the troubles encountered with the lead-acid type of battery are eliminated in the Edison battery. If the electrolyte is emptied out and replaced with new every nine or ten months, satisfactory operation may be anticipated.

Ventilate the battery room or compartment and never bring a flame or spark near the battery when charging. Always be careful, orderly and clean; never undercharge the batteries or try to hurry up the charge by an excess of current. Give the batteries proper and careful attention, and the reward will be satisfactory service and long life.

Lake Coal Receipts at Milwaukee

The following figures show the coal movement to Milwaukee by Lake during 1917 compared with that of the previous year:

Month	Anthracite		Bituminous	
	1917 Tons	1916 Tons	1917 Tons	1916 Tons
January	3,861	10,636	26,037	16,052
February	8,992	24,814	18,847	21,027
March	11,369	24,550	19,394	21,094
April	32,134	74,946	148,753	184,348
May	63,553	78,115	372,463	610,617
June	87,273	70,278	386,510	480,685
July	106,817	138,678	507,671	539,462
August	150,938	157,684	462,156	669,077
September	135,571	71,669	392,660	476,983
October	190,847	90,386	427,101	408,722
November	149,586	132,621	301,736	284,119
December	38,935	71,178	131,978	288,698
Total	979,876	945,555	3,195,306	4,000,884

These figures are from the books of the custom house and include coal which arrived on carferries from across Lake Michigan. This accounts for the winter receipts by lake. Carferry receipts should logically be classed as rail receipts. About 10 per cent. of their volume remains in Milwaukee. The rest goes through to the interior. In 1916, carferries brought 97,256 tons of hard coal and 262,568 of soft coal. Last year the record shows 64,047 tons of hard and 174,144 tons of soft coal.

Coal—Its Origin and Composition

By H. B. MILLER
Pittsburgh, Penn.

SYNOPSIS—*This article answers the oft-repeated questions: What is coal? How was it formed? How is the presence of partings, binders, sulphur, etc., accounted for? The various stages in the formation of coal from vegetable matter to its present form, and the conditions favoring development, are noted. The "earmarks" of coal beds are explained; the substances composing coal analyzed. The heat units spoken of in connection with coal are defined; and the method of determining the calorific or heating value of coal enlarged upon.*

IT IS generally conceded by geologists that coals of the various beds represent in varying stages of preservation accumulations of vegetable matter, also a small proportion of the remains of animal life; and that coal is transformed peat, which formation took place from plant remains in vast lowland or coastal swamps and deltas, and on a nearly horizontal surface at or near sea or lake level. During this formation there was an abundance and luxuriance of the vegetation, such as fern-like plants, numerous climbing ferns, as well as the number and size of lepidophytes and calamites.

The characteristics of climates during the coal-forming period were mildness of temperature, and in most cases tropical or subtropical; also during this time there was a uniformity of climatic conditions, high humidity and abundance of rainfall. This accounts for the great luxuriance in growth of plants and their much greater annual contributions of refuse delivered over the peat-forming area.

Length of Time to Form One Foot of Peat

As to the amount of peat growth per year, it differs according to opinion. It can be assumed, however, that 1 ft. of peat can be formed under a bog in 10 years, which would be known as surface peat; but this would be further reduced when compacting would take place and under bacterial action furthering the decomposition of the underlying peat. So it is figured that the rate of formation is 1 ft. per century at a depth of about 18 ft., and that it takes 3 ft. of well-compacted old peat deeply buried to produce 1 ft. of bituminous coal having the character of the Pittsburgh bed of Pennsylvania, or 300 years to produce 1 ft. of coal, or 1800 years for 6 feet.

The formation of a thick bed of coal is therefore seen to indicate in general the maintenance for a long period of an approximate balance between the rate of peat accumulations and the rise of the water, so as to maintain a depth of water favorable for the growth of the vegetation and its preservation as peat.

The transformation of fresh vegetable matter into coal was accomplished by two different processes known as the "biochemical" and "dynamochemical." During the biochemical process, under somewhat varying and yet restricted conditions attending the formation of peat, the accumulating vegetable matter became more or less disintegrated or decomposed and reduced, and many of the organic chemical compounds of the original material were more or less broken down and changed in ways controlled by those conditions. Therefore, the residual product of the biochemical process was a peat, or its equivalent, according to its process or advanced stage.

The dynamochemical process covered the chemical and physical alterations of the coal-forming matter (peat) induced and controlled by geodynamic influences. The first physical expression is seen in the densification of the peat under the load of superincumbent strata, and in consolidation of the residual substances. In this way the fuel mass, much reduced in volume, assumed its more typical geologic relation as a stratified mineral sediment or bed of coal. The various grades of coal, such as anthracite, bituminous, sub-bituminous, cannel coal and lignite were thus formed, according to the conditions and various stages passed through.

The Interval between Coal Beds

The interval between coal beds and existing stratigraphy of the present day was caused by subsidence and the deposition of varying thickness as of other materials, such as clays, sands and calcareous muds, which became solidified, thus giving the rock and shale stratas. Following this there was a slight uplift of the region and consequent withdrawal of most of the water, so that the level of the subaqueous deposits was so near to the surface of the water cover as again to favor swamp conditions and the formation of another bed of coal. Therefore, coal has been derived from plant life, or rather its most resistant components which make up its residue, of which resin, resin waxes, waxes, and higher fats, or the derivatives of the compounds composing these, are the most important.

The presence of binder in coal is due to the variations of water level that took place attending its formation; the withdrawals of the water cover were temporary irregular reductions, seasonal or perhaps less frequent. These periods of reduction and evaporation appear generally to have been attended by concentration of the hydrocarbon solutes resulting from the putrefaction process in the form of paste, which now constitutes the jet-like "binder" of the coal, or its sheeting by fragments of "mineral charcoal" ("mother of coal").

As coal was formed at or nearly sea or lake level, it is indicated that the sea did probably in some cases break over the coal—formation swamp at times—and caused an intercolation of overwashed muds, silts or sands, which later became solidified, forming partings such as slate or rock bands.

The substances usually considered in the composition of coal are moisture, or water, volatile combustible matter, fixed carbon, sulphur and ash. The amount of moisture in coal is variable and depends upon its nature and physical condition. However, as a constituent it has no value and is dug, handled, hauled and expelled

at the cost of fuel. Every per cent. of moisture present, means 20 lb. less fuel for each ton of coal.

Volatile combustible matter is that portion which may be driven off in a gaseous state by heat and is an important constituent in determining the quality of coal. The variance of the per cent. of volatile matter in coal is due to the work of the dynamochemical process during its formation or the transformation of the fuel from the peat stage, or primary rank of coal, to the more advanced ranks of coal—that is, the progressive reduction of the volatile matter of the fuel, or the "devolatilization" or "carbonization" of the coal, caused by pressure, thrust, expulsion of water, escape of gases, and additional changes in the chemical constituents. Volatile matter consists principally of water in the coal plus a portion of the sulphur combined (say, about one-half the total sulphur in the coal), plus the nitrogen and hydrocarbons of unknown and varying compositions. Nitrogen and combined water in the volatile matter have no heating value. If present in large amounts, the heating value of the combustible will be correspondingly lower.

Fixed carbon is usually the principal combustible of coal, and as its name indicates is mostly carbon, derived from plant life and one of the organic compound elements that go to make up coal. With an increase of fixed carbon there is a decrease in volatile matter, and vice versa.

The presence of sulphur in coal can be attributed to the submergence of the coal-forming peat deposits during the early stages of coal formation, and the immediate occupation of the area by animal life and the action of sulphur bacteria. In some basins the high sulphur content is caused from the erosion that occurred of some of the richly sulphide-bearing rocks in the drainage of the basin. In some cases it also has been caused by secondary enrichment, the sulphur being brought probably as sulphates from overlying strata and anticlines, and deposited as sulphides in the basin by the decomposing agency of circulating ground waters.

Some Data on Sulphur in Coal

Sulphur usually occurs in coal in the form of iron pyrite (FeS_2) and is present either in scattered masses or partings, and sometimes in such a finely divided form that the separate particles are too small to be recognized. When sulphur is combined with carbon, or carbon and hydrogen, it is known as "organic" sulphur. Sometimes sulphur occurs in coal in the form of free sulphur, but the relative amount of this is small. Sulphur when burned will develop heat and is not an inert substance, like moisture and ash; but its occurrence in coal as pyrite, as is usual, is objectionable on account of its forming clinkers and having corrosive features. Sulphur in coal cannot be removed by washing if its presence is organic, but it can be removed to a fair extent if its presence is in flakes or lumps of appreciable size, providing the coal is crushed sufficiently to allow the separation of a large part of the pyrite from the surrounding coal.

It has been conceded that beds of coal represent accumulations of vegetable matter in varying stages of preservation and as a rule but a very small proportion of the remains of animal life. Mingled with the organic substances are different inorganic mineral sediments, which, together with the mineral matter originally contained in the plants themselves, constitute the "ash" of coal. The high ash content of a coal may be due to the precipitation of colloids by the overflow of alkaline waters and the deposition of silica in the organic mass of the coal.

The term "ash" as ordinarily used means the mineral residue left after complete combustion or burning of the coal. It is an inert constituent which means 20 lb. of weight to be handled and 20 lb. loss per ton of coal for each per cent. present. The color of the ash gives an idea of the amount of iron contained in the fuel. In a proximate analysis of coal the moisture, volatile matter, fixed carbon and ash should total 100 per cent.

The Calorific or Heating Value of Coal

The most accurate method of determining the total heating value of coal is by direct determination in the bomb calorimeter (dry basis). A calorie is the quantity of heat required to raise the temperature of one kilogram of water 1 deg. C. at or about 4 deg. C. A pound-calorie is the quantity of heat necessary to raise the temperature of 1 lb. of water 1 deg. C.

A British thermal unit (B.t.u.) is the quantity of heat required to raise the temperature of 1 lb. of water 1 deg. F. at or near the temperature of maximum density, 39.1 deg. F., or the amount of heat required to raise the temperature of 1 lb. of water from 63 to 64 deg. F.

The amount of heat obtained in the burning of 1 lb. of coal under theoretically perfect conditions is called the B.t.u. of the coal. Each heat unit represents 778 foot-pounds of energy, the mechanical equivalent of one unit.

$$1\ B.t.u. = 0.252\ calorie$$

$$1\ pound\text{-}calorie = \tfrac{9}{5}\ B.t.u. = 0.4536\ calorie$$

Before the bomb calorimeter came into use the heating value of coal was frequently calculated from the ultimate analysis by either of Dulong's formulas following:

Calorific value in pound-calories per pound:

$$8080C + 34{,}460\left(H - \frac{O}{8}\right) + 2250S \qquad (1)$$

Calorific value in B.t.u. per pound:

$$14{,}544C + 62{,}028\left(H - \frac{O}{8}\right) + 4050S \qquad (2)$$

The agreement between the calorific values calculated by Dulong's formula and those determined by the calorimeter are fairly close, with a probable error not exceeding 2 per cent. by Dulong's formula.

The combustion of the heat-producing constituents of coal yield essentially the heat produced by the oxidation of the carbon plus the heat produced by the oxidation of the hydrogen not combined with oxygen, plus the oxidation of unoxidized forms of sulphur and iron.

The fusibility of the ash is dependent upon the chemical and physical condition of the minerals present. When sulphur is present as pyrite it may produce, by being united with other constituents of the ash, a fusible compound or clinker. Generally the most readily fusible mixtures are those approximating a uni-silicate. Some silicates up to a tri-silicate composition are fusible at temperatures between 1000 and 1200 deg. C. (1800 to 2200 deg. F.). Ash from coals high in pyrite is necessarily high in iron, and the ratio between the

bases and silica is often such that easily fusible compounds may be formed.

Phosphorus occurs in coal and rocks of various kinds and ages. Its name is derived from the Greek words *phos*, "light," and *phoros*, "bearing." Its presence like sulphur in coal, in large amount, makes a coal of that kind objectionable for the manufacture of iron and for metallurgical purposes generally.

In conclusion, from the foregoing it can be judged that coal has originated from plants of various kinds ranging all the way from algae and fungi to large trees (and a very small proportion of animal life) which finally took the form of peat under the biochemical agencies during the peat stages and then underwent the action of the dynamochemical agencies during the coal stages. Coal is therefore considered transformed peat.

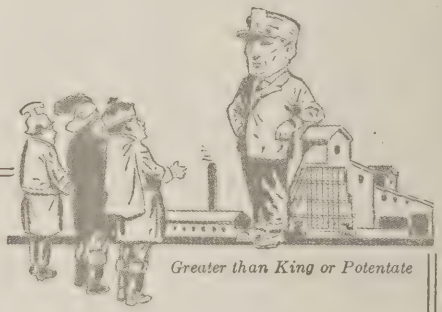
The proportion of the products of the composition of coal has already been described and accounted for, but it can be stated that the analysis of a coal does not necessarily determine its value or the use to which it can be put. However, by comparison of various analyses certain standards may be adopted showing in a general way for what purpose it is best suited.

EXAMPLES OF THE VALUE of anthracite lands in the early days may be of interest. In 1792 large areas of land were leased to the Lehigh Coal Mine Co. for two ears of corn a year. The State of Pennsylvania patented between 1795 and 1816 large areas for $2 to $4 an acre. In the period 1840-60 as much as $50 was received for this coal land, and in the late '70s the value had risen to $500 an acre, while at the present time $3000 an acre for virgin coal land is not dear.

Coal Exports from New York

During the year 1917 there was exported from the Port of New York 134,253 tons of anthracite coal, 14,348 tons of bituminous and 21,908 tons of coke. For the year 1916 the exports were 204,327 tons of anthracite, 42,302 of bituminous and 18,872 tons of coke; showing a decrease in the amount of anthracite exported in 1917 of 70,074 tons; 27,954 tons of bituminous and an increase of 3036 tons of coke. The exports by months, as compared with 1916 follow:

Month	Anthracite		Bituminous		Coke	
	1916	1917	1916	1917	1916	1917
January	8,921	7,934	893	2,049	136	1,660
February	8,740	4,981	1,245	1,731	817	1,211
March	8,231	13,720	2,193	3,224	2,177	505
April	19,257	8,339	2,229	171	1,677	1,325
May	17,809	16,714	4,419	995	1,331	1,900
June	20,949	14,693	5,108	1,939	966	3,650
July	19,489	15,967	4,387	448	1,897	3,434
August	40,671	3,942	6,025	967	1,195	1,763
September	6,800	26,988	1,012	593	2,447	2,909
October	36,235	3,288	8,427	43	2,521	1,531
November	7,751	10,856	1,934	1,229	1,957	304
December	9,474	6,831	4,430	959	1,751	1,716
Total	204,327	134,253	42,302	14,348	18,872	21,908



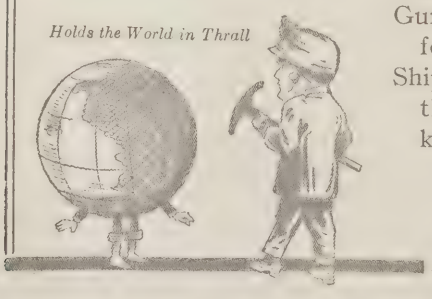
The reports show that of the anthracite exported from this port Canada received 98,402 tons; Newfoundland, 9445 tons; San Domingo, 11,738 tons; Brazil, 986 tons; while 1497 tons went to Chile.

Of the bituminous coal Brazil received 1999 tons; San Domingo, 755 tons; Canada, 30 tons; and Chile, 316 tons. Chile received 3475 tons of coke, Brazil 1115 tons and England 437 tons.

To France was sent during the 12 months 8571 tons of coke, 112 tons of anthracite and 54 tons of bituminous; while Italy received 200 tons of anthracite, 804 tons of coke and 125 tons of bituminous.

THE MINER

BY BERTON BRALEY



Greater than King or Potentate

GRIMY, and caked with dust of coal he stands,
Grasping his pick within his mighty hands;
The arbiter of destiny and fate,
Greater by far than king or potentate.

Shops may not run except at his behest,
At forge and blast his strength is manifest.
The rolls that rumble and the shears that scream
And all the million miracles of steam

Depend on him for fuel that will turn
The wheels that urge them and the belts that churn.
Guns that will shatter fortresses of steel,
Ships that will plow the waves on steady keel.

Holds the World in Thrall

BEARING munitions for an army's need
Must wait the miner's orders and take heed
That he who toils within the coal mine's murk
Gives them the coal with which they do their work.

Behind the men who battle in the trench
There stand the workmen at the lathe and bench,
But back of them and master of them all
The miner stands and holds the world in thrall.

Not soon again shall any man forget
How much the world is in the miner's debt,
For we shall read upon fame's honor roll
"He won the war—his labor gave us coal!"

[Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Union Trust Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 307, Union Trust Building, Washington, D. C., while at the capital.—Editor.]

State Administrators Granted More Power

An excellent opportunity to measure the caliber of state fuel administrators was presented on the occasion of the recent meeting of these officials called by Dr. Garfield. While there are some notable exceptions, the general opinion, formed by those who had an opportunity to estimate their ability, is that many unfortunate selections were made.

The state administrators were granted additional authority at this meeting in that they will hereafter determine from whom diverted coal is to be withheld. In order, however, to safeguard the exercise of this power, they have been asked to appoint an advisory committee of three men. It is specified that they must be familiar with the coal business in the state in which they are to serve. State administrators also have been asked to coöperate with the state councils of defense in the hope that diversions may be made so as to cause the least possible loss and inconvenience.

The Fuel Administration admits that the failure to specify from what consumer or area coal should be withheld, when it is diverted to meet an emergency, is apt to create new emergencies and therefore is generally unsatisfactory. It is feared very much that the inability of many of the state administrators to obtain a grasp of the situation is going to interfere seriously with the plans of J. D. A. Morrow, who is in charge of distribution.

Weekly Production Statistics

Production of anthracite coal continues far below the rate of that of a year ago. For the week ended Feb. 2, production totaled 9,423,000 tons. This was a decrease of 113,000 tons in the average per working day, as compared with average of the week preceding. The decline was shared by beehive coke. Production during the week ended Feb. 2 was 446,000 tons, or a drop to 74,000 tons per working day. There was a slight increase in anthracite shipments, which totaled 34,804 cars, in the week which ended Feb. 2. The figures given above are estimates made by C. E. Lesher, of the United States Geological Survey. The Survey receives weekly returns from such a large percentage of coal operators that their estimates rarely vary more than 1 per cent. from the final figures.

Coal-mining operations at bituminous mines throughout the country were conducted at 66.1 per cent. of full-time capacity during the week ended Jan. 26. Car shortage was responsible for 26.6 per cent. of this loss. Production increased decidedly in Illinois, where it reached 74.3 per cent. of full-time capacity. In Ohio, however, the showing during the week ended Jan. 26 was poor due largely to unfilled car orders. The mines in that state operated at 53.3 per cent. of capacity. Alabama made a good showing by operating at 87 per cent. of capacity. Southwestern Virginia attained 83.6 per cent. of full-time capacity.

A decided improvement was shown during the week of Jan. 26 at the byproduct coke ovens, where 70.6 per cent. of capacity was attained. Inability to secure coal was the only factor of importance limiting production.

Prices Increased in West Virginia

An increase in the President's schedule of coal prices has been allowed in the Kenova and Thacker fields of West Virginia. The new prices are: Run-of-mine, $2.40; prepared sizes, $2.65; screenings or slack, $2.15. This represents an advance of 40c. An additional 45c. may be added by those operators who have complied with the Washington wage agreement. The same price is to apply to all coal mined in Maryland and in Mineral, Grant, Tucker and Preston (in part) Counties of West Virginia.

More District Representatives Appointed

H. N. Taylor, of Kansas City, has been appointed district representative for the coal fields of Arkansas, Iowa, Kansas, Missouri, Oklahoma and Texas to serve as representative of all individual shippers and mines included in that area.

Mr. Taylor is directed to establish the necessary organization properly to conduct the activities of the office. He will arrange with each individual shipper and mine in his district to furnish notice of production, working time, free coal and shipments. He will compile reports of production, working time, car supply, shipments and

free coal and report such figures to Washington in totals at the end of each week.

The reports of District Representative Taylor, as well as those of the other district representatives heretofore appointed, are to be made to J. D. A. Morrow.

John C. Brydon, of Somerset, Penn., has been named the district representative of the Fuel Administration for the coal operations in Somerset County which are tributary to the Baltimore & Ohio.

G. B. Kilgore, of Norton, Va., will be the district representative for the counties of Dixon, Lee and Wise, in Virginia. He also will have charge of production in a portion of Russell County.

Coal fields in Arkansas, Iowa, Kansas, Missouri, Oklahoma and Texas are to be represented by H. N. Taylor, of Kansas City, who has been named district representative of the Fuel Administration. The district representatives collect from each mine data as to production, working time, free coal, shipments and car supply.

Coal fields in western Kentucky are to be represented on the Fuel Administration's staff by C. E. Reed, of Louisville. Mr. Reed is the eighteenth district representative to be appointed.

Our Coal Exports in 1917

Total exports of bituminous coal in 1917 amounted to 21,362,670 tons. This compares with 18,977,346 tons in 1916 and 16,764,857 tons in 1915. Anthracite exports in 1917 were 5,400,509 tons. In 1916 they were 4,165,652 tons and in 1915 they were 3,540,406 tons. Exports of coal to Italy fell from 1,735,072 tons in 1916 to 560,628 tons in 1917. The principal increase in coal exports was in those going to Canada, which country in 1917 took 16,256,006 tons of American coal. This compares with 11,839,447 tons in 1916. There was a slight increase in the coal sent to Panama; a decrease in the amount sent to Mexico; a slight increase in that going to Cuba; a slight decrease in exports for Brazil, while Argentina secured only one-third of the amount of coal which it has been accustomed to get from the United States.

What the "Closing-Down" Order Meant to the Country's Industries

An estimate of the losses caused by the closing-down order and the amount of fuel saved has been made by officials connected with the office of the Director General of Railroads. The estimate is as follows:

City	Fuel Saved	Wages Lost	Manufactures Lost
New York	$31,500,395	$357,498,000	$1,063,677,000
Chicago	27,486,908	213,757,000	381,535,000
Philadelphia	14,378,757	138,249,000	333,303,000
Detroit	5,446,475	69,447,000	178,099,000
Cleveland	10,903,284	67,351,000	153,925,000
Boston	3,845,540	49,444,000	134,234,000
Buffalo	6,824,615	34,818,000	89,520,000
Pittsburgh	10,470,576	45,066,000	96,779,000
Milwaukee	5,349,465	36,270,000	98,679,000
Baltimore	3,135,391	35,509,000	94,639,000
Cincinnati	2,198,284	33,159,000	96,735,000
Newark	3,424,436	36,647,000	97,163,000
Minneapolis	2,430,957	18,895,000	56,655,000
Jersey City	2,928,492	17,657,000	52,746,000
Perth Amboy	1,353,245	4,996,000	13,215,000
Rochester	1,569,614	26,600,000	82,167,000
Indianapolis	2,765,979	19,042,000	43,636,000
Akron	1,273,176	17,310,000	56,230,000
Totals	$137,285,589	$1,218,715,000	$3,122,937,000

Idle Monday Order Is Suspended

The order providing for heatless and workless Mondays until Mar. 25 was suspended on Feb. 13 by an official announcement from Fuel Administrator Garfield. The order was concurred in by Director General of Railroads McAdoo.

The only drastic regulation which still remains effective is that providing for a preference list to which coal will be shipped first, other industries and interests being forced to depend upon their supply from surplus coal.

The fuelless Mondays had been discontinued on Feb. 8 in North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana and Tennessee, as the needs for domestic requirements in those states are very much less than in the East, while the absence of congestion on the railroads in that section had made possible a general distribution of coal.

Mine Workers Favor Curtailment of Passenger Traffic

Curtailment of passenger service on all railroads of the country to allow the motive power thus engaged to aid in clearing up congested coal yards and switches, and to bring empties back to the mines, has been indorsed by two district executive boards of the Ohio Mine Workers.

These boards, representing subdistricts Nos. 1 and 2 of Ohio, indorsed the passenger-train reduction plan for 15,000 miners of seven Ohio counties in southern Ohio, who have worked less than 50 per cent. time in the past two months, because of the critical car situation.

"It's more motive power we need, and unless we get some action soon there is bound to be more serious want among the miners of this district," says George Cecil, of Wellston, president of subdistrict No. 2, which represents 3500 miners in Meigs, Vinton, Jackson and Lawrence Counties. This sentiment was also expressed by Sanford Snyder, of Athens, president of subdistrict No. 1, which represents 11,500 miners in Hocking, Athens and Perry Counties.

"Reduction of passenger-train service to give us more engines looks to me to be a way out of the present tie-up," was the expression of Conrad Weir, of Murray City, secretary of subdistrict No. 1.

An indorsement of the proposed passenger-train curtailment was given by nine coal operators in Jackson County, who have wired Director of Railroads McAdoo asking annulment of passenger-train service every other day, after the public receives due notice. Among the signers of this telegram is Jerry Morrow, for 52 years an operator in this district, who is president of the Jackson County Coal Club, an organization of 25 operators. "Such action would undoubtedly help a great deal and ought to be taken," says Morrow.

L. A. Snead, in charge of distribution for the Fuel Administrator, prior to the appointment of a representative of the coal-mining operators as manager of distribution has been assigned to the task of working out a method of equitable distribution of coal among domestic consumers. In this work he will visit a large number of localities throughout the country.

Minecdotes

Why Mine Mules Are Invariably White?

Some years ago, when mules were generally used for motive power in mine haulage, the operating officials of a large anthracite colliery received from the general office of the operating company a letter reading about as follows:

On Monday morning, Mr. ———, a representative of the "Philadelphia ————," will call on you. He is desirous of writing a description of an anthracite mine, and the methods employed in mining, for publication in his paper. Please show him through the mine and give him an opportunity to gather material for his proposed article.

The letter was signed by an executive official of the operating company, a gentleman not familiar with the details of mining.

The mine was a shaft mine, and a large producer. The principal workings were in the Mammoth seam, which had but slight inclination, and there were numerour gangways, headings, etc., in the neighborhood of the shaft bottom, through which several routes could be taken to walk from one side of the shaft to the other, without crossing the bottom of the shaft.

The operating officials were opposed to visitors entering the mine, unless they were mining engineers, or officials of other mines who came to see some specific operation, for such men could be relied upon not to interfere unduly with the hoisting of coal, as they would know how to keep out of the way of moving cars at and near the foot of the shaft.

The mine, being a large one, had besides the regular inside foreman two assistant foremen, one of whom was a young Welshman with a keen sense of humor and the ability to "put up a job" on a novice without cracking a smile.

When, on the particular Monday morning, the mine foreman told his assistants, with many imprecations and much grumbling, that the visitor would shortly arrive, and that he "hadn't any time to waste on him," the aforementioned assistant foreman, with twinkling eyes, said: "I'll take care of him, and when he comes out he'll be able to write a fine story." The foreman, knowing Tom's disposition, said "All right, Tom—here he comes now."

The newspaper man entered the office, introduced himself, and was informed that Tom would show him through the mine. Tom excused himself to arrange for an empty cage, and incidentally to see the hoisting engineer. The cage being ready, Tom and the reporter stepped on the cage, and the signal to lower was given. The engineer dropped the cage rapidly, and the visitor immediately sank to the floor and grasped one of the track rails, to keep the cage from dropping away from him. When the cage gently landed at the bottom, he was led, trembling in every nerve, off the cage, and was given a few minutes' time to partially recover and focus his eyes so that he could see to get around by the light of an ordinary miner's lamp.

Tom then took him on a long walk through gangways and headings around the shaft, repeatedly covering the same ground, showed him the pumproom and sump gangway, then through a passageway in which there was an old white mule used for numerous odd haulage jobs near the shaft bottom. As they approached the mule, and were about to pass his rear, or business end. his driver, a typical driver boy, yelled, "Look out fer that meule, he kicks!" Tom, of course, guided the visitor by the mule in safety, and then regaled him with many stories of the peculiar intelligence of mine mules. He told him that besides pulling the large mine cars, they pushed them, by "breasting"; that they knew to the minute starting time in the morning, when twelve noon arrived, starting time at one o'clock, and quitting time at night, etc., etc. He also told him many weird tales of the deviltry and visciousness of mine mules generally.

In the meantime, he managed, unknown to the visitor, to tell the driver boy to lead the mule around, so that as he walked the visitor repeatedly through the same passageways, they would frequently meet the mule. In due course, as Tom was careful to keep the visitor out of the way of moving trips, and he saw no other mules, he commented on the number of white mules in the mine, and of course Tom explained why white mules were used. Several times, either before or after they passed the mule, the driver would tease him and start him kicking.

Then, after Tom had taken the visitor into a productive part of the mine, and the sound of the firing of shots had given him an uncomfortable feeling, he was taken to the foot of the shaft and hoisted to the surface. With many expressions of thanks and protestations that "never again will you get me inside a coal mine," he left.

Two days afterward the Philadelphia ———— published a three-column article on "How Anthracite is Mined." Among many other statements that amused its readers in the coal regions, appeared the following:

Owing to the darkness in the mine, only white mules are used to haul the coal to the foot of the shaft, because they can be seen much more easily than those of other colors. These mules, while trained to a high degree of intelligence in their work, are invariably bad tempered and vicious. It is claimed that the inky darkness of the mine has a great effect in developing both the intelligence and visciousness of mine mules.

Cement Needed for Concrete

The following table, taken from "The Ransome Book," shows the amount of cement used in the making of concrete having various mixtures:

CEMENT USED PER CUBIC FOOT OF CONCRETE

Mixture	Sacks	Mixture	Sacks
1 : 1 : 1	0.5404	1 : 1 : 1	3.375
1 : 1½ : 3	0.2808	1 : 1½ : 3	1.895
1 : 2 : 4	0.2220	1 : 2 : 4	1.498
1 : 2½ : 5	0.1848	1 : 2½ : 5	1.247
1 : 3 : 6	0.1570	1 : 3 : 6	1.060

An electric machine has been installed in the Crescent mine, near Mineral, one of the largest mines in Cherokee County. Similar equipment has been contracted for at other of the larger mines. President Howat is now preparing to make a machine-coal scale at Osage City for the operations of the Jackson-Walker Coal and Mining Company.

THE LABOR SITUATION

General Labor Review

The mine workers are still deprived by the serious car shortage of a chance to make a good living, buy Liberty Bonds and War Savings Certificates. At the recent Indianapolis convention it was stated that in one field only four days' work were secured in an entire month. One of the delegates declared that he reported for work eight consecutive days and only got two hours' work in all that time. Of course, the Geological Survey's figures, which have a broader scope, do not show these extremely unfavorable conditions, because they are too local; but even in that report it is shown that the car shortage in the high-volatile coal field of southern West Virginia mounted to 70 per cent. in the week that ended Jan. 26.

The Southern coal fields, of course, showed the least evidence of a car shortage. The weather conditions practically determined the situation North and South. In the Arkansas semi-anthracite mines there was absolutely no shortage of cars in the week ending Jan. 19 and only 2.1 per cent. in the week following. But in this field mine disability rose during those two weeks to 70.7 and 10.4 per cent., an extremely bad showing. The districts which show less than 10 per cent. of car shortage in the two weeks were Iowa, Alabama, Arkansas (semi-anthracite), Montana and Wyoming, Colorado and New Mexico, Oklahoma and Arkansas (bituminous coal), also Kansas and Missouri.

Fairmont Region Hard Hit by Car Shortage

Not every region is short of equipment. It is said in a Kemmerer, Wyo., exchange that the Union Pacific R.R. at that place was so well supplied with transportation facilities that it purposed to lay off some of its freight-engine crews. Among the sections hard hit by the shortage is the Fairmont region with 62.5 and 52.1 per cent. car shortage in the two weeks considered. The Junior-Philippi field along the Tygarts Valley River, Barbour County, West Virginia, had a shortage of cars which decreased tonnage in the two weeks 56.4 and 43.7 per cent. respectively.

Just at present strikes are not numerous. The difficulties are of another kind. The companies are trying to get the utmost out of their men, especially where cars are plentiful, which is not, of course, a general condition. The Philadelphia & Reading Coal and Iron Co. finds its position precisely opposite to that obtaining in most of the bituminous mines of the country. As J. L. Lewis, the statistician of the union, has pointed out, the shortage in bituminous mines has been principally in the day men and not in miners. In order to help the day men and make their lot more pleasant they have been awarded the larger increases when scales had to be made. But at the Reading mines, at least at the Alaska colliery, at Mt. Carmel, the excess of force was in company hands, or day men, and not in miners. Sixteen men repairing tracks, opening ditches, building brattices and other light work were offered employment in the mining of coal. They refused to exchange their positions and were discharged, with a notification that they must drive gangways, chutes or breasts or apply for work elsewhere.

On Feb. 8, the operators in the Alabama district were notified by the Fuel Administration, Order No. 370, that they would not be allowed a 45c. increase in the price of coal. The contract made recently by the operators does not provide for an increase in wage, and consequently, though satisfactory to the Fuel Administration and approved by it, the contract is not a ground for any price increase.

There seems a probability that fine weather will soon remove all risk of a fuel shortage in Alabama. Dr. A. C. Williams, chairman of the state fuel committee, is doing much toward gaining pledges among the colored miners to do more and better work. Every mine village he has visited has given him a large and enthusiastic audience and he has aroused a greater interest among colored workmen than they have hitherto shown.

The anthracite region seems to have a few men who are disposed to strike and make trouble. In the issues of the last two weeks the trouble at Laflin with the Traders Coal Co. has been recorded. On Feb. 6 several more miners went to work, but the others still held out and the tonnage of the mine did not reach capacity. This week a strike must be recorded at Moosic, which is quite close to Laflin and one of the little group of disaffected towns. On Feb. 7, 200 employees of the Lehigh Valley Coal Co., employed at the Broadwell colliery at Moosic, went on strike for the second time in two weeks. On both occasions, the difficulties related to wage scales. The strike was called by the union grievance committee.

Going back a little in time but pursuing a steady course northward, reference should be made to a strike at Taylor. Taylor lies between the disaffected territory and Scranton. On Feb. 4 1100 men and boys at the Archbald colliery of the Delaware, Lackawanna & Western R.R., Coal Department, went on strike because of a grievance presented by eight foreign miners. The strike was called off on Feb. 7 after it had been agreed that the mine superintendent and members of a committee would visit every section of the mine and adjust the scale of wages for mining both on pitch and level. The men had been receiving $2.72 per car for coal mined on a pitch. When the men were moved to a level place they wanted not only the $1.30 the contract requires, but $2.72 per car.

Trouble at Henryetta, Okla., and Drumheller, Alta.

The next strike to record is far away from the anthracite region—Henryetta, Okla. The 200 men employed by the Victoria Coal Co., at Henryetta, went on strike, Jan. 21. They have recently returned to work. The men struck because of a dispute over the water furnished to the men in the company houses.

On Monday, Feb. 4, 2000 mine workers in the Drumheller field, Alberta, went on strike. The trouble started on Saturday, Feb. 2, 175 men walking out because, according to reports, the operators refused to run a closed shop. About 70 per cent. of the mine workers are aliens, 40 per cent. being alien enemies and only 30 per cent. Canadians.

In Illinois the Peabody Coal Co., recognizing that the men in its employ were aiding the Red Cross in their attendance at the Kinkaid Centennial celebration, has decided to refund the $3 fines it had assessed under the automatic penalty clause against the men employed at its No. 7 mine at Jerseyville and its No. 8 mine at Tovey for taking a day off to attend the celebration.

Miners Ask for Better Transportation

Mine workers in many places are seeking better transportation. Two hundred mine workers at the mine of the Devereux Coal Co., located 2½ miles northeast of Springfield, Ill., have filed a petition with the State Utilities Commission of Illinois asking that train service to and from the mine be supplied. The miners complain that a train runs to the Peabody mine near Sherman every day, but it will not stop at the Devereux plant to take men from there or permit them to get off the train. The train runs within 100 ft. of the plant and might just as well make the stop.

A petition has been prepared for submission to the Indiana Public Service Commission asking that a miners' train be run on working days on the Pennsylvania R.R. between Harmony and Glen Ayr mine. On this petition appear the names of 508 coal-mine workers. Operators having mines along the track have also signed a petition. Harmony is in the Brazil field of Clay County, which is gradually growing less productive. The Glen Ayr mine is near Terre Haute and like the other Vigo County mines comparatively new and active.

Four hundred O'Fallon and Lebanon miners refused to go to work at the St. Ellen, Nigger Hollow and Prairie mines one morning last week because the East St. Louis & Suburban Electric Railway Co. sent only two cars to transport them to the mines. The St. Ellen mine was closed entirely for the day and the other two were able to work at part force. The officials of the miners' unions say they will make a report on conditions to the Fuel Administrator.

The problem of transportation is a growing one. Old mines are closing up their activities. The miners who built homes adjacent to them are left without opportunity for labor and they are seeking rapid and cheap means of reaching new mines and returning at night to their homes. This fact and the disposition to work where the coal is thickest and conditions most favorable together with the growing desire for life in larger communities will make the mine worker a leading factor in the transportation problem and will cause him also to be a great advocate of shorter hours. A man cannot labor a full day who lives a long way from his work.

Severe Discipline at Mines

Recently a Russian miner employed at the Oak Hill mine, near Belleville, Ill., near St. Louis, Mo., was arrested for firing a shot, which he found in his room unexploded, when he returned to his place in the morning. All the men were in the mine when the shot was fired. Some fled to the shaft and others made an investigation. For one reason and another no one worked that day as a result of William Matthews' imprudent action. When the case came before the county judge the man pleaded guilty, and was offered his choice between a fine of $100 and costs and 30 days in jail, and $200 and costs. After a week's consideration the man decided to accept the higher fine and save the month in jail.

The action of the miner seems to have met with the general disapprobation of operators, mine workers and the public. The heinousness of his offense caused the judge to give him the maximum penalty. Some people have doubted whether laws against such offenses can be enforced, because witnesses are hard to obtain and juries are slow to convict. Here at least is an instance where witnesses were apparently not lacking. It is ill to assume that the public and the mine workers are not interested in safe mining, for in cases of negligence, the importance of which they understand and appreciate, there is little hesitation.

Another instance in which a mine worker was fined for an offense against the mining laws is that of Philip Lipnok, who was arrested at Farmington, near Fairmont, W. Va., charged with breaking open a safety lamp in a gaseous mine. However, Lipnok had extinguished the lamp before breaking it so he did not risk his life or that of his fellow workmen. However, he was fined $50 and costs.

Suit Against Mine Workers' Union

Depositions were taken in the United States Court at St. Louis, Mo., in the $600,000 damage suit of the Pennsylvania Mining Co. A violation of the Sherman antitrust law is alleged. The suit is the outgrowth of a strike in June, 1915, at the mines of the Pennsylvania Mining Co., a Scranton, Penn., corporation. The mines are located at Jamestown, near Clarksville, Johnson County, Arkansas.

The company alleges that the strikers were mobilized in a colony of 200 tents near the mine, that they intimidated employees, destroyed the pumping plant of the mine with dynamite and fired on employees in their homes. It is claimed that the strike was the culmination of a conspiracy of the union to hamper the output and interstate shipment of nonunion coal. Peter Hanraty, former president of the union for district 21, one of the defendants, testified that he placed two organizers in the mine who worked secretly to establish the group system. He said that the union from 1910 to 1915 spent $200,000 in propaganda in an effort to unionize the "Jimtown" mine and that the union determined on its unionization because the union mines were unable to sell coal in competition with the cheap coal produced in the nonunion operation.

Women Get Same Pay as Men

The United Mine Workers of America have opposed the employment of women, urging that the dilution of labor was entirely unnecessary, as there was plenty of men to do all the work needed. It was also said that women were to be hired because they would work for less pay than men.

It has been so clear that there is a scarcity of labor in the anthracite region that the labor leaders from the anthracite districts are not among those who contend that there is no labor shortage. They are quite ready to concede it. When women were employed as clerks, weighmasters and supply-house officials in the anthracite region an investigation was made. It was found that the girls and women were working, but that they were receiving the same pay as men, so no complaint has been entered. Five more young women have recently been employed by the Susquehanna Collieries Co. and more are to be added.

Lawson Repudiated in Colorado

John R. Lawson, the leader of the miners in the Colorado strike, has been defeated by George O. Johnson, of Chandler, as president of the United Mine Workers of America in district No. 15. Johnson got 377 votes majority.

Lawson, who was tried and convicted of murder in connection with the southern Colorado strike, has been getting more and more unpopular of late. This was shown at Indianapolis, where he was denounced as a labor agent of the Victor American Fuel Co. Someone alleged that when in jail he was secretly assisted by the agents of the coal companies.

It was alleged that he was fed with chicken twenty-one times a week, without, it may be added, developing any clerical leanings. Luke Brennan, of Colorado Springs, was chosen a member of the International Executive Board. None of the "Lawson ticket" was elected, the administration carried their candidates into every office.

Strike at Drumheller Continues

The 1500 mine workers at Drumheller, Manitoba, Canada, deny that their strike is for the closed shop. They say that all they desire is the privilege of organizing a union and that this has been denied them. There seems some probability of violence, but it is being met by the Royal Northwestern Mounted Police under Major Fitz-Horrigan who are quartered at the Rosedale mine. Warrants have been sworn out by union officials for Alfred and Kenneth Moody, of the Rosedale Mining and Clay Products Co., and for several other employees of the company. The union officials charge the company's officers with having threatened the union organizers. The warrants were served on Feb. 6.

As many of the men are foreigners, and as bootlegger whiskey is circulating there is some fear of trouble. F. E. Harrison has been sent by W. H. Armstrong, the coal commissioner of the district to investigate the situation. President Thomas Biggs, of District No. 18, which includes all western Canada accompanied him. The Saskatoon, Sask., city council, board of trade and the Fuel Dealers' Association of that city, have called on the government at Ottawa to interfere as Saskatoon is mainly dependent on the coal from the Drumheller field.

Effect of the War on Labor Problems

THE war affords an opportunity to consider labor problems without the bitterness that spoils the discussion during times of profound peace. The combativeness of labor and capital is sidetracked. It is venting itself on the enemies of both. Thus it is that capital is learning to respect the leaders of labor, and labor is learning to appreciate the genius and constructiveness of capital.

And when both labor and capital are surrendering to the national needs of the war; when labor is giving its blood, its leisure, its privileges, its comforts for a great, a supreme national purpose; when capital is giving blood and services to the same great cause, there cannot fail to be a common sentiment regarding those matters about which labor and capital have too long and too often quarreled.

It is surely well when the war is still going on and all are consecrated to a great common end; when all can talk, without the heat of controversy, that the great problems of labor and capital shall be solved; not for all time nor in their entirety (when was any matter, even of science, so settled?), but solved, at least, in part and in their main essentials.

It is a time of earnest thinking. Some are hoping that capitalism will come to an end. But there must always be capital, for it is the machinery of commerce. The pick of the miner, the needle, the tamping tool, his lamp, his home, his furniture are all capital wherewith he produces coal and earns his daily bread. The miner is hourly in need of these instruments of production, and to buy them he is compelled to put by something or he must consent to put by something later to pay for them. No one can keep all he produces. He must, like the farmer, hold back something for future seeding.

And there are other forms of capital essential to the economic production of the miner—the mine workings, the haulage roads, the tipple and its power house. These are the machinery of production. We cannot do without them. Either the state or the manual worker or the management must have them, for we cannot do without them. We must put something by or we will not have them. That something is capital.

Just now the railroads, deprived of capital necessary to enable them to advance with the rest of the country, have failed to do their duty, and hence there are shortages of fuel, idle days for miners, idle days for industry, lack of food and deprivation of comfort. The railroads are without equipment because they have spent all they earned and have not been accumulating capital. Labor is nothing without the support of the past product of labor. You cannot grow a crop without seed, or harvest it and beat it into food without using the product of past industry.

And something must be given to those who save and produce this capital, or no one will save it. Profit is the wage of capital. The capitalist is much like the working man, he will not work or let his capital work without a wage. Would the working man work if he knew he was not going to be paid?

But we say profits are too large. Perhaps we shall never be able to agree as to that matter. But surely if profits are kept down to a meager amount, and the capitalist is going to stand the losses of false calculation or unfortunate conditions, he is soon going to expend his whole capital. On this investment, perhaps, he loses and on that he wins. One year he has favorable balance and the next a loss. He will always have to cast up his earnings against his losses. Sometimes he builds an industry, such as is the Panama or the Erie canal, on which he loses, as the nation and the State of New York are losing in those enterprises.

So he must find another extremely fertile source of income or he will be a loser. And if all are losers, then the world is loser. There will be no wealth at all. There will be no capital if the produce of toil does not have a favorable balance.

Some are saying that the war will bring profit sharing of labor with capital. Capital might be willing to try it, but the working man does not want it. The mine workers have repeatedly repudiated it at their national conventions and by their leading spokesmen. They have asked instead a permanent wage increase as did the mine workers last year in central Pennsylvania, the same for all persons engaged, whether in profitable or unprofitable toil. They do not wish to expose their earnings to the uncertainties with which capital has to contend. Similarly, the mine workers in the anthracite region condemned the sliding scale. They wanted higher wages not profit sharing, and the copper miners will stand by the sliding scale only so long as it slides upward and not downward.

Nor does labor take kindly to the communistic idea. There have been mines operated on a coöperative basis in Illinois and elsewhere. But the men working in them have been put out of the union, because miners employed at these coöperative mines have been so anxious to work steadily in slack periods that they have operated the mines at a loss rather than lie idle, and made deductions from wages to cover that loss. As a result the price at which they sold their product was continually forced down to the general impoverishment of all the other workers in the coal industry.

In fact labor, as a whole, might look with favor on bonuses which became progressively larger, but it does not remain contented when bonuses shrink, are cut off, or are replaced by assessments on wages. Nor do union men favor national ownership which deprives them of liberty and puts them under an autocracy, not less but more inflexible than that of capital.

Labor, as a whole, is not opposed to capital, though it is true that it does seek to have all excessive profit cut off, especially such profit as is made out of tem-

porary necessities, and which bear with unreasonable hardship directly on the working man in the purchase of a livelihood. Rightly or inadvisedly, but certainly naturally, labor will endeavor to prevent inordinate profits even though thereby the law of supply and demand seems unduly interfered with. The workman will argue with some show of truth that a profit twice that which is usual will, eventually, if not immediately, work the readjustment called for without creating any unnecessary disturbance of living conditions.

It will allow those creating a certain necessary kind of product all the opportunity needed to thriftily expand and supply the field, and will bring in enough outside capital to serve the industrial need. In order to produce quiet during the war and even after the war, excessive profiteering may well be prohibited as the President's Mediation Commission has just suggested. But the miner will naturally want to know why profiteering in coal is wrong and profiteering in cotton, wool and all foods but wheat is permitted.

Conservative labor believes in capital and is working always to acquire some of it for itself. It is frugal and forward-looking, and it will always oppose itself to radical labor which is seeking to provide that the whole product of labor will be used up, destroyed and consumed as fast as it is produced. The differences existing are hardly between capital and labor so much as between conservative and radical labor—the labor that realizes that pay comes from product, and the labor that believes that by agitation each individual workingman can secure a competence far larger than that which labor produces.

An individual industry can arrange to secure for itself excessive payment. It can always make other industrial workers pay it excessive wages so long as those wage earners are willing to assist it in getting the exorbitant wage it desires. In the last analysis, it is the worker pays the worker, and it is the worker who is interested in opposing wages which are inequitably high.

Continuous Vernier

ON PAGE 329 of this issue of *Coal Age* is an interesting discussion of deflection angles and azimuth with special reference to coal-mine engineering. This matter ever has been a bone of contention among certain mining engineers and probably has been settled frequently by each man selecting the method that most appealed to him.

Transits in the anthracite field of Pennsylvania were, at one time, frequently graduated so as to give quadrant readings. This graduation was especially well adapted to continuous vernier work. The quadrant readings gave every alternate course direct, and the intermediate courses were exactly 180 deg. from the true bearing, as a little thought will readily disclose, and were set down in the notes in their correct quadrant. The telescope was not plunged.

The needle on the transit was released at each station set-up and read each time a B. S. or F. S. was taken, both as a check on the angle and also on the quadrant reading. The correctness of the quadrant readings as recorded were thus never for a moment in doubt. Local attraction often deflected the needle, but the B. S. and F. S. needle readings should show equal deflection from the vernier courses and serve as a valuable check nevertheless.

In mentioning checks, an old engineer once told his assistant: "You will often make mistakes; every engineer does, but do not let them get out of the office. Surround all your work by every practical check so as to discover mistakes before they do any harm."

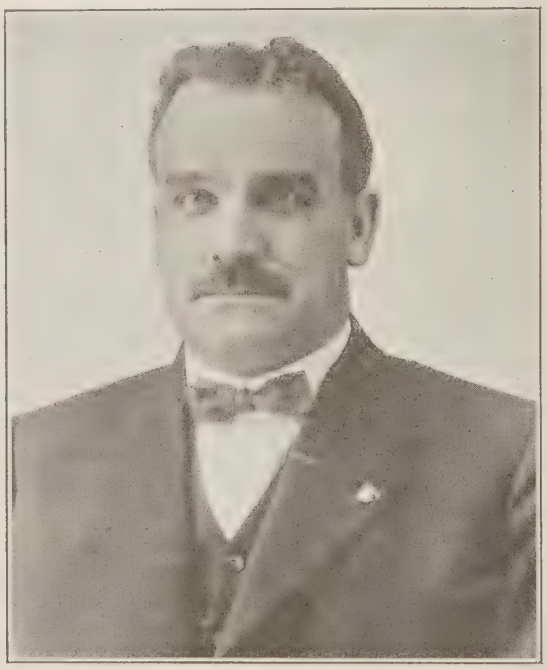
In continuous vernier work, a word of caution might save annoyance at times. After the vernier is once set, clamp the plate and vernier screws sufficiently tight to prevent any possibility of their slipping; and also guard against anything rubbing on the tangent screws. In carrying the transit from station to station, or in setting up the instrument, it is very easy for the sleeve to brush against a tangent screw and give it at least a part turn. Guard against the possibility that something may touch the tangent screw between transit settings and thus cause the horizontal limb to move.

The United States Geological Survey fills in most of the topography by plane table, but continuous vernier is merely a modification of this method; if a transit is provided with stadia wires and a leveling rod is available, the two systems approach closely in efficiency as far as the ordinary requirements of coal-mining engineers are concerned.

Standards Rather Than Methods Are Desired

THE fuel administration in Luzerne and Lackawanna Counties in Pennsylvania has ordered the operators to prepare their coal in the customary way "by passing the same through a breaker or a washery, so as to properly size and remove the rock, slate, dirt and ashes (*sic*) from the coal." It is good news that this action has been taken. It has certainly not been instituted any too soon. There has been for some months too much impurity and undersize in the coal as delivered to market, but it must be remembered that washeries and breakers can be run in such a way that they will not exorcise the evil in the coal as it is delivered to them.

Screens and pickers can be regulated to give a minimum result. They can be arranged to permit pea to be sold as chestnut and chestnut to be sold as stove, while rock, slate and bone coal can be allowed to masquerade as a prepared product. The only solution is to be found in an inspection of every car with a report to the Government of its condition. While the requirements of peace times in regard to thermal units were in many cases somewhat excessive and their imposition burdensome to the industry and hence to the public, a reasonable inspection which casts out coal having excessive slate and sends it back to the washeries and breakers is grievously needed. With all the clamor for coal it is natural that some men who seek money rather than the national welfare will let steam-size coal run into the prepared-sizes chute, and purposely reduce the selective efficiency of the slate pickers.



But we cannot believe that Campbell and Williams will be satisfied with a perfunctory compliance with their order. The days of the unscrupulous are, we feel sure, numbered. The conscience of the coal industry is aroused and in a few days the fuel administrators will put a crimp in the practice of shipping to market everything that looks like coal.

Who's Who In Coal Mining

Seward E. Button

To have risen from the humble place of day laborer to the highest position in the mining industry in Pennsylvania, to have controlled the operations of thousands of men in his 18 years' experience as mine foreman and superintendent without once undergoing a strike, even for a day; to have reclaimed one of the most gaseous mines in the region to a point of safe operation—these are a few of the high lights in the career of Seward E. Button that show that the field of opportunity is still open to the youth of ambition, perseverance and energy.

Seward Button, the new chief of the State Department of Mines of Pennsylvania, is an old-school miner, his

SEWARD E. BUTTON
Chief of State Department of Mines of Pennsylvania

ancestors having delved in the mines of England for generations back. He is a son of Owen Button, and was born in Somersetshire, England, on Oct. 5, 1875. His years of schooling were scanty, and at the age of 15 years he came to America, to the home of an older brother who had settled at Avoca, Penn. He went to work at once as a day laborer at the Hillside colliery of the Hillside Coal and Iron Co., and while he was yet a youth gained certification as a miner. He was employed for a number of years at Carbondale and again at Peckville, to return to Avoca, where, ten years from the time he began work as a day laborer, he became a mine foreman at the Hillside colliery, where he was engaged for four years. For five years he was foreman at the Erie colliery at Jermyn, and then went to the Temple Coal Co. to become superintendent of the Mt. Lookout colliery at Wyoming, where gas conditions had become particularly bad and had just been responsible for a serious tragedy, costing the lives of a number of men.

It is noteworthy that in the nine years Mr. Button has been superintendent of the Mt. Lookout there have been no disastrous gas explosions there, and it is now safe to work in this operation with a naked lamp. This achievement has gained for the new mine chief a distinct reputation as an authority on mine gases.

A pointed commentary on the personality and ability of Mr. Button is supplied by the fact that in his 18 years of authority as foreman and superintendent he has not been obliged to face a single strike.

Mr. Button has been a conscientious worker for the advancement of the mining industry and of his fellow workers. He has been active in the promotion of the Pittston Mining Institute and is its president. On various occasions he has lectured before the institute on mining problems. He is a member of the Engineers' Club of Northeastern Pennsylvania.

Although a sound Republican, Mr. Button has never taken an active part in the chaotic politics of the Keystone State. He has been doing his bit for his country since last June by serving as a member of the Second District Draft Exemption Board of Luzerne County.

Mr. Button went to Harrisburg on Feb. 12 and assumed his office. He will continue his residence at Wyoming.

The new mine chief is a married man with two sons. The older, 20 years of age, is a driver boss in the Mt. Lookout colliery. The younger, at 18, is an engineering student at Cornell University.

Shortage of Coal Increases Demand for Illuminating Gas

That the coal shortage has greatly increased the demand for gas is shown by the report of the Consolidated Gas Co., of New York, for the year 1917. This report shows that until December of last year the combined maximum day's output of that company and its affiliated companies had amounted to 125,148,000 cu.ft., but that on Dec. 15, due to the low temperature and the extraordinarily severe weather conditions, the output amounted to 129,959,000 cu.ft. On Dec. 28 the output was 137,310,000 cu.ft., and on the last day of the year it was 155,006,000 cu.ft. The output for the last three days of the year aggregated 460,613,000 cu.ft., an increase over the three corresponding days of 1916 of 134,297,000 cu.ft., or 41.16 per cent.

The price of boiler coal, used in generating electricity, increased 59.2 per cent., and of anthracite and bituminous coal used in gas manufacture 11.3 per cent.; the average increase in the price of all varieties of coal used amounted to 34.3 per cent. The increase in the price of gas oil was 66.2 per cent., and it has increased again this year 30 per cent.; the increase in the price of gas oil in 1917 over that of 1916 amounting to 116.6 per cent. The increase in the price of these items alone added $4,530,600 to the cost of manufacturing gas and generating electricity during the year 1917.

In 1916 the Consolidated Gas Co. and its subsidiaries operating in Manhattan and The Bronx used 119,238 tons of coal, coke and boiler fuel; 415,016 tons of coal and coke for generator fuel, and 352,611 tons of gas coal was carbonized, a total of 886,865 tons. The New York Edison Co. used 655,805 tons of coal, and the United Electric Light and Power Co. used 204,928 tons of coal during the same period.

Broken locomotives and bad weather caused the shortage of coal from which these Newark, N. J., people are suffering.

The miners of America are proud that THEY never failed to do their utmost to provide the needed fuel.

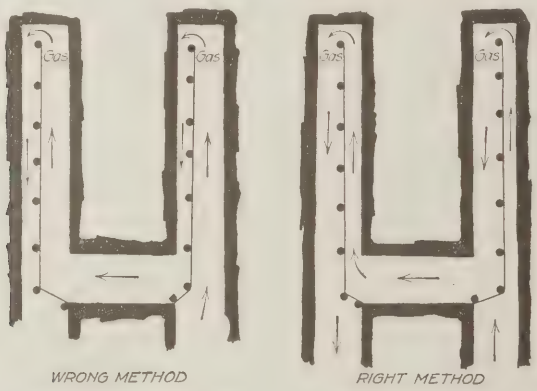
Line at coal yards of Lehigh Valley Coal Sales Co., Eighteenth Ave. and Lillie St., Newark, N. J.

The weather is better now and the miners, we hope, will have even a better chance to make scenes like this unnecessary.



DISCUSSION BY READERS

Erecting a Line of Brattice

Letter No. 1—Having followed the discussion in *Coal Age*, regarding "Clearing a Heading of Gas," it has occurred to me that the difficulty experienced in removing gas from the face of a heading is often due to a wrong way of building the brattice. As this is a very serious matter, and one that should be thoroughly understood by all mine foremen and firebosses, it seems to me that a discussion along this line would prove of interest and value.

Without referring, further, to the suggestion of hanging a curtain 90 ft. back from the face, in the return airway, which would be a strange thing to do, let me explain my ideas in regard to the right and the wrong way of building a brattice to remove gas from the face of a pair of headings.

On the right of the accompanying figure, I have sketched the arrangement that experience has taught

REMOVING GAS FROM FACE OF HEADING

me is the most effective in removing gas. The wrong method, which is commonly used is shown on the left.

By way of explanation, let me assume that the main entries are driven due east and gas has accumulated at the faces of the 4 and 5-N headings driven off the main east, the 5-N being the intake and the 4-N the return for that section of the mine.

Proceeding up the intake or 5-N heading, a line of brattice should be started from the outby corner of the last crosscut on the west rib of this entry. From that point the canvas should be carried across the entry to within 2 or 3 ft. of the east rib and then carried along that rib toward the face of the heading. The aim is to make the air space on the intake side of the brattice much narrower than that on the return side.

After the brattice has been extended to the face of the 5-N, and the gas removed from that heading, another brattice should be started from the outby corner of the same crosscut, on the east rib of the 4-N. As shown in the figure, the brattice should be carried along the east rib toward the face, making the air space on the intake side, here also, smaller than that on the return side of the brattice. This arrangement gives the air greater force at the end of the brattice where it strikes the gas.

On the other hand, when a brattice is erected as shown on the left of the figure, and the intake side is made wider than the return side, the effect is to produce eddies in the air current at the head of the entry, which greatly interferes with the removal of the gas.

Overlooking the Salaried Man

Letter No. 1—The reference to "Injustice to salaried employees" made in a letter signed "Equity," *Coal Age*, Dec. 22, p. 1068, calls to mind an excellent Foreword that was published in *Coal Age* more than a year ago. [Vol. 10, p. 375.] It was an open letter addressed to presidents, directors and managing executives of large concerns, and drew attention to the fact that the salaried employee is rated and paid on a different basis than that applied to day men and apprentices.

While it is true that the salaried class of employees is proportionately small and the number of applicants large—a fact which would tend to lower the rate of pay in that class—the chief reason for the difference between salaried men and those who perform day labor lies in the fact that the latter class is organized to drive wage bargains with its employers.

The question is a broad one and applies alike to all industries and professions. The law of supply and demand does not altogether remove our perplexity. There appears to be another factor operating to enlist the interests of employers of labor in favor of the one class, while the other class is seemingly overlooked or regarded as of less importance.

UNFAIR DISCRIMINATION IN CLASSES OF WORKERS

For illustration, compare the school teacher and the lawyer, or the minister and the doctor. The lawyer's services are generally more highly regarded and his reward greater than that of the school teacher, notwithstanding both are equally essential. Likewise, the services of the doctor are generally held in higher esteem, in respect to the amount paid for his services, than is the work of the minister; yet both supply what the race needs.

To the candid mind, the situation is one that should be remedied; but how? In the broadest sense all employees serving as clerks, bookkeepers, timekeepers and others holding official positions and paid a stated salary, are affected, and every community has many such men whose labors should be (but seldom are) rewarded according to their faithfulness.

Much could be done in communities through education and influence. Large corporations or companies holding controlling interests in local affairs can exert an influence for good, and the responsibility rests on

such more heavily than it does on the smaller companies, who can only lend their aid to a limited extent by serving on school boards, boards of trustees and executive committees.

In this connection I do not want to be understood as failing to appreciate the splendid work done by many large companies along welfare lines. That this work can be extended and made to apply to the salaried class of workers will not be denied. It should be extended to include school teachers and ministers serving the community. But, we are particularly interested, here, in the salaried men of the coal industry, to which the Foreword mentioned had particular reference. As bearing on this question, allow me to cite a single instance, which is but one of many, showing the need of giving more careful attention to and rewarding more justly the pay of salaried employees.

Injurious Effect of Favoring Certain Classes of Workers

A friend who works in a railroad shop recently told me that he began work in the shops as timekeeper. In order to increase his chances of promotion he studied shorthand, typewriting and bookkeeping in his spare hours. It was not long, however, before he realized that the time and effort he was putting forth would not pay in the end. The result was that he became an apprentice, and in five years was working for more money than he would have made in ten years of promotion on the office force. The same man mentioned others who had given up good positions in the office to become apprentices, because, from a financial standpoint, it paid.

There are thousands of ambitious men working as apprentices in our shops who would make good executives, engineers, electricians and inspectors, were these positions for which they are fitted made more attractive. It goes without saying that the companies are the losers in the end. It is called "good business" when a manager is able to secure a $75 man for a $100 position, and many an employer yields to the temptation to pay his men as little as will hold their services, rather than pay what the position is worth.

In closing, allow me to name a few of the qualifications of the faithful salaried man: He has ability and is always on the job; he systematizes his work, by which he accomplishes more at a reduced cost for helpers and assistance; he is reliable and meets conditions as they arise; he is trained for his particular work; he is loyal to the company interests, which he constantly strives to safeguard; he never threatens a strike, but labors day and night to accomplish the work in his charge. For this faithful service, let me ask if he should not be amply rewarded.

New Straitsville, Ohio.

Helpless Helpers

Letter No. 1—Reading "The Story of the Helpless Helper" calls to mind an incident of my boyhood days that impressed itself so forcibly on me that memory often brings back the scene I then witnessed. It has taught me that when a man is seeking help or asking for information, to hear him out in what he has to say and then assist him in the best manner possible.

At the time of my story, I was working for the Broadway Coal Mining Co., at Simmons, Ky. My duties were those of a trackman. I was talking to the boss, who was resting himself, on the parting, when a boy came out of the mine and told the driver who was there and who hauled the coal from his room that, in switching the empty car in his place, it had run off the end of the track and he was unable to put it back again.

Overhearing the complaint, the foreman asked the boy if the car was loaded, and being told that it was not, replied, "Well, we don't put empty cars on the track; but when a loaded car is off the track, we are willing to help put it on again." The boy stood a while, studying over the matter, when an idea seemed to strike him and he went away. Knowing that it was impossible for him to get the car back onto the track, he decided to load it where it was.

Having finished the task, the boy again sought out the foreman, whom he found in the same place as before. Walking boldly up to him, he said: "Mr. Jones, that car is loaded now. Will you have a man help me put it on the track?" The boss was not slow to see that the joke was now on him, and, without further delay, he gave the driver orders to put the car back on the track.

The boss, in this case, was a "helpless helper," refusing to give the boy the assistance that he had asked and had a right to expect. Like others of his kind, the man did himself a greater harm and retarded his own work, or the work in his charge, more than he delayed the boy. It is a simple incident, but teaches a good lesson that foremen and others will do well to learn.

Harrisburg, Ill.

Conservation of Mine Gas

Letter No. 3—I was glad to read the letter of my old friend, H. G. Davis, on the Conservation of Mine Gas, *Coal Age*, Jan. 26, p. 210. Like him, I have been "watching and waiting" for some of the big fellows who know all about gas to tell us how the waste gas of the mines is to be collected.

Candidly, it struck me that the previous letter of E. B. Wilson, to which Mr. Davis refers, was too pessimistic, in regard to the possibility of conserving the gas that is now wasted in such large quantities in the anthracite fields.

We all know this is a big job, but we should regard it in the same light that our honored governor has looked at it, which caused him to remark, "Watch some fellow do—the impossible." I am willing to admit that the proposition may be impossible of accomplishment by any one man; but I have great faith in what may be developed by a broad discussion of the subject in *Coal Age*, by practical mining men, if they will give it their attention. In the hope of assisting in a discussion that may develop some practical means of carrying out the project of saving the gas, let me suggest what might be called a "gas mine."

In this connection it has occurred to me that the large boundary pillars left between adjoining workings, in the anthracite mines, might be utilized by driving a heading into the center of such a pillar and then driving both ways on the center line and extending this central heading practically the length of the pillar.

When this has been done, the opening could be sealed off with a heavy concrete wall into which a pipe should be built, say 10 in. in diameter, for the purpose of piping the gas to the surface.

There are, of course, other ways of collecting large quantities of the gas in our coal seams. Boreholes have often been suggested for this purpose. It seems to me that, while this is a good suggestion, the flow of gas through these holes could be greatly accelerated by connecting them with a vacuum pump that would exhaust the gas from the mine. The subject is one that has greatly interested me, and I cannot but hope that some of these schemes will be tried out in a manner to determine their practical value. W. A. BARRETT.

Nanticoke, Penn.

[The scheme suggested by this correspondent, in respect to what he styles a "gas mine," will hardly be considered as a safe proposition in connection with a mine that is being operated. The driving of a heading into and through the center of a barrier pillar would hardly conform to the requirements of the state mining law, which requires a solid pillar of coal as a protection against water and gas proceeding from the abandoned workings of adjoining mines. We shall be glad to hear from any of our readers who may have some practical thoughts and ideas along the line of conserving waste mine gases, which we all admit is a valuable field for investigation.—Editor.]

Mine Cars

Letter No. 1—In his recent article reviewing the anthracite industry for the past year, *Coal Age*, Jan. 26, p. 191, H. M. Crankshaw discusses certain improvements that have been accomplished in the modernization of the industry during that time. Concerning mine cars, he suggests that it is the logical thing to replace cars having antiquated stiff bearings by cars with roller bearings of a good modern design.

Judging from the extensive research work and dynamometer tests made within recent years, the results of which have been widely published in mining literature, there cannot be the slightest doubt about the truth of such a statement, as well as regarding the considerable saving effected in the total cost of haulage resulting from the use of easy running roller-bearing cars. It is self-evident, that, in comparing costs, two mines of about the same size should be selected, one for each type of rolling stock. Each mine should be laid out to best suit the particular kind of running gear in use. When, however, Mr. Crankshaw states that "it does not pay to mix roller-bearing cars with other rolling stock," I must disagree with him.

Inasmuch as it has been proven that roller-bearing cars are the least expensive in the end, it seems to me to be in the interest of any coal operator to change over his present equipment as fast as they come through the repair shop, where they have been sent owing to breakdowns or natural deterioration. It goes without saying that, during this changing-over period, the two types of cars will become mixed, more or less, but this period will be limited to a few months or a few years depending on the size of the mine and the facilities for such work. Coal companies having several mines in operation are solving this problem by starting to equip one mine at a time, throughout, with roller-bearing cars using up the remaining rolling stock in their other mines. In short, I do not see why a coal company should penalize itself forever, on account of a temporary inconvenience due to mixed rolling stock.

In concluding, I want to mention that I have been, personally, in a number of anthracite mines using mixed rolling stock, and have found that the miners soon discover which cars are pushing easily and which do not. With the present and future difficulty to attract and keep labor in the mines, I would consider this another and quite as important a reason for the speedy weeding out of old-fashioned equipment. L. B. PAUL.

East Orange, N. J.

Coal Production and Booze

Letter No. 5—I was interested in reading the excellent letter of J. H. Tipton, *Coal Age*, Jan. 19, p. 156, regarding the effect of booze on the production of coal. Like him, I have wondered that this subject has not attracted more attention than it has, and that mining men in particular have not availed themselves of every opportunity to denounce what is quite generally admitted to be the greatest evil with which the coal-mining industry has to contend.

Many reasons might be given why the booze question has not aroused the efforts of coal-mine officials to action. It may be that they have had to contend so long with the effects of the drink habit among miners that they have become calloused to these conditions and strive to endure rather than to oppose them. My observation and reading, alike, convince me that the coal-mining industry has no greater enemy. I would say that the American people have not a greater enemy, even in the Kaiser and his allies.

No one will take me as having pro-German inclinations, however, when I say that my father and grandfather were both born in this country, which gives me a just claim to American citizenship. I have made the reference to the Kaiser merely to emphasize the fact that I believe the wide spread of the drink habit in this country is the blackest spot on American history, and no American who loves his country and is loyal will encourage the liquor traffic.

How Drink Affects Otherwise Good Workers

As an illustration of the effect of the drink habit on men, allow me to cite one instance of a fine fellow who worked for me, in the mine of which I had charge. He was a good worker; go into his place when you would you would always find him singing or whistling, and it was good music. But, when payday came, you could rest assured that he would not be in his place again as long as he had anything left with which to buy drink.

I recall one day he had a large pay coming, but did not show up at the mine in time to receive his check. He went directly to my house only to be told that I was then at another mine, paying off the men there. When he reached the place he was told that I had left a short time previous to take the train for the mines below. He hurried to the station and boarded the same train himself, but was forced to ride two miles down the track where I was waiting to take the train.

He received his check, but his troubles did not end there, as the bank refused to cash the check before it was O.K.'d by the paymaster; and to get this he was compelled to pay 25c. telephone charges. Notwithstanding he had been out two weeks before, the man did not show up again for three weeks more, making five weeks' lost time. During that period he could have mined and loaded 200 tons of coal, which shows the great loss to the country through the drink habit of one miner only in five weeks.

Observation compels me to think that one possible reason why the booze matter is not more steadily opposed by mine officials is that many of them are too anxious to indulge in the habit themselves. I wish this were not the case; but in more than one instance, I have seen men who hold responsible positions in the mine enter barrooms and drink with their men. It is unnecessary to say that this places the mine official in a very embarrassing position when men neglect their work by reason of boozing.

Effect on the Man Who Does Not Drink

The question is often asked, "Does it hurt the man who does not drink?" The answer is, Not directly, but indirectly. It destroys the social atmosphere of a place and not only makes it unfit for living but a dangerous place in which to bring up a family of children. Indirectly, it increases the cost of living, as many drinkers fail to pay their bills and the prices of goods, at the store, are forced upward to meet the deficiency.

Again, the man who works with a buddy who drinks must often lose a day when his drinking partner does not come to work. Then, for a day or so after he returns he is hardly a safe man. It is a frequent occurrence for daymen and miners, coming to the mine the day after payday, to find that the mine cannot run for lack of men. Much of the expense continues whether the mine runs or not, and the cost of production is increased. The country loses the coal and its cost to the consumer is increased. The town merchants lose, because the money that should come to them for goods goes to the saloon.

The question before us is, What can we do to rid the country of this curse and help the production of coal, which is so much needed at this time? If the coal administrator would consider this question and make some effort to cut off the supply of drink to coal-mining districts, he would accomplish a great task and one that would return him four-fold. His biggest job would then be to dispose of the coal that the mines would produce.

S. D. HAINLEY.

Osceola Mills, Penn.

Shaft vs. Slope Opening

Letter No. 4—It seems to me that the arguments advanced in Letter No. 2, *Coal Age*, Dec. 8, p. 989, and Letter No. 3, Dec. 29, p. 1110, favoring a shaft in place of a slope opening, are not convincing.

The writer of Letter No. 2 refers to the necessity of moving the pump as one objection to sinking a slope. But, the suction lift of a pump being dependent only on the vertical height of the pump above the water in the sump, disregarding the friction of the suction pipe as being nominal, it is unnecessary to move the pump in a slope oftener than in a shaft, and the difficulty of moving it is more imaginary than real.

In a shaft, the expense of providing cages, guides and other shaft equipment will nearly or quite offset the cost of rails, extra length of rope, and electric cables, pipe lines, etc., so that the difference is hardly worth considering. In regard to ventilation, if the sectional area of the slope is equal to that of the shaft, there is no appreciable difference, here also, between these two types of openings. In fact it seems to me that the various objections offered are hardly realized in actual practice.

Hoisting on Steep Slopes

The writer of Letter No. 3 objects to a slope having an inclination greater than 15 deg., or 27 per cent. grade. I would draw his attention to the fact that there are numerous slopes, in various parts of the country, having a grade of 30 deg. or more, and these are operated with perfect satisfaction. Simple devices are employed to prevent coal rolling off the cars in hoisting. These devices do not interfere with the loading or dumping of the cars. It is worthy of note that a slope can be sunk on a uniform grade, which will permit of a steady haul and reduce the tendency of coal to fall off the cars. My preference would be, in this case, to sink a 30-deg. slope whose length would be $118 \div \sin 30^\circ = 118 \div 0.5 =$ 236 ft., instead of the 437-ft. slope mentioned, having an inclination of 15 degrees.

Assuming, as suggested in this letter, there are from 18 to 29 ft., or double that amount of gravel, sand or other soft strata that must be passed through before the coal is reached, it is not clear to my mind why this would present any greater difficulty in the sinking of a slope than in sinking a shaft. When sinking a slope through such strata, forepoles can be used and good timber frames placed in position, until solid formation is reached. In the case of a shaft, there is more difficulty in keeping the alignment when passing through such strata than is found in sinking a slope.

It is true, however, that if the ground to be passed through is mostly bad, the upkeep of a slope will be more expensive than that of a shaft. Otherwise, I would favor a slope opening in the case mentioned, for the reason that the extra cost of timbering a shaft, constructing the headframe and supplying other equipment not needed in a slope will, I believe, more than offset the extra length of slope to be driven.

Comparison of Shaft and Slope Hoists

The following brief comparison between the capacity of a slope and a shaft, for hoisting coal, would seem to favor the former type of opening: For example, assuming a 30-deg. slope, where three 1½-ton cars are hoisted every two minutes, the output is 135 tons per hour, or 1080 tons in an eight-hour shift. This estimate makes a liberal allowance for the time of hoisting a single trip and returning the empties to the foot of the slope where a loaded trip is waiting to be hoisted. At the slope bottom, the track should be arranged so that the empties will run toward the mine while the loads gravitate toward the slope bottom.

When hoisting in a shaft, a motorman and a helper could handle a fair output and handle, say a 15-car trip on a half-mile haul in 20 min., running at a speed of 6 miles per hour and making due allowance for switch-

ing and starting and stopping each trip. This would represent an output of three trips, or 45 cars, making 67.5 tons per hour, or 540 tons in an eight-hour shift. To equal the capacity of the slope, in this case, it would be necessary to hoist two cars at a time in a shaft.

If rapid development is required, a single track slope can be sunk first; and this can be widened from the bottom up, as the mine is being developed, without interfering with the hoisting of coal. Surface arrangements, in either style of opening, must be largely governed by local conditions. One plan that has worked well in hoisting from a slope is to haul the loaded trip up an incline to a dumping floor above the mouth of the slope, where the entire trip is dumped in a single operation by means of a rotary dump. This plan cannot be used in a shaft opening.

Where the railroad runs close to the shaft, and the latter is equipped with self-dumping cages and coal conveyors, the shaft has much to recommend it, in respect to economy of handling coal at the surface. I agree with the suggestion made in this letter that the advice of a competent engineer should be sought in deciding these matters.

In considering a slope opening, it is important to provide against the slipping of the track down the slope. This must be avoided by anchoring the track by the use of long ties or cross-timbers at frequent intervals. These are hitched into the strata on each side of the track. To give rigidity to the track, 30- or 40-lb. iron must be used, fishplated and spiked well to the ties. When the track is well ballasted there is no reason why it should not last for years with little attention.

———, Wash. MINE BOSS.

Answering Examination Questions

Letter No. 2—Referring to the letter of Joseph A. Greaves, *Coal Age*, Jan. 19, p. 158, I want to say that his idea of arranging a key to the mining law, so as to fix in the memory all the requirements of the law in respect to different operations performed in the mine, is good. It is an effective, yet simple, method of memorizing what the mine boss should know and which he is apt to forget when attending to his many duties in the mine.

In general, it may be said that the state mining law covers practically every point relating to the health and safety of mine employees, and it is these points that are mostly emphasized and treated in the examination of candidates for mining positions.

EMPHASIZING IMPORTANT POINTS IN MINE LAW

I assume that Mr. Greaves has observed that there is much duplication in the several articles of the mining law to which he has referred, but this fact merely emphasizes the importance of those points and the repetition in the law is not a bad feature, since too much emphasis cannot be placed on the necessity of being thoroughly familiar with every requirement of the law, especially those on which the safety and efficiency of coal mining depends. It is well to remember, however, that the method of securing and retaining this information should not be so mechanical that it will tend to lessen the exercise of one's faculties for thinking and using his best judgment.

Therefore, while our answers to examination questions should conform to the requirements of the mining law, they should also partake of a practical nature that will show the examining board that a candidate has a practical knowledge of mining beyond what he has studied and read. Let me say, here, that the questions themselves should be such as to call forth a candidate's practical knowledge of the operation of the mine in respect to safety and economy.

IMPORTANCE OF PENALTY ENACTMENTS

There appears to be one point that Mr. Greaves has seemingly overlooked in his analysis of mining law. I refer to the penalties enacted for the violation of its requirements. It seems to me to be very important that a man should know what the penalty is for the violation of any section of the law. For example, there is a minimum and a maximum fine or imprisonment, or both, for the violation of any of the requirements in respect to blasting in coal mines.

A knowledge of these penalties would command more respect for the law and decrease the dangerous practices of miners that frequently exact such a tremendous toll on life and health. A hunter usually knows the penalty for violation of the game laws and, in the same manner, every miner should know the penalty for violation of the mining laws. W. H. NOONE.

Thomas, W. Va.

Clearing a Heading of Gas

Letter No. 7—I have been reading the letters on this subject, and the suggestion of hanging a canvas in the return airway 90 ft. back from the face reminds me of an attempt I once made to block the gas, at the face of a heading, and prevent its coming out into the airway, long enough to allow a machine to cut the coal in the last room.

For this purpose, I hung the canvas as close to the face of the heading as I could approach. After waiting some time, I found that the canvas did little good where it was, as the gas was still too strong to permit the machine to operate in the room. Therefore, I abandoned the idea and determined to clear out the gas in the usual manner, by extending a line of brattice from the last crosscut to the face, along the rib of the heading.

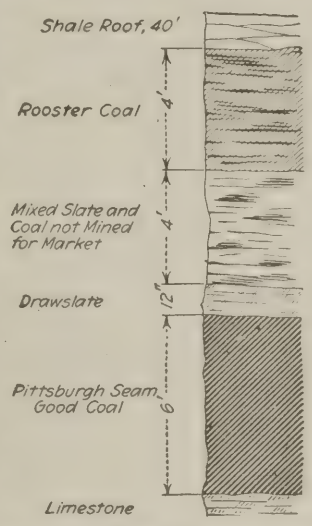
This had the desired effect and the gas was quickly moved, even before I had completed the extension of the brattice to the face, as it gave the air a straight shoot to the gas and swept it from the face.

Harrisburg, Ill. MINE EXAMINER.

Correction

Kindly permit me to call the attention of *Coal Age* to a misstatement in the article entitled "Illinois and Missouri Coal Fields," Jan. 12, p. 72. The last sentence in the second paragraph of this article should read as follows:

"But *below* that level, within the Illinois basin, about 1000 ft. of strata were *previously* deposited, which were entirely separated from and have no connection with the Missouri basin." GILBERT H. CADY



Urbana, Ill. State Geological Survey

INQUIRIES OF GENERAL INTEREST

"Rooster Coal," Pittsburgh No. 8 Seam

I am seeking information that I know many readers of *Coal Age* can give, in regard to working what is so widely known as the "rooster coal," which occurs in connection with and overlying the Pittsburgh No. 8 seam in many districts. What I desire, particularly, are the answers to certain questions, which I hope will be submitted through *Coal Age* to readers who have had practical experience in the working of this seam. The questions are as follows:

1. Is it practical to work the rooster coal with rooms 24 ft. wide?
2. If this is considered practicable, explain how the rooms should be ventilated.
3. What percentage of this seam is usually recovered, in the present system of mining?
4. What steps should be taken to insure safety and comply with the requirements of the Pennsylvania Mining Law, in the working of the rooster coal?

SECTION OF PITTSBURGH SEAM

The accompanying figure shows a section of the seam as it occurs in the locality that I have in mind. As here shown, the lower 6-ft. seam of coal, resting on a limestone bottom, is overlaid with 1 ft. of drawslate, above which is 4 ft. of mixed slate and coal, which is of too poor quality to be mined for market use, but makes a fair roof. Overlying this stratum is 4 ft. of rooster coal, with 40 ft. of good shale roof.

Any information regarding the most practical and economical method of working this seam will be greatly appreciated. MINE FOREMAN.

Cumberland, Md.

Coal Age gladly submits this proposition to its practical readers who have had experience in working the Pittsburgh seam, and hopes that they will furnish this correspondent with the answers to the questions asked, as may be suggested by their own experience.

In general, it may be stated that the rooster coal partakes of the nature of a high-grade bony coal that, under ordinary normal mining conditions, is not considered marketable. At the present time, however, when the demand for coal has so greatly exceeded the available supply, it is quite probable that much of this inferior coal will be marketed and used. We shall be glad if readers will give their opinions frankly, based on their experience in respect to the utility of rooster coal at the present time, and explain their methods of working the two seams shown in the accompanying section, assuming, for argument, that the seam is overlaid with, say 200 ft. of cover.

Answers to this inquiry should be accompanied with sketches showing the proposed plan of working. The order of working the two seams should be plainly stated and the difficulties to be encountered and overcome fully explained. These factors can only be correctly judged and provided for by those who have had experience under similar conditions and are familiar with the peculiar character of the Pittsburgh seam and the overlying formations.

Divining Coal Beneath the Surface

Kindly state whether it is possible, by any means, to detect the presence of underlying coal seams that do not outcrop on the surface, except by drilling or sinking prospect holes. I do not refer, now, to observing any physical conditions that might suggest the presence of coal seams because of a geological knowledge that discloses the coal formations; but I have understood that there is a device, the use of which will enable one to discover the presence of coal or other minerals lying beneath the ground. If there is such a device, I am interested in knowing where it can be procured.

Niagara Falls, N. Y. PROSPECTOR.

There is no such device as that referred to by this correspondent. The presence of underlying coal seams must be ascertained either by an intimate knowledge of the geological formations and a close study of the local conditions, or by sinking prospect holes or drilling.

This inquiry reminds one of the old "divining rod," which was formerly used to detect the presence of water beneath the surface, for the purpose of ascertaining the best location for sinking a well for water supply. The divining rod consisted of a simple hazel twig, which was held lightly in his hand, by the prospector, as he walked over the surface.

It was assumed that where the twig inclined downward water could be found beneath the ground, and many wells have been located and sunk for water depending on this belief. The method, however, did not always prove infallible, and the failures that occurred have caused faith in the hazel twig as a divining rod to wane, although some can still be found, in the western wilds, whose faith remains unshaken.

For the detection of some minerals, particularly iron, nickel, or other magnetic substances, the dipping needle is frequently used. This consists of a magnetic needle mounted in a vertical plane. The prospector holds the instrument in his hand, as he walks over the surface, and observes closely its deflection in certain localities where the ore may lie nearer to the surface.

EXAMINATION QUESTIONS

Alabama First-Class Examination, Birmingham, Jan. 21-24, 1918

(*Selected Questions*)

Ques.—If you had charge of a mine, with 10 in. of drawslate over the coal, what instructions would you give your men in regard to timbering?

Ans.—When mining coal under a 10-in. drawslate, posts should be set not more than 4 ft. apart, or less where the slate has a tendency to fall between the timbers. In driving rooms 7 or 8 yd. in width, the miner should be instructed to keep two rows of posts behind him, the rows to be not more than 4 ft. apart and the first row not more than 6 ft. from the face of the coal. The posts in the two rows should be staggered; that is to say, those in one row should not be set behind those in the preceding row, but halfway between them. As the face is advanced, the posts in the back row must be drawn and the slate allowed to fall. These posts are then reset nearer to the face of the coal. Where the coal is cut by machines, it may be necessary to draw and reset each post, at the face, in order to allow the machine to work.

Ques.—What is the rubbing surface in an airway 4 ft. high, 9 ft. wide and 1000 ft. long?

Ans.—The perimeter of this airway is $2(4 + 9) = 26$ ft. The rubbing surface is, therefore, $1000 \times 26 = 26{,}000$ square feet.

Ques.—What dangers arise from lack of judgment in placing shots?

Ans.—When a shot is improperly placed, the charge of powder is unable to perform the work expected, and either blows the tamping from the hole or cracks the coal without throwing it down. In either case, the force of the explosion is expended largely on the air. When a shot blows its tamping it is called a "blownout shot"; but if the shot merely cracks the coal without breaking it down, there results what is called a "windy shot." In either case, flame at a high temperature is projected from the hole or through the crevices made in the coal. Under these conditions, a large quantity of fine dust will be blown into the air by the force of the blast. This dust, acted upon by the flame of the explosion, is converted into gas so rapidly that a dust explosion is produced.

Ques.—What conditions would guide you in determining the width of headings and rooms?

Ans.—The width of headings is determined not only by the practical requirements of the mine in respect to haulage, drainage and ventilation; but, also, by the depth of cover, thickness and inclination of the seam, character of the roof, floor and coal, and the length of time the heading must be kept open.

The width of rooms is determined by the depth of cover, character of the roof, floor and coal, the system of mining employed, and the time the rooms must be kept open. The width of the room must also bear a fixed relation to the width of pillar, both being determined by the conditions just named.

Ques.—What percentage of relative humidity would you consider necessary in a dry and dusty mine?

Ans.—It would be difficult to maintain a constant percentage of moisture, in the mine air, where the mine is dry and dusty, since the relative humidity or percentage of moisture in the air depends not only on the weight of moisture contained in a cubic foot of air but, likewise, on the temperature of the air. The weight of moisture, per cubic foot of air carried into the mine, will depend on the degree of humidity and the intake temperature, both of which are variable.

Where artificial means are used to maintain the humidity of the air current, in a mine, better results are obtained; but the moisture is alternately deposited and absorbed, at intervals, in the passage of the current through the mines. Mine air is most healthful and work is less exhausting when the relative humidity is from 60 to 70 deg. On the other hand, it may be assumed that less danger will arise from the presence of dust when mine air is fully saturated. Such a condition, however, is rare, in a dry and dusty mine.

Ques.—What quantity of air will be necessary to ventilate a mine in which 200 men and 10 mules are employed?

Ans.—Sec. 40 of the Mining Law of Alabama requires the operator or superintendent of a coal mine to maintain "ample means of ventilation for the circulation of air . . . to an extent that will dilute, carry off and render harmless the noxious and explosive gases generated in the mine." The law requires not less than 100 cu.ft. per min. per man and 500 cu.ft. per mule or horse, which would mean, in this case, the circulation of $200 \times 100 + 10 \times 500 = 25{,}000$ cu.ft. of air per minute. As much more may be required as the condition of the mine with respect to gas may demand.

Ques.—What are the dangers due to shotfiring, in gaseous mines? What precautions are necessary to prevent the same?

Ans.—In the firing of shots, in gaseous mines, the danger always exists of the possible ignition of the gas accumulated at the face or issuing from the coal as a feeder. To avoid danger, in the former case, no shots should be fired before the place is examined for gas and found to be safe. Care should then be taken not to overcharge the hole, and good judgment should be used in placing and tamping the shot, to avoid a blownout or windy shot. All accumulations of dust must be removed from the working face and the place thoroughly sprinkled immediately before firing. Not more than one shot should be fired in a close place, at one time. As a further precaution, all holes should be examined, charged, tamped and fired by competent shotfirers authorized to refuse to fire any shots that, in their judgment, are unsafe.

COAL AND COKE NEWS

Harrisburg, Penn.

In response to a questionnaire sent out by Fuel Administrator H. A. Garfield, the fuel administrator for the Pittsburgh district has estimated the amount of coal saved by the five-day shutdown of industry and succeeding "heatless Mondays." About 500,000 tons of coal have been saved so far in the district.

The unprecedented congestion on the Reading Ry. system took into the hard-coal region President Dice, General Manager F. M. Falck, Vice President Ewing, and other high officials of the company. A thorough investigation of railroad conditions was made all along the road, with the result that the greatest shakeup in the history of the Reading Railway Co. came. Superintendents were ousted, trainmasters were changed from one place to another, and from out of the maze of shakeups came the placing of practical railroad men—men of the "old school," as railroaders put it—at the reins. The effect of this old blood thus injected was evident in every vein of Reading transportation service. Coal began to move with a regularity that made possible a more thorough and familiar delivery to collieries of empty cars and the prompt removal of loaded cars.

On one of the visits of the officials of the Reading Railway Co. thirty cars of coal were discovered snowbound at a siding of the Shamokin division. Inquiry revealed that these same thirty cars had been standing on the siding for almost a month, without any effort made to convey them to the main line for transportation to their scheduled destination. This was one of the conditions that brought about the change of railroad officials and the elevation of the old and experienced practical railroaders to places until recently occupied by civil engineers.

To combat the practice of operators who ship coal of such poor quality that, experience, shows, it cannot be burned, Mr. Potter issued orders to county fuel administrators in the state to authorize the railroads to stop furnishing cars to every mine owner who failed to live up to the ruling that only standard coal was to be shipped.

The first case reported of seizure of coal was made by Baird Halberstadt, fuel administrator of Schuylkill County, when John Conway, inspector for that district, on Feb. 8 seized a quantity of so-called coal being placed on cars at Pioneer Island for shipment to New York and Philadelphia ports. The stuff, it is alleged, consisted largely of yellow dirt, slate and slag with small percentage of anything combustible. Tons of the stuff that was already loaded were ordered to be unloaded. A number of concerns in this section who have, it is alleged, been imposing on the public will be accorded similar treatment.

To put a stop to the mixture of 75 per cent. of buckwheat with pea coal, and about the same proportion of pea with chestnut, Mr. Potter on Feb. 9 issued an order to all operators that coal must be standardized strictly according to prepared sizes before shipment, on the threat of being prosecuted under the Lever act, which provides a $5000 fine or jail sentence.

Governor Brumbaugh has written a letter to the President of the United States asking that he prohibit the delivery of coal to breweries. In his letter to President Wilson, the Governor says:

"Pennsylvania produces substantially half the coal of the nation. We are now in great distress because of the lack of fuel for the homes and industries and institutions of the people of this commonwealth. The closing of our industries on defined days has brought slight relief and continued distress. Our working people have not the fuel to keep themselves and their loved ones warm. Our great industries, so essential to the well-being of our people, are hampered and hindered in their operations. Even our miners are without fuel at their homes and are working only part time because sufficient cars are not delivered at the mines to receive the output. Our schools are in many places closed for the lack of heat. Many of our churches cannot be used for divine services because there is no available coal to heat them. The outlook is most disquieting. The people of Pennsylvania are loyal and steadfast to national purposes and have always been so.

"But, Mr. President, in the name of our people, I beg to suggest that fuel should not be furnished to agencies that tear down and denied to agencies that build up the substantial fabric of spiritual good of productive genius in Pennsylvania. May I, therefore, suggest that you would be generally commended were you to exercise your high powers by denying coal to breweries and like concerns, and thus providing more coal for our homes, our schools, our hospitals, our churches and our industries. I appeal to you in this crisis, in these days of distress, to give thought to this matter and take such action as to you is wise. The situation is acute. The relief is needed. The remedy is with you."

Baird Halberstadt, fuel administrator for Schuylkill County, has announced the appointment of John Conway as United States Coal inspector for the county. Conway has had long experience as mine foreman and superintendent and has been instructed that no discrimination is to be shown in favor of any corporation, large or small.

It is expected this appointment will do much to correct the abuse of flooding the market with improperly prepared coal. Conway will inspect shipments from breakers, washeries, river receiving plants and culm banks as well as stocks in coal yards.

Investigation of the quality of coal shipped by anthracite operators, big and little, has brought to light such conditions as to cause the Federal Fuel Administration, through A. C. Campbell and Tudor Williams, administrators in Luzerne and Lackawanna Counties, to take summary action.

An order was issued by Mr. Campbell on Feb. 5 in behalf of the Fuel Administration that puts up the bars against any further sale of inferior and impure coal. The order, effective at once, is as follows:

"The United States Fuel Administration feels that no anthracite coal should be sold unless it has been prepared properly the customary way—that is, as it was in the beginning of the year 1914. Pursuant to instructions received, the Fuel Committee directs that you hereafter do not ship or sell any coal unless it has been prepared in the customary way, to wit: by passing the same through a breaker or a washery, so as to properly size and remove the rock, slate, dirt, and ashes from the coal. We demand that you will immediately comply with this order and send us a letter to that effect."

PENNSYLVANIA

Anthracite

Nanticoke—Anthracite collieries are threatened with a famine, and lack of water pressure is seriously hampering the production of coal. Nos. 6 and 7 collieries of the Pennsylvania Coal Co. were closed the greater part of several days because of water shortage. Other operations had low pressure and the coal output was not up to normal. Officials of the water companies declare that the situation is acute.

Scranton—Daniel Young, general superintendent of the Scranton Coal Co., suffered a fractured hip and severe bruises about the body, when caught under a fall of rock in the Capouse mine.

Wilkes-Barre—Freight congestion has seriously interfered with the supply of mining powder for local mines, and resort has been had in several cases to transfer of powder from one mine to another and use of the wrong grade of powders because the right was not available.

Sunbury—The Northumberland County Grand Jury has recommended that the county commissioners direct the assessors to increase the valuations placed on coal culm banks for taxable purposes. At the last biennial assessment the valuation of anthracite property in the county was raised from $4,500,000 to $7,000,000, by a board of mining engineers, working in conjunction with Judge Mosier, who was a mining engineer before becoming a lawyer, and the county commissioners.

Hazelton—Women cannot work at collieries except in a clerical capacity, declared officials of the United Mine Workers. This apparently settles the question raised by some operators who thought they might relieve the labor shortage by hiring females to do outside work and thus release men for employment underground. The law was quoted which states that "women cannot work in or about the mines of this commonwealth."

Mauch Chunk—What may prove to be a disastrous fire has been discovered in the No. 11 colliery of the Lehigh Coal and Navigation Co. by one of the loaders who was drawing coal from a chute. The consensus of opinion seems to be that it is from the burning mines near-by. Everything possible is being done to head off serious trouble.

Bituminous

Johnstown—It is reported that many bituminous coal mines in Pennsylvania will suspend operations around Apr. 1, when most contracts expire, unless the Government price of $2.45 a ton at the mine is increased sufficiently to give the operators a "reasonable profit," or at least sufficient to permit them to break even.

Irwin—Four hundred miners employed at the Yough shaft of the Westmoreland Coal Co. were thrown out of employment by a fire in the boiler house.

Woodville—The fire in the coal mine at the county home, which has been burning since Jan. 27, is practically under control. The fire had been eating its way through a five-foot seam of Pittsburgh coal. The entrances to the mine had been sealed and then the workings were flooded. It will be necessary to open new entries and drain out the water.

WEST VIRGINIA

Quick—The first car of coal has been shipped from the mine here, which was recently opened by Lebow Brothers, of Charleston. The operation is located on the Kanawha & West Virginia Railway.

Wheeling—A new coal-mining concern, advertising as the "W-G" Co., (probably the Whitaker-Glessner Co., of Wheeling) is sinking a shaft for a coal mine on the property now occupied by a family by the name of Cage at Elm Grove. The work has been in progress for the past three weeks. If it proves to be the local concern, the new mine will undoubtedly be joined with the other mines of the concern, which extend to Wheeling Park (one mile from Elm Grove) from the company's offices.

KENTUCKY

Lexington—Work has been begun by the H. C. Frick Coke Co. on the development of coal fields in Harlan County. It is planned to spend $9,000,000. The maximum output is expected to be 2,000,000 tons of coal a year.

OHIO

McArthur—Stratton Brothers, who own the Ballard lands in Madison township, are preparing to open the coal on this land by stripping the surface over the coal.

Bellaire—The Star Coal Co., of which W. J. Watterson is president, has taken a lease on the mine of the Brooks Run Coal Co. and has already resumed charge.

Steubenville—Copper wire by the hundreds of pounds has been stolen from the coal mines of this vicinity during the past year, the last theft of this sort endangering the lives of nearly 100 miners at the Gilchrist No. 3 mine of the West Virginia Coal Co. On Saturday, Feb. 2, with about 100 men in the mine, the wire on the big fan which supplies air for the workings

was cut mysteriously. The theft was discovered in time to hastily repair the damage, and a tragedy was thus avoided. It is believed that the culprit has been caught.

INDIANA

Brazil—Franklin-Tandy-Lowish Coal Co., operating a large mine southwest of Staunton, have announced that a larger mine would be sunk on their land in the early spring. The offices of the company are in the Davis Trust Building.

Terre Haute—The tipple of Mine No. 5 of the Jackson Hill Coal and Coke Co. was burned on Feb. 12. The fire is declared by General Manager Kolsem to have been incendiary. Coal production will be cut down about 2000 tons a day until the mine can be reopened. This was the third mine tipple in this coal district destroyed by firebugs.

ILLINOIS

Benton—Twelve men were injured in the mine of the Benton Coal Co. recently, when the engineer of a cage which was being lowered into the mine lost control of his engine. Ten of the men were taken to the hospital at Ziegler.

Duquoin—Coal has been reached in both the main and air shafts of the new coal mine belonging to the Union Colliery Co., of St. Louis, Mo. The mine is located at Dowell, Ill., a new town near Duquoin. Coal was found in the air shaft at a depth of 220 ft. and in the main shaft at slightly more than that depth. The mine is said to be second to none in Illinois in capacity. A mine tipple and an office building will be erected, as well as a hotel, store, bank and houses for 1000 people.

Lincoln—The Lincoln Mining Co., operating one of the oldest established mines in central Illinois, has decided to close its mine and to discontinue the affairs of the company. The company has been unable to extinguish a fire which has been raging in the mine since Oct. 23, 1917, although six distinct attempts involving the expenditure of considerable money have been made to put out the fire. The company was organized in 1867 and began mining operations Dec. 15, 1869. Three seams of coal were passed through before the present 5-ft. seam was struck. The business was conducted for many years under the name of Harts & Frorer, but in 1905 was incorporated under the name of the Lincoln Mining Co. The company sustained destructive fires in 1883 and 1903.

Pana—Two hundred and fifty miners who refused to work in the Pana Coal Co.'s mine here for two weeks because the washhouse was not sufficiently warm for the changing of clothing have been fined $4 each by the Federal Fuel Administration. It is understood to be the first fine of its kind in the Illinois field.

Bush—The mine and washer here of the Western Coal and Mining Co., of St. Louis, has been entirely dismantled. The tipple and machinery have been removed to the Henderson-Wallace mine at Marion, where it will be used.

Zeigler—The Ziegler mine, which has been shut down for the last few months since the explosion, has been opened up, cleaned out and is now producing coal. This mine produced between 3000 and 4000 tons per day.

West Frankfort—For the first time in the history of southern Illinois the coal mines here have arranged with their men to work seven days a week, provided cars are available. The plan is to be worked out for a period of five weeks in an effort to increase local coal production. Six large mines are affected

Johnston City—Shaft No. 2 of the Johnston City Big Muddy Coal Co., controlled by P. H. Holland and others in Chicago, is now down to coal. It is expected that the mine will be on a producing basis some time in the early spring. It is located a mile and a half northwest of Johnston City.

Christopher—The old Moderwell mine here, which was shut down for several weeks, due to an explosion, has been opened up and is now producing.

Gillespie—A branch of the Northwestern R.R. is being built from here to the site of Mine No. 4 of the Superior Coal Co., which is to be the largest mine in the world, employing 2500 men and with a hoisting capacity of 8000 tons a day. The Superior company already has three mines here, one of which, No. 3, holds the world's record for hoisting 5550 tons in eight hours. The three mines employ 2500 men and the biweekly distribution of wages is about $125,000. The right of way for the Northwestern spur to the new mine was furnished by Gillespie business men.

Stonington—Following the gas explosion in the Stonington mine, which killed three miners, threats were made by friends of the victims that they would blow up the mine. The mine was idle one day because the men feared to go down, although half of them appeared at the shaft.

OKLAHOMA

Tulsa—Coal mines of Tulsa County, Oklahoma, are working at full capacity, both night and day, in an effort to meet emergency orders. The daily consumption of coal in and about Tulsa has been greatly increased within the last few weeks, due to the fact that many large industries that have been using natural gas for fuel are turning to coal because of the inadequacy of the gas supply in severe weather. The Cosden Oil Refinery, the largest plant of the kind in the world, has installed 110 large coal burners under its boilers and will consume 2500 tons of Dawson coal daily. New mines are being opened in Tulsa County, and it is said that the output of this county will be more than trebled in a few months. Practically all coal mined in Tulsa County is being used in Oklahoma.

Personals

S. A. Carson has sold his holdings in the Southern Connellsville Coal Co., of Uniontown, Penn., and has resigned as director and general manager. He will devote his time to other interests.

Frederick W. Bell, formerly superintendent of the Bessie mines, property of the Sloss-Sheffield Steel and Iron Co., of Birmingham, Ala., is now general manager of the Debordelaben Coal Co., of the same place.

Edmund Ewing, who for the past year has been safety mine inspector for the Alabama Coal Operators Association, has accepted a position with the Sloss-Sheffield Steel and Iron Co., of Birmingham, Ala., as superintendent of the Bessie mines.

John Rollo, who has been general manager of the Sunnyside Coal Co. at Herrin, Ill., for eighteen years, has resigned and is succeeded by John Goalby, former mine manager. The local union tendered the new superintendent a banquet and presented him with a diamond ring valued at $175.

C. H. Weiser has resigned as secretary of the St. Louis Fuel Committee as a result of criticism by State Administrator Crossley of Weiser's action in lifting the early-closing order the night before the time fixed by Crossley. Weiser's explanation was that it was done at the request of the Chamber of Commerce in compliment to visiting merchants. His successor has not been named.

A. H. Storrs, formerly a consulting engineer, of Scranton, Penn., has accepted the position of secretary of the War Committee of the Technical Societies of the Naval Consulting Board, his office being in Room 521, 15 Park Row, New York City. This war committee receives communications of inventors of war devices, sifts them and passes them on to subcommittees and committees of the various technical societies. When they are approved, they are reconsidered by the Naval Consulting Board.

John J. Shannon, for the past few years general superintendent of the Woodward Iron Co. furnaces at Birmingham, Ala., has been promoted to the position of general manager in charge of operations. For 42 years Mr. Shannon has been connected with furnace work in the Birmingham District, being first with the Tennessee Coal, Iron and Railroad Co., then the Sloss-Sheffield Steel and Iron Co. He was also connected with the Alabama Steel and Wire Co., at Gadsden, Ala., prior to his coming to the Woodward Iron Co.

Edward J. Newbaker, general superintendent of the Lehigh and Wilkes-Barre Coal Co. at Wilkes-Barre, has tendered his resignation to take effect Mar. 1, at which time he will enter the service of the Berwind-White Coal Mining Company, in the capacity of assistant general manager. He will be located at the headquarters of the company in the Commercial Trust Building, Philadelphia. Mr. Newbaker has been in the service of the Lehigh & Wilkes-Barre Coal Co. for the last 20 years, his first employment being on the engineering corps in the Honey Brook Division, from which position he was advanced to division engineer, and later to the position of division superintendent, which capacity he occupied until six years ago, when he was made superintendent of the company's operations.

Obituary

Daniel O'Hara, aged 85, a retired coal operator, died at his home in Washington, Penn., on Feb. 4.

Thomas M. Brewster, president of Brewster & Son, coal and lumber dealers of Ridgefield Park, N. J., died suddenly at Jacksonville, Fla., on Feb. 9.

Jenkin R. Daniels, mine foreman for the Consolidation Coal Co. at Hoffman, Md., died on Feb. 5 after an illness of one year. Mr. Daniels was born in Wales, coming to this country in his youth. He worked for a short period in the anthracite region at Scranton, Penn. He had been mine foreman at Hoffman for five years.

Foreign News

Vancouver, B. C.—Three hundred and fifty miners, said to have been mostly Germans, Austrians and Poles, attempted to wreck the Rosedale mine in the Calgary district on Feb. 2. To drive them off the police had to turn a machine gun on them. The mine is nonunion.

Sydney Mines, N. S. — On Feb. 2 the mayor and town council of Sydney mines petitioned the prime minister of Canada, the premier of Nova Scotia and the controller of Canada to compel the Nova Scotia Steel and Coal Co. and the Dominion Coal Co. to exchange submarine coal holdings on opposing sides of Sydney harbor, so that the operation of the mines of both concerns may be facilitated and the thicker seams in larger measures be available for operation.

Winnipeg, Manitoba, Can.—The chief inspector of coal mines in Alberta, John T. Stirling, on Feb. 4 advocated an embargo on United States coal for all points west of Winnipeg. He said that Alberta can easily furnish all the coal needed for that area. The preference for Pennsylvania coal he declares to be largely the outcome of habit.

Edmonton, Alta.—According to figures compiled by J. L. Sterling, of the Mines Branch of the Public Works Department, Alberta, the total output of coal for that province during 1917 was as follows: Lignite, 2,637,829 tons; bituminous, 2,206,868 tons; anthracite, 118,718 tons, and briquets, 93,818 tons. There were also 31,630 tons of coke burned. The figures for 1916 were lignite, 2,172,801 tons; bituminous, 2,335,259 tons; anthracite, 140,544 tons; briquets, 107,959 tons; coke, 41,950 tons. The total number of men employed in the coal mining industry was 9812 in 1917, as compared with 8599 in 1916.

Industrial News

Ironton, Ohio—The Ironton Engine Co. announces that F. C. Tomlinson has been elected as treasurer of the company. He assumed his duties on Dec. 1, 1917. H. A. Marting is president.

Wilton, Ky.—The Corum-Parker Coal Co., of Wilton, has filed notice of dissolution, stating that the corporation is winding up its existence. The notice is signed by J. L. Corum as president.

Pikeville, Ky.—The Keel Coal Co. has completed its organization plans, and will inaugurate operations at an early date for the development of 200 acres of coal lands recently acquired. J. L. Morgan is president and manager; D. T. Keel is vice president, and J. F. Pauly is secretary-treasurer.

Snyder, Tex.—A vein of good grade bituminous coal, 18 in. in thickness, was struck at a depth of 150 ft. in Scurry County, six miles west of here. A company is being organized and plans are being made for developing the property, for it is believed that a paying coal mine can be developed.

St. Louis, Mo.—Tabulations made by W. I. Jones, traffic manager of the St. Louis Fuel Committee, show that most of the coal delivered by the committee in the past five weeks to supply essential industries was taken from the railroads. The Missouri Pacific turned over 151 cars and the Frisco 111 cars in January.

Columbus, Ohio—At the annual stockholders' meeting of the Hocking Valley Products Co., operators and jobbers of coal, S. L. Chamberlaine, of New York, was reëlected president; Sidney S. Schuyler, vice president, and Frank J. Shaffner was elected secretary. Norbert Heinsheimer was elected assistant secretary-treasurer.

Columbus, Ohio—The Columbus Shippers Terminal Pool Association, which has now been in operation for about five weeks, is performing good service in the distribution of coal to the needy consumers. The pool has been handling on the average of about 80 cars daily. For the period covered from Jan. 5 to Jan. 31, the pool handled 535 cars of coal.

Columbus, Ohio—City Purchasing Agent Louis Guthke declared it seems practically impossible to buy coal for the Columbus municipal coal yard, recently created by council for relief of domestic consumers. Service Director Borden more than a week ago placed an order with Guthke for two car loads of lump coal, to be distributed in bushel lots from city firehouses, at cost, to consumers.

Columbus, Ohio—Governor Cox of Ohio called on Railroad Director General McAdoo last week in an effort to get more cars for Ohio mines. The governor was fortified with statistics secured from the Ohio Utilities Commission and from operators and miners. He had a pleasant talk with Mr. McAdoo and claims to have received some promises of a better car supply for Ohio mines.

Louisville, Ky.—Losses to river coal companies as a result of heavy running ice and gorges in the Ohio, Kentucky and other rivers of the state have been rather heavy, hundreds of tons of coal having been sunk, and many boats and barges. On the Kentucky River the flood carried away Lock No. 14, which has since resulted in stages too low for bringing coal out from the mines at Beattyville.

Columbus, Ohio—County Fuel Administrator Young has made an arrangement with several Hocking Valley operators to receive the output of several mines to supply the fuel needs of Columbus and Franklin county. As a result of this arrangement 72 cars of coal arrived within 24 hours after the plan was completed. Special attention will be given to the coal trains supplying Columbus.

Columbus, Ohio—The Maynard Coal Co. of this city, has purchased the coal docks at Duluth owned by the Hocking Valley R.R. and operated by the Boston Coal Dock and Wharf Co. The Maynard Company a few months ago purchased the Connors Point Dock at Superior, and will now be able to handle 1,000,000 tons of coal a year, to be supplied by Ohio, Kentucky and West Virginia mines.

Covington, Ky.—The grand jury reporting to the United States District Court here returned 61 indictments against coal operators in central and eastern Kentucky, charging violations of the executive order providing for prices of coal at the mines. The indictments resulted from investigations by special agents of the Fuel Administration, and these investigations are still under way, it is understood.

East Liverpool, Ohio—A model mining town is to be established at West Point, 11 miles north of here on the Youngstown & Ohio River R.R., by J. L. Francis, of this city, whose headquarters are at Salem. The company has over 1000 acres of coal, and is now producing at the rate of about 3,000 tons daily. This coal property is the largest that has ever been opened in this part of Columbiana County.

Sayreton, Ala.—The Roberts & Schaefer Co., engineers and contractors, Chicago, who are building the extensive fireproof tipple and coal washery for the Republic Iron and Steel Co. at Risco, Ala., have been awarded another contract by this company to rebuild the tipple and washery recently destroyed by fire at Sayreton. The new plant will be of fireproof construction and will cost approximately $200,000.

St. Louis, Mo.—The cost of the coal "input" is twice that of previous years. In former winters the universal price paid for putting the coal in the cellar was 1c. a bushel and the laborers kept it all. Now it is 2c. a bushel. Ten cents of the increase goes to the man who does the work and 15c. to the dealer. The dealers say the 15c. a ton covers the cost of bags, shovels, chutes and wheelbarrows furnished by them to the laborers.

Kansas City, Mo.—The Mayor and other city officials held a meeting here this week and appointed a delegation to go to Washington with Fuel Administrator Crossley of Missouri to protest to Fuel Administrator Garfield against the creating of zones that will prevent Kansas City and adjacent territory from getting Illinois coal. This privation, it is contended, will work a hardship that cannot be overcome by securing coal from other fields and the outlook is extremely grave.

Columbus, Ohio—Columbus coal men took a prominent part in the campaign in Columbus to secure $3,000,000 as a war chest to take care of all war relief work during the present year. A special soliciting team of coal men was named, of which G. A. Davis, of the Hitt-Davis Coal Co., is captain. Other members of the team are T. C. Collins, S. L. Comley, Paul Spence, George C. Weir, R. J. Framer, W. P. Plant, R. W. Rittenhouse, George F. Schwartz, C. M. Anderson and H. H. Leukhart.

Louisville, Ky.—The January Grand Jury in retiring recommended to the city that the latter purchase and operate its own coal mine for supplying city institutions with coal. The Board of Works announced later that under no consideration would the city own its own mine as it would cost too much to operate. J. M. Thompson, a mine operator of Central City, Ky., wrote the Board of Works, directly following the statement made by the Grand Jury, offering to sell a mine, but the offer was declined.

Murphysboro, Ill.—Railroad trainmen here complain that crews are needlessly delayed along the lines in what appears to them an effort on the part of the roads to break the prevailing eight-hour service law. A number of trainmen say that such delays are frequent and apparently without real cause. This is prevalent on the M. & O. in particular, and it is understood to prevail on nearly all roads in southern Illinois. This is one reason why coal has not been transported from the mines to the market.

Whitesburg, Ky.—It has been announced that the Garey Coal Co., of Lexington, Ky., recently organized, capital $50,000, will start developments of coal properties on the Louisville & Nashville branch into Perry County. The Elkhorn Block Coal Co., composed of Tennessee people, is at work on a coal development project below Jenkins, Ky., on the Baltimore & Ohio R.R., where the Reuben Anderson coal property is being developed. It is said that a new mining town will be built here and operations carried on at a large scale.

Columbus, Ohio—John H. Winders, as receiver for the Sunday Creek Coal Co., has filed a receipt in the common pleas court showing the claims against that company. The claims aggregate more than a half million dollars. The largest, $228,000, is held by the New York Coal Co., on royalty claims. Similar claims of $88,000 and $25,000 are held respectively by the Imperial Coal Co. and the estate of J. B. Tompkins. The Central Trust Company of New York holds a claim of $153,000 against collateral trust bonds. Practically all of these claims, except that of the trust company, are in dispute.

Columbus, Ohio—Bids will be opened Feb. 25 by George A. Borden, president of the board of purchase, and Louis K. Guthke for approximately 35,000 tons of coal for the various city departments. The advertisements contain the usual provisions such as deposits of 50 per cent. of the amount of the contract. The amounts of coal required are 5800 tons of mine-run or nut, pea and slack for the garbage-reduction plant; 12,500 tons of nut, pea and slack for the waterworks department; 15,000 tons of nut, pea and slack for the municipal light plant; 900 tons of lump for the workhouse and several smaller amounts.

Cincinnati, Ohio—In order to distribute coal to consumers in the congested districts of the city who were unable to secure ton lots, the city of Cincinnati has adopted the plan of placing coal at the fire-engine houses, where small consumers can secure bushel lots for emergency needs. This plan was resorted to in the severe weather during the early part of last week, and proved useful in getting to people who would otherwise have been compelled to go without. Several large retail dealers furnished trucks to haul the coal to the stations. Most of this coal was sold at 30c. a bushel, although some was distributed free of charge to needy families.

Cincinnati, Ohio—At a meeting held in Cincinnati on Feb. 4, attended by coal operators, rail officials and members of the Fuel Administration, plans for complete coöperation in forwarding and distributing coal, in order that essential needs might be supplied, were thoroughly discussed, and assurance was given that public utilities, at least, would be supplied with coal, in order to avert threatened widespread distress. The meeting secured immediate touch with the Fuel Administration's Washington headquarters by telephone, and was assured that Cincinnati would be supplied with as much coal as was necessary to meet pressing needs.

Youngstown, Ohio—The Republic Iron and Steel Co. has confirmed the purchase of the Bessemer Coal and Coke Co.'s coal properties in Pennslyvania, consisting of about 3000 acres of coking coal, with two shaft openings and a capacity of about 2000 tons a day, and has been operating them since Jan. 1 through the Woodside Coke Co., a subsidiary company. J. W. Deetrick, vice president of the Republic company, in charge of its fuel operations, is handling the business. The properties are located in Allegheny County, Pennsylvania, and constitute about one-third of the company's coal production, which, at full capacity, give it all of the 6000 tons a day required in its extensive steel operations.

Louisville, Ky.—A special Federal grand jury at Covington, Ky., on Feb. 2 returned indictments against 60 coal operators, a majority of whom are operating in eastern Kentucky sections, charging these operators with violation of the orders of the Fuel Administration, in that they are charging prices in excess of those set by the administration. Leading coal operators of Kentucky have stated that most of these indictments have been returned against the small wagon mines, which never recognize a market price at any time, and who are always a source of great trouble. Some of the larger operators are in hopes that such operators will be dealt with harshly and feel that it should be done under existing conditions.

Charleston, W. Va.—A new scale of demurrage charges has been placed in effect, beginning Feb. 10, by the West Virginia Public Service Commission, cancelling the schedule of demurrage rates placed in effect Jan. 21, and providing for 48 hours' free time for loading or unloading, and 24 hours on cars held for any other purpose permitted by the tariff. New demurrage charges on all cars after the expiration of free time will be $3 for each of the first four days, $6 for each of the next three days, and $10 for each succeeding day. The Commission intends the new charges to expedite the movement of cars and to relieve, to that extent, the shortage of cars which continues to hamper the output of the mines.

St. Louis, Mo.—The Union Electric Light and Power Co. will hereafter operate its own coal mine under the name of the Union Colliery Co. The company has 420 acres a few miles south of Duquoin, where a main shaft and air shaft have been sunk to a thick coal vein at the depth of 225 feet. Development work is being rushed. Office buildings and tipple are being erected and contracts are let for a hotel, bank and store buildings and dwellings. The town is to be called Dowell. Between 1200 and 1500 men are to be employed. The maximum output will be 5f tons a day. It will be operated by electricity under a contract with the Central Illinois Public Service Co. The capital stock is $250,000, all held by the Union Electric. A total expenditure of $800,000 is contemplated.

Cincinnati, Ohio—An interesting development of the coal shortage in Cincinnati is a special mission sent by the Hamilton County Fuel Administration to the coal fields of the Jackson and Wellston district, in Ohio, to secure the shipment of fuel to Cincinnati, if possible, although under normal conditions little of this coal comes to the river, most of it going north, while Cincinnati is supplied from West Virginia and eastern Kentucky. The Fuel Administration is prepared to buy for cash from Ohio operators who are in a position to forward coal to Cincinnati, and hopes to be able to secure some fuel by this means. Display advertisements in newspapers in the Ohio coal fields were used to call the attention of miners and operators alike to the distress existing in Cincinnati, and urging them to assist in relieving it by forwarding coal.

MARKET DEPARTMENT

Weekly Review

TIRED of playing the villain, the weather man early last week evidently came to the conclusion that he would essay the rôle of all-round good fellow. The result was sunshine and warmer weather. The new guise proved more than acceptable to shivering humanity, and the nation began to sit up and smile. However, it is far too soon to begin to crow, for it will be well along in the early spring before conditions in the industry will assume any semblance of stability.

The let-up in the urgent demand for domestic fuel has enabled a partial increase in the filling of industrial requirements in some quarters, though conditions in New England are far from favorable. There is still a great scarcity of steam grades, and cities in the interior are in a bad way for fuel, principally anthracite.

The use of bituminous coal has been advocated in many quarters where formerly anthracite had been burned. Some municipalities have practically suspended their smoke ordinances for the time being, the authorities evidently taking the broad viewpoint that it is better to have a little smoke and some heat rather than compel their industries to shut down and their citizens to freeze.

The effects of the recent blizzard are still being felt by the railroads, and reports from all over the country seem to emphasize the fact that transportation—or rather the lack of motive power—is still a factor which exerts a demoralizing effect on coal production. Scores of locomotives are laid up in the repair shops, and hundreds of switches which are frozen tight require attention. The work in the railroad shops should be speeded up to the highest possible pitch.

The rise in temperature has also brought to Uncle Sam's railroads the menace of floods. In many regions tracks were washed out and severe damage was done by the torrents from melting snow. Quite a few mines were flooded. With the thaw many collieries that suspended because of zero weather are now running.

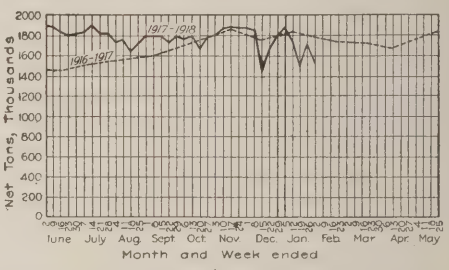
The general freight situation is showing signs of improvement, and another cause for congratulation is that there are not many supply ships being delayed in New York harbor for lack of fuel.

Inadequate car supply, as ever, is the one bugaboo that the operators do not seem to be able to overcome. The United States Geological Survey shows that during the week of Jan. 26 production for the country as a whole amounted to 66.1 per cent. of capacity; and the one dominant factor limiting production is car supply. To this cause were ascribed losses amounting to 26.6 per cent. of full-time capacity, as against 7.3 per cent. for all other causes combined.

Mine workers' locals in two Ohio districts have indorsed resolutions petitioning Director General of Railroads McAdoo to suspend the operation of passenger trains one or two days each week, and to use the engines thus released for the hauling of empties to the mines.

Such a course is worth a trial. Business houses could be informed, for instance, that passenger trains would not operate on Tuesdays and Fridays of every week, and traveling men could adjust their schedules accordingly. In the event that Government officials found it necessary to reach certain points on these days, coaches could be attached to the rear end of mail trains. If sufficient warning of such a plan were given, it would meet with much less opposition than did the Fuel Administration's workless-days order.

Speaking of this order, now a thing of the past, it is universally acknowledged that though it saved little fuel, it helped considerably to relieve freight congestion. No less a person than Secretary McAdoo was against a continuance of the measure, as he feared that to adhere to the plan would seriously affect the taking up of the next Liberty Loan.



Dr. Garfield states that there will be no necessity for the shutting down of industry in the future, as he believes it possible henceforth to rely upon embargoes and the preference in the movement of food and fuel.

Operators in Washington are up in the air as regards the policy of the Fuel Administration. If that body would come out with a definite statement of its attitude on contracts, its feelings toward jobbers, and its intentions regarding prices, it would go far toward clearing up a great deal of uncertainty. Many operators are marking time insofar as the purchases of machinery and equipment are concerned, for they have no means of knowing if the new price schedule would justify any considerable investment in extensions to plant.

The few days of warm weather have brought a general feeling of optimism, a feeling it was impossible to experience with the thermometer reading zero and no fuel in sight.

COAL PRODUCTION

For the third time in two months the rate of production fell below 1,600,000 tons per working day, a drop of more than 200,000 tons as compared with the normal. The total production of bituminous coal during the week ended Feb. 2, including lignite and coal made into coke, is estimated at 9,423,000 tons. The output of

beehive coke continued to decline. Production for the week is estimated at only 446,000 tons, or 74,000 tons per working day. Shipments of anthracite were reported as 34,804 cars, as compared with 33,406 during the preceding week.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Jan. 12	Jan. 19	Jan. 26	Feb. 2
Bituminous shipments, 121 roads	180,411	150,865*	181,471*	170,131†
Anthracite shipments, 9 roads	36,178	31,861	33,406*	34,804†
Beehive coke shipments, 4 roads	11,560	10,826	10,408*	9,161†

*Revised from last report. † Subject to revision.

Atlantic Seaboard

BOSTON

New England situation progressively worse, although less strenuous weather gives a hopeful turn. Railroads and domestic consumers have priority over manufacturers in distribution through the Fuel Administration. Cargoes of "Storrow coal" arriving are parcelled out only to consumers high on the preferred list. Hampton Roads loading improves somewhat. Several important utilities were on point of shutting down when coal arrived. Rail movement slightly easier. Anthracite extremely scarce and bituminous much sought for domestic use.

Bituminous—Throughout New England there are cases of extreme distress through lack of coal. In a city near Boston the local fuel committee asked for authority to pull down unoccupied wooden houses, there being not a ton either of anthracite or bituminous in the yard of any dealer in the place. Supplies for water and sewerage pumping stations, hospitals and other vital needs have had to be rushed out from meager emergency piles at Boston, such as the reserve supply belonging to the Navy Department. The railroads, too, have responded handsomely. The Maine Central has been kept running by fuel taken from the New Haven, and the Boston & Albany has lent coal to the Central Vermont to tide it over until boats could arrive at New London, Conn., its southern terminus.

Under the circumstances, from what limited supplies are at its disposal, the New England Fuel Administration can only furnish weekly supplies to the priorities named in Schedule A of the Garfield order of Jan. 17, to the exclusion of manufacturers of every kind. The situation of industrials is rapidly getting to an extremely acute stage, for unless fuel is forthcoming in greater volume soon, some important plants will have to close their doors.

The extreme cold of Feb. 4 and 5 again slowed up the movement of boats. Ice conditions in Nantucket Sound were unusually severe, even for this winter, and none but steamers following the outside route were

able to make Boston. Besides coal for the Navy the arrivals have only been enough to keep running the largest utilities; others have managed to scrape along by means either of emergency shipments rushed from neighboring places or through the use of buckwheat, silt and screenings. They are making their slender stocks go as far as possible.

One fortunate happening gave Boston a real thrill this week. A British collier was reported in the offing, sent here with Welsh coal for British warships when it had appeared the supply for bunkering at various ports was at least doubtful. The diversion of the ship to Boston was accomplished through the British embassy.

It still remains a remarkable fact that while there are constant reports that large plants are about to close down the number of actual shutdowns of that kind is relatively small. Of course, the pass to which things have come has roused every manufacturer to make his representation to the Fuel Administration in order to get his share of the emergency coal that is being distributed. Several instances have come to light where industrial plants are in full operation with more or less reserve supply of fuel, and in the same town there are retail dealers without a pound of coal of any kind to distribute to people for their homes. The New England Fuel Administration issued orders on Feb. 7 that local fuel committees should see to it that retailers get fuel for delivery in small lots, if necessary, by asking the state administrator to commandeer coal arriving for manufacturers in the same town.

All the receipts of bituminous for delivery to retail dealers are pooled and then distributed through orders made out by a central agency. Likewise a committee of shippers has been formed to serve in an advisory way, and generally assist in the fair distribution of what coal arrives, whether through the administration or through ordinary channels. Shippers are now consulting the fuel authorities before they attempt to distribute cargoes, and the result of this coöperation is a general improvement not only in means and methods but in the fairness of distribution.

The 300 cars Mr. Storrow was authorized to divert at the New England gateways on Jan. 31 have now practically all come through, except via Mechanicville, where movement is preëminently slow. The diversions were accomplished from consignees other than retailers, utilities, and plants working 100 per cent. on Government orders. Much confusion arises over the latter classification, since there is hardly enough fuel to keep them all running more than part time. The pressure brought to bear in favor of certain of these plants is something tremendous.

Loading conditions have improved somewhat at Hampton Roads, dumping being easier, but the delayed unloading of cars is already having its effect on the volume of coal available. The improvement in dispatch is therefore likely only to be temporary, until something like an equilibrium can be established.

Anthracite—Although the movement of domestic sizes is improving slightly via Maybrook and Harlem River, the volume of coal in the hands of retail dealers throughout New England is very small. In a large number of towns and in some cities domestic consumers are forced to rely upon what meager supplies of bituminous are placed at their disposal. Practically everywhere, and especially at points near tidewater, the price of soft coal is on the same basis with anthracite, and the demand for it for domestic use is increasingly insistent.

Nearly 30 per cent. of the "anthracite" shipments coming through the rail gateways recently was culm, silt or other steam size. This is a commentary on the statistics so frequently quoted as showing the excess of shipments into New England compared with a year ago.

NEW YORK

Anthracite situation is slightly relieved owing to milder temperatures, but conditions are still serious. Bituminous released for household purposes. Fuel Administrator sends warning to business organizations. Ask that Delaware & Hudson Canal be surveyed. Vessels being supplied and situation is much easier. Car supply bad and transportation slow.

Anthracite—There has been some relief in the situation due to seasonable temperatures and the breaking up of the ice in the rivers and bay, causing a better delivery of supplies. Early this week, owing to the severe storm in the mining regions (the twenty-ninth snowstorm of this season), which tied up transportation and resulted in a falling off in production, it was possible to move coal at the Tidewater docks so as to keep ahead of receipts. However, there was not much headway gained and the situation continues to be serious, but the hope is expressed by tradesmen that unless this section of the country is again hit by a heavy snowstorm and unseasonably low temperatures, the shortage will not be so severe as it was a few weeks ago.

Reports received here the first part of this week show there was a good movement of coal toward Tidewater and that the mines have resumed work to their full capacity. More attention, it was said, would be devoted to preparation as a result of numerous complaints made to the Washington authorities. Inspectors are now at work at the breakers supervising the work of preparation and to carry out the orders of the Fuel Administration officials.

State Fuel Administrator Wiggin has written to the presidents of the Chamber of Commerce of the State of New York and the president of the Merchants' Association of the City of New York, citing defects and difficulties of the coal supply situation at this port. These, he says, call for study and thought looking toward future relief. Mr. Wiggin says the four main difficulties here are insufficient unloading facilities at the docks; inadequate storage facilities in Manhattan and Brooklyn; insufficient supply of tugs, many of which have been commandeered by the Federal Government, and insufficient coal-carrying barges to bring coal from the docks to Manhattan Island. This latter, he states, has not been an important defect this year because of the small quantity of coal, but with a normal supply will become a great factor.

The Chamber of Commerce has adopted a resolution recommending that the necessary legislation be passed authorizing a preliminary examination and survey by United States Army Engineers, for determining the advisability of restoring the Delaware & Hudson Canal, saying that it would be an important factor in relieving railroad congestion and in providing cheaper transportation rates for coal to the industrial centers of New York, New Jersey, the New England states and other points.

During the past ten days the New York market had gone through the most critical period of the entire winter. Only a moderation of weather conditions prevented a real coal famine which would have caused untold suffering and an almost general closing down of industries. Temperatures were nearly as low as in the middle of December, while heavy ice floes went far toward bringing river transportation to a standstill. Loaded barges and tugs were icebound and many remained in that condition for several days, some destined for Long Island points not being released until Monday of this week. The scarcity of anthracite became so serious that the Fuel Administrators released bituminous to private houses, apartments and hotels, ignoring the local ordinances which prohibit its use unless under proper conditions.

The situation in Manhattan and The Bronx remains serious. The dealers have no supplies but are able to keep their large customers supplied with the aid of the new zone system. Conditions in The Bronx are more acute, the receipts of coal there having been prevented by heavy ice blocking the canals and creeks. In Brooklyn conditions have improved. The breaking of the ice in the Gowanus Canal and Newtown Creek released many thousand tons of coal. In Queens there has been a decided improvement, many cars of coal having been sent through the Pennsylvania tubes.

A committee of aldermen has been appointed to conduct "any investigation that may be deemed necessary on the subject of the method of storing, distributing and retailing coal," and to "inquire into all matters of concern relating thereto insofar as said subject is of concern to the city or its inhabitants."

The shortage of anthracite steam sizes is not so acute, but there is no surplus.

Current quotations, per gross tons, f.o.b. Tidewater, at the lower ports, are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buck Wheat	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	..

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—The heavy demand for bunker supplies and the curtailment of receipts because of the heavy snow storms and bad rail transportation caused a decided shortage of coal at this market. There is a big shortage of coal in the Metropolitan district, the demand from cities and towns in other parts of the state being just as heavy.

The work of clearing the harbor of vessels held up because of the lack of bunker fuel is progressing rapidly.

The new price fixed for Maryland coal and in mines along the Western Maryland road in West Virginia affects from 30 to 40 companies, many of which have New York offices.

The situation in the manufacturing district of New Jersey close to the waterfront opposite New York is extremely serious, it being feared that many factories will have to suspend unless supplies are received shortly. It was also stated that several up-state gas plants are in bad shape because of the lack of fuel.

Operations at the mines have been bad, some mines not averaging more than three days a week. Car supply is poor, mines along the Pennsylvania receiving about 5 per cent. of their requirements, while those along the New York Central have been getting close to 40 per cent. of their quota. It was said that some of the mines along the Pennsylvania received about 13 per cent. of their normal supply of cars in January.

Many tradesmen are concerned over conditions that may exist after Mar. 31, when a majority of their contracts, many of them made on a basis of from $3 to $4, will expire. No word has come thus far from the railroads or big companies as to the course they will take.

The local situation shows a slight improvement, although supplies at the piers are about as low as they have been in some time. New England continues to get its share of the local receipts.

PHILADELPHIA

Anthracite shipments helped by milder weather. Suffering still acute. Use of bituminous increases. Coal stealing serious. Poor preparation causes action to be taken. Distribution plans for next season under way. Culm causing trouble. Steam coals sold up. Bituminous shipments aided by open weather, but critical conditions continue. Domestic confiscation felt. Question of price of seized coal. Contract rumors. Zoning delayed.

Anthracite—Milder weather conditions for a week have now afforded some relief, but only to the extent of making the suffering less acute. The shortage of fuel continues unabated. This week Chairman Lewis of the City Fuel Committee announced that his investigations show there are 10,000 families in the city without coal. This shows that the progress toward improving conditions has not been satisfactory.

Early in the week another severe cold spell, with the thermometer below zero, again upset calculations, causing idleness at the mines and greatly interfering with railroad deliveries. The operators reported the temperature as being from 20 to 25 degrees below zero at the collieries and that unusual snows had also prevailed. As a result the collieries lost at least two full working days and the trade here is just beginning to feel the effect of the lack of production on those days. The retail delivery system was also badly crippled by drivers and yardmen failing to report for work.

Much of the soft coal recently commandeered from industrial to domestic use has been gas coal. While the retail dealers show some indifference as to handling it, no one has refused to accept any such consignments ordered by the fuel authorities. While first reports from the consumers were somewhat unfavorable, later reports are that it is meeting with satisfaction. The fuel committee has been so impressed by the results of their experiment that they expect to make further heavy seizures, and in one day recently they diverted 103 cars of bituminous coal to the anthracite retailers. However, by an arrangement with the dealers who have been handling anthracite buckwheat for their steam trade, the bituminous coal is being used to replace buckwheat and this latter size turned over to domestic users. Often also a mixture of both is sold to the family trade.

A new departure was made this week when Chairman Lewis ordered the seizure of domestic sizes of coal which had been stored in retailers' yards by manufacturing plants. In one case 50 tons of egg coal owned and stored by a large baking company was confiscated and the dealer instructed to make deliveries to 50 different homes. Later State Administrator Potter prohibited a dealer from delivering buckwheat from a stock of 1000 tons owned by a large printing establishment and authorized its sale to domestic consumers. Last resort measures are being taken to protect the people in their homes from cold, no

matter how much business may suffer. The alarming number of pneumonia cases, with numerous deaths, as reported by the Health Department, is no doubt having its effect.

A conference to discuss ways and means for relieving the acute domestic shortage was called by State Fuel Administrator Potter after a hurried trip to Washington, where he had conferred with the National Fuel Administration. Attorneys were present to discuss the legal phase of the diversion of coal from original consignees, a practice that is rapidly increasing.

The dealers have been informed by the authorities that they are determined to hold them absolutely to the "householder first" rule, and any ignoring this priority order in the future will be dealt with by the District Attorney. The dealers have been told that so long as there is a single home without fuel none shall be delivered to other consumers. The people have been called upon to report any case of domestic coal being delivered to buildings not occupied as dwellings, while agents of the administration will keep up a vigorous scouting for offenders. Householders who are able to use steam sizes and bituminous mixed are to be given the preference over all other consumers. The committee this week also inaugurated the plan of requiring the dealers to call at the office of the administration and explain just what disposition they have made of their stocks.

The practice of stealing coal from cars after their arrival in the city continues to give much concern. There is hardly a car that does not show the loss of a ton or two. A shortage of 50 per cent. is common, and this week several cars had their entire contents stolen. On his return from Washington State Administrator Potter stated that this city enjoys the unenviable reputation of being the only city in the country where the robbery of cars has got beyond the local authorities, and he has once more appealed to the Director of Public Safety to give better protection to the shipments.

The complaints as to poor preparation of coal has now culminated in an investigation being started by the fuel authorities. An investigation of the quality of coal shipped by anthracite operators, big and little, was certainly in order, more particularly as to the steam sizes. While some shipping companies have said all along that they do not sell culm, inspection of shipments of rice coal lately would indicate that they are no longer taking out the culm. The chief complaint as to the domestic coal is as to size, and numerous complaints have been received by the committee of buckwheat coal being charged for as pea.

Fuel administrators in Luzerne and Lackawanna Counties report that "everything black" is being shipped. A change is now looked for. It has been directed that the standard of preparation as adopted in 1914 must be strictly adhered to. The order will necessitate an inspection at the mines of every car, but even at that should poorly prepared coal come out we cannot imagine a consignee refusing it on this account.

It is understood that some action is on foot to change the entire system of distribution of coal beginning with Apr. 1. This week a meeting of the special committee appointed by the General Committee of Anthracite Operators was held and plans for distribution formulated. This committee, consisting of W. J. Richards, president of the Philadelphia & Reading Coal and Iron Co.; S. D. Warriner, president of the Lehigh Coal and Navigation Co., and Joseph B. Dickson, of New York, recommended that everything be done to increase production, to take measures to maintain the standard of preparation, prevent use of anthracite domestic sizes in manufacturing, list the war requirements for fuel, apportion the output by cities and towns, and lastly to route anthracite from points of production by traffic lines that will afford distribution on the quickest and most economic basis. It is understood that this plan has been presented to the National Fuel Administration and probably has the approval of Chairman Potter, by whom it is rumored it was presented to Dr. Garfield.

With the continuance of the present mild weather all connected with the trade are much encouraged, as the thaw has been general throughout the mining region. Collieries that had suspended are now working again to their full capacity and the car movement is becoming better than for several weeks past. Because of this milder weather locomotives are able to haul nearly full tonnage. Because they claim the "backbone" of winter is broken, many dealers are more optimistic than they have been for months. The operators, however, are still much concerned and fear the possibility of flooded mines hampering operations.

Most shippers continue to disregard the request of dealers to ship certain sizes. They contend that a "car of coal is a car of coal" regardless of size or grade. In fact, most orders read: Any kind, any size and any car.

There continues to be little change in the steam coal market. Everybody is closely sold up and some houses even claim to be filled up with orders for culm. There has been much criticism recently about this latter size, due to the wide publicity given a complaint by a large manufacturer who received some worthless material and made a report to the Washington authorities asking that such shipments be prohibited. The prices for such coals as individuals have to offer are buckwheat, $4.15, rice $3.35, barley $2.35 and clum $1.50.

The prices per gross ton f.o.b. cars at mines for line shipments and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—As was to be expected, the softening of the weather had a favorable effect on conditions, but only to the extent that it prevented what many predicted would be a complete collapse of the fuel supply. There can be no gainsaying that if the severe weather had continued for another week the results would have been appalling. This is proved by the critical state in which the situation still remains. Coal has probably been received in greater volume than the preceding week, but the former period was the worst so far experienced.

Then again, the manufacturing industry, which is mostly dependent upon bituminous coal, has been hard hit by the heavy confiscation of coal for domestic use. With the easing of the weather conditions the problem of railway motive power takes the forefront as being the chief factor retarding the fuel supply. Even after the mines have received cars they frequently remain for long periods loaded on the sidings waiting to be moved from the collieries.

The amount of coal consigned on strictly commercial orders remains at a low ebb, and even when consignments are made on such orders the chances are much against their ever reaching the original consignee, owing to the many chances of confiscation encountered en route.

There continues to be quite a little discussion as to the price to be paid for coal which has been commandeered by fuel committees in this city and other sections. While it is generally understood that the fixed Government price will apply on many shipments, yet there is still a large proportion of coal being sent out on contracts with higher prices still in effect. So far as we have been able to learn the authorities have been careful in this respect and we do not believe that any shipper will suffer on account of the price received for his coal on this account.

Many plants in this territory continue to be idle for lack of fuel. While the public utilities in this vicinity have not as yet been compelled to suspend, several have been perilously near it and have only been able to keep going by curtailing their hours of operation, even after being helped out with coal seized by the fuel authorities. In this connection the state administrator has made a ruling that before any coal may be commandeered and delivered to an electric power plant, the committee must be assured that all nonessential customers have been cut off. Churches even have been put in this category.

We have recently heard of the willingness on the part of some shippers to enter into contract relations with certain essential plants on the basis of the Government figure. While this gives no particular present advantage to the producer, yet with higher priced contracts expiring they are placed in the position of being compelled to market their coal at the $2.45 figure anyway, and it seems to be a good policy to tie up to some good concerns who will develop into desirable customers when normal conditions arrive.

BALTIMORE

Warmer weather brings improved railroad movement and a better coal supply, although the situation is still acute. Anthracite receipts far below requirements. Industries short.

Bituminous—Although the railroads benefited materially in movement through the milder weather conditions of this week, the deliveries of soft coal here are still far short of requirements. Many industries are desperately short of fuel, and only by skimping and cutting down production in many cases were they able to continue operation.

Over Sunday the fuel administrator was able to report the unloading of 114 cars of bituminous and 79 cars of anthracite for local use, but as much of this went to public service corporations and for domestic call, there was not much relief for hard-pressed industries. At times the number of bituminous-laden cars unloaded in 24 hours drops back to 40 or 50. Industries with Government contracts were in several instances forced to cut down work.

President Willard of the Baltimore & Ohio spent the past week upon his line to speed up coal movement. The congestion at many points remained serious, however. Lack of motive power to move laden cars or empties is the greatest drawback. Industries here, spurred on by demurrage charges or appeals to patriotism for quick unloading, have frequently seen the empty cars remain on their sidings for days before being hauled away. Conditions at many mining centers remain unsatisfactory, as there have been numbers of days lost through inability to get cars to load. The recent increases in price allowed in Washington are expected to be reflected here, although at present no one worries much about price.

Anthracite—The little anthracite received here is quickly gobbled up. The domestic trade is using much soft coal now, or has given up hope of any coal at all and is relying on oil or gas heaters. Thousands of homes are still without fuel. Many dealers, with uncertain supplies, have been forced to cut down in regard to equipment. It is a serious matter to have many wagons and men with no coal to deliver for days at a time. The result has been that when coal came through in many cases there was no means of delivering it promptly. Consumers are frequently told that they can get coal if they will arrange to have it hauled.

Lake Markets

PITTSBURGH

Pittsburgh zone defined. Practical operation being arranged. Four lower pools of Monongahela open. Car supplies better with milder weather.

R. W. Gardiner, zone distributor for the Pittsburgh district, was in conference with the Fuel Administration at Washington the last two days of last week and is now taking the first active steps toward putting the new system of distribution into operation for the Pittsburgh district. The zone to be served by the Pittsburgh district is roughly the triangle made by running lines from Pittsburgh to Lorain, Ohio, and Rochester, N. Y., respectively. This triangle practically includes in their entirety all the roads that haul coal north from the Pittsburgh district as well as the mines north of Pittsburgh, as follows: The three divisions of the Pennsylvania Lines West, reaching Cleveland, Ashtabula and Erie respectively; the Pittsburgh & Lake Erie of the New York Central system, with connection at Youngstown with the Erie R.R.; the Bessemer railroad, reaching Conneaut Harbor; the Buffalo, Rochester & Pittsburgh and finally the Allegheny Valley division of the Pennsylvania. A meeting of coal operators will probably be held about the beginning of next week to adjust various matters in connection with operating the zone system.

At the beginning of this week the Monongahela River began to fall, without the gorges at Brownsville or Morgantown having broken, so that the fifth and higher pools are closed, while mines in the fourth and lower pools are resuming. After a practically complete cessation of river coal movement for more than five weeks, more than half the river mines upon which various Pittsburgh consumers depend are in line for full operation, except that a few tipples have been destroyed.

Car supplies at the rail mines have been improving, there having been mild weather beginning Wednesday of last week. Pittsburgh observed heatless Monday this week, but believes weather conditions are such that the Fuel Administration's order in this matter will be rescinded before next Monday.

Ordinary open market transactions in coal amount to practically nothing, but technically there is a large turnover of coal at the set prices, caused by the various orders of the Fuel Administration. The market remains quotable at the set prices: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. additional permitted to be charged in the case of sales by brokers.

TORONTO

Coal very scarce. Shipments altogether inadequate to increased demand. Many dealers' offices closed. Three heatless days ordered by government.

The coal situation is worse than ever, and many cases of suffering are reported. About 225 cars of coal arrived here on Feb. 3, but the supply was altogether inadequate for the demand and since then comparatively little has come in. Some of the large dealers had to close their offices, being unable even to fill small orders. Conditions have been aggravated by the fact that many consumers who had laid in stocks to carry them over the winter have found their supplies insufficient owing to the extreme cold, and are now buying from hand to mouth. Many of the smaller dealers, finding themselves entirely unable to get supplies, have gone out of business. At some yards orders are only being filled for those who could undertake the delivery themselves. The civic authorities, churches and charitable organizations are endeavoring to relieve cases of extreme necessity.

The government has ordered three heatless days, Feb. 9 to 11, on which manufacturing plants and business places heated by coal must close down. This is expected to improve conditions considerably.

Nominal quotations for best grades per short ton are as follows: Retail anthracite: Egg, stove, nut and grate, $9.85; pea, $8.85; bituminous—steam, $9; slack, $8 to $8.50; domestic lump, $10; cannel $11. Wholesale, f.o.b. cars at destination, three-quarters lump, $7 to $7.50; slack, $6.85 to $7.

DETROIT

Moderating weather conditions avert suffering for those without coal and permit freer movement of shipments. Public schools are closed.

Bituminous—Rising temperatures, for the present, have saved Detroit from what threatened to be a most serious situation for both domestic consumers and users of steam coal. With shipments cut off by reoccurring snowstorms and zero temperatures, residents of the city were confronting almost certain hardship and suffering, when a change in weather conditions brought restoration of hope.

Though coal supply has not improved and all public schools of the city are closed, the fact that more moderate temperatures prevail is a comforting condition. Through the aid of Federal Government agencies relief has been afforded the Detroit City Gas Co., on which many homes were wholly dependent for heat. Shipments of gas oil are reported on the way from Chicago and arrangements have been made by the local representatives of the state fuel administration to assure the company's coal supply.

Anthracite—Little anthracite is coming into Detroit. Household consumers in most cases find it impossible to get their needs supplied as few of the retail yards have been able to get anthracite. Shipments of wood from the interior of the state have been arriving in small volume, but wood fails as a substitute for anthracite. The wood, cut to 16-in. lengths, sells around $8 a cord delivered, which makes its use rather costly in the opinion of consumers. Coke is almost unobtainable at present and brings hard-coal prices when it is to be had.

COLUMBUS

With warmer weather, operations at Ohio mines have been improved. There is still a serious shortage in both domestic and steam grades.

The coal trade in Ohio has been bettered to a marked degree by the breaking of the severe winter weather and the fact that the snow and ice are melting gradually. This means reduction in the supply of fuel necessary for domestic consumption and the helping of transportation. With less cold weather, it is believed that the worst of the situation is now passed.

The condition of the domestic trade still remains a feature. Efforts of county and state administrators have been devoted almost exclusively toward supplying the needs of householders. Rush orders were made for the shipment of coal to certain points where the scarcity was acute, and the Federal Fuel Administration was called upon frequently to make certain rulings. As a result of these efforts central Ohio was fairly well supplied. Considerable suffering, however, was reported from western and northwestern Ohio, where the coal shortage was extremely severe. Dealers were still controlled as to the amount to be delivered to each customer. Reserve stocks in the hands of dealers have been low, and in many cases they were entirely exhausted. Prices have been firm at the levels fixed by the county committee. Pocahontas is quite scarce, and there is also a scarcity of West Virginia splints. Anthracite is now almost entirely out of the market.

The steam business has been strenuous in every way. Large users have been compelled to stand aside while coal they have on the way has been diverted to private users. The county committees, working in conjunction with the state administration, have succeeded in keeping most public utilities going.

The production in Ohio fields showed an increase toward the latter part of the week. This is especially true in the Hocking Valley field, where the output is estimated at 55 to 60 per cent. of the average. In eastern Ohio shortage of cars and motive power are still holding up production. Massillon and Crooksville are credited with about 45 per cent. of normal.

Prices on short tons, f.o.b. mines, are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.70	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

More moderate weather and the receipt of coal by rail have enabled the relief of domestic consumers, but the industrial supply is limited. Flood stage in the river adds to complications.

A sudden change from below-zero weather to temperatures above freezing helped to relieve distress among domestic consumers in Cincinnati, while the receipt of 100 carloads of coal from the concentration yards at DeCoursey, Ky., served to give retailers a supply of coal to distribute to their patrons. Many dealers had been entirely without coal for their trade, so this served to relieve a situation which was becoming serious. The shortage of fuel was complicated early this week and during the latter part of last week by the high flood stage of the Ohio River, brought about by ice gorges that dammed the stream completely and forced it to back up higher than is usual even in severe spring floods. The river has been gradually receding, however, so that river-front coal yards can now operate. The principle difficulty is still that of supplying manufacturers with fuel for their plants, many having been forced to shut down due to lack of coal. Others have been operating on a narrow margin. The railroads have been unable to reach normal operating schedules on account of the ice on their tracks, coupled with the severe cold. It is hoped that the worst of the winter weather is over, and that conditions will improve steadily from now on.

LOUISVILLE

Moderating weather has reduced demand and given dealers and carriers a chance. Flood waters in mining districts have subsided, and production is expected to increase. Conditions show material improvement.

Production of coal in the eastern Kentucky fields was reduced to a minimum during a period extending from Jan. 23 to Feb. 2, as a result of the high water experienced throughout the coal district because of melting snow. Few mines were flooded, as most of the operations are high in the hills.

The high water meant a still further shortage of cars, and this combination of circumstances resulted in a light production for the district. However, now that the water has gone down and the railroads are getting back into shape, it is expected that with moderate weather there will be an improvement in conditions.

An interesting feature of the week has been the movement of mine-run coal from the western Kentucky mines into Louisville in box cars, it being handled much in the same way as coke has been handled in such cars in the past. There is a shortage of open cars and some miners are willing to accept any kind of equipment. The small dealers and some small car-lot consumers are glad to accept such coal, but the larger dealers claim that it involves too much labor in handling and are opposed to accepting it.

BIRMINGHAM

Shortage of both steam and domestic coal continues acute, though warm weather is relieving the situation to some extent. Demand for both grades brisk, as domestic dealers endeavor to accumulate stocks, and the steam trade hustles for current needs. Production slightly better than last week.

While the demand from the householders for domestic coal has assumed a normal status, the retail dealers are endeavoring to accumulate sufficient stocks to tide them over future cold snaps. While weather conditions have not been severe in three weeks, spring temperatures prevailing most of that time, not a yard in the eastern section of the city has any coal on hand.

Alabama, along with the other Southern states, has experienced its last "heatless" Monday, and normal industrial operations were observed and business was conducted as usual last Monday. There has been no diminution noted in steam-coal requirements—inquiries being strong and urgent. The priority clause in the Fuel Administrator's order remains in force, and preferential industries and public utilities will continue to receive their fuel supply, if need be, at the expense of operations not considered of vital import to the welfare of the nation.

Production at the mines was somewhat better than the previous week, though far from normal, as yet. Operations are not suffering materially for lack of cars, the supply being satisfactory in most cases.

Coke

CONNELLSVILLE

Car supplies improving. No prospects of river shipments in near future. Byproduct ovens doing better.

Car supplies have been improving since zero weather disappeared Tuesday of last week, but the recovery of the railroads, even with the mild weather of the past few days, has been very slow. The smallest shipments of any week since early in 1915 occurred week before last, representing only a trifle more than half the coke requirements of the blast furnaces depending on the region. Last week's shipments were only a trifle better, on the whole, while this week promises to show a material improvement. During January a considerable part of the accumulation of coke between ovens and furnaces was moved, but this did not seem to afford the furnaces much relief, and furnace operations have been very light, only an occasional furnace having been able to resume in the past few days.

River shipments of coke stopped the first week in the year by ice in the Monongahela River are not likely to be resumed in the near future. The ice gorge at Brownsville, in the fifth pool, is holding, with the river now falling, and this shuts off all coke movement.

The byproduct ovens are gradually increasing their operations, being better supplied with coal, and are this week operating at a trifle above 75 per cent. of capacity.

The market remains quotable at the set prices: Furnace, $6; 72-hour foundry, selected, $7; crushed, over 1 in., $7.30, per net ton at ovens. The Fuel Administration has not made the recently expected ruling to allow a brokerage on coke as is allowed on coal, and it is quite doubtful now whether any action will be taken.

The Connellsville "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 2 at 214,658 tons, a decrease of 7077 tons, and shipments at 228,539 tons, a decrease of 38,882 tons.

Birmingham—Coke producers report a brisk inquiry from a wide range of territory but admit inability to provide for more than their usual line of customers, deliveries on contracts in many cases being far behind. However, the car supply has shown considerable improvement and restricted routing eliminated to such an extent as to enable producers to make more liberal shipments to Texas and Pacific Coast territory. When deliveries are caught up with on this business it is expected that there will be some free tonnage for the spot trade. The fuel administrator has allowed an advance in the oven price on beehive coke, Big Seam furnace coke being increased from $6 to $6.75, Yolande and Brookwood foundry from $7 to $8, and Empire from $7 to $8.25 per net ton ovens. Under present market conditions the increased figures will not affect inquiries in the least.

Middle Western

GENERAL REVIEW

Warm weather helps solve the panicky market conditions.

The first two days of last week found the market generally without fuel. Zero to 15 deg. below prevailed throughout the Middle Western section, and this temperature came at a time when the railroads were paralyzed and dealers and industrial plants were without coal. Since Wednesday warmer weather has prevailed, however, thereby greatly relieving the distress and affording the railroads an opportunity to move some of the badly needed coal.

Coal cars are still scarce, however. If present weather conditions continue, no doubt there will be more cars available, and a little fuel will be accumulated at points where relief is the most needed. Mine operation has not been above 65 per cent. in any locality, and in most fields it fell far below this figure. The movement of coal in both Indiana and Illinois has been confined largely to these respective states, which is in accord with the instructions of the state fuel administrators, that localities producing coal should be served first.

Northern Illinois has always been a large user of Indiana coal, but the withdrawal of Indiana from this market has put a heavier burden on the Illinois operators and has created a new trade relationship.

Warm weather has caused the snow to disappear in southern Illinois and Indiana, enabling the refilling of ponds and reservoirs with a sufficient supply of water. The lack of water has long been a source of delay and expense to many mine operators, as water cars could not always be moved when needed, due to insufficient motive power of the railroads.

CHICAGO

Chicago is still short of fuel, due to inadequate transportation facilities.

At the instance of Fuel Administrator Raymond E. Durham, Chicago was divided into 12 districts, and dealers undertook to supply fuel to those most urgently in need of it. District 12 was found to contain about 10 tons of anthracite and 75 tons of bituminous. Other districts were found to be in little better shape. At the time the survey was made it was claimed that at least 500,000 tons of fuel was tied up in various yards in and near Chicago and en route, this being held up or delayed because of insufficient motive power. This state of affairs clearly indicates that transportation and not production has been causing so much trouble.

This market has been independent practically of Western coal for some time, and the fact that Indiana coal has been held out of Chicago for several days has increased the demand made on Illinois operators and the railroads serving their mines.

Anthracite and eastern bituminous coals are indeed scarce in this market, and only an occasional car of Kentucky coal is arriving here.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La-Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Supply of hard coal is exhausted. Coke manufacturers return all orders to dealers, because of inability to catch up with the demand. Interior cities in a bad way, because of lack of fuel.

Milwaukee coal companies have announced that the supply of hard coal is exhausted and that nothing but the bituminous varieties can be furnished in future. Thousands of families employing stoves and heaters which are not adapted to the use of soft coal are hit hard by the famine, but dealers and the fuel administrators can offer them no relief. Coke producers have returned all orders to retailers and will do their best to meet the demands upon them without priority obligation. There has been no change in the price schedule.

W. N. Fitzgerald, state fuel administrator, says there is plenty of coal at Wisconsin lake ports, but that the weather and rail situation hampers the movement of it so that it is impossible to get coal to interior points as fast as it is needed. This is the chief problem which faces the fuel administration. At present it is impossible to average more than 15 carloads per day. A few days of warm weather during the past week made things look a little brighter, but a sleet storm which followed upset all optimistic calculations.

Demands for coal from interior cities become more urgent every day, and at many places the schools have been closed because of a lack of fuel. Southern counties of the state are seriously affected by the holding up in Indiana and Illinois of coal in transit. No coal has been received from these states in weeks. The matter has been taken up with the Federal Fuel Administration and it is expected that a drastic order to Indiana and Illinois administrators will be the result. A former order in this regard has been ignored by the latter.

County fuel administrators are trying to get in touch with owners of summer resorts and homes which have been closed for the winter, in order to take advantage of fuel lying in the bins.

The canvass by the State Council of Defense to obtain estimates of the amount of coal which will be needed next year is progressing, and reports have already been received from many cities of the state. The plan is to move all coal to central lake ports next season and then to distribute it as far as possible pro rata to all points within the coal consuming area.

ST. LOUIS

Weather conditions good, and this has helped the fuel situation. Mines working one and two days per week on account of transportation facilities. Tonnage very light from all fields and moving generally to outside markets where need is greatest. Local situation satisfactory.

The conditions at the present time in St. Louis are especially good, considering the plight of other centers. There is no surplus of any kind of coal in the market. As a matter of fact, St. Louis is short; but it is so much better taken care of than any other city that places that are suffering are being supplied with coal from the St. Louis requirements.

The railroads have curtailed production in the Illinois field the past week. The Illinois Central is giving some mines only one and two days' work per week, and sometimes it bunches the cars so that the mines cannot load them. Again it fails to pull loads for fully a week's time. The other roads seem to be holding up far better, and conditions in general show improvement, except as noted above.

Complaint has been made that the railroads are not using their men and equipment so as to get the best efficiency. This complaint comes from the railroad men themselves.

In St. Louis the Terminal, which is supposed to be a unified terminal, continues to use embargoes against different parts of itself as well as against the trunk lines. These embargoes continue to be used in defiance of instructions from the Fuel Administration that embargoes are not legal and not enforceable. These practices continue to cause congestion at East St. Louis and confusion in general in coal trade circles.

In the Carterville field, comprising the Williamson and Franklin County districts, working time still continues poor and the railroads and Government seem to be getting the bulk of the output. It developed the past week that about 80 per cent. of the domestic business in Chicago formerly consisted of Eastern coal, and that it has come to a point where but 20 per cent. is now coming in, the other 60 per cent. being made up from the Illinois and Indiana fields. This has drawn all the coal from the Carterville district, and Chicago still continues to be short. The same conditions exist to some extent in the DuQuoin field. The Rutledge and Taylor Coal Co. there seized the opportunity to cancel all its contracts, claiming that Fuel Administrator Garfield's priority order invalidated contracts.

In the Mt. Olive field the bulk of this coal still goes for railroad purposes, and there is still a shortage of this coal for domestic uses in the St. Louis market.

Railroad facilities in the Standard field have kept the production down, and railroad requirements seem to keep a large percentage of the domestic tonnage out of its usual channels. However, the St. Louis territory is getting its share of this coal and in sufficient quantities to prevent any suffering or factories from shutting down.

Trunk lines other than the Illinois Central are making good time from the mines to East St. Louis with coal, but the trouble is with the Terminals.

There have been some receipts in the past week of anthracite coal, some 25 to 30 cars having come in. There has been nothing from Arkansas nor any West Virginia smokeless.

Fuel Administrator Crossley has removed all local restrictions with regard to fuel conservation, and only those of the Federal Fuel Administrator Garfield are now in effect.

The prevailing market per net ton f.o.b. mines is:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80
3x6-in. egg	2.65@2.80	2.65@2.80	2.65@2.80
2x3-in. nut	2.65@2.80	2.65@2.80	2.65@2.80
No. 2 nut	2.65@2.80	.....	.....
No. 3 nut	2.65@2.80	.....	.....
No. 4 nut	2.65@2.80	.....	.....
No. 5 nut	2.15@2.30	.....	.....
2-in. scrgs	2.15@2.30	2.15@2.30	2.15@2.30
2-in. lump	.....	.....	2.65@2.80
3-in. lump	.....	2.65@2.80	.....
Steam egg	2.65@2.80	2.65@2.80	2.65@2.80
Mine-run	2.40@2.55	2.40@2.55	2.40@2.55
Washed:			
No. 1	$2.65@2.80	$2.65@2.80	.....
No. 2	2.65@2.80	2.65@2.80	.....
No. 3	2.65@2.80	2.65@2.80	.....
No. 4	2.65@2.80	2.65@2.80	.....
No. 5	2.15@2.30	2.15@2.30	.....

Williamson and Franklin County rate is 87½c. Other fields, 72½c.

General Statistics

NORFOLK & WESTERN RAILWAY

The following tabulation shows the shipments of coal and coke over the Norfolk & Western Railway Co.'s lines during the month of December, 1917, and for the twelve months ending Dec. 31, 1917, as compared with corresponding periods of the previous year. The figures are in net tons.

	December 1916	December 1917	Twelve Months 1916	Twelve Months 1917
Coal:				
Tidewater:				
Foreign	153,483	93,021	3,307,443	2,280,914
Coa'w'se	227,741	199,229	3,373,072	3,149,992
Domestic	2,124,096	1,591,278	27,680,401	26,993,496
Coke:				
Foreign	1,993	584	48,634	18,453
Domestic	171,755	313,215	1,999,680	2,529,627
Total	2,679,068	2,197,327	36,409,230	34,972,482

The following table gives the coal tonnage from mines on the Norfolk & Western Ry., and from other railroads, for the month of December, 1917:

From	Net Tons
Pocahontas field	987,382
Tug river field	228,311
Thacker field	197,032
Kenova field	89,038
Clinch Valley field	112,922
Other northern and western territory	14,405
Total northern and western fields	1,629,090
Williamson & Pond Creek Railroad Co.	96,220
Tug River & Kentucky Railroad Co.	42,702
All other railroads	81,921
Total	1,849,933

COAL AGE

Vol. 13 NEW YORK, FEBRUARY 23, 1918 No. 8

Shotfirers and the Alien Enemy Miner

RECENTLY, sticks of dynamite have been found mixed with coal in several coal cars. Investigation has shown that the explosives were placed in the cars at the mines, and certain Austrian miners are suspected of having committed this crime in an attempt to wreck coal transportation.

Perhaps these acts of vandalism were not perpetrated primarily to aid the enemy. Instances are on record where such things have happened accidentally. Then there are cases where revenge has been the sole motive. Nevertheless, such acts may not only interrupt railway transportation, but may result in an explosion that will wreck a building or sink a transport.

Crimes of this kind may be largely prevented through the compulsory requirement of shotfirers in all mines. Safety engineers and mine inspectors have frequently advocated such a measure. Some states already require duly authorized shotfirers; other states require shotfirers under certain conditions. In gaseous mines particularly, the hazards from improper loading, tamping and firing are great. However, the mining industry is not unanimous in the belief that specially appointed shotfirers are necessary as a safety measure in all mines under all conditions.

IN ADDITION to the increased safety that results from having all holes fired by specially appointed men, there is now the further incentive to comply with the Explosives Regulation Act—a law designed to prevent explosives getting into the hands of alien enemies. This act requires the licensing of all users of explosives; yet, as at present enforced, practically all miners can get explosives and the law furnishes but little protection.

The inclusion of high explosives in cars of coal today makes it advisable that the coal industry as a whole seriously considers the adoption of some compulsory shotfiring measure. Mine operators have here an opportunity to coöperate with the Government for the protection of its war-making efforts, as well as for the protection of life and property. Careful discussion will determine whether it is best for the state mining department to exercise power to make such requirements compulsory; or whether it is necessary for state legislators to enact additional legislation; or whether Government officials acting under authority of the Federal explosives regulation should correct the evil.

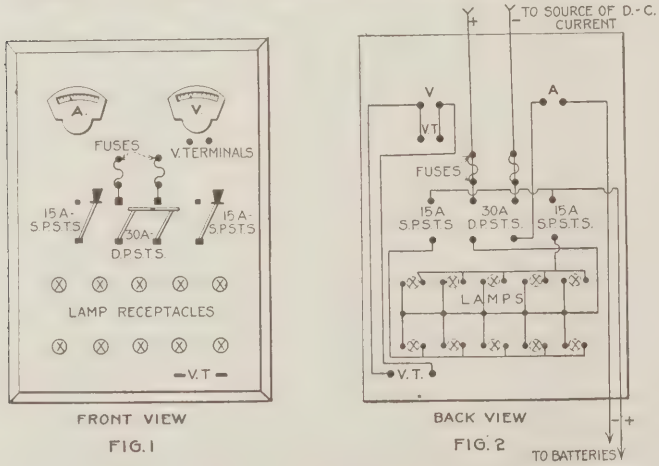
ONE thing is certain—this is not a time for halfway measures. such as the appointment of shotfirers who merely ignite shots loaded by miners. No plan can prove really effective unless it embodies the designation of specially qualified individuals, who will have sole charge of the custody, storage, transportation, loading, tamping and firing of all explosives. In small mines it is not necessary to appoint some man who has no other duties than shotfiring. In these small operations a reliable company man, the foreman or the superintendent, can perform such duties.

With the universal adoption of shotfirers there will come a material reduction in the accident ratio in coal mines. Fewer men will be injured through the careless handling of explosives and by flying particles of coal. There will also be a reduction in the number of those greater catastrophes caused by blownout shots, and finally such action will eliminate the serious dangers that arise from explosives being mixed with shipments of coal.

This matter is worth discussing right now, and *Coal Age* will appreciate an expression of opinion from the industry at large.

IDEAS AND SUGGESTIONS

Storage-Battery Charging Panel



BY FRANK HUSKINSON
Lafayette, Colo.

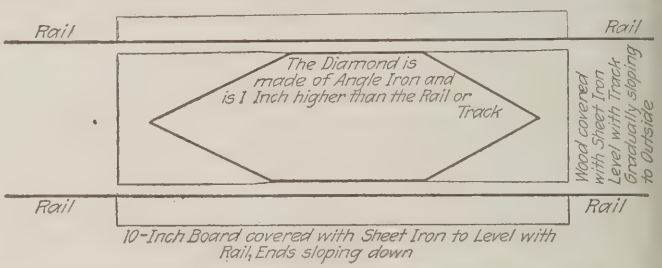
Having a number of small portable storage batteries, also a few storage batteries used in automobile lighting and starting, to keep in shape and charged, I made up the satisfactory and serviceable charging panel shown in Figs. 1 and 2.

Fig. 1 shows a front view of the panel. *A* is a Weston direct-current, 15-amp., back-connected, small-size switchboard ammeter. *V* is a Weston direct-current 15-volt, back-connected, small-size switchboard voltmeter. The direct current for charging is taken from the direct-current busbars behind the circuit breakers, at the substation, so as to have an uninterrupted source of current for the charging of the batteries.

The direct-current lines come to the fuses, and a 30-amp., double-pole, single-throw switch. One line then goes to the ammeter and thence to the batteries. The other line goes to one side of all the lamp receptacles. the two 15-amp., single-pole, single-throw switches are each connected to one-half of the lamp receptacles, and then to the batteries. This arrangement allows each switch to connect one-half of the lamps in series with the ammeter and the batteries. For a finer adjustment of the load, the lamps can be turned on or off in the receptacles.

The voltmeter is arranged with two sets of terminals; the upper set is for connecting a portable cord and testing the voltage on any desired batteries. The lower

FIGS. 1 AND 2. FRONT AND REAR OF CHARGING PANEL



set of terminals, marked *VT*, are two pieces of strip copper fixed to the panel board, and so spaced that in testing the small size portable storage batteries, the battery terminals are brought in contact with the two copper pieces and the voltage then read on the voltmeter.

The size of lamps to be used in the receptacles is determined by the amount of current needed and the number of batteries on charge. The lamps can be replaced with resistance units if desired.

The Diamond Rerailer

BY JOHN HITTMEIER
Mt. Olive, Ill.

A rerailer that has been in actual service for a year and is still in good order is shown in the accompanying illustration. This is placed permanently between the

CARS QUICKLY RERAILED WITH THIS DEVICE

rails at any point where pit cars get off the track along the motor haulage. If cars become derailed while moving in either direction, or on either side of the track, they will rerail or get on the track without lifting or even stopping the trip.

Generator Polarity Reversed

BY JOHN J. NOLAN
Linton, Ind.

Some few months ago the electrician at one of the Vandalia mines reported to me that the arc lamps used for headlights on a certain locomotive could not be made to give sufficient light compared to lamps used on other locomotives in this mine.

After discussing the various causes of this difficulty, he stated that on idle days the lamps burned brightly; so I investigated and found that the generator supplying this side of the mine was reversed, making the rail the positive side of the circuit.

The two generators were not connected in parallel, but had separate positive lines supplying their respective sides of the mine. The two locomotives, however, came in to the bottom over the same rails. Also the machines on both sides of the mine fed off the trolley and used the rail for a return. The reason for having better light on idle days was that the generator which was not reversed supplied the whole mine on these days.

The reversal was not caused by either of these two generators, but by another plant supplying the machines and gathering locomotives from a water shaft about a mile away, and a switch so arranged that this plant could furnish power at nights for pumps, motors, fans, etc., over the whole mine. This switch had probably been put in before the main plant had been cut out.

This occurrence might seem strange, but the same thing happened twice afterward; and each time this same generator had been reversed and the arc lamps would indicate the trouble.

A Plea for Conservation

By E. H. Coxe
General Superintendent, United Coal Corporation, Pittsburgh, Penn.

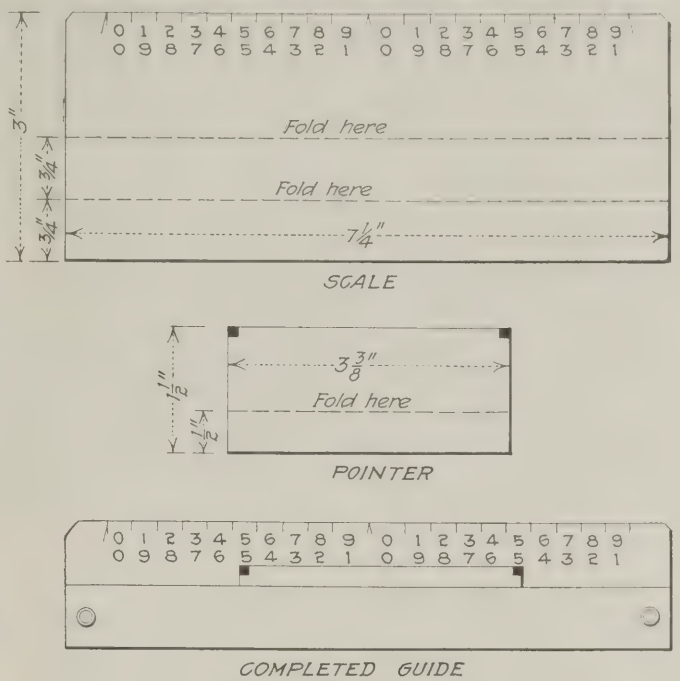
In visiting our mines, I have noticed a lamentable lack of interest in, and compliance with, the numerous orders and requests of the various Government administrators, looking toward the conservation of articles essential to the winning of the war. I cannot think that our men are less patriotic or thoughtful than others, and am led to believe that this condition prevails generally throughout the coal fields of the country.

I notice a lack of observance of meatless and wheatless days; carelessness in allowing lights to burn unnecessarily in the day time, and the use of an excessive number of lights at all times where they are furnished free or on a flat rate.

On mentioning this lack of observance of these rules or orders, the reply in some cases was, in effect, "What difference will the little I can save make?" If each individual will consider that there are 100,000,000 people in this country, and if his saving is multiplied by that number, he will readily see that the total saving would be considerable. If every person figured that his or her individual saving was not enough to count, there would be no conservation and we would have no more show to win the war than has the oft-mentioned snowball in Hades.

Another thing I have noticed is the amount of good coal going over the slate dump. In cleaning roads and falls, a large amount of coal is loaded in slate cars that could be separated and saved, instead of being wasted on the dump.

The failure to recover spikes and ties, now expensive and hard to get; the careless tearing up or repairing of tracks; the throwing of scrap in the gob instead of on the scrap pile; the haphazard handling of small supplies; the lack of care of tools and machinery; all these cause loss to our employers and waste of material which could be used in making ammunition for use at the front.



As has often been said, the winning of the war depends just as much on the men behind the men behind the guns, as on the men behind the guns, so it is up to us here at home to economize. Let not people of other occupations point to us at the mines as slackers, but let us all put our shoulders to the wheel and practice conservation and economy in those things and materials necessary for victory.

Guide for Use with Traverse Tables

By Philip A. Arnold
St. Marys, Penn.

In taking figures from traverse tables, a guide of some sort is almost a necessity if one wishes to avoid mistakes. Many are the devices used for this work, from the slip of paper with two pencil marks the proper distance apart to elaborate arrangements with dials and arrow points. I have worked with a number of different styles of guides, but the one that has given me best results and that I have used for some time is shown in the accompanying illustration. This guide is simple to make and can be operated with quickness and ease.

To construct, take a piece of medium weight drawing paper and cut a scale and pointer to the dimensions shown. Make graduations on scale to correspond with the vertical ruling on pages of the traverse book and place two rows of numbers as shown—the upper row being used for angles up to 45 deg. and the lower row for angles from 45 to 90 deg. Fold the scale and pointer on the indicated lines and place the flap of the pointer under the flap of the scale; then fasten an eyelet close to each end of the scale. The guide is

SIMPLY MADE GUIDE TO ENABLE CORRECT READING OF TRAVERSE TABLES

now ready for use, as the pointer is securely held in place but can easily be moved along the scale to the desired point.

The guide shown in the accompanying illustration is constructed for use with "Gurden's Traverse Tables"—four decimal places. In order to make a guide for use with other tables it is, of course, only necessary to change the length and graduations of the scale and the length of the pointer to correspond with the columns of the book.

To Compute the Area of a Circle

B. B. Gordon, of Greenville, Mass., in the *Engineering News-Record* gives the following method for calculating the area of a circle. The general rule is to multiply the square of the diameter by 0.7854, but engineers usually rather hesitate to make the calculation in that manner. Mr. Gordon's method, which he says may not be new, substitutes a somewhat easy series of multiples which calculated can be added together. For the purpose of this example the diameter is taken as 4. Then

If D = 4	$D^2 = 16$
	0.7
D^2 Multiplied by 0.7 =	11.2
D^2 Multiplied by 0.07 =	1.12
D^2 Multiplied by 0.014 or (0.007 × 2) =	0.224
D^2 Multiplied by 0.0014 =	0.0224
D^2 Multiplied by 0.7854 =	12.5664

Modern Rectangular Coke-Oven Plant

BY DEVER C. ASHMEAD
Tarrytown, N. Y.

SYNOPSIS — *With scarcity of labor coke men turn to improved types of ovens susceptible of operation by mechanical appliances. A thoroughly modern rectangular coke-oven plant is here described, with details of the mechanical coal leveler, the coke quencher and the coke loader. The construction of this new type of oven is fully covered and illustrated. An interesting comparison is made of the labor necessary to operate the 200 rectangular ovens and the same number of beehive ovens at this plant.*

AT SYKESVILLE, Clearfield County, Pennsylvania, the Cascade Coal and Coke Co. has a plant of 400 coke ovens, 200 of which are rectangular, the other 200 being of the beehive type. These ovens are supplied with coal from the Cascade mine, which is owned and operated by the same company. The coke ovens and most of the surface plant are shown in the general panoramic view, Fig. 1.

The whole surface plant is in every way thoroughly modern, up to date, and comparatively new, part of it having been installed in the last three years. The recent construction includes the new boiler house and the low-pressure turbine building; the rectangular coke ovens were completed about five years ago, the rest of the plant being older.

There are two separate boiler houses for the production of steam. One is shown at the right in Fig. 2 and contains four 300-hp. Babcock & Wilcox boilers. The second boiler house is shown in the foreground of Fig 3; it occupies the right half of the building and contains two 300-hp. Babcock & Wilcox boilers. Both of these boiler houses are fireproof, being built of brick and steel. A 150-ft. brick chimney is provided for each set of boilers.

There are two engine houses; one is in the right-hand end of the building shown in Fig. 2, at the right of the illustration. This engine house contains the hoisting engine which raises the coal from the mine, 183 ft. below the surface; also it contains four two-stage Ingersoll-Rand compressors, which furnish compressed air for the punchers that undercut the coal in the mine.

The exterior of the second engine room is shown in Fig. 3, at the left-hand end of the building, in the foreground. This engine room contains two thoroughly modern, low-pressure Ridgway-Rateau-Smoot turbo-generator outfits, built by the Ridgway Dynamo Co. These outfits are 375 kv.-a., 94.3-ampere, 2300-volt, 60-cycle, three-phase units. The steam used in the two turbines is the exhaust from the air compressors, the hoisting engine and other small engines. As the pressure of this steam is quite variable, it is sent through a Rateau regenerator, which equalizes the pressure before the steam goes to the turbines. The capacity of the regenerator is such that it will hold sufficient steam to run the turbines for 2 min. after the plant is shut down. It is also arranged that steam, from the boiler plant in the same building, can be supplied to the regenerator for the operation of the turbines in case there is not sufficient exhaust steam to operate them. The interior of this low pressure turbo-generator room is shown in Fig. 4. In the immediate foreground can be seen the top of the condenser.

The headhouse (center of Fig. 2) is built of steel and is covered with corrugated sheet iron painted black. The cages are self-dumping and the coal goes directly into a weigh basket. As the coal seam in the Cascade mine is particularly free from impurities, it is unnecessary to give the coal a careful cleaning. Therefore, from the weigh basket the coal is dumped into a 60-ton bin, whence it is carried by a 42-in. belt conveyor into another part of the headhouse where the coal is broken to 1-in. size in a Link-Belt crusher. Afterward it goes by chute to a Williams crusher, operating at 1800 r.p.m., in which the coal is crushed to pea and smaller; thence to a pit from which it is picked up by 24-in. rubber belt conveyors, 250 ft. center to center, and taken to the two large 1000-ton coal bins, shown at the left in Fig. 2. The frame of the bins is of steel; the bin proper is lined

FIG. 1. PANORAMIC VIEW OF COKE OVEN PLANT OF THE CASCADE

FIG. 2. VIEW OF PLANT SHOWING BOILER AND POWER HOUSE, HEADHOUSE, STORAGE BINS AND LARRY TRACK

with wood, which is covered with sheet steel. Coal is loaded direct from the bins into larries, from which the ovens are charged.

The oven layout is shown in the panoramic view (Fig. 1); each of the three parallel rows of ovens is approximately 1600 ft. long. The single bank of beehive ovens is in the foreground; in the middle are the block, or double row of beehive ovens; and immediately in the rear are the rectangular ovens, which were under construction at the time the picture was taken. The larry tracks from the bins to these three rows of ovens are plainly shown in Fig. 1.

Coke is loaded from the ovens into cars on tracks located between the rows of ovens. The grades of the railroad tracks favor the loaded cars, which are dropped in the direction of the bins and headhouse, where they are made up into trains.

The rectangular coke ovens are a particularly interesting feature of this plant and are well illustrated in the accompanying views. These ovens are 5½ ft. wide by 32 ft. deep and have the charging hole in the center of the top (see Fig. 12). This charging hole is also the vent for the escape of gas. The general construction of the oven is well shown in Figs. 6, 10, 11 and 12. Fig. 11 shows the details of construction of the front of the oven as well as the interior wall. The front of the oven is built of cut stone and the interior side walls as well as the top and bottom are of firebrick. The top of the oven rises from each end to the center and is arched as shown. The form for constructing the top of the oven is illustrated in Fig. 9 and it is shown in place in Fig. 6. The firebrick on the sides has given only a very short life, not over two years. The top of the ovens has lasted fairly well. In fact, during the five years they have been operating they have not yet burned out.

While the ovens were under construction, the portable roadway, shown in Fig. 10, was built so that the teams could readily deliver the earth for covering the ovens.

COAL AND COKE CO., SYKESVILLE, CLEARFIELD COUNTY, PENNSYLVANIA

FIG. 3. EXTERIOR VIEW OF POWER PLANT

FIG. 4. INTERIOR OF TURBO-GENERATOR ROOM

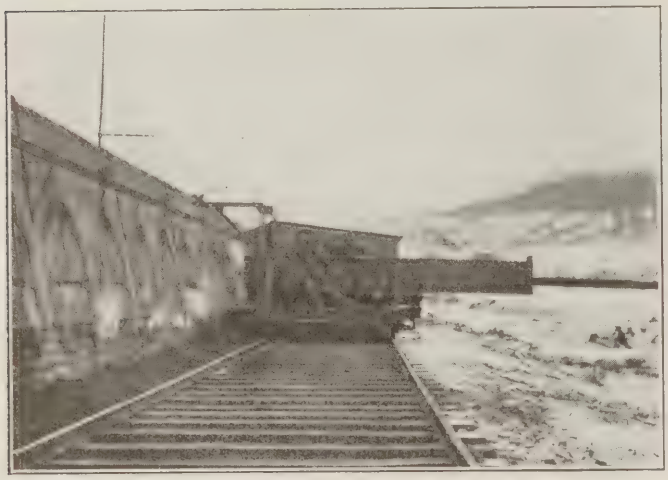


FIG. 5. LEVELER FOLLOWED BY DAUBING CAR

This saved considerable extra handling, facilitating the delivery of the material at the proper point.

The coal bins are connected to the coke ovens by a steel trestle about 500 ft. long, on which the larries run. Fig. 8 shows the larries as well as the steel construction of the trestle. The plate girders in this illustration are over the trolley tracks on the county road below. The larries are run in batteries of three, with one motorman in charge, and are so arranged that they will charge every other oven.

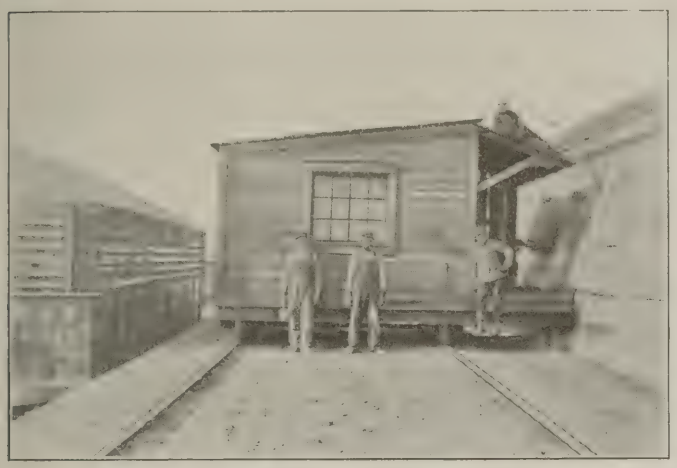
The larries have a maximum capacity of 10 tons each, but they only carry the amount of coal that is necessary to charge an oven. This amount depends on the time the ovens are to burn. At this plant they are using two burning periods of 48 and 72 hours respectively. As mainly furnace or 48-hour coke is made at this plant, when it is desired to use the longer burning time (72

FIG. 6. VIEW OF THE OVEN DURING PROCESS OF CONSTRUCTION

hours), it is necessary to use a larger charge—therefore, the two size charges, one of 7 tons for the 48-hour period and one of 10 tons for the 72-hour period. As previously mentioned, the larries are so arranged that three ovens can be charged at the same time.

When the coal from the larries is charged into the ovens, it forms a pile in the center and it is necessary to level the coal evenly in the oven. Fig. 5 is an illustration of the leveler. The machine runs under its own power on the track shown. When it is necessary to level the coal, the leveler is run directly in front of the oven, and the lower part of the doors on each end of the coke ovens are swung into place (see Fig. 14). The leveler is provided with a long arm with a scraper on the end that has an over-all reach of 35 ft., which is operated by an electric motor, moving the arm backward and forward. One man operates the leveler, which was manufactured by the Connellsville Manufacturing and Machine Supply Company.

Immediately following the leveler is the daubing car, shown in Fig. 7. This car moves on the same track as the leveler, and is also propelled by its own motor.



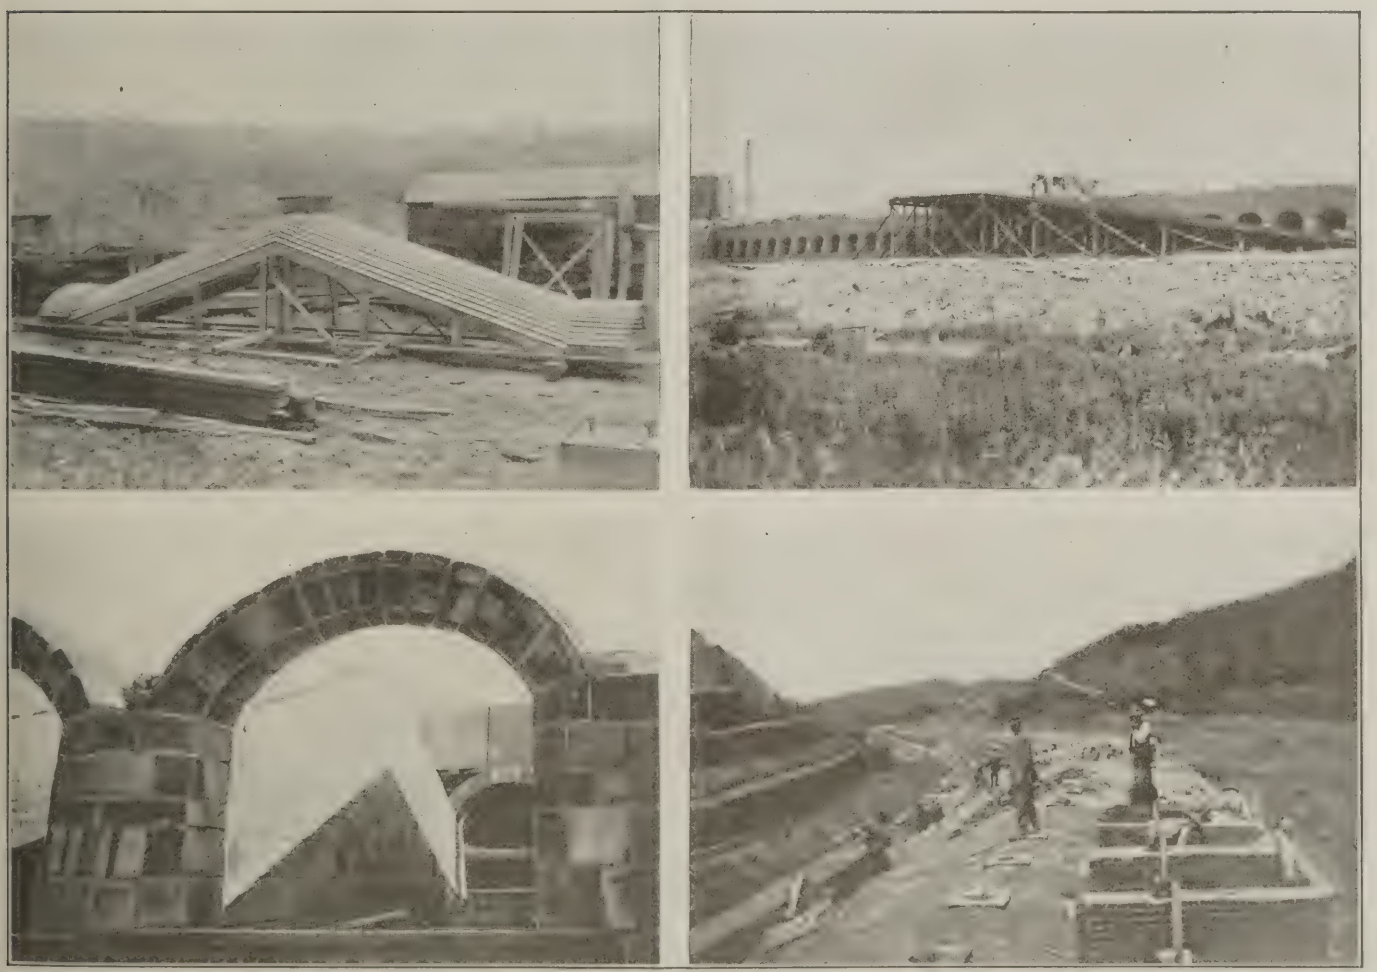


FIG. 7. VIEW OF THE DAUBING CAR

FIG. 8. TRAIN OF LARRIES ON WAY TO OVEN

FIGS. 9, 10, 11 AND 12. GENERAL VIEWS OF THE OVENS DURING CONSTRUCTION

Upper Left—Form for constructing top of oven. Upper Right—Knockdown roadway for taking earth to top of ovens. Lower Left—Oven before top was put in place. Lower Right—Top of oven before covering.

As there are doors on each end of the oven that have to be daubed it is necessary to have two of these daubing cars, one on each side of the bank of ovens. As soon as the leveling machine finishes with an oven, the daubing car moves up and takes its place. The men on the daubing car then swing the top section of the oven door into place, closing the oven. Then all the cracks and holes in the door and between the door and the oven are daubed with clay, in this way sealing out the air.

After the coal has been burned for either the 48- or the 72-hour period, depending on whether the 7- or the 10-ton charge has been used, the doors on both ends of the coke ovens are swung out of the way. Then the watering or coke quenching machine, built by the Wellman-Seaver-Morgan Co. (see Fig. 15) is run into place in front of the oven. An arm with a nozzle on the end is extended into the oven, and moved back and forth to allow water to spray over the hot coke to quench it. As

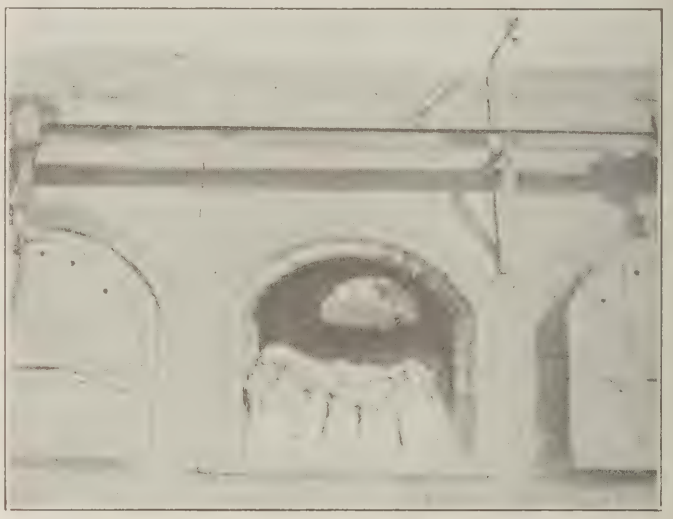

FIG. 16. COKE IN OVENS AFTER QUENCHING AND BEFORE BEING PUSHED OUT

FIG. 18. SIDE ELEVATION OF LOADER

FIG. 19. MACHINE USED TO PUSH COKE OUT OF OVENS

these arms are only 15 ft. long, it is necessary to use two of these machines, one on either end of the oven; the one on the side with the leveler is always two ovens in advance of the one on the opposite or coke-loading side. Fig. 16 shows the coke in the oven after it has been watered down.

About six ovens back of the watering machine is the coke pushing machine, built by the Connellsville Manufacturing Machine Supply Co. This machine, which is operated by electricity, is shown in Fig. 19. It is placed directly in front of the oven, and a pusher arm provided with a large head shoves the coke out of the oven. The coke falls onto a loading machine (see Fig. 18) manufactured by the Scottdale Foundry and Machine Company.

The coke loader consists of a motor-driven apron conveyor, which receives the coke as it emerges from the oven, carrying it to a bar screen. As the coke is passed over this screen, the breeze is removed and the marketable coke is carried to another apron conveyor, which dumps it into the railroad car on the loading track immediately below the end of the loading machine. Fig. 13 shows this coke loader in the operation of handling the coke from an oven, which takes about 3 min., and loading it into a railroad car.

One of the great savings that is made in the use of the rectangular type of coke oven is in the number of men employed. For the operation of the 200 rectangular coke ovens at this plant the labor is distributed as follows: One man each for the larries, leveler, pusher and loader; 4 men on watering machines; 4 men on daubing machines; 5 men cleaning up coke breeze after the loading machine; 2 men placing oven doors in position; 2 men shift railroad cars; 1 man cleans up railroad track; 2 men attend to ashes; and 2 masons are required on the plant.

This makes a total of 26 men required to operate the 200 rectangular ovens, but as some of these men also spend part of their time on the beehive ovens, it is estimated that 25½ men handle the rectangular ovens while 48 men are required to run the same number of beehive ovens.

Efficient Division of Work in Coal Mining

By Ralph W. Mayer
Connellsville, Penn.

The H. C. Frick Coke Co., which operates about 70 mines in the Connellsville field, has the labor at the working face divided in such a way as to make specialists of the different kinds of workmen. Doing one kind of work all the time, these men become more proficient at their particular job. After the loaders have loaded all the coal out of their working places they go off shift, and the night shift goes to work.

First come the machinemen, who undercut the coal by pick machines. One man operates the machine; another, called the "scraper" in the Connellsville field, keeps the cut clean, scraping out of the cut and shoveling back the "bug dust." Both these men work together in moving the machine from room to room and in setting it up preparatory to making a cut. The machine is loaded on a specially constructed car and hauled from place to place by a mule.

After the machinemen have undercut a room they are followed by the drillers, who bore the shotholes with power drills. The cut and holes are usually about 6 ft. deep; the rooms are 10 or 12 ft. wide. Having the track up to the working face makes the coal handy to load, bringing it almost against the car.

Three shotholes are usually drilled in a room of the size mentioned; one in the middle of the room and halfway between the floor and the roof, the other two holes being rib shots, one on each side, with the back end of the hole nearly touching the roof. The powder distributor follows after the drillers and leaves the powder for each shot; he uses his judgment as to the quantity of powder required, but two sticks to the hole is the amount usually needed.

The shotfirer, who follows next, loads the holes and fires the shots. Clay tamping alone is used. This tamping is prepared by the loader before he quits work. The damp clay is kneaded into cartridges, or "dummies," approximately the size of the drillhole and about 6 in. long. These dummies are placed in a shallow box, convenient for the shotfirer to get at them. One box of tamping is at each working place. Electric detonators and batteries are used to fire the charges of powder. All these men do only their one particular job, and then their shift is finished. The machine men and their helpers, as well as the loaders, get paid according to the cars of coal loaded from their working places.

In the morning, three hours before the mine starts work, the firebosses make an examination of the mine. The sections are small enough so that the firebosses can make several rounds through the places while the loaders are working. The firebosses start at four o'clock in the morning and quit at twelve o'clock noon. During the afternoon the assistant foreman makes several rounds through the working places, after the firebosses have left the mine.

The assistant foreman also may make examinations of the places during the morning, independently of the fireboss, to see if the fireboss is attending to his work. Each section has a fireboss, also an assistant foreman who starts work at seven and quits at three, or when the coal is cleaned out of the rooms, which may be later than three o'clock.

The loader shovels the coal into the mine cars and trims up the ribs and face so that no loose coal is left to fall down on the machinemen. He also sets one prop in the center of the room, after he loads out one car of coal, thus making room for placing the prop.

After the loader has cleaned up the coal in a working place, the timbermen come around and timber up the place. Props and cap pieces are usually sufficient, although tunnel sets and lagging are sometimes necessary. The firebosses and foremen always examine the roof on making their rounds. They also look out for other dangers. If the roof is dangerous, they send timbermen to fix it. With this division of labor and the close oversight exercised, the loader does not necessarily need to be a skilled miner.

In Leisenring No. 1 mine of the H. C. Frick Coke Co., safety lamps are used exclusively. Compressed air, mule and man furnish all the power used in the mine. The pick machines for mining the coal and the drills for boring the shotholes are run by compressed air, the air pipes running up into the rooms.

Dry Process of Thawing Coal

SYNOPSIS — *The fuel, in the plant described, is not dried by steam lances thrust into the coal, but by placing the car in an insulated building in which hot air is circulated. The coal is dried rather than made wetter by the process and so is less likely to freeze solid again as soon as it is removed to the barge or wagon. The cost of thawing is less than 1½c. per ton and the process takes less than 2 hours.*

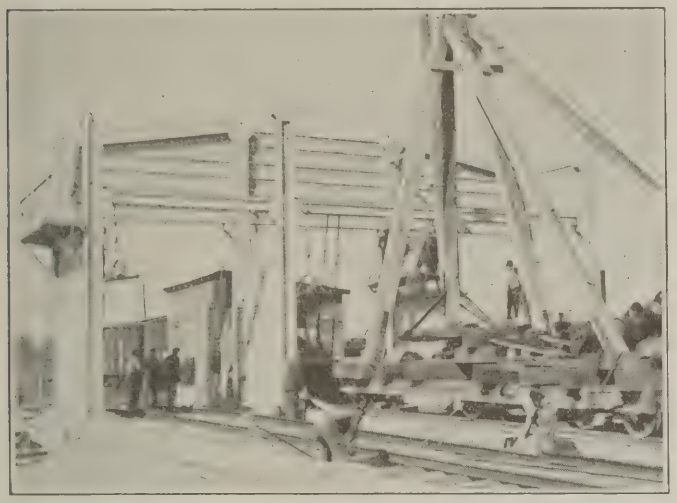
THE concurrence of the coal shortage and the unprecedented cold wave of the first week in January brought to the attention of the coal-using public around the tidewater ports their dependence upon some method of thawing out the coal so as to permit its being unloaded, says Scott W. Linn in the *Engineering News-Record.* Car after car reached the New Jersey-New York harbor ports with contents so hard as to resist almost any manual effort to release them. To meet such conditions where mechanical car dumpers are used, large thawing plants have been installed at a number of terminals. These are inclosed houses in which cars or trains of cars are run, there to be heated by one means or another to a temperature which will thaw the frozen coal and permit its easy dumping from the dumper along the same track. A number of such plants has been installed by the Walter S. Newhall Co., of Cleveland, Ohio, in the past few years, culminating in one of precast reinforced concrete at South Amboy, N. J., for the Eastern Coal Dump Company.

In the first thawing plant built for this company in 1910 a live-steam point system was used. A boiler plant of adequate capacity was provided, and an underground main steam line laid from the boilers to intersecting steam lines parallel to and between railroad tracks. At intervals of about 20 ft. manifolds were used, to which several lines of rubber hose were connected. The other end of each piece of hose was attached to a malleable-iron casting on the end of a piece of 1-in. pipe about 10 ft. long. The opposite end of this pipe was pointed and perforated near the pointed end. These pipes were drilled or driven into the frozen coal and live steam admitted to the coal through the perforations.

A winter's use of this thawing system proved that it was not a success, especially in thawing bituminous coal. It was not economical in the use of steam and the handling of the points and hose was dangerous to operators. When a point was driven into the body of frozen coal instead of the steam being distributed through the coal for any distance, the tendency was for it to thaw out a cylinder around the pipe, allowing the steam to escape to the top of the coal. This was particularly true in the case of bituminous coal or finely divided anthracite.

This action of the steam made it necessary to drive in the points a considerable number of times in each car. When the coal was finally thawed the moisture from the condensed steam rendered it very wet. The coal was also in a heated condition and on cool days a visible vapor arose from it for a considerable time after a boat was loaded. This gave rise to a fear among shippers that spontaneous combustion was imminent.

As a result of the various difficulties encountered in the point system a study was made of other proposed systems of thawing in which the trouble mentioned might not appear. Several methods of combining and applying heat to cars were considered, in all of which it was thought to be economical to provide an inclosed building with insulated walls. Construction difficulties, cost of maintenance and other objections led to the abandonment of most of the schemes. The plan that finally appeared to be most practical from the construction and operating standpoints was the hot-air system used in the latest plants.



Early plants of this type were built of wood frames with insulated walls and roof, and a later one at another site was of steel and concrete with insulated walls. Finally, in 1916, the latest plant at South Amboy was built of precast concrete members under a structural system developed by C. D. Watson, of the Precast Concrete Co., Cleveland, Ohio.

The building for the thawing plant is 570-ft. long and

ON THE LEFT THE OLD TWO-TRACK THAWING PLANT AT SOUTH AMBOY, ON THE RIGHT THE NEW THREE-TRACK PLANT

48-ft. wide. It spans three tracks and has a capacity of forty-two 40-ft. cars. It is an inclosed shed with four longitudinal rows of columns, and walls making a separate room for each of the three tracks and carrying a roof sloping both ways from a central longitudinal ridge and an intermediate ceiling, the space between being utilized for the air ducts. In the middle of the length is a higher section 50-ft. long, in the upper part

ERECTING THE PRECAST MEMBERS FOR A COAL-THAWING SHED

of which is located the blower. Structurally all the members are of precast reinforced concrete joined together.

Boilers furnishing steam for the thawing plant are situated about 400 ft. from the apparatus rooms. The boiler plant was installed several years ago for the purpose of supplying steam for the live-steam point system. It was later used for the first hot-air plant. It has been enlarged to accommodate both hot-air plants.

The building is divided longitudinally into three rooms. As each room covers one track and can be used as an independent unit with or without the two other rooms, three complete apparatus units are used. These units are duplicates in detail and arrangement, and a description of one is applicable to all.

Each unit consists of one blower, one engine and two sets of heating coils. The engine is of the vertical inclosed type, and is direct-connected to the blower at a sufficient distance away to provide clearance for free return of air to the blower wheel. The blower is of the multi-vane double-discharge type and furnishes air in large enough quantity to give frequent complete change of air in the thawing rooms. Each unit has two sets of heater coils arranged one on each side of the blower and carrying sufficient pipe to insure delivery of the desired volume of air at the required temperature. The heater coils are provided with valves and other accessories necessary to divide them into groups for further regulation of operation when the full capacity of the plant is not required.

Usually from one to two hours will thaw the ice in the coal so that it will dump freely when the car is turned over on the dumper. Under this system coal was thawed at an average of approximately 1.4c. per ton with the price of fuel coal obtainable up to the fall of 1916.

Anthracite Shipments in January

The shipments of anthracite in January, 1918, as reported to the Anthracite Bureau of Information at Philadelphia, Penn., amounted to 5,638,383 tons. This total constitutes a fine showing for the industry considering the handicap with which the operators had to contend, and is but 60,562 tons less than the December figures. January was the coldest month of a generation in the anthracite fields. The mining companies were forced to suspend operations at many mines for intervals of several days at a time, and the weather conditions made it impossible for many other operations to reach the high average monthly figures of the past year.

The total shipments for the first ten months of the coal year, which commenced on Apr. 1, 1917 (almost coincident with the declaration of war against the German Government), amounted to 64,663,456 tons, an increase of 9,054,374 tons, or more than 16 per cent., over the shipments of the corresponding period of the preceding coal year, when the United States was still at peace.

Distributed by carrier companies the shipments during January, 1918, were as follows:

	January, 1918	January, 1917	Coal Year, 1917-1918	Coal Year 1916-1917

Change in Bunker Regulations

The War Trade Board announces that the rules governing the issuance of licenses for bunker fuel and ships' stores have been amended so that American vessels not requisitioned by the Shipping Board are brought within the regulations prescribed for neutral vessels in paragraphs IV and V of the "General Rules No. 1," which were published on Jan. 19 to go into effect Feb. 1, 1918. Paragraphs IV and V as amended read as follows:

IV. No application for "bunkers" by any neutral vessel *or by any vessel of American registry not requisitioned by the United States Shipping Board* shall be approved unless the person or persons managing, owning, chartering or controlling such vessels shall have reported to and filed, in duplicate, with the War Trade Board, the names of all the vessels and masters, and any changes that may from time to time have occurred respecting said vessels and masters, managed, owned, chartered, or controlled by him or them.

V. No application for "bunkers" by any neutral ship *or by any vessel of American registry not requisitioned by the United States Shipping Board* shall be approved unless the person or persons owning, managing, chartering or controlling such vessel shall enter into an agreement in a form to be approved by the War Trade Board, agreeing to comply with and be bound by each and all of the following regulations. Failure to comply with any of these regulations in the case of any one vessel may involve the refusal of "bunkers" to all of the vessels of the particular person, firm or corporation managing, owning, chartering or controlling the vessel in question.

Supporting the Roof in Coal Mines—I

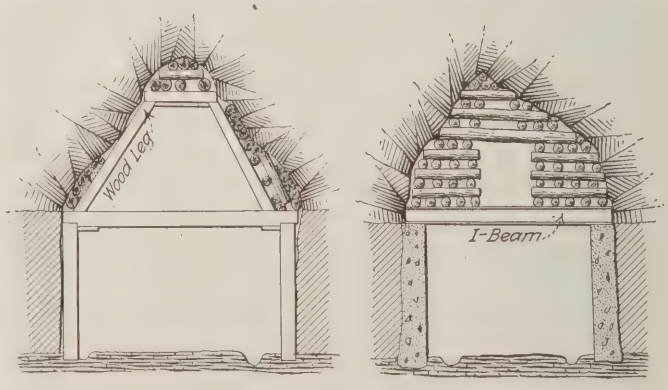
By R. D. BROWN
Harrisburg, Ill.

SYNOPSIS—*Various types of roof and complications met with in coal mines; artificial and natural methods of supporting top. Adequate barrier and chain coal pillars reward intelligent laying out of mine in better recovery of coal and more economical working of a property. Discussion of temporary and permanent wood supports in this issue.*

ROADWAYS in mines are timbered for the purpose of protecting the lives of workingmen and for the prevention of an accumulation of obstructions which would hinder the economic operation of the haulage system. To accomplish this purpose, it must first be decided which is the most suitable policy—permanent roof protection and support or systematic continuous maintenance. Local conditions may alter a proposed plan of maintaining the roadways at any particular mine. Consider the roof and bottom, the strength of pillars, the system of mining and the life of the mine.

If possible, no timbering should be permitted on haulage roads; but in many cases this will be found to be impracticable on account of safety and cost. Nevertheless some of the most modern mines permit no timbering on roadways. The method of maintaining the roadway without roof protection not only depends on the nature of the roof but also on the relative location of aircourses. Generally the haulage road should not be located in an air-course, on account of the resulting action of the air on the roof; and in gaseous mines, on account of the danger of igniting gas not sufficiently diluted in a return airway. This difficulty may be overcome by the adoption of some form of multiple-entry system to suit the local conditions. If gas is not present, the roadways may conveniently be established on a return airway; and in case gasoline locomotives are used it is essential that this be done to provide sufficient aid to dilute the noxious gases given off.

Roof Conditions Requiring Timbering



Roof conditions requiring timbering may be divided into four classes: (1) Swelling ground and moving or creeping strata; (2) tender roof; (3) faulted roof; (4) good roof which may become bad.

Swelling ground is a term applied to strata or filled ground which expands with oxidation. This condition is not common in coal mines, but is often encountered in metal mines. Moving or creeping strata is a condition resulting from robbing pillars or from a slip in the strata along the line of a fault. The movement may be slow and confined chiefly to a gradual heave in the bottom with a slight bending of the roof, which is known as a "creep"; or it may develop more quickly with immediate roof fracture and crushing of pillars, which is known as a "squeeze." If the robbing is done systematically, either advancing or retreating, heavy weight must be provided for along the haulage roads if they are to be kept open.

Timbering may check local roof movements, but it is almost useless in case great weight is to be supported. If the bottom heaves gradually, and may easily be removed, it may be possible to support local shattered portions of the roof by packwalls, timber cribs or cogs, or by closely spaced timber sets. The moving strata may not extend to the surface, and proper support in addition to the pillars may help preserve a possible haulage road; but if all pillars are removed, as in longwall mining, considerable difficulty may be experienced in maintaining an open roadway. Summing up, we may say that although timbering may help to overcome difficulties resulting from moving strata, it is more practical to anticipate and prevent roof movements by the use of barrier pillars or other mining methods.

"Tender roof" is a classification given to roof which has not sufficient coherence and strength to withstand either the separate or combined action of superincumbent weight, or stresses due to blasting or the disintegrating action of the mine air. Soapstones, shales, clod and some slates when found immediately above the coal are difficult to hold in place. If the tender strata are thin, and durable strata such as limestone or sandstone are found just above, it will usually be worth while to take down the soft strata, as shown in Figs. 1 and 2. All limestones and sandstones, however, are not sufficiently durable and chemically stable to resist the action of the air. Slate which contains a high percentage of lime may also be similarly affected.

Blasting will injure tender roof, especially if the shots are heavy—for example, those used in shooting coal off the solid. Blasting may greatly weaken roof which would be good otherwise, owing to the opening up of cracks which allow air to penetrate deeply into the rock

FIGS. 1 AND 2. EXAMPLES OF TENDER ROOF

and thus hasten its complete disintegration, as in Fig. 3. As a rule machine mining protects the roof from heavy stresses due to blasting, and in case the coal is cut at or near the top the roof is only slightly affected by the process of the removal of the coal.

Inherent structural strength of the rock does not always afford complete evidence of safety from falls. Geological disturbances may have fractured the overlying strata, leaving loose ends and unsupported rocks which must either be taken down or supported by some form of timbering. Sometimes it is not possible to de-

tect the location or extent of the seam or slip in the rock, and timbering must be done to insure safety. (These conditions are shown in Figs. 4, 5 and 6.) In other cases it would be impracticable to remove the loose rock, which may be partly held in place, because more extensive timbering would be required to support overlying strata which would then be affected.

If the roof will stand without timbering and only occasional well-defined faulty places are evident, the timbering will be local and easily constructed and main-

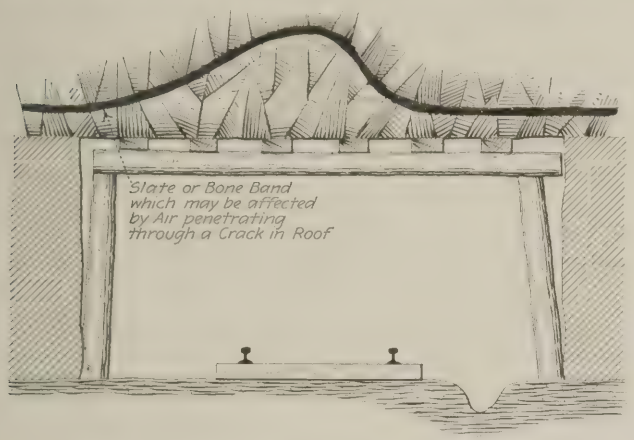


FIG. 3. EXAMPLE OF ROOF REQUIRING TIMBER

tained. In general an unprotected faulted roof is dangerous and requires constant attention, for it is not always possible to ascertain exactly its weakness, which may develop suddenly at some unsuspected point. Falls of rock can only be prevented by adequate timbering.

A large percentage of accidents caused by falls of rock are the result of carelessly trusting the integrity of roof supposed to be safe. Careful daily examination will partly eliminate the cause for such accidents on traveling ways. If the top is over 12 to 15 ft. high, a thorough examination is practically impossible and timbering may be necessary to insure safety. There is a certain hazard connected with mining which cannot be overcome practically as long as the human element exists; and it is useless, therefore, to attempt abnormal expenditures to decrease liability below a definite limit if the resulting burden from that expenditure would hopelessly cripple the industry.

Barrier Pillars

All main and secondary entries driven for development contain the haulage roads. These must be permanently maintained, and they should therefore be protected by barrier pillars the width of which will be dependent upon the nature and depth of the strata, the thickness and inclination of the seam and the method of mining. Since there are so many variables to be considered, it is not practical to derive a fixed rule; consequently, the proper width will be determined according to the best judgment of an engineer thoroughly acquainted with the limiting natural conditions and the proposed method of mining.

As a protection to roadways in the panel room-and-pillar system of mining, the recommendations of Table I will be found to be within the limits of safe operation for seams lying nearly level.

An important purpose of the barrier pillar is to protect the roof over entries from being affected by the mining of coal from adjacent panels. If robbing takes place and the overbearing strata are shattered over insufficient pillars, many local falls may occur in the entries in spite of the fact that intervening pillars remain uncrushed. Coal left in barrier pillars may be worked out when retreating after the stub entries have been abandoned; little coal is lost and the mining of substantial pillars might decrease the cost of production at a time when other expenses have reached a maximum.

The size of the chain pillar between entries must also be adjusted to fit properly the determining natural conditions. For example, a combination of great weight, small pillars, soft bottom and a strong roof may cause a heave. As the state laws usually regulate the distance between crosscuts, it is necessary to increase the width of the chain pillar where the bottom consists of soft fireclay or rocks of equal consistency. When the depth to the coal is more than 200 ft. it is not advisable to limit the width of the chain pillar to less than 20 ft., re-

TABLE I. WIDTH OF BARRIER PILLARS

Depth of Strata, Ft.	Thickness of Seam, Ft.	Width of Barrier Pillar, Ft.
50 to 100	3 to 5	75
50 to 100	5 to 12	100
100 to 200	3 to 5	100
100 to 200	5 to 12	125
200 to 400	3 to 5	125
200 to 400	5 to 12	150
400 to 600	3 to 5	150
400 to 600	5 to 12	175
600 to 800	3 to 5	175
600 to 800	5 to 12	200

NOTE—For depths over 800 ft., the barrier pillar may be assumed to be one-third the depth of the seam. When the roof is faulted it is usually advisable to increase the width of the barrier pillar, according to conditions encountered.

gardless of the fact that a switch might be necessary to load out the coal from the crosscut. Wide roomnecks on stub entries may also weaken the roof. In order to avoid wide openings breakthroughs should never be placed opposite roomnecks. If the roof is bad and timbering is required, a narrow location for a turnout from the roadway should always be provided. The yardage cost for driving a narrow place will be offset entirely by the reduced cost of maintaining the roadway.

The type of timbering used in coal mining should depend on its utility. By utility is meant the nature and length of service. Along main haulage roads the con-

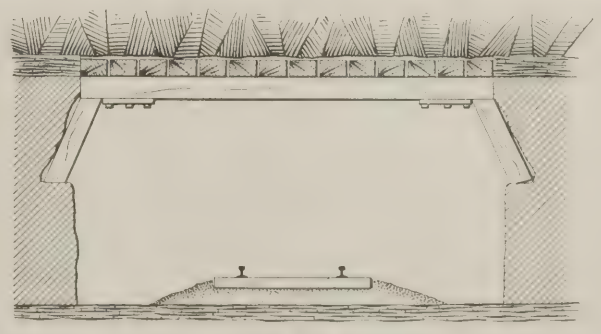

FIG. 4. EXAMPLE OF FAULTED ROOF

struction must be substantial and permanent. In rooms and stub entries the usefulness of the timbering is temporary, and the type of construction is dependent on the ultimate cost. Practically, therefore, we consider temporary construction as timbering with props and permanent construction as timbering by means of sets and masonry.

Roof protection in rooms and in short stub entries has a limited period of usefulness. Unless the roof is unusually tender, crossbars and lagging will not be necessary and props, the simplest form of timbering, syste-

matically set will serve the purpose adequately. Systematic placing of props according to a regular pre-arranged plan eliminates the chance of the faulty judgment or neglect of the average miner. Primarily the plan is adopted for the purpose of protecting the employee, and eventually it proves to be economical.

With ordinary conditions, rows of props set from 4½- to 6-ft. centers on each side of the roadway, but never closer than 2½ ft. from the rail, will give adequate protection from local falls of slate. Successive rows will

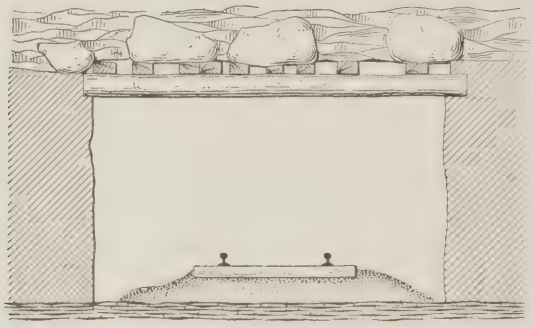

FIG. 5. EXAMPLE OF BOULDER TOP

depend on the width of the place, the nature of the roof and the method of working, and all succeeding rows should be staggered to be thoroughly effective.

If props are used to prevent local falls where the strata are moving, the great weight will crush the solidly set prop; and provision must therefore be made to prevent this early failure. The most effective method of doing this is to sharpen one end of the prop, thus causing an earlier partial failure but not a later ultimate failure. In Europe a telescoping prop has been introduced to be used where great weight is encountered and the top and bottom are both hard. This prop is made of a steel cylinder, partly filled with sand, cinder or refuse, into which is fitted a wooden plunger. Weight forces the plunger deeper into the cylinder, gradually compacting the filling. If desirable, the height of the prop may be adjusted after the weight is on by removing a part of the filling through holes in the cylinder, which are otherwise covered by a steel band. A similar result may be obtained by using a hollow round prop of steel or iron with a thick, soft wood cap which will crush under an increasing weight.

The diameter or sectional dimensions of any prop depend on the length, the weight to be supported and the material from which the prop is made. If wood props are used, as is almost universally the case, the kind of wood will be quite a factor not only on account of the structural strength but also on account of the resistance to decay. A prop is nothing more than a simple column, and the mechanical principles of structural design apply accordingly. Practical experience has shown that a column the length of which is greater than 15 times its least diameter is subjected to bending stresses additional to and resulting from the direct compressive stresses. Therefore, no prop should be longer than 15 times its least diameter. On account of the unreliability of small pieces of timber, no prop should be less than 4 in. in diameter. Since the diameter of the prop bears a definite relation to the length and to its structural strength, depending on the kind of wood from which it was made, Table II has been prepared, showing these relations.

The spacing of props may be increased by increasing the length of the cap pieces placed over the top of the prop. The immediate service of a cap piece is to adjust the length and to protect the prop from early failure by splitting; but by using a cap piece of considerable length a greater area of roof will be supported safely, by means of the cantilever action developed. Along the roadway the cap pieces should be placed perpendicularly to the line of track, as the cantilever ends thus span a part of the necessarily wide space between the rows of props on each side of the track.

When the life of the roadway is greater than five years, timbering, if necessary, must be substantially permanent. Adequate protection will require standard

TABLE II. LENGTH AND LEAST DIAMETER OF PROPS OF VARIOUS KINDS OF WOOD

Kind of Wood	Length of Prop in Feet: 5	5½	6	6½	7	7½	8	8½	9	9½	10
	Diameter of Prop in Inches

cross-bars, or caps, and lagging. In order to increase the period of usefulness of timber sets only the most durable woods available should be used. Hard woods are more resistant to destructive agencies than soft

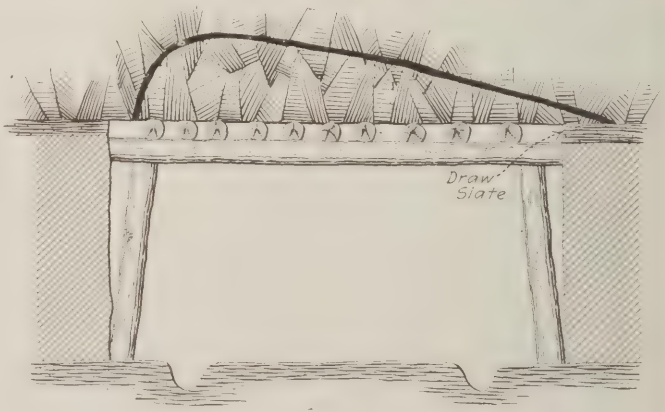

FIG. 6. SLIP IN ROOF DIFFICULT TO DETECT

woods and are therefore preferable if the cost is not excessive.

All mine timbers should be cut in the winter months, when the sap is out of the wood, and allowed to season properly before being taken underground. Seasoned wood not only has greater strength but is also more resistant to decay. Peeling the bark from green timber before seasoning will also add to its life from 10 to 50 per cent., according to local conditions.

The factors which cause a variation in the life of wood mine timbers are: (1) Humidity, temperature and

quantity of air in circulation; (2) the amount and chemical content of the mine water present; (3) condition of the timbers when placed. Fresh dry air adds to the life of timber properly exposed to the ventilating current; but moist, stagnant air furnishes an ideal condition for the growth of wood-destroying fungi. These fungi develop under favorable conditions from spores which are carried from infected timber by the air currents. Replacement with untreated wood should therefore not be intermittent, and scattering but whole sections should be renewed at one time.

Mine water when present in quantities sufficient to keep the timber continuously wet will preserve such timber for several years, but condensation from a warm, humid atmosphere may cause an early decay. Green timber has only approximately two-thirds the strength of well seasoned timber and it is also more subject to decay, due to the presence of sap in the wood. Experience has proved that green posts have a comparatively short life when placed in the mine immediately after being cut.

(*To be continued*)

Clean and Otherwise Acceptable Coal

By H. A. Turner
Birmingham, Ala.

Clean coal will always be demanded by the coal market. That operator who produces the cleanest fuel will, under normal conditions, receive a better price for his output than his less-careful competitor, and during a dull market will run full time while the other fellow who produces an inferior product will suspend operations for lack of orders.

Over this question of clean-coal production there has always been a struggle between the mine management and the miner. It is human nature, or it is certainly the human inclination to follow the lines of least resistance—that is, to pursue the easiest way or the way which appears most profitable.

In the absence of a deterring hand the miner breaks down his coal in the most effective manner as to quantity, loads coal and rock together, and receives the coal compensation for the combined weight. This is his natural inclination, because less effort is required and the results, to him, appear more profitable. On the other hand it is easier for the operator to dispose of a product properly prepared; and in case of coal free from impurities his returns are greater, hence the struggle which has gone on for so many years.

In the days of the skilled coal digger, when practically all the coal was pick-mined and wedged down, clean coal was produced with little effort on the part of the mine manager.

When explosives were introduced for breaking down the coal these same skilled miners were inclined to use them sparingly, and with judgment, finding it difficult to depart from their habits of loading an acceptable product. But the elimination of the manual labor brought about by the explosives had its effect, in a limited way, and the coal began to come out with a little slate mixed with it.

Production of coal increased rapidly, undercutting machines were perfected, and explosives came into universal use. Production was so rapid that the old-time coal miners were insufficient in number to handle the situation and new ones ceased to be trained in their methods, preferring the short cut of shooting on the solid and the operating of a coal-cutting machine.

With the advent of the general use of explosives, mining machines, and the rapid increase in coal production, came a class of miners, quite different in training from the old pick miner, and with ideals far removed from those of the latter. Under the new conditions coal-washing plants began to appear, picking belts were installed here and there, friction between miner and manager arose, and various forms of preventive measures were formulated by mine owners with the hope of checking the growing inclination of their men to load out everything in sight, without regard to its fitness for market. Thus another step in the deterioration of the miner's habits and methods is recorded.

Picking belts, screens, coal washers, etc., have been made necessary by the conditions described above, the coal consumers demanding a product reasonably free from foreign matter. The mine owners, continually harassed by the consumers, have endeavored to control the miner by penalizing him in various ways. In many cases the penalties have been severe, in some unjust, and in nearly all an unfortunate feeling of antagonism has sprung up between miner and manager which detracts from the efficiency of the mine organization.

These things being true, it would appear logical to seek until found some method and device that will create an incentive for the miner to perform his work well. Such an incentive should be stronger than that for shooting coal to pieces on the solid because it is easier broken down in this manner, and one that is stronger than the inclination to load everything in sight because this is less trouble than picking out the rock. A step in this direction would be to establish bonuses as a reward for good work and as an offset to the fixing of any just penalties that may be required.

Again, as a result of a nagging coal-consuming public, penalties have been enforced which were too severe. Why not modify these to the extent that the punishment will be in keeping with the dereliction and no more?

My observation of the different methods by which the output of individual miners is tested for rock is that the tests are imperfect in that the average of the miner's work is represented only by accident; that guilty miners escape "dockage" when deserving it; that innocent ones are punished; and that the operator does not discover his real loss until customers reject shipments of coal, or in the case of a washery, railroad weights of the prepared product are in hand.

It would seem wise, then, to work out some mechanical device (which can be done) that would truly sample the daily work of each individual miner and then make a separation which would clearly indicate the average amount of rock being loaded out by each.

A sheet form could be got out and posted in a public place, at the tipple or company's office, showing the record of each miner for each day.

It will be found by those trying this plan that the impurities in the coal will, in many cases, be reduced by one half; that the manifest fairness of the tests has a most wholesome effect on the men; that in a short time a pride will spring up among the miners in im-

proving their publicly posted record; and that the rivalry between them will yield the mine owner results to be attained in no other manner. This condition will replace years of friction and ill feeling between miner and mine manager, as well as the disorganization and other ills growing out of the old, ill-considered "dockage" system.

The plan mentioned here for improving and practically eliminating a most troublesome and expensive condition of affairs is not an unreeled theory of a remedy which every operator would like to see successfully applied, but is a true description of what has been accomplished at the Banner mine, Alabama, property of the Pratt Consolidated Coal Co. The mechanical device for sampling the coal and separating it is the work of Erskine Ramsay, vice president and chief engineer of the company. It is fully described in Patent No. 1,191,227, issued July 18, 1916. A description of this device together with some of the results attained was printed in *Coal Age* for Apr. 7, 1917.

The growing evil arising from the improper loading of coal by miners, discussed in the early part of this article, has been highly intensified since the country entered the war. As illustrating the point in question, Van H. Manning, director of the Bureau of Mines, Department of the Interior, states that coal which ran from 6 to 8 per cent. of ash in normal times is running from 12 to 18 per cent. of ash in these abnormal times.

General installation of the device in operation at the Banner mine or a similar mechanical sampler, and the adoption of the methods used in connection with it would, in my judgment, be of great national benefit at the present time.

New York City Coal Requirements for the Coming Year

The various branches of the New York City government will consume at least 532,590 tons of anthracite and bituminous coal during 1918, according to a report submitted by Francis P. Bent, Director of the Bureau of Contract Supervision, to Mayor Hylan and the members of the Mayor's Coal Committee headed by City Chamberlain Alfred J. Johnson. The report shows that the budget allowance for coal for the 36 departments and institutions provides for the actual consumption of 516,280 tons of coal at a cost of $3,346,079.29. The difference between the budget allowance and the estimated needs for the year is due to the continual changes taking place in the various institutions and departments, to allowances made in the budget for projected buildings not yet in operation, and in some instances to money spent for coal out of the corporate funds of endowed enterprises such as the New York Public Library and the Metropolitan Museum of Art.

Of the tonnage provided for by the budget, less than one-quarter, or 122,631 tons, will be domestic sizes of anthracite; the remainder, 409,959 tons, will be steam coals. Of the entire amount, 460,345 tons will be anthracite; 63,495 tons will be semi-bituminous, and 8750 tons will be a mixture of buckwheat No. 3 and semi-bituminous. The points of delivery number 1700, located in 20 zones into which the Greater City has been divided.

The estimated needs and the budget allowances of the several kinds of coal used are as follows:

Anthracite Coal	Estimated Needs	Budget Allowance	Budget Estimated Cost
Broken	48,812.0	47,655	$447,557.75
Egg	26,377.1	25,945	219,005.85
Stove	11,391.0	11,747	99,908.25
Pea	34,899.0	31,311	235,782.00
Chestnut	1,152.0	581	5,091.95
Buckwheat No. 1	74,029.0	60,557	428,854.25
Buckwheat No. 2	116,652.0	116,330	652,337.50
Buckwheat No. 3	147,033.0	153,563	780,013.74
Soft coal, semi-bituminous	63,495.0	68,591	477,528.00
Semi-bituminous and anthracite coals mixed	8,750.0	.....	.....
	532,590.1	516,280	$3,346,079.29

The report quotes from a statement of the Federal Bureau of Mines to show what the use of inferior coal means in the operation of the boiler room, stating that the preparation has not been so good as in times past and that repeated cases have been brought to the attention of the Bureau of Mines where coal which would run from 6 to 8 per cent. ash in normal times is running from 12 to 18 per cent. at present.

The report further says that the estimated needs, 532,590 tons, will cost about $3,461,835 and that if the government does not make adequate provisions for controlling the quality of the coal sold, and in the production and use of steam in city institutions, the city will have to make provisions for an increase of approximately 15 per cent. over the figures given, which is estimated to be 79,888 tons of coal at a cost of $519,272.

Legal Department

NEW YORK WORKMEN'S COMPENSATION ACT—Although it is doubtful that an employee injured while shoveling coal from a freight car into a wagon, through his slipping and coal falling upon him, was entitled to an award under the New York Workmen's Compensation Act, on a theory that he was engaged in handling coal "on any dock, platform or place, or in any warehouse or place of storage," or that he was engaged in the "operation of wagons or vehicles," occupations declared by the Act to be hazardous, still his employer, having entered into an agreement for a settlement and that agreement having been approved by the State Industrial Commission, neither the employer nor an insurance carrier is entitled to have the agreement set aside on the ground that the injury was not compensable under the law. (New York State Industrial Commission's "Bulletin," January, 1918; Hassen vs. Elm Coal Co.)

ASSESSMENT OF UTAH COAL LANDS—In a suit brought by the state auditor of Utah against a county auditor to compel correction of an erroneous assessment of coal lands whereby lands purchased from the United States and from the state were assessed at a flat rate of $50 an acre, although the Federal lands were purchased at prices ranging from $10 to $350 an acre and the state lands at from $50 to $10,000, the Utah Supreme Court sustains the right of the state auditor, in a proper case, to maintain a mandamus suit to compel a proper assessment, but holds that such suit does not lie where the assessor's functions have ended by completion of the assessment, equalization of taxes, establishment of the tax rate, apportionment of funds, and by the passing of the assessment roll beyond his control. For the guidance of assessors, however, in the future the court points out that assessment of coal lands at a flat rate is improper under the constitutional and statutory provisions in force in the state, requiring coal lands purchased from the United States to be assessed at the price paid the Government therefor, and other property, including coal lands not purchased from the United States, at actual value. (Ririe vs. Randolph, 169 Pacific Reporter, 941.)

Developments in Byproduct Coking

THE subject of a paper by George Blake Walker before the December meeting of the Institution of Civil Engineers (London, England) was "Recent Developments in Byproduct Coking." He showed that in the present century a revolution has taken place in the system of coking, and now large numbers of plants of ovens of the retort type with recovery of byproducts are in existence, and are being constantly added to. The principles of external heating of the retort oven, as originally introduced by Evenee Coppée, remain the same, but considerable modifications in detail have been introduced as the result of experience. The object of these modifications has been chiefly to increase the rapidity of the coking process by the application of more intense heat, and by the heating of the air for combustion, convenience and economy in operation having also received a good deal of attention. The recovery of byproducts has been greatly developed and in particular many experiments with more or less success have been made for achieving the "direct" recovery of sulphate of ammonia. One of the most important developments has been the utilization of the surplus gases in internal-combustion engines, and for town illumination, metallurgical furnaces and other manufacturing purposes.

Results Sought in Latest-Type Ovens

Mr. Walker says the objects aimed at in all recent ovens are: (1) More intense and better equalization of heat in all parts of the oven walls, in order to burn off the charge more quickly and uniformly. (2) Equalization of the pressure of the gas between the ovens and the heating flues. (3) Reduction in the time of coking, whereby a larger output of surplus gas, coke and byproducts is obtained from a given number of ovens, and reduction in the cost of coke making, etc. (4) Good means of inspection of the heating flues. (5) Facility of regulation. (6) Increased yield of ammonia and benzol. (7) Reduction of quantity of gas required for heating the ovens by the use of regenerators.

The retort coking systems may be divided into two classes—namely, that in which byproducts are not recovered, and that in which they are. In the first method the gases of distillation are conducted, without the separation of the tar and ammonia, into the oven flues where they are utilized for burning the charge contained in the oven, and afterward to fire boilers or heat furnaces. In the second method the ovens may be either of the waste-heat or of the regenerator type, the tar and ammonia being separated and the purified gases used for other purposes. In waste-heat ovens upward of 80 per cent. of the gas is burned in the oven flues. In the regenerator type 40 to 50 per cent. of the gas driven off during the burning of the charge of coal is used for heating the oven flues, and the balance is available either for heating boilers, or for supplying gas to gas engines or for town lighting, etc.

The author described the principal features of half a dozen of the most successful types of oven in use and the recovery plants associated with them, and cited figures showing the economies obtained by the "direct" recovery of sulphate of ammonia. He also compared the relative value of the surplus gases used in producing steam (utilized through turbines) and in internal-combustion engines, to the advantage of the latter. He summarized the advantages of the plant described thus: (1) The recovery of the sulphate of ammonia is performed without the use of condensers, coolers or scrubbers. (2) The results obtained are equally good in summer and in winter, as they do not depend on the cooling and scrubbing of the gas, and no loss of ammonia can occur. (3) No cooling water for condensers is required. (4) No noxious effluent whatever is produced, whether or not benzol be recovered. (5) The labor and supervision involved in the working of the plant are less than with the scrubber process. (6) The plant is simple in design and no more expensive to maintain than the scrubber process.

Mr. Walker says the use of coke-oven gas for power purposes at collieries is certain to make rapid progress. Up to the present time colliery managers have scarcely realized that a considerable supply of power from byproduct coke ovens was available. In some cases there is a disposition to build waste-heat ovens and use the whole of the gases, after they have heated the ovens, under boilers. There is, perhaps naturally, a very great reluctance on the part of most colliery managers to scrap existing steam plant which is serviceable, although it may be far from economical, and the tendency seems to be in favor of introducing steam turbines to generate electricity, especially where exhaust steam can be utilized.

Better to Gasify Poor Material

"Mixed-pressure" turbines, running on exhaust steam during the day and on live steam at night, have been introduced at collieries in large numbers. From the point of view of actual heat efficiency the author says the advantage is clearly in favor of the gas engine and the regenerator type of oven; but the varying circumstances of collieries modify this conclusion to some extent, inasmuch as at most pits there is a quantity of unsalable fuel available. There can, however, be no doubt that such inferior material could be gasified in gas producers with results far more advantageous than if it were burned under boilers.

Comparing the amount of power which can be obtained by raising steam with waste heat from nonregenerator ovens and using it in steam engines, and by using the surplus gases from regenerator ovens in internal-combustion engines, Mr. Walker says a coal containing 30 per cent. of volatile constituents and yielding not less than 10,000 cu.ft. of gas per ton may be taken as representative.

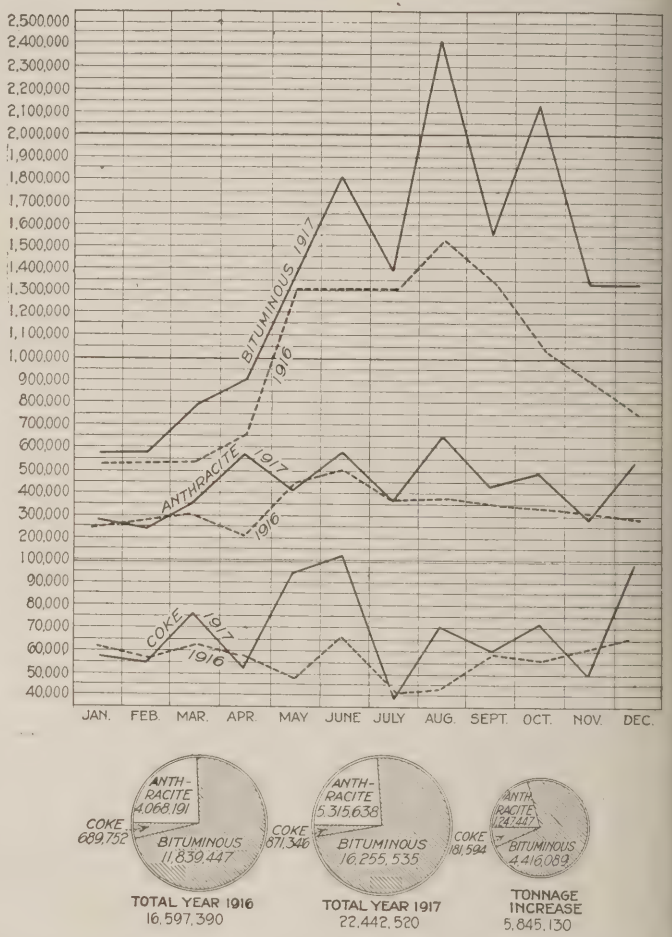
In a battery of 50 modern byproduct ovens, each having a capacity of 10 tons of damp coal, and burning off in 30 hours—say 5½ charges burned per week—2750 tons of coal per week would be carbonized. If these are "waste-heat" ovens without regenerators, there will be sufficient waste heat at about 800 deg. C. to fire six Lancashire boilers (say 30 x 8 ft.), which would evaporate (say) 500 gal. of water per hour, and produce steam in noncondensing engines to the extent

of about 250 hp. each or 1200 hp. in all. In addition to this there would probably be some, but not very much, surplus gas. This, of course, could be used in gas engines.

If the ovens were of the regenerator type the heat would be absorbed from the waste gases in passing through the regenerators, and would be of little value for steam raising. The highly heated air for combustion in the heating flues of the ovens effects a great economy in the quantity of gas required for carbonization, and leaves a considerable surplus for use in internal-combustion engines. As much as 60 per cent. of the scrubbed gas is sometimes available, but 40 per cent. is a very moderate proportion; 2750 tons of coal at 10,000 cu.ft. per ton give 27,500,000 cu.ft. of gas, 40 per cent. of which is about 11,000,000 cu.ft. Reckoning 30 ft. of gas per horsepower-hour in gas engines $\frac{11,000,000}{30 \times 168} = 2182$ hp., or more than double the amount obtained by steam raising.

Of course, the author adds, these figures are exceedingly rough, but they are fairly representative of results obtained in actual practice. If the gas was used in gas engines whose consumption was only 20 cu.ft. of gas per horsepower-hour the advantage over steam would be 50 per cent. more, and probably such a consumption as 20 cu.ft. per horsepower-hour will soon be common practice.

The Untruthful Magnetic Needle



Writing to the *Engineering News-Record*, A. M. Strong, of Veuve & Strong, consulting engineers, remarks that one instrument with which he has worked has always shown a variation about one degree greater than other instruments on the same work.

"It is also found that in certain places the same needle will give differing results at different times. The best illustration of this fact coming under my notice was as follows: The instrument was set up on a high rocky point and a true north line laid off, the needle being set at zero and left free. In a short time it was noticed that the needle was pointing about 30 min. off, but there had been no change in the line of sight. The instrument was in this position for several hours, during which the needle varied several times. The day was partly cloudy, and it was found that the pointing of the needle varied with sunshine or shadow on the rocks, the variation being due undoubtedly to the varying quantity of static electricity.

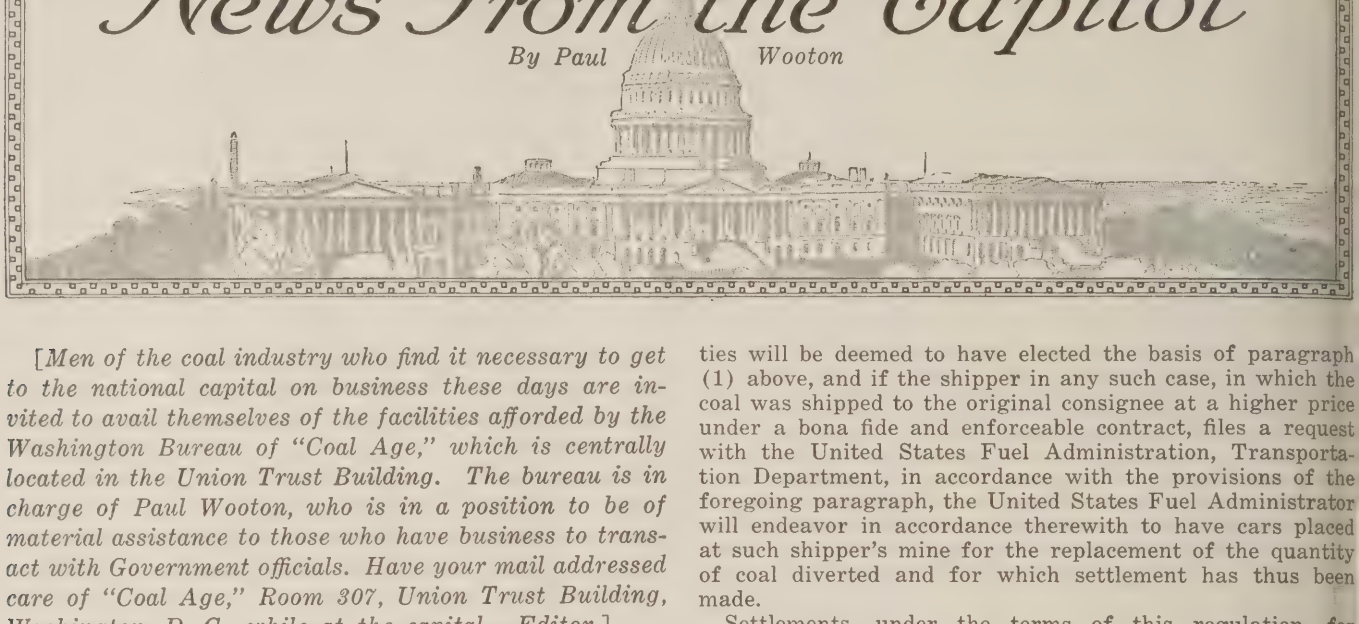
"There should always be a constant but slight increase in variation as one goes north, but I found one district where there was a distinct jump of half a degree in crossing a strip a few hundred yards wide, while the variation remained the same for miles on each side of this point."

Our Coal Exports to Canada During 1916 and 1917

Various misstatements have been published with regard to the amount of coal which was sent to Canada in 1917. The exact figures with regard to the exportation of American coal to Canada have been set forth clearly by the Federal Trade Commission and are given in the table below. The curves prepared in the office of the Commission to show graphically the relationship of the exports during 1917 and 1916 are reproduced in the diagram shown above.

RELATIONSHIP OF COAL EXPORTS TO CANADA DURING 1916 AND 1917

EXPORTS TO CANADA DURING 1916 AND 1917



Compiled by the Federal Trade Commission from information received from the Department of Commerce (does not include bunker coal)

Kind	January	February	March	April	May	June	July	August	September	October	November	December	Total
						1916

Whenever there are Railroad Cars to fill.

[Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Union Trust Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 307, Union Trust Building, Washington, D. C., while at the capital.—Editor.]

How Settlement Will Be Made for Coal Diverted by Fuel Administrators

Settlement for coal which was diverted from the original consignee by order of fuel administrators, is to be handled as follows, an order from the Fuel Administrator states:

Bituminous coal shipped from the mines prior to Jan. 15, 1918, and diverted in transit on orders of or by authority of the United States Fuel Administrator, so that it was not received by its original consignee, shall be paid for by the party receiving the coal to the owner thereof (either shipper, jobber or original consignee as the case may be) by agreement between the parties in interest on either of the following bases as they may elect, and if they are unable to agree then on that one of the following bases which the party who was the legal owner of the coal at the time of such diversion may elect:

1. At the going Government price at the time and place of shipment, and in addition thereto the jobber's commission, if a jobber was the owner, or if the owner purchased through a jobber the coal so diverted and has paid or is legally liable to pay the jobber's commission thereon; or

2. At the contract price at which the coal so diverted was shipped or sold under a bona fide contract enforceable at law, and in addition thereto the jobber's commission, if a jobber was the owner, or if the owner purchased through a jobber the coal so diverted and has paid or is legally liable to pay the jobber's commission thereon.

Upon receipt by the United States Fuel Administration (Transportation Department) prior to Mar. 1, 1918, of a written request therefor, showing that settlement between the shipper or jobber of the coal so diverted, and the party to whom such coal was diverted, has been made on the basis of paragraph numbered (1) hereof, instead of on a higher contract price under paragraph numbered (2) hereof, conditioned upon replacement by the shipper to the original consignee of an equal number of cars of coal at the contract price, and that the original consignee has assented to such settlement, the United States Fuel Administrator will arrange to have supplied to the original shipper prior to Apr. 1, 1918, if practicable, cars for the purpose of enabling the shipper to make such replacement in addition to his mines' distributive share of available cars.

In any case where settlement has already been made at the going Government price for any diverted coal, the parties will be deemed to have elected the basis of paragraph (1) above, and if the shipper in any such case, in which the coal was shipped to the original consignee at a higher price under a bona fide and enforceable contract, files a request with the United States Fuel Administration, Transportation Department, in accordance with the provisions of the foregoing paragraph, the United States Fuel Administrator will endeavor in accordance therewith to have cars placed at such shipper's mine for the replacement of the quantity of coal diverted and for which settlement has thus been made.

Settlements, under the terms of this regulation, for diverted coal may be made only as full settlement of all liability in connection with such diversion as between all parties, including the Government.

New Coal Price Regulations at Three Illinois Mines

New prices have been allowed three mines in Illinois, as follows: Moweaqua Coal Mining and Manufacturing Co., Moweaqua, Christian County, run-of-mine, $2.40 prepared sizes, $2.65; slack or screenings, $2.15. Assumption Coal Mining Co., Assumption, Christian County, run-of-mine, $3; prepared sizes, $4.55; slack or screenings, $2.15. Spoon River Colliery Co., Ellisville, run-of-mine, $2.65; prepared sizes, $2.90; slack or screenings, $2.40.

Increase Granted in Central Pennsylvania

After long negotiations, central Pennsylvania has been granted an increase in price. Sixty cents has been added to the President's schedule, which for run-of-mine in that district was $2. By permitting an increase to $2.60, Dr. Garfield stated that nothing could occur that would be a more cogent argument in favor of the reduction of the new prices than for him to learn that the operators to whom these prices have been granted are not constantly increasing the productivity of their mines by proper development, or to learn that the amount of production from this district is not constantly on the increase, or that the coal shipped from the district is not kept free from impurity.

In addition to the 60c., five mills per ton may be added in order to provide funds to meet the expenses of pools and other arrangements made by the operators to facilitate the movement and distribution of coal. An operators' committee is to be named later to handle the funds which thus will be created.

The central Pennsylvania district is described by the Fuel Administration as consisting of the counties of Tioga, Lacoming, Clinton, Center, Huntington, Bedford,

Cameron, Elk, Clearfield, Cambria, Blair, Somerset, Jefferson, Indiana, Clarion, Armstrong, Butler, Mercer, Lawrence and Beaver; Allegheny, from the lower end of Tarentum Borough north to county line; in Westmoreland County from a point opposite the lower end of Tarentum Borough north along the Allegheny River, and along the Kiskiminitas River eastward to the Conemaugh River and continuing along the Conemaugh River to the county line of Cambria County.

Weekly Production Statistics

Coal production for the week ended Feb. 9 was 10,215,000 tons. Beehive coke production for that week totaled 505,000 tons. Anthracite shipments were 32,011 cars. These figures are based on returns made by practically all producers to the Geological Survey.

The rate of production for the week ended Feb. 9 reflects the improvement in weather conditions and is the highest attained since the week ended Jan. 5. With better supplies of coal, the beehive ovens were able to show an increase of 75,000 tons over the week preceding. The anthracite forwardings, however, are 2500 cars under shipments of the week ended Feb. 2.

During the week ended Feb. 2, byproduct coke plants, representing 99 per cent. of production, were operated at 70.8 per cent. of capacity. They produced 517,184 tons of coke.

New Maximum Prices for Beehive Coke

Maximum prices for beehive coke in certain districts were fixed last week by the United States Fuel Administration. For coke produced in the New River district the maximum price fixed was $8. The price for the Big Seam district in Alabama was fixed at $6.75, except the coke made by the Newcastle Coal Co., which is permitted to charge $7.50. In the Black Creek, Brookwood and Blue Creek districts in Alabama an $8 price was fixed. An exception from this latter is a price of $8.25 allowed the Empire Coal Co. at Empire, Ala. The highest price that may be charged by the United States Cast Iron and Foundry Co. at Bessemer, Ala., is $8.50. The McCurtain Coke Co., at McCurtain, Okla., will be permitted to charge $10.75 for smelting coke and $11.75 for selected 72-hour foundry coke. Any grade of coke made in Walker County, Georgia, is to be sold at a maximum price of $8.75.

Jobbers' Margin To Be Eliminated

A general increase in the President's coal price schedule will be made before Apr. 1, so as to allow coal operators to pay the jobber for his service. At the same time the existing jobbers' margin will be eliminated. This action, the Fuel Administration announces, makes possible a reduction in retail prices of both anthracite and bituminous coal. This is a return to the system in vogue before the Government assumed control of the industry. The change was made necessary by certain abuses of the plan, whereby the jobber received a guaranteed commission, as well as by the fact that the jobbers' commission could be reduced by the return to the old method.

Retail Dealers Asked To Report on Receipts and Storage of Soft Coal

In the effort to obtain an equitable distribution of coal among the essential industries and users, the Fuel Administration has requested *Coal Age* to reproduce the blank shown below. Retail dealers supplying coal for heating have, of course, very necessary requirements, and in the effort that these needs may be promptly and surely met during the coming year, J. D. A. Morrow, Manager of Distribution of the Fuel Administration, is sending these blanks to all dealers of whom he has record.

UNITED STATES FUEL ADMINISTRATION

Department of Distribution, Washington, D. C., February, 1918.
Return to Room 4205, Interior Bldg., in enclosed envelope that requires no postage.
Report on Receipts and Storage of Bituminous Coal by Retail Dealers.

State .....
County .....
(Name) .....
Town .....
Approximate population .....

1. Receipts of all soft coal (in tons of 2000 pounds) by months, in 1917.

January	February	March	April	May	June
July	August	September	October	November	December

2. Yard storage capacity in bins and on the ground ..... tons.

3 Tons sold in calendar year, 1917, to householders, hotels, restaurants, hospitals, schools, charitable institution, office buildings, stores, churches, theaters, municipal buildings (do not include water works or pumping stations; or public utilities such as gas companies and street railways) ..... tons.

4. Tons sold in calendar year, 1917, to all other users ..... tons.

5. Was coal received by rail or water? .....

6. From whom did you purchase your coal in 1917?

Name	Address	Total tons purchased

In order that provisions may be made by the United States Fuel Administration for coal to all domestic consumers next year, it is necessary that you fill out and return this blank by March 4th. Failure to completely and promptly supply these figures may result in your not receiving a full supply of coal.

Date signed. Name of person signing.

If these blanks are generally answered, the information supplied will be tabulated by localities, and thus furnish the Fuel Administration with the desired data. Any retailer who has not received such a schedule should make a copy of it and send in to Mr. Morrow at the earliest possible date the information requested.

Smithing coal must now be sold at the going Government price for prepared sizes from the mine producing the coal, according to a recent order.

Every effort is being made by the Secretary of the Interior to arouse interest in the coal fields of Alaska. He points out that the Matanuska field in 1917 produced 50,000 tons of bituminous coal and predicts that it will double that output in 1918. He is calling attention to the opportunities which are offered to file applications for leases in the Nenana field. These applications may be filed up to Mar. 1 or during the period of advertisement of the applications filed up to that date, which will be for a period of thirty days, beginning Mar. 4.

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

When will we get discipline behind the military lines as well as in them and settle our differences without strikes? This week's record is bad—a little strike in the anthracite region and a big strike in Alabama. It is to be hoped that the parties at fault, whoever they may be, will receive the strongest public censure. But in any event the mine workers should not strike. Right or wrong, the situation is too tense for this crude and dangerous method of adjustment.

At the Enterprise colliery at Excelsior, Northumberland County, Pennsylvania, 500 men and boys struck on Feb. 16 because the operators, W. L. Connell & Co., had failed to adjust wage differences to suit their personal wishes.

A conference between officials and the colliery grievance committee failed, the men demanding that company miners, who had been reduced to consideration miners—that is, from day labor to piece labor—be reëstablished in their former places and given the higher scale of wages paid to company men under the new wage contract. The company reserved its undoubted right to change men from one class of labor to another, and the strike is the result.

The strike in Alabama is quite serious. There, several mines are closed down. The company's opposition to the union is the cause of the trouble. Dr. Garfield has ordered the operators to recognize pit committees, which is tantamount to a recognition of the union. The operators having strikes are said to refuse to accord this recognition. They do not oppose the 8-hour day, but they do think that Dr. Garfield is unjustified in demanding the other provision.

The supply of cars is mending considerably in some places. In the Central Illinois district the men are working more steadily than for a long time. The car supply is better than it has been for months, and the mines of the members of the Central Illinois Operators' Association are producing almost their normal output of more than 60,000 tons a day.

In Ohio the condition is less satisfactory. Five locals at Murray City, Carbon Hill, Corning and Jacksonville, have sent a protest to William G. McAdoo, the Director of Railroads, saying that the mines are working less than half time while others are working less than 25 per cent. of full time. They say they believe that there is not such a severe shortage of cars as of motive power, and they petition Mr. McAdoo "to reduce the number of passenger trains to a minimum on all the railroads of the country, whether they be trunk lines or coal roads."

In the anthracite region the Lehigh Coal and Navigation is being quite active in bringing in men. The president of the Carbon County Exemption Board No. 1, ex-Sheriff Michael Hartneady, has received orders from the War Department to ship to Camp Meade men who have been using their mine service as justifying exemption while failing to perform their duties steadily at the mines. The men will be treated as slackers and given the full penalty. Eight of them were taken from the Lansford jail on Feb. 9, and committed to the county jail. Others are under arrest and surveillance at Lansford and Summit Hill.

The mine workers in West Virginia have had the laugh on the slacker law in that state. Every man has to work 36 hours a week or he is liable to land in jail. Lately the men have had hard time securing a day's work a week and they gather round the posted notices requiring 36 hours' work asking why they do not get it. No one begrudges them their little joke, and most of them are well enough versed to know that neither the operators nor the state officials are in any way to blame for the failure of the plan to get 100 per cent. efficiency out of the labor of the state.

In Kentucky the mine operators are expecting that the labor situation will become somewhat worse in the spring, and especially following the next draft call. The opening of the farming season is expected to call out much labor which has been employed in the mines during the winter, and the timber interests will also become more active, as some big development work is being planned in eastern Kentucky by timber operators. However, the mine operators have been paying high wages; in fact, wages that can not be touched by the timber people and farmers. It must be recalled, however, that the mine operators can not promise full employment unless the car supply shows improvement, and therefore it is expected that with the opening of spring the labor supply for the mines of the state will be low.

Operators of Fulton County, Illinois, are confronted by a shortage of miners, due to the large number of unnaturalized Austrians in that county who will not be permitted to work in the mines. The operators are trying to get miners from other parts of the state, but there is a shortage everywhere and they are not meeting with much success.

In another column we call attention to the proposed work of the Shiloh mine workers on behalf of the Community War Camp Recreation Fund. It is interesting to note the personnel of the union committee which put that patriotic resolution up to the management of the Southern Coal Co. The names were Ed Reegan, president of the local union; Gottlieb Luetcher, Bill Arey and Mr. Petre. Sometimes it is to be feared that we criticize too freely the failures of Uncle Sam in naturalization.

Foreigners are apt to comment rather favorably on the wonderful regenerative powers of our national melting pot. However, we never seem to scan anything but the horrible examples of our failures. After all we have not gone very far wrong, as many a Gottlieb and many a Giovanni will testify. The United States, like Great Britain, appears to be a horrible mistake, but a tree is justified by its fruit whether it be good or evil.

Alabama Miners Begin Strike

On Feb. 14 a strike commenced at the mines of the Tennessee Coal, Iron and Railroad Co., and the following day there were said to be 2000 men idle. The strike has since spread further, one report saying that 5000 men were out.

On Feb. 15, mines Nos. 1, 2, 3, 7 and 10 in the Pratt division and mines 7, 9 and 10 in the Blocton division had ceased to work. The mine workers of the Republic Iron and Steel Co. at Sayreton soon followed them.

The men allege that the companies affected have failed to comply with the Garfield decision and a complaint was filed with the fuel administrator. J. R. Kennamer, the president of the district, No. 20, declares that when "we [the United Mine Workers of Alabama] accepted the agreement, we understood that all the corporations in the Birmingham district had done likewise, and if we had known that this was not the case, we, ourselves, would not have acted."

It is understood that the companies having trouble with their mine workers are observing that part of the agreement which has reference to the 8-hour day, but it is said that the companies are refusing to recognize pit committees, as also provided under the agreement, prepared by Rembrandt Peale on behalf of Dr. H. A. Garfield, accepted by the mine workers, but only granted partially by the mine operators on the imperative demand of the Fuel Administration.

Dr. Garfield has asked for information of G. B. McCormack, president of the Alabama Coal Operators' Association, and will take action as soon as the information he

desires is received. President Kennamer says that his men will comply with the agreement, and the union will not give any assistance to any man who does not obey strictly the terms of that contract.

Though domestic consumption is being greatly reduced by the advent of warmer weather, the need for coal for industrial purposes is still urgent. Coal production was quite active until the strike occurred.

Loyalty in Illinois Mines

The loyal Illinois mine workers—and they are many—are determined to clean up the reputation of their members in Illinois. They are weary of the action of those who are collecting money, not for the war or the Red Cross, but for the defense of certain miserable Industrial Workers of the World under charges of disloyalty.

On Tuesday, Feb. 12, two men adjudged disloyal by the mine workers, were tarred and feathered at Stanton, Ill., and 100 men known or suspected of being disloyal were rounded up, compelled to kiss the United States flag and sign an oath of allegiance.

The demonstration arose from the following cause: Severine Oberdan, an Industrial Worker of the World, of Nokomis, Ill., was placed for his disloyal actions under two indictments for violation of the espionage act. He was let out on a $2000 bond. Certain parties endeavored to raise a defense fund for Aberdan, and the Stanton miners' union voted a donation of $100 for that purpose.

The check, however, was held up by the president, Frank Schaefer. A meeting was called to censure the president, and at this the American element, who, though strong, had let the union drift into the hands of the disloyal element, now took a hand in the dispute. As a result there was a fight. Members of the American Defense Society, deputized by the mayor, arrested several of the fighters, including Oberdan and his lawyer, John H. Metzen, of Chicago.

Oberdan and Metzen were permitted to escape the deputies, but they were seized by other men, taken to the edge of the town, tarred and feathered and driven out of town in different directions. The crowd then visited the homes of disloyalists and compelled them to kiss the flag and sign an oath of allegiance drawn up by the Staunton Branch of the American Defense Society.

Another evidence of the depth of feeling regarding the war is furnished by the action of the Shiloh mine workers. Shiloh is near Belleville, St. Clair County, Illinois, not a great way from St. Louis, Mo. A committee was appointed to meet Assistant Superintendent Fred Boettcher of the Shiloh mine and authorized to make an arrangement with him to work one day without pay if the Southern Coal Co., the owner of the Shiloh mine, would turn over all that was received for the coal so shipped and donate it to the Community War Camp Recreation Fund. The mine workers resent being regarded as disloyal and are determined by this effort to lift the imputation from their shoulders.

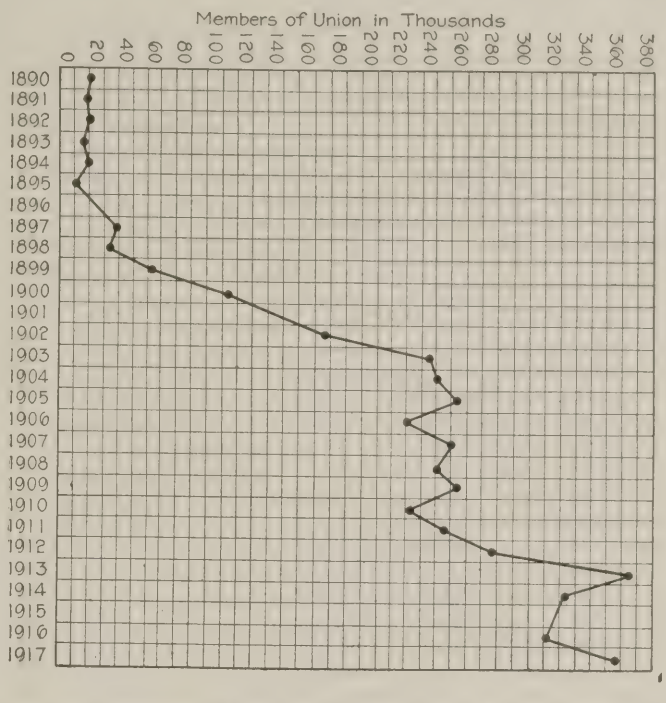
Agreement of Dominion Company

The Dominion Coal Co.'s agreement with its men, made Feb. 4, is as follows:

1. All men being paid less than $3 per day to receive 10c. per day plus 15 per cent. All datal men receiving more than $3 and not more than $3.75 per day, who are not eligible to benefit by the steady work bonus, to receive 15 per cent. All datal men over $3.75 to be increased 12½ per cent.

2. Steady-work bonus to be extended to 10 per cent. instead of 5 per cent. as at present.

3. All contract rates to be increased 12½ per cent.



4. In the event of any perceptible change occurring in the cost of living the parties to this agreement to be willing to adjust the wage scale to conform with existing conditions, on July 1, 1918, and at the end of each six months period thereafter, upon thirty days' notice.

Note.—Where the adjustment mentioned in paragraph 1 provided an increase of 10c. per day for machine helpers the company agrees to absorb the 10c. thus paid.

The words "datal men" mean the same as "day men," the word "dataller" or "datal man" being quite generally used in England in that connection.

Growth of Unionism in Coal Mines

The chart of union membership on this page shows how markedly union affiliation has developed since 1890. From that year till 1895 the tendency was rather downward than upward. Then came a remarkable advance which continued till 1905. Then there was a period of shakiness which lasted till 1910. Then came a second period of progress, reaching a temporary summit, or peak, in 1913. Since

then the decreases have been large, but the increases recently have been so enormous that unionism seems more prosperous today than even in 1913.

Fortunately, never has the union man been more generally possessed with the idea that a good unionist should be a good citizen. As we approach the 100 per cent. union, the organization is getting large drafts of solid, conservative men who may be relied upon to see that unionism does no harm to industry or the nation.

Grafton Scale To Be Settled

A correspondent under date of Feb. 16 informs us that the Grafton Coal Operators' Association, composed of operators near Grafton, W. Va., will hold a special meeting at the Fort Cumberland Hotel, Cumberland, Md., to ratify an agreement made between the scale committee of the association and the district officers of the United Mine Workers of America.

The 15 per cent. increase in yardage and deadwork provided in the Washington agreement, which was made in October, was held by the mine workers to apply to the differential between narrow and wide work, this differential being paid instead of yardage. The controversy has lasted several months without causing a strike.

It now seems to be settled finally. The agreement provides that instead of disturbing the differential by increasing it 15 per cent, 10 per cent. of the differential shall be applied to all pick and machine mining rates, thus giving the miners the advantage of the increase without disturbing the differential that has existed for years.

The United Mine Workers of Lansford in the Panther Creek Valley have lodged a protest against the food administrator's "fifty-fifty" proposition on wheat bread. They say they are hard workers and require muscle-building food, bread being their chief diet.

EDITORIALS

What Is Labor Unrest?

THE human mind is the most complex piece of mechanism in the world. It is the master mechanism. How it works nobody knows. What it will do individually and collectively under any given conditions nobody knows—not even its owner.

The man who digs your ditches has depths you cannot plumb. You see him come and go every day and his coming and going become a part of your daily habit of thought, like the coming of your morning newspaper. Some day he doesn't blend with the scenery as you are accustomed to viewing it. Unknown to you there has been some crisis in his life; his mental depths are in turmoil; age-old questions come to the surface. Placidity becomes turbulence and you are annoyed—unless you have become similarly turbulent yourself, in which event you are not annoyed. You understand.

Your ditch digger has thousands of years of his ancestors' life and thoughts and yearnings slumbering in his soul and speaking when he is roused. He has not always been a ditch digger. Some centuries past in Asia Minor, in Greece, in Italy, along the whole line of civilization's push upward, he has been oppressor and oppressed, just as you have been—mostly oppressed, for the oppressed have always been in the majority.

One life begins and ends; but the blood-flow is continuous from generation to generation. The thousands of years behind us speak in us and to us and through us every day. The greatest thinkers, ancient and modern, affirm this.

There has been more stirring of the human depths since August, 1914, than there had been in the whole period since our Civil War. All of our accustomed grooves have been upset. In our social bearings we lack a sureness of direction. The guide posts have become weathervanes. Our placid gray matter has been set seething. The former smooth surface of our minds which reflected the current weather, the passing clouds and the orderly seasons, is turbulent; the sediment of the centuries is bubbling to the surface from the depths.

We get into channels. Channels are comfortable. They fix direction. Where you are going doesn't worry you. It suffices that you are comfortably on your way. Then something happens and destroys the channel. You and your ditch digger face each other with the eternal question of your mutual relationship in your eyes. The thousands of years back of each of you is compacted in the look. *And you couldn't phrase the question in words if you tried.* You don't try, either of you. Instinctively you know it, but to save your souls neither of you could say it.

If you tried to say it, you would both use the words you used in the channel—wages, open shop, cost of living. Especially the ditch digger would. He couldn't phrase the concentrated protest of ten thousand years in a moment of crisis any more than he could think it logically in a year in the channel. It is too big, too overwhelming, too much a rising of his whole being. So when you ask him what he is turbulent about, don't quibble about the lack of a clear-cut answer. It can't be made; you couldn't make it yourself. But if you want his answer, get it in his reactions. Hear him give approval to war against the Kaiser; note the set of his features when the war profiteer is mentioned; watch him as he listens by the hour to the man you would call an agitator; catch his constant sanction to the opportunities open alike to everybody and his equally constant suspicion of opportunities not possible for *his* children. The public schools are never afraid to go direct to the people for money; the universities are.

Business based on the idea of maximum cash returns to the owner, at any cost to competitors, to labor, to the social order, to the Government, was bound to be a boomerang.

The labor unrest is the instinctive protest of ten thousand years against all this.

Securing Clean Coal

FOR more than a year the demand for coal has been heavy. The country, normally busy, is now working at a speed never before attained. The consumption of industrial fuel is decidedly abnormal, with the result that tonnage is what has been turned out of the mines. The consumer has been begging for coal—"Any grade, any size, any car"—and bulk, not quality, is what he has received.

For months many mines have neglected preparation as never before. As a result the ash content of the coal shipped to market has increased in many instances as much as 10 per cent. or even more. Nor is the mine operator always entirely to blame for this increase. The logical and proper place to clean coal, to separate it from the slate, bone, rash and other impurities that accompany it in the coal bed, is within the mine. There is no good or adequate reason for moving large amounts of these impurities any appreciable distance from the working face. Even where coal is carefully picked by hand at the tipple it is cheaper to deposit the slate on the gob pile than on the slate dump.

Various means and methods have been tried in the past to induce the miner to load clean coal. These have varied all the way from a more or less casual inspection by the "sulphur boss" stationed on the railroad car, to various methods of random hand-sampling of the pit-car contents and a "dockage" system more or less drastic. It would appear, however, that none of the systems ordinarily employed, as stated in the article by H. A. Turner, printed on page 373, is equitable. Any good results that dockage may have secured would seem to have been largely nullified by almost endless friction, misunderstanding and enmity between mine managers and their men.

It is a well-recognized trait of human nature that men may be much more easily led than driven. The promise of adequate reward is a more powerful incentive to good work than the possibility of punishment. Dockage drives; a bonus beckons.

The chief obstacle in the path of any or all of the various means heretofore generally employed for determining the quality of any man's individual output has been the difficulty involved in truly sampling his product. The common method of selecting mine cars at random and carefully hand-picking their contents was manifestly expensive and unjust. Also, in a measure, it fostered the all too prevalent custom of the miners of loading material of known inferior quality and taking the chance of its escaping detection.

As mentioned in the article above referred to, the solution of this problem lies in mechanical sampling of a large number of pit cars each day and an equitable dockage-bonus system founded upon the results of the samples taken. The Ramsay sampler appears to have solved the first part of this difficulty; the second presents no great obstacles.

It never has been, and certainly is not now, the policy or intention of *Coal Age* through ulterior motives or in the quest of pelf to "whoop it up" for any man, any invention or the product of any manufacturer. When, however, a vital question affecting the coal industry arises and a solution for the difficulty is found, *Coal Age* would fall far short of its mission and ideals did it fail to call that solution to the attention of the coal industry. The Ramsay sampler has accomplished good results where it has been installed, reducing by somewhat over half the amount of refuse sent to the dump from the tipple.

In the stress of present circumstances clean coal only should be loaded out, for several reasons. These, as set forth by the committee on clean coal of the National Coal Association, are: Fewer cars and locomotives will be required in fuel transportation; greater efficiency of railroad locomotives, already overburdened; greater efficiency in stationary power plants; less manpower will be required to shovel coal and remove ashes.

Clean coal means fewer boilers, thus releasing part of the country's boiler-making capacity to build equipment needed for new ships; faster movement of ships, thus enabling them to be of greater service; better coke, consequently better pig iron, consequently better guns; clean coal means faster (and thus safer) passage of our transports through the danger zones.

Of course, it may be said that because dirty coal is loaded on the mine car is no excuse for dirty coal finding its way to the railroad car. It is in all respects, however, cheaper and more satisfactory to keep the impurities within the mine and never allow them to see the light of day. In other words, the gob not the dump is the place whereon to put the bone and slate.

The question of adequate mine-cleaning has always been a bone of contention. If the taking of adequate samples from a large number of mine cars will tend to reduce this friction and insure a cleaner product for shipment, apparatus for taking such samples should by all means be installed.

While it is possible that means other than the Ramsay sampler may be employed, this device has afforded satisfaction where it has been given a trial. With a public spirit that is highly commendable, Mr. Ramsay has informed *Coal Age* that he will gladly allow any coal operator who so desires the free and unrestricted use of his invention throughout the duration of the war. When the struggle is ended, when the present stress has relaxed and conditions shall have again assumed at least a semblance of normal, he will of course expect some kind of just remuneration for the further use of his equipment.

Cleaner Coal

THAT our Foreword of last week on "Enemies Within" was warranted, and that it, with the complaints from all sides, has led to definite action, is indicated by the following request issued within the past week by the Lackawanna County Fuel Committee of the Federal Fuel Administration for Pennsylvania to the anthracite coal operators of its district.

Consistent with the policy of the United States Fuel Administration, that the quality of coal will be improved, which policy has been indorsed by a majority of the anthracite coal operators, I am instructed to make the following request, with which it is assumed you will willingly and immediately comply.

Neither ship nor sell any coal unless it is prepared in breakers or washeries in accordance with former well established standards. The standards upon which inspection will be made are based upon the standards governing quality and size embodied in the old 65 per cent. contracts.

In addition to eliminating impurities, we would especially draw your attention to the practice of permitting a mixture of sizes, concerning which there has been much complaint. Although you may have received no complaints from your customers, still, since the President has fixed definite prices for certain sizes, you will agree with us that as an illustration, if pea coal is mixed with chestnut and sold as chestnut, you are selling pea coal at a higher price than that fixed for the same.

Out of a spirit of coöperation and desire on your part to make the purpose of this request effective, it is further requested that you immediately acknowledge this letter and indicate your willingness to comply at once.

Although the foregoing letter has gone out to the coal producers as a request, it is in such form that it practically must be considered as an order; and we believe it will result in the correction of the two evils—improper quality and mixing of sizes—to which we have before directed attention. The standards "upon which inspection will be made" being those embodied in the old 65 per cent. coal purchase contracts, if insisted upon will put the anthracite product back to the quite satisfactory quality that was maintained before war opportunities led some operators to deviate quite largely from these standards.

From the operator who has been living up to past trade customs there will come no complaint regarding the reasonableness of the Fuel Administration's request; and the murmurings or even howlings that may arise from the producers who have been profiteering, either because of improper quality or mixing of sizes, may be entirely ignored.

THE ANNUAL SUCCESS NUMBER of *Coal Age* will be issued April 13. We want articles on success in the coal-mining industry—successful installations, successful management, successful devices, successful men. Diagrams and photographs should accompany manuscript where possible. Write your story now.

DISCUSSION BY READERS

Rotary Dump at Shaft Bottom

Letter No. 2—Although a little late, the following brief description of an installation of a rotary dump at the foot of a hoisting shaft may be of interest in connection with the inquiry that appeared in *Coal Age*, Nov. 3, p. 779. Since then, as far as I have observed, there has been published in *Coal Age* but one account of a similar installation, which was contained in a letter by Carl Scholz, Nov. 24, p. 900.

The installation that I am permitted to describe was made by the Dominion Coal Co., at their No. 2 colliery, which is regarded as one of the largest, if not the largest, colliery in the world. Two seams are being worked in this shaft at the present time, the "Harbor seam," lying at a depth of 410 ft., and the "Phalen seam," at a depth of 867 ft. below the surface.

These seams are reached by a single large five-compartment hoisting shaft 11 x 37 ft. over all. Two of the four hoistways in this shaft serve the Harbor seam and two the Phalen seam, while the remaining compartment is used for pipes, cables, etc. There are, besides, two escape shafts for hoisting men and material.

Sinking was begun in October, 1899, and the regular hoisting of coal commenced in 1902, when the equipment was practically complete. Since that time the Phalen seam has produced 3½ million tons of coal. The daily output of this seam is upward of 3000 tons, while the largest daily tonnage of the two seams was 5100 tons. The air compressor plant at this colliery has a capacity of 16,000 cu.ft. per minute.

Fig. 1 shows a view of the surface plant, including the steel tower 120 ft. in height, a steel-frame compressor house having walls of concrete of expanded metal, and a large central electric plant where power is generated for pumping purposes, colliery lighting and for operating screens and other machinery used in the plant. Power is also furnished for driving the machinery in the central shops at Glace Bay.

Arrangements at Shaft Bottom Phalen Seam

Fig. 2 shows a plan and elevation of the shaft bottom in the Phalen seam. As here shown, the cars coming from the mine pass over the scales, where they are weighed before entering the rotary dump or tipple, two of which are shown immediately opposite the hoisting shaft. Only the hoisting compartments for hoisting coal from the Phalen seam are shown in the figure. Each mine car has a capacity of 2 tons. The tipples dump the coal into two storage chutes equipped with doors that permit the coal from either tipple to pass into either chute, as desired.

In Fig. 3 is shown a vertical section through the shaft and the two tipples. The chute has an inclination of 50 deg. and holds from 7 to 8 tons when full. As shown in the figure, there is a swinging door at the foot of the chute. This is kept closed by a spring latch except when coal is being loaded into the hoisting tank,

FIG. 1. STEEL TOWER AND SURFACE PLANT, DOMINION COAL CO., NO. 2 COLLIERY, GLACE BAY, N. S.

which is shown in position at the foot of the shaft. This tank also has a capacity of from 7 to 8 tons; but the normal load is 6 tons, or the contents of three cars.

The entire operation is automatic, from the time the coal leaves the scales until it is dumped onto the

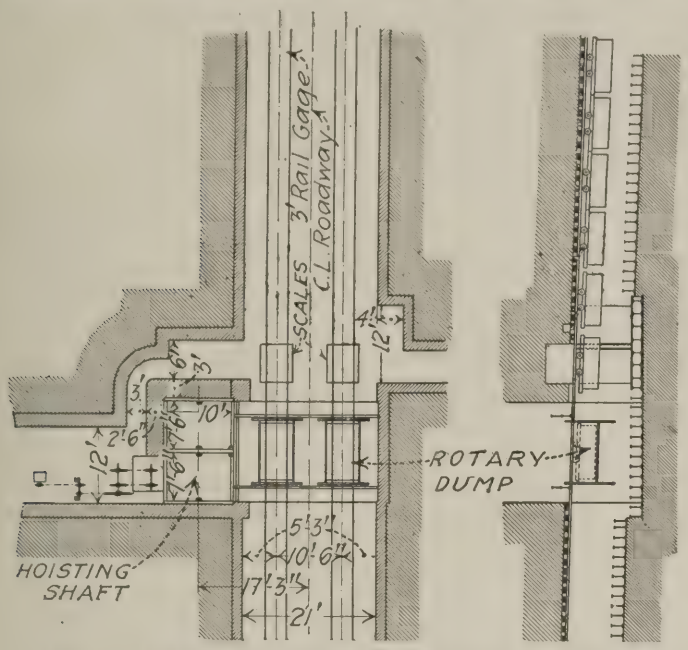


FIG. 2. PLAN AND ELEVATION, SHAFT BOTTOM, PHALEN SEAM

screens at the surface. The descending cage, striking a lever, releases the spring latch that secures the door of the chute. This door is counterbalanced and kept closed by a weight suspended from a chain, which passes over a pulley and is drawn tight across the shaft bottom, in a position where the falling cage, striking it, pulls the door down, allowing the coal to slide into the hoisting tank. As the tank again ascends the shaft, the door is released and closed by the counterweight, while the spring lock holds it fast until the next tank strikes the lever, in its fall in the shaft, and the operation is repeated.

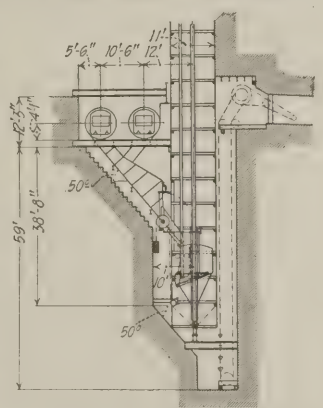

FIG. 3. SECTION THROUGH SHAFT AND TIPPLE

Each hoisting tank is mounted on a pivot very much as a self-dumping cage. As shown in the figure, it has an inclined floor, which permits of the easy discharge of the coal at the surface when the latch-lock is released. The combined tank and frame in which it is held weighs about 10 tons, making the entire load on the rope, in hoisting, about 18 tons. In loading the tank at the foot of the shaft a little coal is apt to fall outside of the tank, but this amounts to less than 4 tons a day. It is caught in a hopper and raised to the level of the shaft bottom by the conveyor shown in Fig. 3. The entire equipment is operated by compressed air and makes it possible to handle a very much larger daily tonnage than would be possible by any other means that would be both practicable and economical.

J. W. GRAY,
Sydney, N. S., Canada. Dominion Coal Co., Ltd.

Requirements in Mining Law

Letter No. 1—The new mining law, which went into effect in the State of Washington, June 7, 1917, and to which reference has been made in *Coal Age*, requires the certification, by examination, of the following mine officials: State mine inspectors, mine foremen, assistant mine foremen and firebosses.

The first examination for mine inspector's certificate was held this year in Seattle, the examining board being composed of one mining engineer, one mine manager and one practical coal miner, as the law requires. The law provides for the granting of certificates to candidates who make an average of 75 per cent., and specifies that practical experience, worthiness and general fitness shall be credited with 40 points; the written examination, 40 points; and the oral examination, 20 points.

CERTIFICATION LAW IN THE STATE OF WASHINGTON

The law further requires that the candidate must make affidavit that he is a citizen of the United States and of the State of Washington; is 30 years of age and has had at least five years' practical experience in mines in the United States, including three years in the State of Washington. He must also present the affidavit of two citizens of the state, testifying to his good character and temperate habits.

These requirements and that of the candidate being in good physical condition would seem to cover the case completely; but the real practical test lies in the power given to the examining board of passing arbitrarily on the fitness and experience of the candidate. The allowance of 40 points to cover this feature of the candidate's qualifications places in the hands of the examining board the means of arbitrarily disqualifying any candidate they may choose and who, perhaps, has passed an otherwise excellent examination in respect to his knowledge of practical mining, including as much of the theory and principles of coal mining as the board sees fit to require.

WEAK POINTS IN THE STATE MINING LAW

Without casting any reflections on the present examining board, in this respect, it can be said that human nature is much the same everywhere and arbitrary power based on individual judgment, which is often apt to err, may result in doing an injustice to a worthy candidate. This may occur through prejudice or a biased judgment.

The law, in this respect, would be less open to criticism if it specified a given number of points per month or per year and a minimum length of time that the candidate must have been employed or had charge of certain work. This would enable an examining board to give each candidate a fair rating and relieve the board of the exercise of arbitrary judgment, which is a variable factor at the best.

The same board, with the addition of the state mine inspector, is authorized to hold the examinations for mine foremen's and firebosses' certificates. Candidates for these positions are likewise required to make an average of 75 per cent. in order to secure a certificate.

In the case of mine foremen, 40 points are allowed for practical experience, worthiness and general fitness,

while 40 points are credited to the oral and 20 points to the written examination. In the fireboss examination, 50 points are allowed for practical experience, worthiness and general fitness, while 30 points are allowed for the oral and 20 points for the written examination. Here again, the law would seem to be not sufficiently specific.

It may properly be asked, Why would it not be more just and fair to allow a credit of 10 points for each year of practical experience and require a minimum of, say five years of such experience in the case of candidates for the position of fireboss and four years for that of mine foreman? This would give every candidate his proper rating, in respect to practical experience, worthiness and fitness. RALPH W. MAYER.

Roslyn, Wash.

Seasonal Freight Rates

Letter No. 2—Kindly allow me to correct a misstatement in my previous letter on this subject, *Coal Age*, Jan. 26, p. 209, which was probably a stenographic error. The production of hard and soft coal was given as 600,000, instead of 600,000,000 tons.

At the same time, in this connection, allow me to make a specific recommendation of seasonal rating, in the transportation of coal, that I believe would result profitably to all concerned. I would suggest the following:

March to June, inclusive, rates to be 20 per cent. less than the present tariff.

July to October, inclusive, the present tariff to be enforced.

November to February, inclusive, rates to be 20 per cent. higher than the present tariff.

In my opinion, the adoption of these rates would give the railroads more net revenue from the transportation of coal, while it would justify large storage piles at steam plants and enable dealers to store winter supplies at points near to large consuming centers, from which deliveries could be made by mail or motor truck as required. R. T. MCKEEN.

Chicago, Ill.

Surveying and Mapping

Letter No. 3—I certainly have enjoyed reading the articles by W. L. Owens, *Coal Age*, Dec. 8, p. 960, and the letter of P. A. Arnold, Dec. 29, p. 1109, on the subject of "Surveying and Mapping." The points brought out by these writers are interesting, although I find that each of the systems they suggest differs from my own method. The latter appeals to me as being better adapted to my particular requirements, which are clearly different from those described by these correspondents.

Mr. Owens has drawn attention to the fact that there are many little details of surveying and mapping, which are used by different engineers in their practice and which would prove helpful to others if they were discussed. In the hope that there may be something of interest in my own system, I will describe it briefly.

It is true that conditions in different mining localities must largely determine the methods employed by engineers, in surveying mine workings. The mines with which I have been associated, in recent years, are worked on the well-known panel system, or some modification of that system. All entries and rooms are driven on sights given by the engineer.

My practice has been to designate every station either by a number or a letter. Letters are used only when a station is located in a room, which is rare. All entry stations, as far as possible, are located on the true course of the entry, which is not permitted to deviate from that course, except in rare instances. Stations on the main entry are numbered continuously, in the usual manner.

Each pair of room entries has its own set of numbers starting from 1, odd numbers being used on the first entry of each pair, while the even numbers are used on the second entry. This makes the station numbers, as being odd or even, correspond to the number of the entry, in the same respect. For example, while stations on the first, third or fifth north are numbered 1, 3, 5, etc., those on the second, fourth, or sixth north, are numbered 2, 4, 6, etc.

Another peculiarity of this system is that, on room entries, a station is located opposite the mouth of each room to be turned later. Thus, by the station number it is possible to tell the number of rooms turned on the entry, up to that point. I realize, of course, that this system could not be used to advantage where the coal is not regular, as it is generally in this district. When it is necessary to locate a station midway between two rooms, such station takes the number of the last preceding station with the suffix ½ added.

It is obvious from the foregoing that the continuous numbering system could not be used in my method, in view of the fact that too high numbers would result, owing to the multiplicity of stations. The system that I have described, however, has advantages that are worthy of note.

Since all the stations are located on the true course of an entry, there is no difficulty in obtaining a backsight should any one of these stations be lost. Rooms are necked by the roomboss, at regular distances apart on the rib, which makes it possible for the engineer to locate the stations in a convenient position to give sights in the rooms when these are turned. The station at the last roomneck on an entry becomes the outby spad for a pair of entry sights.

OBJECTIONS TO USE OF CONTINUOUS NUMBERS

It occurs to me that one disadvantage, in the use of continuous numbers, is the possible failure of the transitman to make a note of the last number used in a survey. I have frequently hunted through transit books to find the highest number recorded, before starting a new survey. The use of distances to designate station numbers, while possessing certain advantages, is open to the objection that the station number cannot be recorded until the distance is measured, and it is impossible to refer to such station in the side notes.

When reading Mr. Arnold's reference to the inconvenience of station numbers not indicating distances to such stations, I wondered if it would not have been possible, in the case he cited, to have scaled the distance from the mine map, for the purpose intended. I have never experienced the slightest trouble growing out of the repetition of numbers on different entries.

Before closing, let me say that the carrying of a paint pot for numbering stations on the rib, or marking them on the roof, seems to me an unnecessary waste of time and material. At least, it would be such in my system. The proper referencing of stations on main entries, in the notes, should be sufficient to locate the same without delay, if they are still in place.

In respect to the use of free-hand or ruled lines, in mapping, it is my belief that there is more realism in free-hand work, although ruled lines, where not too broken, may present a more artistic appearance. I use but a single color on maps and designate the extension of the workings each fiscal year by circumscribing them with a fine dark-green line.

A separate tracing is then made showing only the depletion with dotted lines for the entries. Figures showing the yearly and total depletion are inscribed within their proper areas. Elevations taken every 50 ft. on the entries are entered on the map in their proper location. I would like to inquire why so many engineers adopt the method of closing the ends of rooms and entries that are still working, which makes it impossible to distinguish such live workings from those that have been abandoned.

W. E. Buss,
Vincennes, Ind. Mining Engineer.

Relative Size of Intake and Return Airways

Letter No. 5—Referring to the question that has been raised as to whether the intake or return airway of a mine should have the larger sectional area, I want to say that the correct answer to this question is the one given in *Coal Age*, Dec. 15, p. 1033.

In my opinion the main haulage road of a mine should never be made the main airway, either intake or return; but separate entries or air-courses should be provided for this purpose. When the main haulage road is made the intake airway for the mine much trouble is bound to result from ice in the winter time, and it will often be necessary to delay hoisting operations, in the shaft or slope, in order to cut away the ice to allow the passage of the cages or cars.

To free a shaft or slope of ice may cause a delay of from 30 minutes to an hour, in the morning. Moreover, another objection is the fact that motormen and drivers are compelled to work in a strong draft of air when the haulage road is made the main intake for the mine. This is a particularly bad feature when the thermometer registers zero or below.

When Hauling on the Return Air

There is also equal objection to making the haulage road the main return airway for the mine. In a gaseous mine, of course, haulage cannot be performed with safety on the return air current. In any event, however, there are always noxious gases produced in the mine, in greater or less volume; and when the return current becomes charged with these gases it is not only unhealthful for the drivers whose duties compel them to work there, but much difficulty is experienced by them in holding a light when hauling against such a current.

Also, it must be remembered that a large mine, circulating a great volume of air, would require a high velocity of the air current on the main airways leading in and out of the mine, and this would frequently be in excess of the limit specified in the mining law, unless a separate air-course was provided.

In my judgment the better plan is to provide one main intake airway of ample size and two main return airways, one for each side of the mine, in addition to the haulage road, especially if the mine is gaseous. An overcast should then be built at the mouth of each pair of cross-entries, as early as their development will permit, to conduct the air over the haulage road and return airway on each side of the mine, and provide each section with a separate air split. Sufficient air can be supplied to the haulage roads through regulators, so as to comply with the requirements of the Pennsylvania mining law, which states that haulage by electric locomotives must be performed on the intake air.

Bolivar, Penn. W. H. Clark.

Letter No. 6—There is no doubt in my mind that a trip of cars moving in an airway will have an appreciable effect on the resistance that the airway offers to the circulation. The amount of resistance offered will depend on the relative size of the cars and the airway in which they are moving.

Where large cars are used in comparatively small airways the effect would be considerable. However, this is only for a comparatively short period of time while the cars are passing. Where a good clearance is provided at the side of the track, as has been suggested as one of the requirements for safety, the effect of the moving cars on the resistance of the mine would be much less.

I recall one instance where the miners, in a particular section of the mine where the circulation was restricted by cars standing on the entry, refused to work until these cars were removed and the entry left unobstructed.

Return Airway Should Be the Larger

It has been shown, already, that the volume of the return air current is generally greater than that of the intake, owing to its higher temperature and the presence of gases generated in the mine. In addition to this, let me say there is a further slight increase in volume, because of the decreased pressure in the return airway. Since air always moves from a point of higher pressure to a point of lower pressure, it follows that the pressure on the intake airway is always greater than that on the return.

Taking all of these facts into consideration, it is my belief that the circulation in a mine will be greatly improved by making the area of the return airway greater than that of the intake, even allowing that the latter is the haulage road. The larger area of the return airway will reduce the velocity of the passing air and decrease the resistance, and less power will be required to produce the circulation. This, of course, does not affect the resistance offered by a trip of cars, but lessens the entire mine resistance. There is no question but all will agree that in a mine where haulage is performed on the return airway the latter should have the larger sectional area.

In his letter on this subject, *Coal Age*, Jan. 19, p. 160, W. H. Noone raises the question of whether mine

haulage should be performed on the intake or on the return airway. This question has often been asked; and, while opinions differ, I believe the general belief is that the haulage road of a gaseous mine should be made the intake airway for the mine. But, as Mr. Noone has pointed out, this necessitates the use of an exhaust fan to avoid having doors on the main haulage road.

While the exhaust fan possesses the advantage that the foul gases of the mine do not pass out by the haulage road, what is of greater importance is the fact that the mine is ventilated under a pressure less than that of the atmosphere, so that if the fan should stop, the increase of pressure in the mine would hold back the gases for a time. There is, however, the disadvantage that work on the haulage road is made very uncomfortable for the drivers or motormen, and there is frequently much trouble from ice that forms in the hoisting shaft in winter.

The force fan is especially adapted to nongaseous mines and possesses the advantage that work on the landing or shaft bottom is far more comfortable; the shaft is kept free from ice; there is less liability of falls occurring on the haulage road, and less moisture is absorbed by the return current on that road.

Bluefield, W. Va. D. H. PERDUE.

Clearing a Heading of Gas

Letter No. 8—The suggestion made by "Fireboss" *Coal Age*, Nov. 10, p. 823, in reference to handling a body of gas accumulated at the face of a heading by hanging a canvas on the return entry 90 ft. back from the face is hardly worthy of consideration.

If the idea was that, by choking the air current there would be sufficient carbon dioxide formed to render the gas inexplosive and make the place safe to enter, that is wholly out of the question. It is up to the fireboss to clean out the gas.

The only practicable plan to accomplish this is to extend a line of brattice from the last crosscut toward the face. My experience has taught me that to move the gas from the head of an entry it is often necessary to increase the pressure of the air current where it bears upon the gas.

This may have been in the mind of the fireboss who hung a curtain in the return airway; but if so let me say that he began at the wrong end. As suggested by "Gas Inspector" in his letter Jan. 19, p. 159, it is often necessary to extend the canvas at the end of the brattice so as to deflect the air against the gas.

My plan when a body of gas is not easily moved from the face of a heading is to gradually widen the air space behind the brattice as it approaches the face. This is done by carrying the line of brattice over toward the intake side.

By so doing, the air passing around the end of the canvas is given a greater velocity at the very point where it is needed to drive out the gas. At the same time, the resistance to the passage of the air is not materially increased. This plan has worked successfully in a number of instances, and is one that I always advise following in such cases. R. W. LIGHTBURN.

West Leisenring, Penn.

[This letter will close the discussion of "Clearing a Heading of Gas."—Editor.]

Shaft vs. Slope Opening

Letter No. 5—I was glad to find, in reading Letter No. 3 by "Ajax," *Coal Age*, Dec. 29, p. 1110, that the favored a shaft opening, under the conditions described by Thomas Harris, Sept. 29, p. 551. Being interested to ascertain more particularly the character of the overlying strata, in this case, I wrote Mr. Harris and received from him the following information:

Starting from the surface there is 28 ft. of surface clay underlaid with 30 ft. of hard fireclay, beneath which is 60 ft. of sandstone. This makes the total depth of overburden, as stated, 118 ft. in thickness. I regret that Mr. Harris did not state, in his letter, the thickness of the coal seam, which I will assume is 6 ft. In connection with this inquiry, permit me to present the following estimate of the required size of shaft, which may be of interest.

ESTIMATING THE SIZE OF SHAFT REQUIRED

I will base my calculations on a total output of 1200 tons of bituminous coal, in an 8-hr. working day. Allowing 5 per cent. for unavoidable delays in haulage and hoisting, the actual time of hoisting is $0.95(8 \times 60) = 456$ min., which gives an average rate of $(1200 \times 2000) \div 456 =$ say 5260 lb. of coal delivered each minute. For this depth of shaft, the speed of hoisting may be taken as 12 ft. per sec., and the time of making a single hoist is then $118 \div 12 =$ say 10 sec. Allowing 10 sec. more for caging each hoist, gives for the total time per hoist 20 sec., which is three hoists per min. The weight of coal hoisted at one time is, therefore, $5260 \div 3 =$ say 1750 lb.

Taking the average specific gravity of bituminous coal as 1.3, its weight in the solid is $62.5 \times 1.3 = 81.25$ lb. per cu.ft. When this coal is broken, it will occupy, practically, two-thirds more space than in the solid form. That is to say, 3 cu.ft. of solid coal will make 5 cu.ft. when broken. The weight of broken coal is, then, $81.25 \times \frac{3}{5} =$ say 48 lb. per cu.ft. When hoisting one car at a time, this will require a capacity of $1750 \div 48 =$ say 36.5 cu.ft.

Now, taking the inside width of the car as 2 ft. and the depth of the coal, including topping, 30 in., or $2\frac{1}{2}$ ft., the area of the cross-section through the coal would be $2 \times 2\frac{1}{2} = 5$ sq.ft. The length of the car must then be $36.5 \div 5 = 7.3$ ft., or 7 ft. 4 in. Adding to this length 4 in. for the two ends of the car and allowing 6 in. at each end for the bumpers, gives a total length out-to-out of bumpers of 8 ft. 8 in.

To ascertain the width of the shaft in the clear, it will be necessary to allow 8 in. of clearance on each end of the car, which makes the total width of the shaft in the clear 10 ft. In estimating the length of the shaft, allowance should be made for four 4-in. guides, a manway or pumpway 4 ft. wide, and two hoistways of the same width, in the clear, between the guides and buntons or partition, making the total length of the shaft 14 ft. in the clear.

In laying out the shaft, allowance must be made for the thickness of the curbing in calculating the necessary size of the excavation. If the shaft is to be lined with concrete walls 12 in. in thickness, the size of the excavation, in this case, will be 12×16 ft.

Rawdon, Quebec, Canada. C. MCMANIMAN.

INQUIRIES OF GENERAL INTEREST

Mining a Thick Inclined Seam

The following question was submitted to candidates in a recent mine foreman's examination, held at Price, Utah. As it is an exceedingly practical and, at the same time, difficult question, calling for experience, knowledge and good judgment, may I ask that it be submitted for discussion in the columns of *Coal Age*.

Ques.—Describe your method of extracting the pillars in the following seam of coal: The seam is 28 ft. thick and pitches about 12 per cent. The room entries are driven across the pitch and the rooms turned at an angle of 45 deg. off the entry. The rooms are driven 20 ft. wide with a 70-ft. pillar between them. The lower half of this seam, 14 ft. in thickness, is worked advancing, the remaining 14 ft. being left for a roof, in the first working. In places, there is a hard sandrock on top of the coal, while in other places there is from 10 to 20 in. of rather brittle shale. There are no partings in the seam, and the coal is rather hard. A barrier crosscut is made across the top of the rooms, 350 ft. from the entry.

The question has since provoked much discussion here and a variety of opinions have been advanced. The discussion in *Coal Age* will be read with interest.

————, Utah. STUDENT.

In order to secure the greatest safety of the men and the largest percentage of extraction of the coal, *Coal Age* would suggest that this seam might be worked on the retreating method, say in four benches, each 7 ft. in thickness. It would seem to be a difficult matter to secure even a reasonable percentage of extraction by the plan outlined in the question. Briefly explained, the following plan might be expected to give good results:

Assuming that the mine has been opened by a shaft or slope and headings driven to the right and left in the lower bench of the seam, butt headings are now turned to the rise, say 100 yd. apart and driven up the pitch about the same distance. These headings are then connected by driving crosscuts at the face. All of the work, thus far, is done in the lower bench of the coal. The work of retreating is then started by taking skips along the face of the 300 ft. pillar, and when this has advanced, say 10 or 15 yd., extraction should begin in the next upper bench of coal, the workmen standing on the refuse or broken coal of the lower bench. In this manner, the work is carried back to the gangway in successive stopes or benches. We shall be glad to have the question fully discussed by our readers, with sketches.

A Simple Question in Haulage

The following question was presented at one of our recent meetings and has since attracted considerable attention, as its solution seems to require considerable mathematics with which most of us are unfamiliar. The question is an everyday practical question in mine haulage. It is as follows:

A trip of 25 cars drawn by a locomotive was just starting from the bottom of a shaft. It had gained a uniform rate of speed, when the mine foreman in the rear car of the trip handed a coupler boy a note, telling him to run ahead and give it to the motorman.

Now, assuming uniform rates of speed for the trip and the boy, the question is, What distance would the boy have to run if, on handing the note to the motorman, he turned back at once and ran at the same speed till he reached the rear car again, at the moment that car arrived at the point where the locomotive was when the boy started to run forward with the note? In other words, while the boy was running forward and back, the trip had advanced its full length.

Perhaps *Coal Age* can give us a simple solution of this question, in arithmetic. The old saying is that "All work and no play makes Jack a dull boy," and I believe that an example of this kind will be of interest to mining students. STUDENT.

Townley, Ala.

Although many would be tempted to use formulas in the solution of such a question, it is capable of a more simple solution by arithmetic. It is necessary, in doing so, however, to give concrete values to the length of the trip and the speed of the locomotive and that of the boy.

For example, taking the length of the trip of 25 cars and locomotive as, say 200 ft., and assuming that this trip is hauled at a speed of 8 ft. per sec., while the boy runs at a speed of 14 ft. per sec., it is evident that the trip, will move through a distance equal to its length in $200 \div 8 = 25$ sec.; and, in that time, the boy will run $25 \times 14 = 350$ feet.

By the use of formulas, the solution is as follows: Let l equal length of trip, x the distance the locomotive has advanced at the moment when the boy hands the note to the motorman and call the speed of the trip v_1 and that of the boy v_2.

Then, since the trip advances a distance l equal to its entire length, while the boy runs the full length of the trip and twice the distance x, or $l + 2x$, it is evident that the time taken can be calculated by dividing the length of the trip by its speed, or the distance the boy runs by his speed of running. And, since the time is equal, in either case, we have

$$\frac{l}{v_1} = \frac{l + 2x}{v_2}$$

$$x = \frac{l(v_2 - v_1)}{2v_1}$$

Finally, substituting the values $l = 200$ ft.; $v_1 = 8$ ft. per sec.; $v_2 = 14$ ft. per sec., we have, for the distance the locomotive has advanced when the boy hands the note to the motorman,

$$x = \frac{200(14 - 8)}{2 \times 8} = \frac{200 \times 6}{16} = 75 \text{ ft.}$$

In that case, it is evident that the boy runs a distance of $200 + 2 \times 75 = 350$ ft.

EXAMINATION QUESTIONS

Utah Mine Foremen's Examination, Held at Price, Nov. 7, 8, 1917

(*Selected Questions*)

Ques.—Why is a current of fresh air necessary in a coal mine?

Ans.—In order to keep the passageways and working places in a mine healthy and in a safe condition for work, it is necessary to maintain a circulation of fresh air that will dilute, render harmless and sweep away the noxious gases produced by the breathing of men and animals, burning of lamps, combustion of powder, fine coal and slack and the decay of timber and other organic matter. Not only is the oxygen of the air constantly consumed, in the operations performed in the mine, but a portion is also absorbed by the freshly exposed faces of coal, which makes a new supply necessary in order to sustain life and insure the health of the miners.

Ques.—What is the principle of the safety lamp; or, in other words, what makes the so-called safety lamp safe?

Ans.—The principle on which the safety of the lamp depends is the cooling effect exerted by the wire gauze on the gas burning within the lamp chimney. When a safety lamp is introduced into an atmosphere of inflammable or explosive gases, the gas-charged air enters the combustion chamber of the lamp and is ignited and burned, but the flame of the burning gases is prevented from passing out through the mesh of the gauze, because the tiny streamlets of gas passing through the mesh are cooled below the temperature of ignition, and the flame is extinguished.

The upper portion of the lamp chimney where the greatest danger exists is further protected by the extinctive atmosphere of burnt gases there confined. The former principle, depending on the cooling effect of wire gauze was discovered by Sir Humphry Davy, in 1815, while the latter relating to restricting the outflow of the burnt gases at the top of the chimney was the characteristic feature of the Stephenson lamp, which antedated the Davy lamp a few months only.

Ques.—When does a safety lamp become unsafe?

Ans.—A safety lamp is unsafe when improperly handled, its parts improperly assembled, or any part is omitted or defective. A safety lamp should never be exposed to too strong a current of air containing gas. The lamp should be carried in an upright position and never tilted so that the wick flame strikes the gauze. A safety lamp should not be exposed to an explosive mixture longer than is necessary to detect the presence of the gas. The lamp is further unsafe when it is not properly cleaned or the gauze has become clogged with dirt and grease.

Ques.—How many wires are there in 1 sq.in. of gauze, in a safety lamp?

Ans.—What is known as the "standard wire gauze," recommended by Davy and used in Great Britain and this country, contains 28 wires to the inch, which makes $28^2 = 784$ openings to the square inch.

Ques.—(a) What is the difference between a "squeeze" and a "cave"? (b) To what cause or causes can squeezes in mines be traced?

Ans.—(a) When a cave takes place in a mine, the roof is broken and falls in larger or smaller masses, depending on the character of the material. On the other hand, a squeeze is a gradual settlement of the roof or a heaving of the floor, as the case may be, while the supporting pillars of coal are crushed by the weight of the overlying mass.

(b) Squeezes are caused by leaving too small pillar supports when taking out the coal, or attempting to maintain too large a standing area instead of drawing the timber from abandoned places and allowing the roof to fall. A squeeze may be started by reason of the failure to maintain a regular breaking line when drawing back the pillars in a section of the mine.

Ques.—A haulage road is 100 yd. long, with a semicircular roof. The road is 9 ft. wide at the bottom and the sides rise perpendicularly to the height of 3 ft. where the semicircle begins. How many cubic yards of material have been taken out?

Ans.—The area of the rectangular portion of this roadway is $9 \times 3 = 27$ sq.ft. The area of a semicircle whose diameter is 9 ft. is $\frac{1}{2}(3.1416 \times 9) = 31.8$ sq.ft. The total sectional area of the airway is therefore 58.8 sq.ft., and its cubic contents, $3 \times 100 \times 58.8 = 17{,}640$ cu.ft.; or, $17{,}640 \div 27 = 653+$ cu.yd.

Ques.—A piece of iron measures 14 in. long by 7 in. wide by 5 in. thick. Find the length of a bar having the same contents and 1 sq.in. in section.

Ans.—The cubic contents of the iron is $14 \times 7 \times 5 = 490$ cu.in. The length of a bar 1 sq.in., in cross-section, and having the same contents is, therefore, $490 \div 12 = 40$ ft. 10 in.

Ques.—An airway 60 yd. long, 6 ft. high and 8 ft. wide is full of methane. What quantity of air must be added (a) to render it explosive; (b) to bring it to the highest explosive point; (c) to so dilute it as to render it nonexplosive?

Ans.—The volume of the gas filling this airway is $3 \times 60 \times 6 \times 8 = 8640$ cu.ft. (a) Pure methane first becomes explosive, by the addition of air, when the volume of air to gas is 1:5; hence, to render this volume of the gas explosive will require $5 \times 8640 = 43{,}200$ cu.ft. of air.

(b) The maximum explosive point of pure methane is reached when the proportion of gas to air is 1:9.57; and the quantity of air that must be added to produce this result is, therefore, $9.57 \times 8640 = 82{,}684+$ cu.ft.

(c) To so dilute this gas as to render the mixture of gas and air nonexplosive requires that the proportion of gas to air shall be 1:13; and the quantity of air required to produce this result is, therefore, $13 \times 8640 = 112{,}320$ cu.ft. of air.

COAL AND COKE NEWS

Harrisburg, Penn.

A. C. Campbell, county fuel chairman of Luzerne County, and who is also chairman of the committee to investigate impurities in anthracite coal, has made a statement, explaining and justifying the comparative tardiness and necessary slowness of these measures. He points out that he was neither provided by the administration at Washington with funds for the making of thoroughgoing inspection, nor clothed with sufficient power until recently to make absolute a prohibition of the alleged adulteration. The investigations have therefore been made by voluntary aides, and he has been authorized by Dr. Garfield to employ executive authority to make binding the request for a cessation of the practice.

An important ruling, affecting two mine-accident cases and reversing a decision of the Workmen's Compensation Board, was handed down by Judge Strauss (Luzerne) on Feb. 15, in which the court held that a negligent act by an employee in the course of his employment could not defeat the right of compensation.

The cases are those of Julia Gurski and Mary Sanjeski, of Nanticoke, against the Susquehanna Collieries Co., a claim under the compensation act for the deaths of their husbands, Frank Gurski and his laborer, who were suffocated by entering an abandoned section of defendant's mine on Oct. 19, 1916, to secure their mining tools.

The referee found that the defendants died as the result of violence sustained by an accident in the course of their employment upon the defendant's premises and that their presence was required in the mine at the time. The referee concluded that the plaintiffs were entitled to compensation.

An appeal was taken by the defendant company to the Workmen's Compensation Board, which held in substance that the two men were warned not to enter the portion of the mine where the accident occurred; that they were not engaged in duties nor furthering any business of their employer when they went to the place where the accident occurred, and that they entered the danger despite warnings to secure their own tools.

Judge Strauss, however, takes a different view of the law and the facts, and in the Gurski case says in part: "Had this employee while on his way to work on Oct. 19 gone to a hardware store, not on the employer's premises, to purchase a mining machine, the employee would have been simply furthering his own business and convenience and his act would not have been in pursuance of his employment. But after the employee had reported for work at 6:10 that morning, entered upon the premises by going down into the mine which was under the control of the employer, his right to compensation was not limited to the moments of his actual labor or when he was in some way directly furthering the business of the employer, though not within the special lines of his employment.

"He was entitled to compensation though not so engaged, the sole statutory requirement being that his injury shall result from the condition of premises under the control of the employer or upon which the employer's business or affairs are being carried on while the employee is there in consequence of his employment. The employee shall be entitled to compensation 'without regard to negligence' when he brings himself within the terms of that section.

"This employee by going into a dangerous part of the mine was negligent, but the very purpose of the Workmen's Compensation Act was to transfer to the industry the risk of employment; and among risks of employment the fact is to be considered, well known from general experience, that almost every employee will be negligent at some time and will take some chances, especially so in a hazardous business. Probably in the great majority of cases the chances taken do not result injuriously; but when they do the policy of the law as expressed by this statute, having regard for human imperfections, no more in evidence among employees than among employers, is to compensate the employee and throw the burden of financial loss upon the business."

Judge Strauss concludes his lengthy and interesting opinion by saying: "Junkin vs. Lehigh Valley Coal Co., 3 Dept., Rep. 2903, is very closely analogous to the case now at bar, where it was held that the employees who were specially directed to go to chamber No. 36, and who after they had performed their work there went into chamber No. 27 where an explosion occurred. 'If it be that they went into room 27 against orders fully understood and appreciated by them, this would be but a negligent act on their part, which of itself could not defeat the right to compensation if at the time of the accident they were in the course of their employment on the premises of the defendant.'

"So was Gurski 'in the course of his employment on the premises of the defendant at the time of the accident.' He had reported for work as already stated, at 6:10, and had gone into the mine and was on his way to work in the mine, diverting only to get a tool in another portion of the mine. 'Though his orders not to go (into the blocked off portion of the mine) may have been fully understood and appreciated by him, this would be but a negligent act on his part.'

"Now, Feb. 15, 1918, the judgment of the Workmen's Compensation Board is hereby reversed and judgment is directed to be entered in favor of the plaintiff according to the recommendation of the referee."

The case of the laborer involves exactly the same points.

PENNSYLVANIA

Lansford—The Lehigh Coal and Navigation Co. is tearing down its old No. 11 breaker, preparatory to erecting a much larger and modern one.

Hazleton—More than 1000 samples of coal sold through the Lehigh region have been taken by Max Friedlander, local fuel administrator, and analyzed to learn what proportion of slate they contain. It is charged that much of the fuel sold here has been mixed with a big proportion of waste, which passed muster in the great rush to relieve the coal shortage.

Coaldale—By an explosion of gas at the Lehigh Coal and Navigation Coal Co.'s colliery, on Feb. 12, four miners were so badly burned that they were taken to the state hospital.

Mauch Chunk—Orders have been received from the war department by Sheriff Michael Hartneady, president of the Carbon County exemption board No. 1, to ship the slackers employed at the mines in the Panther Creek Valley to Camp Meade. The men will be treated as slackers and given the full penalty of their crime. Several of them are now under surveillance at Lansford and Summit Hill.

Upper Lehigh—The M. S. Kemmerer Coal Co., which operates the Sandy Run mine, on Feb. 13 announced that it has one man digging coal who earned $3100 to 1917. As he is a married man, he must pay income taxes on $1000. Many miners, railroaders, carpenters and machinists here are included in the provisions of the income tax law, as their wages have increased considerable in the last few months of war-time demands on labor.

Scranton—For more than four hours a team of horses was buried in a mine cave in the 1900 Block, Cedar Ave., close to the National colliery of the Delaware, Lackawanna and Western R.R., Coal Department. The driver was going to the breaker when the earth gave way beneath the horses, both animals being carried down many feet. Men employed at the colliery were sent to get the horses out. Both animals were badly scratched but not seriously injured.

Inkerman—Upon the filing of a bill in equity a preliminary injunction was granted in the suit of Charles P. Holden against George J. Llewellyn and Frank Carlucci, contractors of Scranton, to restrain the defendants from interfering with or entering upon lands of the prosecutor, which contains a culm bank and mine drifts, and to require the defendants to account for the coal and material removed. The plaintiff in his bill alleges that he has been in possession of the culm bank for many years, and that the defendants have entered upon the tracts and removed about 1000 tons of coal and culm.

Bituminous

Huntingdon—Owing to the growing scarcity of coal, workmen have begun tearing down more than 100 coke ovens at the Derry plant of the H. C. Frick Coke Co. They will be taken to Saxton, Bedford County, which is in the heart of the Broad Top bituminous district.

WEST VIRGINIA

New Martinsville—A company of local men have recently secured about 500 acres of coal in this vicinity along with the old mine on the Anthony estate. The new company will be known as the Mountain Coal Co. and will be incorporated in this state. A modern tipple will be erected as soon as the work can be done and good rail facilities will enable the company to expand its business and equip a modern mine.

OHIO

Jobs—A new mine, under lease from the Buckeye Coal and Railway Co., was opened last week on the Hocking Valley R.R., a short distance from the large Jobs mine of the Buckeye company. The 200 acres included in the property is under lease to the Douglass company. The new mine has been christened "Liberty," in honor of the war being fought for democracy. The output will be about 250 tons daily.

Athens—The Jewell Coal Co. has started loading from its new mine, located on Bailey Run, where No. 7 seam is being worked. The Jewell Coal Co. has 300 acres under lease from the Buckeye Coal and Railway Co. The daily output will be about 700 tons.

Bridgeport—The Provident mine No. 2 at Fairpoint has been working steadily during the recent congestion of coal cars. The mine officials, when unable to obtain their daily supply of empties, followed the plan inaugurated by the Valley Camp Coal Co. and dumped their surplus output in a nearby field. The men at the mine, by the plan being put into operation, were able to get an average of five days' work per week.

INDIANA

Terre Haute—A report was to the effect that mine tipple at Mine No. 5 of the Jackson Hill Coal Co. was burned on Feb. 12, the loss being about $20,000. Production will be cut down about 2000 tons a day. J. C. Kolsom, general manager, is of the opinion that the fire was of incendiary origin, it being the third this winter in the district.

ILLINOIS

Pana—For three days last week the three Pana coal companies, Penwell, Pana and Smith-Lohr, shipped their entire output to railroads, domestic consumers, public utilities, byproduct coke plants, manufacturers of perishable food or foods necessary for immediate consumption, and municipal, county and state government, under orders of Fuel Administrator Williams.

Mechanicsburg—Arrangements are under way for the reopening of the Mechanicsburg mine, half a mile north of town, which has been closed several years. It is to be pumped out as soon as possible and the tipple and office buildings erected. It is expected that the mine will employ several hundred men. A Mr. Hans, of Springfield, will be the mine superintendent.

Lincoln—After repeated ineffectual attempts to extinguish the fire which started Oct. 23, 1917, in the mine of the Lincoln Mining Co., the owners have decided to abandon it and the work of dismantling

it has begun. The equipment is to be offered for sale. The mine was originally opened Sept. 15, 1869. The present owners are the Frank Frorer estate, David H. Harts, Mr. and Mrs. Walter Puterbaugh, of Chicago, and D. H. Harts, Jr., of Lincoln. A 5-ft. vein at a depth of 271 ft. has been worked for years. The output has been about 1000 tons a day. The number of men employed was 175. The capital stock of the company is $100,000.

Belleville—The Pittsburg, West End and Abend mines, with a daily capacity of 600 tons, were endangered by the breaking of a dike on Richland Creek north of here, which had been built to protect the mines. Water poured into the Pittsburg mine and caused a shutdown. The miners were put to work repairing the dike. There was danger that the other two mines would be flooded.

Beardstown—Strip mining methods were employed to salvage 32 carloads of coal which were dumped near here when a Chicago, Burlington & Quincy train went into the ditch. A steam shovel was brought into use and with the help of a crew of men the coal was scooped up and reloaded in three days.

Carlinville—A trolley line, it is understood, is to be constructed to connect the new town of Schoper with Carlinville. At Schoper development work is to be done by the Standard Oil Co. It is also understood that large smelters or an oil refinery will be established at Schoper in connection with the mines.

Virginia—Plans are being made to reopen the mine here, abandoned several years ago, or sink a new shaft to tap the 7-ft. vein, which was operated until competition drove the local company out of business. Charles Wilson, who was a member of the old company, is taking the initiative and will help to finance the new concern.

Gillespie—The ranking mine of Illinois in the production of coal in 1917 was Mine No. 3 of the Superior Coal Co., at Gillespie, Ill. This mine employed an average of 690 men, who worked 260 days during the year. The output was 1,158,796 tons, a daily average of 4457 tons. Mine No. 2 at Gillespie stood third, employing 709 men, who worked 249 days and produced 1,071,283 tons. The three Gillespie mines produced an average of 249 carloads a day. These mines, with nine others in Macoupin County, produced 6,578,883 tons and employed 5362 men and gave Macoupin County second place in the state. Williamson County, with 35 mines, working 8241 men and producing 9,634,680 tons, stood first. The gain in Williamson County over the preceding year was 1,754,421 tons. The gain in Macoupin County over the preceding year was 1,327,025 tons. It is expected that when Mine No. 4 of the Superior Company at Gillespie is completed, the county, with only 13 mines, will produce more than any other county in the state.

KENTUCKY

Somerset—After being closed down for several days as a result of water getting into the Barren Fork Mines, Manager C. I. Ross again has things going in good shape, although it took several days to get rid of the water.

ARIZONA

Globe—Four miners were killed in a premature explosion in the Vivian shaft of the Iron Cap mine here on Feb. 14. The charge set in the shaft to tear down a wall of ore exploded before the men could escape. Several other miners were injured.

Personals

J. E. Taylor has been appointed general manager of the Bon Jellico Coal Co., of Bon Jellico, Ky., his father, E. B. Taylor, having resigned that position.

R. E. Butler has been appointed superintendent of the operations of the Benoit Coal Co., Benoit, Ala., having resigned his position as chief engineer of the coal-mining department of the Republic Iron and Steel Co. to assume his new duties.

F. E. Zerbey, vice president and general manager of the Kingston Coal Co., which recently pledged that its employees would take $50,000 worth of war savings stamps, has just been appointed special chairman of the war savings campaign among the coal companies in the anthracite region.

Thomas Hammond, formerly assistant superintendent and mine foreman for the Park Coal Co., at Vandergrift, Penn., has been promoted to chief safety inspector of all the mines, under the management of L. W. Hicks. Mr. Hammond starts his new position Mar. 1.

J. W. McQueen was elected president of the Sloss-Sheffield Steel and Iron Co., at a recent meeting of the directors held in New York recently, to succeed Waddill Catchings who has resigned. Mr. McQueen has been connected with the Sloss-Sheffield company in various capacities since 1891. In 1902 he became vice president. His executive duties have made him a decided factor in the rise of the company to its present position.

Earl E. Eby, who was manager of the Pittsburgh office of the Hyatt Roller Bearing Co., industrial bearings division, for the past two years, has been appointed assistant sales manager and will be located in the Metropolitan Tower, New York. Mr. Eby is a graduate engineer from the Ohio State University and previous to his connection with the Hyatt company he spent four years in the engineering department of the Westinghouse company at East Pittsburgh.

Charles H. Krauss, formerly superintendent of the Weir Frog Co., has resigned to accept a position as general superintendent of the Louisville Frog and Switch Co. (successor to the W. M. Mitchell Co., Inc.), Louisville, Ky., a newly organized company with a capital stock of $200,000. Mr. Krauss is an expert frog and switch man, having been connected with the Lorain Steel Co., Johnstown, Penn., and with the Kilby Frog and Switch Co., Birmingham, Ala., for many years, in the capacity of superintendent.

Tudor Aston, of Carbondale, Penn., who has been superintendent of the Northwest colliery of the Temple Coal Co. for the past few years, has been transferred to the Mount Lookout Coal Co. at Wyoming, one of the companies controlled by the Temple Corporation, to succeed Seward E. Button, who was recently appointed Chief of the Department of Mines of Pennsylvania to succeed the late James E. Roderick. **Bruce Weir**, who has been a mine foreman at the Forty Fort colliery of the company, succeeds Mr. Aston at the Northwest colliery. The changes became effective Feb. 18.

Obituary

Robert Galloway, founder of the Galloway Coal Co., of Memphis, Tenn., and for the past 27 years its president, died at his home on Jan. 11.

Industrial News

Harlan, Ky.—The High Point Coal Co. has increased its capital from $12,000 to $35,000.

Hazard, Ky.—The Yerkes Coal Co. and the Willard Coal Co. have increased their capital from $4000 to $8000.

Barbourville, Ky. — The Hi-Land Blue Gem Coal Co. has been incorporated with a capital of $2000. The incorporators are S. H. Jones, J. R. Jones and Charles Jones.

Hazard, Ky.—The Clean Coal Co. has been incorporated with a capital of $200. The incorporators are David Y. Wooten, Lou Ann Edwards and William B. Wooten.

Barbourville, Ky.—The Huron Coal Co. has been incorporated with a capital of $2000. R. H. Newitt, Henry Branstutter and Thomas D. Tinsley are the incorporators.

Gorman, Md.—The Hamill Coal and Coke Co., Kitzmiller, has acquired the mining rights on 921 acres of local coal lands, and is planning for immediate development work.

Pittsburgh, Penn.—The H. C. Frick Coke Co. has purchased a Reo three-quarter ton truck from the Central Motor Co. The truck will be used at the company's Leisenring No. 1 mine.

Hopkinsville, Ky.—The American Minerals Co. has been incorporated with a capital stock of $30,000. The incorporators are M. V. Armstrong, of Crittenden County, and M. G. Moore, of this city.

Philadelphia, Penn.—The Porter Coal Co. has filed articles of incorporation with a capital of $25,000 to engage in a general coal-mining business. Harry E. Bird, Philadelphia, is the principal incorporator.

Knoxville, Tenn. — The Federal Grand Jury, on Feb. 14, returned 23 indictments against 47 defendants, including coal operators, coal dealers and coal brokers of the east Tennessee field, charging violation of the fuel control bill.

Bethlehem, Penn.—The Dodson Bituminous Coal Corporation, 26 South New St., is planning for the early development of about 3350 acres of coal lands near Wilson, Md., to have a daily output of approximately 3000 tons.

Beaverbrook, Penn. — The Beaverbrook colliery is having plans prepared for the construction of a new steel and concrete machine shop at its plant, about 40 x 100 ft. George Welsh, Coal Exchange Building, Wilkes-Barre, Penn., is architect.

Pittsburgh, Penn.—The Asbestos Protected Metal Co., of Pittsburgh, announces the removal of its Boston office to the State Mutual Building, to be in charge of William H. Cummings. The telephone number, Fort Hill 3688, remains unchanged.

Morgantown, W. Va.—The Berry Coal Co. has been incorporated with a capital of $25,000 to operate mines in Cass district, Monongalia County. The incorporators are Everhard Bierer, Joseph Bierer, Lee R. Shriver, Frank C. Shriver and William E. Glasscock.

Charleston, W. Va.—The Grady Creek Coal and Coke Co., of Princeton, with chief works at Duffy, Lewis County, has been incorporated with a capital of $50,000. The incorporators are J. H. Davidson, T. B. Beckwith, H. C. Hadden, M. A. Lowe and T. M. Fry, of Princeton.

Beckley, W. Va.—The Rogers Coal Co. has been incorporated with a capital of $25,000 to operate mines in Town district, Raleigh County. The incorporators are G. H. Boien, C. M. Rogers, P. L. Blackenship, G. C. Hedrick, all of Beckley, and John R. Griffith, of Ghent.

Shrewsbury, W. Va.—The Franklin Coal Co. has been incorporated with a capital of $5000 to operate mines in Kanawha County. The incorporators are H. J. Lane, B. F. Watson, W. F. Wolf, W. L. Lane, of Mammoth, W. Va., and V. L. Black, of Charleston.

Irwin, Penn. — A coal deal, involving $180,000, has been consummated in which two completely equipped coal mines and 60 acres of coal have been purchased by W. E. Rice, Logan Rush and Thomas Love. The operations of the mines will be continued by the new owners.

Morgantown, W. Va.—The Granville Coal Co. has been incorporated with a capital of $10,000 to operate mines in Grant district, Monongalia County. The incorporators are Everhard Bierer, Joseph Bierer, E. H. Wingrove, Ida M. Wingrove and William E. Glasscock, all of Morgantown.

St. Louis, Mo.—The Illinois Traction Co. (McKinley system), has placed an order for 16 powerful electric locomotives to be used for coal and other freight trains exclusively. They are of a new type and far heavier and more powerful than the old ones, which draw from 20 to 30 cars.

Tioga, W. Va.—The Bear Run Coal Co., Tioga, has been incorporated with a capital stock of $5000 to operate mines in Nicholas County. The incorporators are H. G. Carskadon, Ethel Carskadon, G. R. O'Connor of Richwood, W. Va., W. S. McQueen and F. W. Collins of Tioga.

Milburn, W. Va.—The Milburn By-Products Coal Co., Milburn, has been incorporated with a capital stock of $100,000 to operate mines in Fayette County. The incorporators are E. W. Knight, Angus W. McDonald, L. G. Summerfield, V. L. Black and George S. Couch, all of Charleston.

Williamsport, Penn. — The Bennett Branch Coal Co., 12 West Fourth St., has had plans prepared for the construction of a new two-story club house, about 35 x 65 ft., to be located at Wilmere, for the benefit of its employees. T. J. Litzelman, 129 West Fourth St., Williamsport, is the architect.

Pittsburgh, Penn.—The Madigan-Johnson Coal Co., of Clarksburg, has been incorporated with a capital of $25,000 to operate mines in Harrison County. The incorporators are J. W. Madigan, Florence E. Madigan, Aloysius Coll, of Clarksburg; T. J. Johnson and Amelia Johnson, of Meadowbrook, W. Va.

Charleston, W. Va. — The Pocahontas Coal Land Co., with chief works in Jumping Branch district, Mercer County, has been incorporated with a capital of $25,000. The incorporators are J. B. Earwood, George W. Warren and Ashton File, of Beckley; William Prince, of Prince, and W. O. Abney, of Charleston.

Rising Fawn, Ga.—The Georgia Iron and Coal Co. is planning for the immediate development of about 45,000 acres of coal, iron and manganese lands in Bartow, Cherokee and Dade Counties. Plans for the early installation of mining machinery are now under consideration. Joel Hurt, Hurt Building, Atlanta, is president.

Connellsville, Penn.—The Thompson-Connellsville Coke Co. on Feb. 13 paid its

initial dividend of 15 per cent. following the bankruptcy of J. V. Thompson. The concern went on the rocks at the time of the Thompson failure, but it has now got back on its feet. The paying of a dividend came as a happy surprise to most of the stockholders.

Reynoldsville, W. Va.—The Alpha Portland Cement Co. is arranging for the installation of a series of plants to develop its local coal lands for the production of fuel for its manufacturing plants. Plans are now in progress for a second opening, which, it is anticipated, will be a shaft mine. The company will install electrical equipment for operation.

Paducah, Ky.—The West Kentucky Coal Co. suffered a heavy loss on Feb. 8, when an ice gorge went out at Caseyville, Ky., taking 22 loaded boats and barges, five empty flats, three pump boats and other equipment. Practically all of this equipment was sunk in the ice jam and will result in almost a total loss, estimated at $100,000 by the president of the company, C. F. Richardson.

Marion, Ind—The Marion Machine, Foundry and Supply Co. has taken over the entire business, good will, patterns, patents and drawings of the Planet Steam Specialty Co., which has specialized in the manufacture of soot blowers for all types of water-tube boilers. Gordon C. Bennett, inventor and secretary of the Planet company, will have charge of the engineering department to develop the manufacture of a complete line of water-tube soot blowers.

Charleroi, Penn.—During 1917 a total of 214,673,000 bushels of coal passed through Lock No. 4 on the Monongahela River, an increase of 20,362,000 bushels over 1916. The shortage of railroad cars also brought about the transportation of coke by water, and commencing in March, 4,433,000 bushels of coke were locked through No. 4. No coke was transported by water in 1916 or in any previous year of which there is a record.

Kansas City, Mo.—C. J. Ritter, a coal jobber of Centerville, Iowa, is under detention at the request of the local fuel administration, pending the filing of charges of violating the Lever Act. Ritter, it is alleged, accepted a bonus of $200 in addition to the fixed price for ten cars of coal purchased by I. Pelzman, a Kansas City retail dealer. Ritter says he merely accepted the money as an advance payment on coal to be delivered.

Columbus, Ohio—The warmer weather has aided in railroads resuming almost normal traffic conditions and coal is now coming into Columbus and other points in larger quantities. The Hocking Valley Ry. moved 1247 cars into Columbus during a 48-hour period and the Toledo & Ohio Central moved 1056 cars into the Buckeye capital during the same period. The movement north of Columbus toward the Toledo gateway was also active in every respect.

New York, N. Y.—The annual beefsteak dinner of the Coal Merchants Association of New York was held at Murray's, in West 42nd street, Saturday evening, Feb. 16, and was attended by about 200 coal men. Addresses were made by County Fuel Administrator Reeve Schley as well as by the Deputy Fuel Administrators from State Administrator Wiggin's office, Harry T. Peters, chairman of the State Fuel Conservation Committee, Commissioner Arthur F. Rice and others.

Charleston, W. Va.—Twenty-five men were killed in West Virginia mines during the month of January, according to the report issued by Earl Henry, chief of the department. McDowell County led in the list of fatalities again, having six. Ten counties reported deaths as follows: Barbour County, 1; Braxton, 1; Fayette, 1; Harrison, 1; Kanawha, 4; Logan, 2; Marion, 3; Mason, 1; Ohio, 1. Of the 25 killed, 20 lost their lives inside the mines and five outside.

Columbus, Ohio—Upon the return of Prof. Frank A. Ray, coal expert to Columbus, the Buckeye Coal and Railway Co. will start development work in No. 6 seam in the Bailey Run section of the Hocking Valley field. This seam will have to be reached by shafts which will be sunk to the depth of 80 ft. The Buckeye Coal and Railway Co. will make leases to operating companies to work this seam, retaining the right to sell the product. The mines in No. 6 seam will be large operations.

Wellston, Ohio—Jackson County coal operators were summoned to Columbus to confer with J. B. Dugan, of the Ohio Public Utilities Commission, to improve the car-supply situation in the Jackson district, particularly as to the Cornelia branch of the Detroit, Toledo & Ironton R.R. The operators asked that a connection be made with the Baltimore & Ohio and the Hocking Valley systems so that cars may be delivered to its line without being hauled many miles from other points.

Jefferson City, Mo.—The State of Missouri has no money in its fuel appropriation to pay its January coal bill, and the St. Clair Coal and Mining Co., of St. Louis, will have to wait for its money. When the January bill was presented it was found that the state lacked $835 of having enough to pay it. The $15,000 appropriation for this year and next year has been exhausted. It has not been determined whence the money is to come if more coal is needed.

Louisville, Ky.—Senator Brock has introduced a bill before the State Legislature calling for an individual department for the inspection of mines, the appointment of a chief mine inspector, and three assistant inspectors, and providing that the Chief Inspector give all of his time to the work. The present inspector of mines has charge of the engineering department of the State University. This bill creates the "Department of Mines," and gives the Governor the right to appoint the chief executive.

Scottdale, Penn.—As the result of an investigation into electric power conditions in the Connellsville coke region by agents of the Council of National Defense, there is a possibility that a curtailment in the use of power by industries less essential than the mining of coal and the making of coke will be made. At any rate, the data secured by the investigators will be used as a check against the consumption as shown by the reports and records of the West Penn Power Co., which supplies the region.

Charleston, W. Va.—Max T. Price, of Charleston, secretary of the Kanawha Valley Coal Operators' Association, has been appointed temporary manager of the Chesapeake & Ohio forwarding bureau, of Russell, Ky. Feb. 25 has been set as the date for the beginning of operations of the pool. All coal mined from operations along the Chesapeake & Ohio lines in the Guyan, Kanawha, New River and Big Sandy fields will be billed directly to the forwarding bureau from where it will be distributed to consumers, at the discretion of the manager of the exchange.

Danville, Ky.—A total of 1600 cars of coal were recently being held in the local yards on account of congestion, but with the improvement in transportation most of this coal as well as the additional shipments from the mines has been moving forward, 500 cars having been shipped into Indiana within a few days. The transportation situation has shown great improvement. Various commodities are now moving eastward and northward, some commodities being barred from the East—that is, past the Buffalo-Pittsburgh line, this list including lumber.

Chattanooga, Tenn.—An interesting suit, involving the Dayton Coal and Iron Co., and reading "the Equitable Trust Co. vs. the Stockholders of the Dayton Coal and Iron Co.," has been filed, this suit involving about $300,000. The suit is to recover this amount, it being claimed that the corporation was organized in Scotland, and was never domesticated, and therefore the stockholders were acting as partners and liable for all debts that had been incurred. A long list of prominent attorneys have been retained by the plaintiffs, while defendants are represented by Siser, Chambliss & Chambliss.

Columbus, Ohio—Governor Cox has secured from Director General McAdoo a promise that the latter will appoint an Ohio representative to look after transportation in the state, with headquarters at Columbus. In all probability the appointee will be one connected with the State Public Utilities Commission. Governor Cox had a long and satisfactory conference with McAdoo. He submitted a list of specific recommendations bearing upon the Ohio Transportation situation. Chief among these was one that long hauls be abolished as far as possible and that something be done to improve the motive power of the railroads, which is deteriorating rapidly.

Marion, Ohio—Speaking to business men, E. D. Leach, assistant state fuel administrator of Ohio, declared that it is the present plan of the fuel administration to limit the amount of coal domestic consumers can have during the summer. He declared the idea many entertain that they will lay in big supplies in warm weather in anticipation of needs next winter, are to be rudely shaken. In the course of his remarks he said that indications are now that this winter's experience is but a "taste" of what can be expected next winter, and expressed the view that only suspension of industries to take that much burden off the coal-hauling railroads will bring relief.

St. Louis, Mo.—Missouri Fuel Administrator Crossley announces that arrangements satisfactory to him have been ordered by Federal Administrator Garfield for St. Louis to receive its fuel supply from the Fifth and Ninth Illinois districts. A deputy Federal administrator acceptable to Crossley will be appointed by Illinois Administrator Williams. Requisition will be made by Crossley and the St. Louis Fuel Committee on the deputy administrator for St. Louis' needs. The plan agreed upon is a compromise, he says, but under it all the coal needed for St. Louis will be requisitioned. An agreement has also been made for Kansas City to get its steam coal from the Springfield, Ill., district and western Missouri its domestic coal from the same district.

Louisville, Ky.—The final breaking of the last ice gorges on the upper Ohio River resulted in much damage to equipment belonging to river coal companies. On Feb. 13 barges which had broken loose at various points above Louisville started coming down, it being said that considerably more than 100 coal boats and barges, a number of wharf boats, pump boats, and other equipment were going down stream with the ice. Some of this equipment bumped the bridge piers in passing Louisville, but with a current of only six to eight miles an hour the damage was not great. The harbor is now wide open and practically all ice has run out. Towboats on the lower Ohio are endeavoring to catch the runaways. It is expected that some river coal will start moving down within the next few days on the present high water.

Louisville, Ky.—Coal operators are watching with much interest legislative developments in connection with some eight-hour bills which have been introduced before the General Assembly at Frankfort House Bill No. 172, introduced by Representative Bays, was ordered printed and referred to the Committee on Immigration and Labor. This bill is entitled "An Act fixing eight hours as a working day in all contracts between employers and employees, and providing for payment of extra time, and penalties for violation of this act." This bill is aimed especially at the mines and railroads, and provides a penalty of $100 for all violations of the act. The coal men feel confident that the Government under existing conditions will not allow any such state laws to interfere with the production of coal, although there is some strong opposition being pushed by individuals against these measures.

St. Louis, Mo.—A survey of St. Louis factories and industries to determine what industries could be classified as nonessential and closed down in case of necessity, has been completed by E. J. Troy, secretary of the Manufacturers' Association, for the St. Louis Fuel Committee. Troy received replies to his questionnaire from 864 firms, whose aggregate average fuel requirements are 57,000 to 58,000 tons, or 1450 cars a week. Industries considered essential because they manufacture foodstuffs or have war contracts number 243, using 12,863 tons of coal a week. Firms claiming they were essential industries numbered 227, using 40,550 tons a week. Their claims will be passed on by the fuel committee. There were 193 claiming to be essential industries but listed as doubtful by Troy. They use 1760 tons a week. Manufacturers of nonessential goods numbered 138, using 894 tons a week. Firms listed as nonessential by Troy numbered 36, using 105 tons a week.

St. Louis, Mo.—A new campaign for the removal of the 20c. a ton arbitrary on coal, charged by the Terminal Railway Association for hauling it across the bridge from East St. Louis, has been started by former Governor Joseph W. Folk, who resigned as chief counsel of the Interstate Commerce Commission to become chief counsel of the Chamber of Commerce. In an address to the Chamber of Commerce at the Planters Hotel, he expressed full confidence that the Interstate Commerce Commission, in harmony with recent decisions and with the present trend of thought on the subject, would rule that the arbitrary is unjust and order it abated. His confidence is based mainly on rulings of the commission that St. Louis and East St. Louis are to be considered as one destination on shipments of cattle from the West, and that New York and Jersey City are to be considered as one destination. In the new campaign it will be urged that St. Louis and East St. Louis are one destination on coal shipments.

MARKET DEPARTMENT

Weekly Review

Coal Moving Forward from Mines, Though Motive Power Is Still Source of Worry—Domestic Situation Improved—Industrial Market Unable To Meet Demand—Jobbers Dismayed by New Ruling To Abolish Commissions

FOR the first time in many weeks shipments from the mines are moving with moderate regularity. Reports from all sections, with the exception of the New England States, indicate that the coal crisis is over. However, this does not mean that the danger of a recurring scarcity is entirely removed, but that with a continuation of good weather distressing periods such as the country has just experienced are improbable.

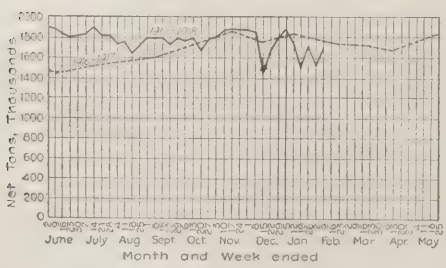
The chief trouble still is lack of motive power, and many loaded cars yet remain on sidings on this account. A report by Government investigators shows that thousands of cars in poor condition clog the terminals and impede delivery. Railroad companies state they are unable to get sufficient men to keep up repairs. An appeal to mining companies for the transfer of men with mechanical ability has met with some success.

The general public expressed much satisfaction at the demise of "heatless Monday." Some industrial plants are working on close margins of fuel supply. Anthracite is still scarce, though the mines are shipping large quantities to tidewater. The resumption of water-borne traffic will also aid in the movement of coal and take some pressure off the railroads.

Radical changes in distribution routes are in prospect. So great is the demand from the East that a plan of coal distribution, approved by the Fuel Administration, proposes that Eastern seaboard states shall have first choice on the cutput of anthracite. This means that after Apr. 1 states in the West and Northwest will not be permitted to receive hard coal. This will be true also of Canada and the South. The mines of the Middle West will thus have their natural markets pretty much to themselves.

The committee in charge of the zoning plan seems to be making but little progress. It has been found to be a more difficult proposition than at first contemplated. Theoretically the arrangement seems ideal, but so many difficulties have beset the practical application that it looks as if the plan will not be ready for operation for some time.

Domestic demand is considerably lighter, and dealers are rapidly catching up with their orders. The industrial market is not so fortunate, however, a brisk demand for steam coals being in evidence, with the possibility that Eastern industrial plants of all kinds will be forced to burn bituminous only in the future.



Little contracting is reported for future requirements, and activity in this direction is not expected to develop to any extent until conditions become more favorable. Operating companies are now busy preparing new contract forms, as in order to conform to the Government regulations it has been necessary to make changes in the present blanks. All contracts made must be submitted to the Fuel Administration for approval. In this way the national authorities will be able to keep a check on the sizes of coal that are being used for steam consumption.

The announcement that the 15 to 30c. commission which jobbers are now permitted to add to the mine price will be done away with after Apr. 1 has been received with consternation by many middlemen. It cannot be denied, however, that the order will tend to eliminate a great deal of profiteering on the part of some operators who established subsidiary companies for the express purpose of selling coal, thereby absorbing this commission. Under the new ruling retail dealers will obtain coal at the same price, whether they purchase it from the mine or through a middleman.

Production will doubtless be greatly stimulated by the order of the Fuel Administrator granting an increase of 60c. a ton for coal mined in the central Pennsylvania district. This will go far toward encouraging the investment of further capital in development work.

COAL PRODUCTION

With the return of milder weather the production of coal again began to approach normal, although the severe congestion of transportation caused by the cold weather of mid-January had not been entirely overcome by Feb. 9. The total production of bituminous coal, including lignite and coal made into coke, is estimated at 10,215,000 net tons during the week of Feb. 9. The

rate of production was the highest attained since the five-day week of Jan. 5. Beehive coke shared in the recovery reported by the bituminous industry as a whole. The week's production is estimated at 505,000 net tons, an average per working day of 84,000 tons. Shipments of anthracite, however, declined from 34,482 cars to 32,011 cars.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Jan. 19	Jan. 26	Feb. 2	Feb. 9
Bituminous shipments, 121 roads.	150,865	181,471*	170,552*	183,783†
Anthracite shipments, 9 roads....	31,861	33,406	34,482*	32,011†
Beehive coke shipments, 4 roads....	10,826	10,408*	9,655*	10,365†

*Revised from last report. † Subject to revision.

Atlantic Seaboard

BOSTON

Small reserves dwindle in cities. Receipts still far behind actual consumption, although mild weather leads public to think conditions better. New prices and trade already look ahead to next season. A few "contracts" placed, but question of bottoms looms up. Railroads unable to increase tonnage hauled. Loading improves at Hampton Roads, but still not enough coal available for New England.

Bituminous—While a few days of mild weather gave rise to some optimism over the fuel situation, those in touch with it saw reason only for continued apprehension. Another Panama R.R. collier diverted to New England, the "Ulysses," helps somewhat in meeting the smaller emergencies like pumping stations and power plants, hospitals, etc., all over New England, and it is just such deliveries spread over a large area that save the situation. Except in a relatively few instances, the fuel authorities are not interfering with the flow of coal on contract, whether all-rail or at tide, but what shipments are at their disposal are still being strictly confined to immediate needs in "Class A." A few exceptions have been made in cases where a small mill is practically the sole dependence of a community and a few cars are sent in order to forestall real distress. During the last week the situation got so serious that a full cargo for a group of woolen mills was practically halved to give the Bangor & Maine R.R. a small supply for the Boston end of the system. The Maine Central is in straits for coal, and every few days a steamer has to be diverted.

The Boston retail market ordinarily absorbs 8000 tons or so daily of bituminous, but under the conservation rules in force the consumption is now being held down to about 3500 tons. Only a few of the public schools are in session, and only by the closest calculation can the Fuel Administration assure a continuous supply of this quantity for more than one or two days a week. The rest, if it comes, will have to come through the usual channels and the prospect for the current week is not encouraging. Receipts have shown a steady falling off, and unless shipments by water are in some way increased there will be acute suffering should the weather turn cold.

Ice conditions in Long Island and Vineyard Sound are still a menace and the number of losses last week was even larger than was feared. Much has been expected from the "thaw," but the watersheds have not yet loosened up to any extent that would help. The flow of streams like the Connecticut is away below normal, and power stations are still dependent on the maximum efficiency of steam auxiliaries.

The mild temperature at Hampton Roads, however, has had a marked effect. Dumping is fast becoming normal, although as to arrivals and receipts it is now a close race between coal and boats. Instead of accumulating, the latter are now in scarcely sufficient number to take the coal as fast as it arrives, and it will soon be up to the authorities to supply bottoms from somewhere; that is, if New England industries are to be kept in operation.

Some relief is expected from the recent order placing an embargo for three days against westbound coal on the three Virginia roads, but it is still felt that the Federal authorities underestimate the actual needs of New England. The railroads are powerless to handle any material increase in the tonnage they hauled in 1917, and the rest must come either by water or not at all.

On the New England order of Jan. 3 calling for 500 cars daily, all-rail, the average during February has so far been only 91, including a quota for the railroads. It is now necessary to increase the proportion for certain of the roads and to decrease others. The larger systems use for engine supply in the aggregate about 16,400 tons daily, and this must all be available at necessary points in order to keep coal rolling into New England.

On Feb. 16 the trade was delighted to hear of the 60c. advance in central Pennsylvania following the 40c. granted the Piedmont region ten days or so earlier. There is a feeling that with such an advance a large number of operations can "resume business," and it will be interesting to observe the effect of the recent order. The question of contracts is now to the fore, and while at this writing it is too soon after the price announcement to report any developments in New England, the week is sure to be a stirring one. The "zone plan" is also coming in for liberal discussion, along with the new ruling of the Fuel Administration affecting "jobbers." Comment on the latter seems generally favorable, although middle houses here are in some trepidation over the attitude of some of the producers who may feel themselves in position this year to dispense with such "useful service" as jobbers have rendered in the past.

A few tidewater "contracts" have been placed by Boston distributors who apparently rely upon their lightering facilities to justify the alongside prices named. It would seem more like speculation than selling coal.

Large manufacturing centers like Lowell and Lawrence, Mass., have been on the verge of general shutdown two or three times the past fortnight. Only by emergency supplies coming either through the Fuel Administration or on sufferance have these plants been in position to run, after borrowing from one another and using wood and anthracite screenings and culm to a larger extent than would have been thought possible.

NEW YORK

Anthracite situation shows improvement, but conservation is urged. Jobbers fight elimination as result of Garfield order cutting off commission. Local fuel administrators reject badly prepared coal. Bituminous supplies scarce and car supply continues poor. New England is promised larger shipments.

Anthracite—While the situation in this market has been greatly relieved by several days of mild weather, the local trade is not satisfied that danger has passed. Receipts have been steadily increasing, and although the heatless Mondays are a thing of the past, the coal coming to the dealers is being rapidly absorbed. More coal has been received during the past week than for several weeks, but it has been far short of the normal requirements. The Fuel Administration officials and dealers are constantly warning consumers to go slow on consumption.

The decree of Dr. Garfield eliminating jobbers' commissions was not a surprise to the local trade. In fact, the order which at that time had not been promulgated, but had come to the knowledge of the officers of the Wholesale Coal Trade Association, was the reason for the calling together of the trade at the Whitehall Club on Feb. 13.

The Garfield decree is considered in various ways by the local trade. Some view it with alarm, while others, more conservative, do not think that it will result in the elimination of the jobber. The latter believe that the operator, who according to the order, is to be allowed an advance in the price of coal to cover the selling costs, will dispose of his product through the middleman as at present instead of establishing his own selling force. The other jobber believes the new order means the ultimate wiping out of the jobber, who has for many years been the means of disposing to the trade a large part of the output of the mines.

About 150 jobbers or middlemen are doing business in this market. Many of these have small mine connections, while others have sufficient mine connections, some through ownership, to furnish them with the full tonnage requirements. No matter what the outcome of the decree may be ultimately, the majority of the dealers are of the opinion that it means a fight if they are to retain their business.

Efforts to compel anthracite operators to send well-prepared coal to this market are being pursued by the State Fuel Administration officials. A statement issued by Deputy State Administrator Robertson says that the office has rejected two cargoes which analysis shows contained 69 per cent. of rock and slate, and 31 per cent. of coal. The consignee of the coal was requested to refuse shipment and to notify the shipper to return his prepaid payment. The railroad company carrying the coal notified the producers that no more coal would be furnished to them.

While consumption has not been so heavy as for the past several weeks, the demand continues strong, due in most part to the desire of consumers to replenish their stocks sufficiently to carry them into warm weather. The improvement in receipts is noticeable in the large number of vehicles carrying coal seen in the streets.

The situation is better in all the boroughs of the Greater City, but is particularly good in The Bronx. The dealers there, according to reports, have more coal in their yards than the dealers in the other boroughs. In Brooklyn there has been a decided change for the better. Dealers are impressing into service any kind of vehicle to make deliveries, and consumers are willing to take as a substitute for the coal ordered any other size sent them.

Another investigation into the local coal trade is promised by the Board of Aldermen as the result of a resolution introduced into that body. The Mayor's Coal Committee, which asked for $50,000 to purchase coal for the very poor of the city, has received about $17,000, and in addition about 1000 tons of coal.

The anthracite steam sizes continue to be scarce with the demand strong, particularly for rice and barley. Considerable culm or dust is being sent here, which is mixed with bituminous.

Current quotations, per gross ton, f.o.b. Tidewater, at the lower ports, are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buckwheat	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—The situation here continues serious despite the let-up in heavy consumption. Many industrial plants continue to be without supplies, while in New Jersey several hundred persons were idle because of the lack of coal.

The one bright spot in the situation was the fixing of a price for coal from the thin vein district of Pennsylvania at 60c. above the former figure. An advance had been expected for several weeks. The order which provides for the one price for all the coal, instead of separate prices for run-of-mine, prepared sizes and slack, also provides that in order to provide funds to meet the expenses of pools and other arrangements made by the operators to facilitate the movement and distribution of coal 5 mills per ton is to be added to the new price and the money is to be placed in a fund, which fund is to be distributed by an operators' committee to be named later.

An order was also issued making all smithing coal subject to the Government price for bituminous coal. This repeals the order of Oct. 1, providing that coal specially prepared for use in smithing may be sold at the market price prevailing at the time of sale.

Local tradesmen are now anxious as to the additional advance in price that Dr. Garfield will decide upon to cover the cost of selling expenses and which will practically eliminate the jobber from the situation unless the latter can secure his commission from the operator.

The assurance given at Washington to the New England fuel administrators that they will receive at least one million tons of coal a month to relieve the situation is expected to divert some coal from this market, but not a large amount, since more than half the amount will go by water, most of it from the Southern ports.

There is nothing new in the contract situation. While it was not expected that there would be many renewals at the former Government price, the new price may result in some renewals.

There is considerable bituminous being used in apartments and hotels, most of it being mixed with the smaller anthracite coals.

Requests have been made on local houses by the New England fuel officials for increased shipments of coal for railroad use, but it was pointed out that this was impossible because of the poor car supply. Cars are running badly, one operator instead of receiving nearly 30 cars so far this month having received less than five.

PHILADELPHIA

Anthracite domestic trade helped by mild days. Believe worst past. Planning for next winter. Rule covering spring deliveries. Entire production for East. Pea coal situation interesting. New contracts. Bituminous price increased to $3.05. Increased production expected. Mild weather helps situation, but supply still short. Drastic brokerage ruling. Crippled cars and lack of motive power hold back deliveries.

Anthracite—There is a general improvement in conditions. As anticipated, the mild weather proved the salvation of an unbearable situation. The worst of the city's coal troubles are virtually over for the balance of the winter, at least this is the opinion given out by the fuel administration. For a week the consumption of coal has been much lighter than for months and the railroads have made heavy deliveries. Some of the big companies really made such large deliveries that a few dealers were actually compelled to hold their orders until they could unload coal that had arrived.

Chairman Lewis of the city fuel committee has some ideas that he hopes to put into effect if they are supported by the state fuel administrator. In the first place, he believes that there are about twenty times too many yards here. Instead of 230, the present number, Mr. Lewis would favor about one dozen yards.

On account of the number of dealers at present, territories overlap and it is not unusual for a dealer in an extreme section of the city to make deliveries to the other end. He acknowledges that any plan to eliminate about 95 per cent. of the coal yards would not be successful, and he would refuse to try to force any of them out of business; nor would he want to aid the larger concerns in creating a monopoly of the business. His plans embrace a zoning system so that dealers can only deliver coal in their particular district. Mr. Lewis is also anxious to prohibit the sale of domestic sizes, including pea coal, to any manufacturing plant, business house, office building or hotel. His idea is to conserve the entire production of this coal for dwelling houses. Where the former are not equipped to burn steam sizes or bituminous, he hopes to force a change in the heating systems.

That the coming summer will be an extremely active one was forecasted at a meeting in the state administrator's offices Friday of last week. At this meeting were assembled the various county administrators, and the national administration for the first time announced its plan of wholesale distribution. The plan was outlined by L. A. Snead, Dr. Garfield's representative, who imparted the information that the entire production of anthracite was to be confined to the Atlantic seaboard and that the states in the West and Northwest, which had formerly depended upon anthracite for their fuel must depend upon the bituminous mines located nearest to them. This is also to include the shipments formerly made into Canada. It is understood that the plan is to go into effect on Apr. 1, and all consumers of anthracite will be encouraged to lay in their winter's supply during the spring and summer.

The order cutting out a direct commission to the jobber came as a great surprise. While this has long been advocated by that portion of the press not thoroughly

acquainted with the coal trade, it was not really expected that such a rule would be made at this time. As a matter of fact, there is but a small tonnage of anthracite sold in this city through middle houses, as following the lead of the largest company some 10 or 12 years ago, the system had been almost entirely eliminated.

Owing to the plan worked out by the National Administration to allow an increase in the mines prices in order to cover the jobber's commission, it would seem that the continuance of this feature of the trade is entirely in the hands of the operating companies now. This suggestion of increased mines price now brings to the front the question of what the new April figures will be. It will be recalled it was positively stated when the President approved the increase of 35c. on Dec. 1 last that the usual April reduction of 50c. would be insisted upon. So far as the dealers are concerned, they are opposed to an April reduction this year, as last year they were flooded with so many orders at the spring prices that they were unable to fill them at the reduced prices and were compelled to fill them later in the year at a loss. From this it would seem that it is the Government's intention to increase the present basic or winter price by about 15c. and then order the usual April reduction of 50c. With the information at hand, no other deduction seems plausible.

Another matter of great interest to the retailers is what will be the status of pea coal after Apr. 1. There is already a ruling of the National Administration against the sale of this size of coal for steaming purposes, and for this reason it looks as if a great quantity of pea coal will be thrown upon the retail market. It will be recalled that around the first of last year many of the big producing companies closed extensive contracts with manufacturing plants for big tonnages of pea coal, one company selling 400,000 tons to a single concern. With all this tonnage being turned over to the domestic trade, it would seem as if there will be enough of this size to go around this summer. It is possible also that the dealers will be able to accumulate stocks of this size, as was the case in normal times. Much, of course, depends upon how well the consuming public keeps its resolution not to be caught short of fuel another winter. If the warm weather should dispel some of these good intentions, even the operating companies may accumulate some stocks in their storage yards. The entire subject is a most interesting one and is causing much conjecture.

At this time all of the operating companies are busy preparing their contract forms. Most of the anthracite contracts expire at this time, and in order to conform to the Government regulations it has been necessary to make changes in the present blanks. All contracts that are made must also be submitted to the Fuel Administration for approval, and in this way the national authorities will be able to keep a check on the sizes of coal that are being used for steam consumption.

Despite the progress made during the past week there are still many homes in the city without coal, but present plans will no doubt bring prompt relief.

Dealers are disturbed lest their gross margin of profit be reduced from $2.50 by the city fuel committee. It will be recalled that when this basis was decided upon there was a strong protest from press and public, and it was announced at that time that the ruling was not to be considered permanent. A statement late in the week from Chairman Lewis that the margin would not be lowered for the present, but would probably be taken up later, is not at all comforting to the dealers.

All sizes of steam coal are still held at the figures prevailing for the past six weeks, from culm at $1.50 to $2 up to $4.15 for buckwheat on spot shipments from individual shippers, although the demand for culm fell off quite considerably this week in anticipation of an increased supply of bituminous coal.

The prices per gross ton, f.o.b. cars at mines for line delivery and f.o.b. Port Richmond for tide, are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—The trade was greatly encouraged by the order of the Fuel Administration granting an increase of 60c. a ton for coal mined in the central Pennsylvania district. While the increase was not altogether unexpected, yet it had been so long delayed after many almost authentic rumors had heralded its coming that the operators had almost lost hope.

Another interesting feature of this latest ruling is that the administration authorizes an additional increase of 5 mills per ton to cover the cost of pools and other arrangements to facilitate the movement of coal. This fund will be handled by an operators' committee to be named in the near future.

With the continuance of mild weather there has been a slight improvement in the receipts of fuel here lately, but despite this the situation continues most serious and many plants continue to remain closed for the lack of fuel. Even concerns working on war material have been idle, and it is these concerns which are receiving the earnest attention of the fuel committee. Owing to the improvement in the anthracite trade, the drain from that source has ceased and no soft coal has been commandeered for family use this past week.

Lighting and power plants in adjacent towns have been sorely pressed for coal and have only been kept going by the commission taking coal in transit consigned to less important industries. In many of the suburban towns the lighting has been curtailed as much as 50 per cent. on this account. The chief trouble remains one of motive power and many loaded cars are reported to have been on sidings for weeks on this account.

The announcement by the National Fuel Administration of the abrogation of the commission allowed brokerage houses, effective Apr. 1, has caused intense discussion. While Dr. Garfield has stated that he believes the broker is necessary, he feels that because of the abuses that have crept in whereby a very large percentage of all coal has been sold with the brokerage charged, it has become necessary to find a remedy.

As indicated last week, there is just the least little contract activity, but this is not expected to develop to any great extent until conditions become more favorable. The Government is encouraging the closing of contracts, but even this is not sufficient to induce a general closing of this kind of business.

Lately there has been a cleaning up of the coal at the piers, following a period when much coal had been loaded into bunkers by priority orders. However, there is much coal on the way, and as soon as the congestion is relieved there will be a heavy tonnage of coal going forward. The new regulations as to declarations by shipmasters as to the tonnage taken and used is meeting general approval and working out satisfactorily. It is thought by some that the taking control of foreign trade by the Government will have a tendency to curtail the bunkering, depending upon the ports from which the commandeered ships will sail.

The receipts of soft coal here are also likely to be affected earlier than usual by the expected advance opening of the Lake trade, owing to the prospects of an early clearing of the Lakes of ice.

BALTIMORE

Fuel supplies are still far short of requirements. Confiscations of coal almost at destination cause confusion. Plants traveling from hand to mouth.

Bituminous—In the midst of other worries over the drastic changes planned for their business by the Government after Apr. 1, the coal men here were still being deluged with demands for industrial coal. Only a few of the plants can be satisfied to the degree they demand. Under requests from the fuel administrator the jobbers have worked heroically to distribute the coal in their grasp to the most urgent cases. Plants having Government work were among those still short of coal. The milder weather prevented additional diversions of soft coal from industrial to domestic use, but this was a mere touch of aid after all, and colder days between increased the domestic call from time to time. The mining sections are still complaining that they can not get the coal cars needed to move the production they otherwise could put out. The railroad congestion continues marked, and few mines are working at capacity. Most of the industries here have given up hope of getting a sufficient supply of fuel for some time to come, as they are convinced that the railroad situation is to blame and is impossible of early remedy.

Anthracite—The hard coal dealers have received a little better supply recently, but it has been insufficient to meet even emergency calls, and these have in many cases been satisfied temporarily with bituminous delivery. Dealers are complaining that they never know when they are to get coal, as after being notified of a car or so on the road for their account they find it has been seized by some fuel administrator and diverted to other uses. The result is that dealers for the most part have stopped promising customers coal. Many of them have cut off their home telephones to prevent being aroused even in their slumbers by insistent customers. And all this trouble and worry for a business that is sadly out in profits because coal can not be had to sell when everybody wants to buy.

Lake Markets

PITTSBURGH

Zone distribution plan being perfected. Heavier receipts of coal, with slightly improved supply of empties at mines. River coal movement largely resumed.

Some progress has been made in the adoption of plans for putting the zone system into effect, as regards the Pittsburgh district. R. W. Gardiner, distributor for the zone, has had to spend considerable time in Washington for conferences with the National Administration and the settlement of various questions that arose at the outset.

Tuesday of this week completed a full fortnight of favorable railroad weather in the central west. The railroads are believed to have made good use of the time in clearing congestion at various points, but the practical results of the movement have been in freight that was congested en route reaching destination, rather than in empty cars being furnished in larger numbers to shippers. This is expected to follow in due course, but thus far the improvement in car supply has been only a very moderate one.

Much of the ice in the Allegheny River ran out last week, filling the Ohio River, while the Monongahela was clear. Mills in Pittsburgh received considerable river coal last week and this week it is possible to ship to mills on the Ohio as well. Only the four lower pools of the Monongahela are open. The local fuel situation is now a comfortable one, but rail points beyond are still suffering somewhat. The movement of byproduct coal has been improving steadily and the byproduct coke ovens are now nearly fully supplied.

Free coal has not yet appeared in the open market in any volume. The market remains quotable at the set prices: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. permitted to be added in the case of sales by jobbers to consumers.

BUFFALO

Bituminous plenty, but still hard to get. A better state of things looked for if the crippled cars are fixed up. Enough coal mined. Anthracite coming slowly.

Bituminous—The supply is better, though the motive power of the railroads is so deficient that cars stranded at junctions and way stations are slow to reach destination. With prompt delivery there would be a supply sufficient to meet every need. As it is, the reports of congestion at many points continue, not only in the near-by Canadian yards, but on this side of the line. The move to repair the crippled cars will do much toward easing up the situation in time.

The recent thaw went a little too far, but it did no damage in this territory. The return of cold weather after ten mild days has probably shut out the later spring floods, besides putting the railroads in a better physical condition. Jobbers of bituminous are afraid that the zoning system, if it ever gets into operation, will substitute the government official for them, and that they will have to whistle for business; but that is conjecture, for no move has been made yet to set up that system here. Factories are uneasy yet, but they are not doing badly.

As time goes on it becomes more and more difficult to quote a bituminous price. The new order increasing the price of coal produced in thin-veined sections of Pennsylvania 15c. a ton now makes it necessary to add that amount to the following table, all per net ton, f.o.b. Buffalo, where it applies:

	Slack	Lump
Pittsburgh	$3.75	$4.25
Bessemer	3.70	4.20
Allegheny Valley	3.60	4.10

Anthracite—The city distributors complain that with the coming of the mild weather the mines have cut down the supply, apparently sending the surplus eastward, so that the situation is not so much improved here as it should be. Consumption has dropped off more than half. Colder

weather has returned, but nobody looks now for anything like the low temperatures of the late cold spell.

The demand of many anthracite consumers for next winter's coal sets the shippers to studying the possibilities of a year hence. One shipper advocates no reduction in price this spring and the making of an extra effort to supply the outlying districts before winter, so that the sections near the mines can be supplied readily and at least expense to the roads. If the price should be lowered these near-by points would complain that they were deprived of the privilege of buying at the reduction.

Neighboring towns appear to be as short of anthracite as ever, though it is impossible to make sure. Many consumers do not scruple to say the coal is entirely out even when the shippers contradict the reports. Within the last few days the supply has been more general and the consumption has gone down fast, especially as low "war fires" are resorted to during work hours by some households.

DETROIT

Continued moderate temperatures ease coal situation and aid in lessening freight congestion. Coal pool considers dissolution.

Bituminous — Noticeable relaxation of tension has taken place in Detroit within the last week, owing to continuance of moderate temperature. The improvement in weather conditions has aided the coal situation locally, not only by diminishing pressure of demand from household consumers but by facilitating partial clearing away of freight congestion on tracks south and southeast of Toledo, permitting freer movement of coal from the mines.

Detroit consumers, however, are not yet "out of the woods." Though somewhat increased in volume, the quantity of coal coming into the city is still below consumption requirements and the situation continues to be one of a hand to mouth supply both as regards consumers of steam coal and users of domestic stock.

Anthracite—Supplies of anthracite are still insufficient for current needs. Shipments are reaching the city in small volume, and the coal is more than offset by unfilled pending orders before it is unloaded. Few of the retail yards have any stock and are dependent on inbound shipments to meet needs of their customers, many of whom are still obliged to do the best they can with bituminous coal in heating plants designed for use of anthracite.

Efforts to increase the available fuel supply by bringing wood into the city have not been highly successful. With cost of freight and delivery added, consumers in some instances are asked to pay $18 to $20 for a cord of 128 cu.ft., or $6.50 to $7 for 16-in. wood, equal to one-third of a cord.

Dissolution of the Detroit terminal pool association is under consideration. The organization arouses complaint of some retailers, who assert its operation delays delivery of their consignments. Complaint is made also by some of the steam coal users, on the ground that coal of superior quality consigned to them is diverted to other consumers and an inferior grade of stock substituted. The local fuel administration indorses the pool.

COLUMBUS

A better supply for both domestic and steam users is now reported from all parts of the state. Warmer weather had aided transportation.

The coal trade in Ohio has been in much better shape during the past week owing to warmer weather, which has both aided transportation and reduced the supply necessary for domestic consumption.

Domestic trade is still one of the important features of the industry. Retail stocks are better but dealers are still compelled to apportion their available supply to various householders. In other words, none of the consumers is allowed all he wants in case his order is for more than three or four tons. Investigations are made by the county committee when large orders are placed with dealers. As a result of this method hoarding is out of the question. Retail prices are unchanged from the previous week. There is a strong demand for Pocahontas and a little is coming in. The same is true of West Virginia splints. Anthracite is quite scarce.

Steam business is also active to the extreme. Manufacturing plants which were compelled to suspend because of lack of fuel are now being operated. Public utilities have been able to accumulate a small surplus and there is no immediate danger of suspension. With the countermanding of the fuelless Mondays by Administrator Garfield, general industry is now resumed. Schools which were closed in many sections are in session and there is little to show that the fuel shortage several weeks ago was acute.

Production has been increased largely during the past week. This is especially true of the Hocking Valley and Pomeroy Bend fields. In both fields the car supply was from 80 to 90 per cent. High waters incidental to the breaking up of the snow and ice caused several mines to suspend operations. Floods also interfered with operations in the Pomeroy Bend field. On the whole, the output has been about 85 per cent. of normal with the exception of eastern Ohio, where it was about 65 per cent.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.70	2.45
Screenings	2.20	2.45	2.20

LOUISVILLE

Weather improvement, coupled with great improvement in transportation facilities and a slightly better supply of labor, has resulted in quicker movement of coal. Retail demand somewhat lighter, and dealers are rapidly catching up with their orders, now being able to make immediate delivery.

Due to clear streets and the letup in the demand for coal, retailers are now catching up on deliveries and are enabled to take orders for immediate delivery. Deliveries have been greatly simplified, and as a result the Fuel Administration on Feb. 16 reduced the 50c. additional delivery charge which was allowed the retailers during the period of snow and ice. This will leave the gross margin of profit at $1.95 a ton, bringing retail prices in Louisville down to $5.43 for western Kentucky mine-run, and $5.94 for Jellico mine-run. The new range of prices on anthracite is: Stove, $11.06; chestnut, $11.15; egg, $10.80, delivered.

A considerable quantity of western Kentucky mine-run is now moving into Louisville, most of this coal being from Vein No. 9. The retail demand has been checked by warmer weather, but there is a fair wholesale demand. The reduction in retail prices is expected to stimulate retail deliveries during the week. The mines in western Kentucky are managing to run fairly well, as the supply of cars is much better and transportation has shown big improvement on the lines of the Louisville & Nashville and Illinois Central, the two big coal carriers.

In the eastern Kentucky fields an improvement has been seen since the flood waters went down. Labor is in better supply again, while the car supply is better and transportation has improved with the rebuilding of washed-out tracks, trams and railroads. However, the eastern Kentucky mines are not getting more than a three to four day supply of cars each week, and this is holding back production considerably. The Harlan fields have been producing a considerable quantity of coal that has been moving to the South Atlantic seaboard for export to Europe through Jacksonville and Savannah, and for coaling vessels. The Harlan Coal Co. has been especially active in obtaining this business, which has been made possible through the movement to utilize Southern ports to a greater extent than formerly, and which has been featured by the work of Fairfax Harrison, of the Southern Railroad.

BIRMINGHAM

Domestic stocks in local yards much better than last period, and receipts improving. Steam demand continues strenuous, with little free coal to be had. Labor disturbances hindering production.

During the past week all local retail yards have received sufficient coal to take care of orders in hand and accumulate small stocks to meet future requirements, an inventory taken by the fuel board at the close of the week showing 4218 tons on hand as against 2500 tons Feb. 1, with about 2500 tons in transit. No severe weather conditions have prevailed for several weeks, and it appears that the domestic coal crisis has passed for this season.

Coal men report little change in steam trade channels. There is a steady and strong demand for far more coal than can be furnished from the district under present operating conditions, and essential industries and public utilities are priority consignees, other users taking the residue of the supply.

Coal production is suffering to some extent by the perturbed conditions following the placing in effect of the Garfield agreement, which has been adopted by all operators in the district. However, misunderstandings as to the proper interpretation of certain of its provisions have developed and the miners have gone out on strike at several collieries in the district, and it is not unlikely that the trouble will assume more serious proportions. Operators aver that they are complying strictly with the letter and the spirit of the agreement.

Coke

CONNELLSVILLE

Car supplies increasing only slowly. Reduction of congestion produces heavy receipts at many blast furnaces.

Car supplies on the Monongahela R.R. last week averaged about 41 per cent. of ratings, starting the week with 70 per cent. and ending with 30 per cent. The P. & L. E. had larger supplies, approaching 100 per cent., but this did not help a great deal. Supplies on the Pennsylvania continued light.

Receipts of coke have made a different showing altogether. When favorable railroad weather appeared Feb. 6, a fortnight ago, the railroads applied their greatest effort to relieving congestion at the various points, this being of loaded cars, not empties, and the result was heavy receipt of coke by the majority of blast furnaces, coke that in many cases had been en route for several weeks. A number of furnaces received much more coke than currently needed, and more than could be unloaded and stocked. There was a sharp increase in blast furnace operations, many furnaces that were banked being able to resume, while others that were running slow increased the blast to normal.

No free coke is yet to be found in the open market, although occasional sales are made as an accommodation. The market remains quotable at the set prices: Furnace, $6; 72-hour selected foundry, $7; crushed, over 1-in., $7.30, per net ton at ovens.

The Connellsville "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 9 at 224,145 tons, an increase of 9487 tons, and shipments at 275,907 tons, an increase of 47,368 tons. The excess of shipments over production in the later week did not represent the taking up of stock coke, but the weighing of coke that had been loaded previously, but on account of congestion did not reach the railroad scales.

Buffalo—As a smelting proposition the coke supply keeps up well, though consumers are obliged to look closely to its movement. These consumers are so often connected with the supply of munitions that they get the preference when there is any to be given. Manufacturers of gas and other by-product coke are no more able to keep a supply on hand than can the sellers of coal, for if the consumers have no regular way of using it they will mix it with their coal. Therefore the market is always stiff and the seller unable to control either stock or prices.

Birmingham—The local coke market continues to evince great strength and inquiries are largely in excess of the supply available. The first export order of any magnitude reported for some time calls for 3000 tons for shipment to Carizal, Chili, through Pensacola, the entire lot to move within the next few weeks. This coke goes to smeltering interests in that country. Coke is moving much easier now than for some months past, the securing of equipment being less difficult and unnecessary restrictions as to destination have been removed. The output is not what it should be, and capacity production is not being obtained.

Middle Western

GENERAL REVIEW

Domestic market relieved; industries still very short.

The domestic trade has been greatly relieved by the warm weather that has prevailed in the Middle West for the past several days. While there has been but little excessive production over the former week, consumption has been so reduced that it has been possible to obtain enough coal to keep people warm and get a little tonnage in the dealers' bins from the coal arriving.

Railroads are still short of equipment, the supply at no time for the week past in any mining section having reached 65

per cent. Some operations report that they have not received in excess of a 30 per cent. supply during the week just past. In Williamson, Franklin and Saline Counties the car supply has ranged from 40 to 55 per cent. In Indiana this percentage has been considerably better, because of the confining of the state's production to and within the borders of Indiana, which gives the railroads a shorter haul and permits the prompt return to the mines of cars after they are released.

The Ziegler mine, located in Franklin County, has resumed operation, although the tonnage is much reduced. It is thought that little time will be required to boost the tonnage back to where it was before the explosion.

CHICAGO

Snowstorm last Friday night and Saturday increases demand and delays transportation.

Operators, dealers and industrial firms had about reached the conclusion that the crisis was over, when Chicago was again visited by a heavy snowstorm, which continued for 24 hours, turning what was hoped to be a brighter situation into another dangerous market.

One of the mistakes of the Fuel Administration is the continued insistence of the operators to apply every pound of coal possible to the domestic trade, temporarily disregarding the other classes of coal users. This has had the effect of putting into route on various railroads a large volume of prepared coal for dealers, to the neglect of steam plants. If this situation is not remedied immediately, many plants will have to suspend operation. Had trade relationship not been disorganized by the interference of local and state fuel administrators, all classes of trade would have been provided for in turn, with little or no hardship.

Coal from the Eastern fields is still scarce in this market. Some coal that was started from West Virginia two weeks ago arrived in Chicago the latter part of this week, but the larger part of the shipment encountered delays in transit. It will no doubt reach here some time in March, therefore the market is still almost without Eastern bituminous and short of anthracite.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La-Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Warmer weather relieves coal situation at interior points in Wisconsin. Illinois holding back coal from Milwaukee and other places. No new price edicts.

Warmer weather has brought about a let-up in the clamor for coal, and the incidental improvement in the railway situation has meant relief for cities and villages in the interior which were suffering a serious shortage of fuel. Some anthracite has been received by rail and additional consignments are expected if there is no relapse in the favorable weather conditions. Illinois coal seems hard to get, and complaint has been made to State Fuel Administrator Fitzgerald that it is being withheld from the state by shippers at the mines since the order restraining the seizure of coal on track bound for Wisconsin. The matter is being investigated. Milwaukee uses thousands of tons of Illinois coal and the southern part of the state is practically dependent upon that source for fuel.

On Feb. 1, Lake Michigan docks held 98,632 tons of hard coal and 747,769 tons of soft. Of these amounts Milwaukee held 82,933 tons of the former and 515,104 tons of the latter. Since that date, however, the draft upon fuel stocks has been heavy, particularly on anthracite coal, which was pronounced exhausted by dealers a week since. There is still some on hand, however, but the small sizes are scarce. Dealers are now holding anthracite for consumers who are positively unable to burn soft coal.

ST. LOUIS

Mild weather has eased general conditions. Transportation improved and car supply better, with increased tonnage from all local fields. Domestic demand easy and more ample needs for steam in evidence. Country sections continue short.

A more normal condition is prevalent here in local fuels than has existed for many months past, circumstances considered. The weather has had more to do with this than all other factors combined. With an easing up in domestic demand, steam business was in line for more consideration, especially plants far down on the priority list.

Steam conditions have improved, and there is a gradual accumulation of storage in some plants, in anticipation of adverse conditions later. The country sections are not so fortunate, except in isolated cases; but there is no acute need except in southeast Missouri and eastern Arkansas, where the high water is threatening railroads and which sections have been short of coal all winter, more so than other southwestern points.

Railroads continue to draw heavily from all fields and do not seem to be able to get any great surplus ahead.

In the Carterville field of Williamson and Franklin Counties somewhat better working conditions continue to show improvement in tonnage. Car supply temporarily is better, and yet the domestic tonnage is light. Rail and Government orders seem to continue heavy and very little of this coal is coming into the west of the river region south of Iowa.

Similar conditions prevail in the DuQuoin field, but car supply here on the Illinois Central fails to show the improvement that is evident on other lines. The movement is also bad.

Mt. Olive field is one that does not change much. From the early part of the season it has been much the same. Railroad tonnage is heavy, car supply not good, but the St. Louis market gets its share, if not more, from the field; much better than from others in comparison with prewar figures. The short line roads show exceptional service in quick deliveries.

The Standard field is the uncertain one—sometimes with an encouraging future but generally the reverse. There has been an increased tonnage here this week that has helped the local situation wonderfully. Car supply while not good is much better on most roads than for some time past. Even on the Illinois Central there is some slight improvement, but on this road it is motive power that is felt worse.

Some anthracite continues to move in, about 1000 tons or a little better the past week. No smokeless or Arkansas to mention.

The entire trade here is upset by the Garfield order, effective Apr. 1, abolishing the jobbers' margin. This is a jobbers' territory, and both steam and domestic trade is in danger of a shortage resulting from the lack of distributing knowledge, which is in possession of the jobbers only.

The prices for St. Louis market per net ton f.o.b. mine are:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80
3x6-in. egg	2.65@2.80	2.65@2.80	2.65@2.80
2x3-in. nut	2.65@2.80	2.65@2.80	2.65@2.80

Naples	23.87		

Ocean Shipping

OCEAN FREIGHTS

Tonnage is becoming more and more scarce each day and chartering for export coal more and more difficult, but notwithstanding this a few additional steamers have been chartered for coals to Cuban and West Indian ports. A few additional sailing vessels have also been chartered for South American coals at the Chartering Committee's maximum rates. Freight rates, by steamer, are as follows:

South America	Feb. 11
Santos	[1]19.00
Rio de Janeiro	[1]19.00
Chile (good port)	16.50 about
West Indies:	
Havana	7.50 about
Cardenas or Sagua	9.00@9.50
Cienfuegos	9.50 about
Port of Spain, Trinidad	12.00 about
St. Lucia	12.00 about
St. Thomas	10.50 about
Barbados	12.00 about
Kingston	9.25@9.50
Curacao[2]	10.00@10.25
Santiago	9.50 about
Guantanamo	9.50 about
Bermuda	9.00@9.50
Mexico:	
Vera Cruz	10.00@10.50
Tampico	10.00@10.50

[1] Net bid. [2] And p. c.
W. W. Battie & Co.'s Coal trade Freight Report.

The Chartering Committee's maximum sail rates are to Pernambuco or Bahia $18.50 net, and to Para $15.50 net. To the other ports the rates are still $19.50 net to Rio or Santos $18.50 net to Montevideo, Buenos Ayres or La Plata. Gross rates to all of the above destinations are $1.50 over the net rates.

COAL AGE

Vol. 13 NEW YORK, MARCH 2, 1918 No. 9

REVOLUTIONARY PLANS

BY FLOYD W. PARSONS

Important coal measures are being perfected and will soon be made operative by the Fuel Administration.

Jobbers—

THERE IS a unanimity of opinion at Washington concerning jobbers. The determination is to do away entirely with coal speculation. Some jobbers will go out of business. Those having title to coal outputs will not. It is likely some small operators will be pleased to have certain jobbers finance and manage all coal sales. Local fuel administrators, however, when necessary will be the link binding the producer and the consumer together. Washington is aiming at a "mine-to-bin" route for coal.

Plans for Zoning Coal—

A ZONE SYSTEM will shortly be put into operation. Its purpose is to save transportation effort. Speaking generally, the plan will be based on the following principles: The country will be divided into three grand divisions—Eastern, Central and Western. The Eastern section will be supplied by the Allegheny coals. Roughly speaking, the Western limit of this Eastern zone will be the Ohio-Indiana line. All long rail hauls of these Allegheny coals will be eliminated, but this coal will be permitted to reach the Northwest by way of the Lakes. Byproduct gas coals and smithing coals will be permitted to go out of their zone in special cases.

The Central field will have as a western boundary a line between the Mississippi and the Missouri Rivers. This will create a sort of vacuum zone in the Western Mississippi Valley. Colorado, Wyoming, Iowa and the Southwest coal states will be called upon to supply the markets in this barren territory.

Illinois, Indiana and western Kentucky will be expected to increase shipments into the dock or lake territory and into their own normal markets to replace the all-rail Eastern coals cut out.

Inside of the Central and Western zones will be smaller zones, limiting each shipper to short hauls. The net result will be a material gain in transportation facilities.

In the West the trouble has been lack of locomotives and cars, which this zoning will lessen. In the East the trouble has been chiefly due to congested gateways. Much Southern coal could have been gotten north had it not been for this trouble. New England has particularly suffered.

Right here it is worth noting that New England, however, did get more rail coal this winter than ever before, but the loss resulting from the Government taking away ships was not made up.

The details of the zoning scheme will be given out by the Fuel Administration shortly. It is certain, however, that the zone system adopted will be flexible, and that it will be made effective by embargoes. Changes will be made as necessity dictates. Enlargement of output will be encouraged.

Dirty Coal Remedy—

JOHN WHITE, representing the miners, has arrived at a perfect understanding with the Fuel Administration concerning dirty coal. Preventive measures will start with the miner. Fine or discharge will be handed the miner who loads impurities at the face. Operators failing to require clean loading will be recommended for closing down by district inspectors to be appointed. It is further likely that new price adjustments will recognize the ash problem and provide additional payment to operators who inaugurate methods (mechanical or otherwise) that result in producing a superior product.

IDEAS AND SUGGESTIONS

What Does the Future Hold in Store for the Coal-Mining Industry?

BY CHARLES M. MEANS
Consulting Mining Engineer, Pittsburgh, Penn.

REGARDLESS of any price the Government may fix for coal during the period of the war, regardless of any price the economic conditions after the war may dictate, it is fully apparent that true efficiency will soon enter into the operation of all successful coal-mining plants.

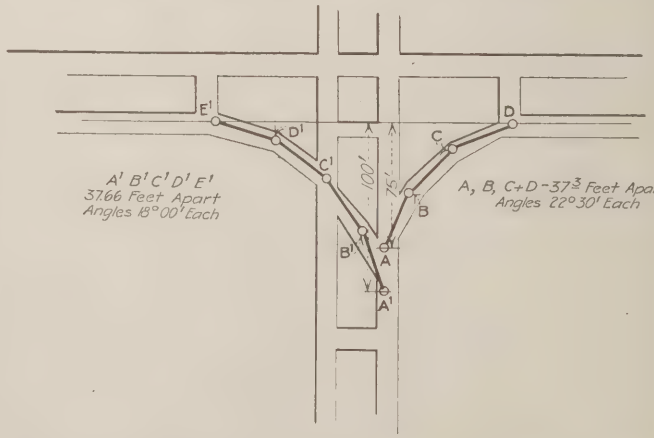
Efficiency, in its ordinary accepted meaning, as applied to coal mining, has been lost sight of to a large degree because of the unusual conditions surrounding the industry. It has been a question of quantity, and as a general proposition the whole matter has been centered on how much coal can a certain mine produce. The margin between the cost of production and the selling price has been such that the finer features of economy could be passed up in favor of increased output. The industry is in such shape as to warrant a retrospective glance at what has happened; and, using the past three or four years as a guide, we may safely theorize as to what the future may have in store.

Beginning at a period just after war was declared in Europe, we find the coal industry at low ebb. From this condition we climbed to unheard-of prices, with maximum production in all fields. The cost of production increased, but at a much lower rate than the selling price. We reached a maximum insofar as selling price was concerned, and from that time the profits have receded and will continue to recede. The cost of production did not follow the selling price, but continued to increase and is still on the upward trend. The time is inevitable when the cost of production will approximate the selling price. Then will come the reconstruction period, and only those operations that have properly protected themselves by efficient methods will weather the storm.

The tide has already started to go out; the margin of profit is growing less and less each month; and just as certain as we have reached the maximum profit period we will continue to take less and less margin until we again touch bottom. When this time will come is impossible to predict; but we must recognize that it is ahead, and that we are slowly and surely moving toward it.

This is certainly a time to consider trimming sails and applying such methods as will allow us to operate on a much-reduced margin of profit. The coal industry will never go back to the conditions existing during the prewar period, but will be stabilized on a new and different basis. Methods that were formerly successful must be thrown in the discard, and schemes must be worked out that will meet the inevitable changed problems we will be called upon to solve. Precedent cannot be followed, and a new and better way must be found and applied to the problems as they present themselves.

Practical Underground Motor Curves



BY HARRY GOODNOW
Duquoin, Ill.

It is easy for the engineer to figure theoretical curves that will take a motor and trip at high speed without derailment, but to have new entries turned off that will contain such curves without making them too wide is a different matter.

To begin with, every cut of the machine must be planned in advance and a plain sketch with the sight lines and the ribs showing is nearly indispensable. This must be followed up with the surveyor's personal attention and the mine manager's hearty coöperation.

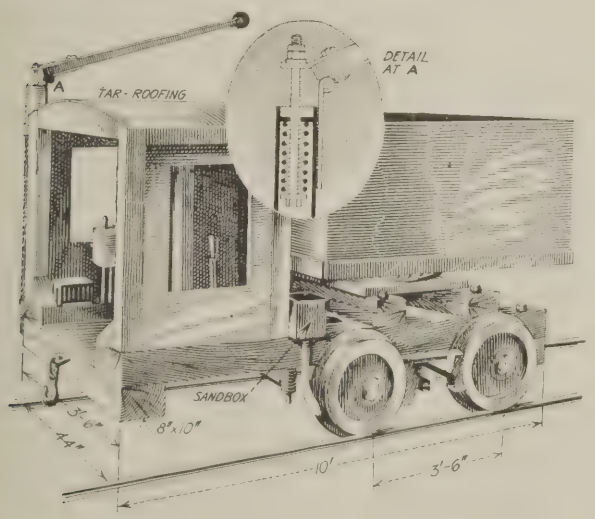
The following is a description and the accompanying drawing illustrates a pair of sub-main entries to be turned off, as usual, at an angle of 90 deg. from the main entries. This plan calls for three changes of sights and it will, in a 9- to 12-ft. entry, contain a regular curve of 92-ft. radius.

Plan to begin your curve at a point 75 ft. before reaching the theoretical sight line of the new entry. At this point (called *A*) widen, toward the way you are going to turn, about 2 ft. in 6 and about 4 ft. in 12 ft. from *A*. Now put in a sight plug at *A* on the transit line of the main entry and, from *A*, turn an angle of 22½ deg. toward the widened side, setting sights on

SUB-MAIN ENTRIES TO BE TURNED AT 90-DEG. ANGLE

this line. Run these sights to the face and mark off the rib of the new entry carefully. A hand-cutting on the ribs forming the acute angle between the two entries and from 4 to 6 ft. in will save cribbing or concreting later. The machine man (or pickman) can then proceed on both entries, being particularly careful in the running of his sights.

At a distance of 37.3 ft. from *A* begin to angle the new entry a trifle more till past far enough to set the plug *B* at the distance of 37.3 from *A*. From *B* turn 22½ deg. more from the line *AB*. Repeat this at *C* and *D* 37.3 ft. more each. *DE* will then be on the true course of the new entry and *D* will be at a latitude of 75 ft. and a departure of 75 ft. from *A*.



With the new "back" entry turned in its normal place and run in, the first crosscut (at 60 ft.) will have, within a few feet, its normal pillar to the haulage road.

With this system you have lost a few feet of extra yardage and a few hours' thought and watching while you have gained a narrow entry which will contain a regular curve. This method, to my knowledge, has been tried out successfully at two mines at least.

A combination of the foregoing curve with one where the point *A* is 100 ft. from the proposed course and turned with four changes of sight lines each angled 18 deg. for a distance of 37.66 ft. will keep the switches separate where you wish to turn your entries both ways from the main. This tunnel will contain a curve of 120-ft. radius.

A Homemade "Dirt Motor"

The superintendent of a mine "somewhere in Ohio" stood watching five or six men struggling to push a loaded dirt truck out onto the dump. It took these men 10 min. to dispose of two tons of slate and refuse. He probably said to himself something like this: "It is

DETAILS OF HOMEMADE DIRT MOTOR

costing us a lot of money to move this dirt, both in time and in the stopping of coal hoisting. I have all the old material that we need. I'm going to build a motor that will do this work, and other things besides." This man usually does what he thinks necessary, so in a few days the "dirt motor" shown in the accompanying illustrations was made.

The frame as shown is built up of 8 x 10-in. oak; the cab is built of 2 x 4-in. pine and common house siding; the platform for the turntable is made of 2½ x 8-in. oak. The trucks are a pair that was discarded from a 6-ton gathering locomotive; the motor (about 25-hp.) is also from a 6-ton locomotive. A Westinghouse controller is used, in series with a cast-iron grid resistance. The trolley connection is homemade throughout, except the trolley wheel.

The dirt box (see dimensions in drawing) is constructed of ¼-in. sheet iron. This is mounted upon a

VIEW OF HOMEMADE DIRT MOTOR

turntable with a ball joint and roller bearings, the rollers being short pieces of 1¼-in. pipe. This box, which holds about 4 tons, can be dumped from three positions. Refuse from the mine is deposited directly into a chute and thence into the dirt box.

Besides removing all the dirt, one man handles all the boiler coal, house coal, ashes from the boiler house, and does many other things too numerous to mention. This larry has paid for itself many times over. The only item of expense for repairs in two years has been two new trolley wheels.

Weight of Cement and Concrete

The following information is taken from "The Ransome Book—How To Make and How To Use Concrete":

	Lb.
Portland cement weighs per barrel, net	376
Portland cement weighs per bag, net	94
Natural cement weighs per barrel, net	282
Natural cement weighs per bag, net	94
Loose portland cement weighs per cubic foot, about	92
Portland cement mortar (1 : 2½) weighs per cubic foot, about	135
Portland cement concrete weighs per cubic foot, about	130
Cinder concrete weighs per cubic foot, about	112
Conglomerate concrete weighs per cubic foot, about	150
Gravel concrete weighs per cubic foot, about	150
Limestone concrete weighs per cubic foot, about	148
Sandstone concrete weighs per cubic foot, about	143
Trap concrete weighs per cubic foot, about	155

The Canal as a Carrier of Coal

By W. W. WOTHERSPOON
State Superintendent of Public Works, Albany, N. Y.

THE Federal Fuel Administrator recently stated that there was 20,000,000 tons of coal at the mines that could not be distributed on account of the inadequacy of railroad equipment. Prominent railroad authorities have stated that the widespread coal famine does not result so much from decreased production and increased consumption as it does from a shortage of cars.

The United States Geological Survey recently announced that soft coal operators during one week in July produced 76.5 per cent. of their capacity. The inadequacy of railroad facilities are blamed for 12 per cent. of the 24 per cent. shortage from maximum.

It is evident, therefore, that the coal problem is a matter of distribution rather than production, and the solution must be reached by increasing the means of distribution and obtaining the greatest efficiency from present facilities.

According to the United States Geological Survey, in a booklet entitled "Coal in 1915," treating with distribution and consumption, coal reaches the markets from producing areas by three general methods of transportation: (1) All rail; (2) rail to tidewater, thence coastwise to coast ports; (3) rail to Great Lakes, thence via lakes to lake ports. Considering the subject from the standpoint of New York State consumers, the second and third methods may be dismissed. From the statistics published by the Geological Survey, it is shown that little of the coal routed to tidewater or to the Great Lakes comes into New York State.

Of all states producing coal, it is shown by the investigation of the Geological Survey that the states of Maryland, Ohio and West Virginia were the only producing areas delivering coal in New York State markets aside from Pennsylvania. Pennsylvania is the greatest coal-producing state in the country. Bordering New York on the south, with its mines in close proximity to the dense population and intense industrial activity in New York, it is natural that Pennsylvania coal should be consumed in great volume here.

Statistics for 1915 show that although Pennsylvania was its own best customer, New York State ranked next, consuming more Pennsylvania coal than any other single state. Out of a total of 157,955,137 tons of bituminous coal produced in Pennsylvania in 1915, there was over 14,000,000 tons shipped into New York State, or something over 8 per cent.

Pennsylvania produced 88,995,061 tons of anthracite in 1915, of which over 20,000,000 tons was shipped into New York. This tonnage moved entirely by rail. Therefore, the first method of transportation mentioned by the Geological Survey (all rail) has been the only means of distributing Pennsylvania coal in New York.

With the completion of the improved canals another route and means of distribution is provided. The canal system extends from Buffalo at Lake Erie on the west, to the Hudson River on the east. To the north, it reaches Lake Ontario at Oswego, and the St. Lawrence River through the Champlain Division, Lake Champlain and connecting Canadian waterways.

Near the exact center of the state, the Erie, or main east and west channel, makes connection with the Cayuga and Seneca Division. This section runs southward connecting Lakes Cayuga and Seneca. Watkins, on Seneca Lake, and Ithaca, on Cayuga Lake, are the two terminals of the canal system nearest the bituminous and anthracite coal fields of Pennsylvania.

A rail haul of less than 30 miles from New York-Pennsylvania state line makes connection with the canal system at points about equidistant from its western, northern and eastern termini.

To all that section of the state between Buffalo on the west, Oswego on the north and Albany on the east, on the line of the canal, the average water haul is 165 miles from Watkins and 143.4 miles from Ithaca.

Of the 157,955,137 tons of bituminous coal produced in Pennsylvania in 1915, 83,698,389 tons was transported by rail. The Pennsylvania R.R. transported 57,059,578 tons, or about 68 per cent., and the New York Central 8,337,868 tons, or about 10 per cent. These two lines were the largest bituminous coal carriers.

There are no statistics available as to the portion of Pennsylvania anthracite production transported by individual railroads, but the five railroads operating from the anthracite fields of Pennsylvania and making connection with the canal system at various points between Buffalo and Albany carried 43,951,145 tons of anthracite coal in the year ended June, 1916.

It is shown by the United States Geological Survey that 14,430,879 tons of Pennsylvania bituminous coal was consumed in New York State in 1915. This is exclusive of railroad coal and bunker fuel for ocean vessels and steamships on the Great Lakes.

Since the Pennsylvania R.R. transported 68 per cent. and the New York Central 10 per cent. of the total bituminous coal mined in Pennsylvania and moved by all-rail routes to other states, it is reasonable to assume that these two roads would participate to the same degree in bituminous coal moved into New York State. On this basis, the coal tonnage of the Pennsylvania R.R.

A SURVEY of the commercial possibilities of the improved canal system of New York reveals a very important feature of the canal operation that is of statewide interest; namely, the ability of the improved canals to transport a large portion of the coal, both anthracite and bituminous, consumed in this state.

At the present moment, when the coal situation is commanding nation-wide attention, any medium that offers even a partial solution of this big and vital problem is deserving of serious consideration and should be utilized in the fullest measure, whenever and wherever available.

from the Pennsylvania bituminous fields into New York State would have been about 9,813,009 tons. The New York Central tonnage would have been about 1,443,000 tons, but inasmuch as it appears the Pennsylvania R.R. is the controlling factor in the movement of Pennsylvania bituminous coal, the traffic of the Pennsylvania R.R. alone will be considered.

It is difficult to estimate the anthracite tonnage that was transported into New York State by each of the five hard-coal roads. The percentage of each line to the total tonnage transported, if applied to the New York State consumption would, however, give the following approximate basis:

	Per Cent.	Total Tonnage
Lehigh Valley	30.5	6,340,795.67
Delaware, Lackawanna & Western	23.2	4,833,162.61
Delaware & Hudson	22.5	4,677,636.15
Erie	18.7	3,887,635.38
New York, Ontario & Western	5.1	1,060,264.19
Totals	100.0	20,789,404.00

On movement of coal from the Pennsylvania bituminous fields via Pennsylvania R.R. into New York State, by far the greatest area of the state is served by the joint Pennsylvania and New York Central routes. The junction of the New York Central and Pennsylvania railroads at which there is the greatest coal interchange and through which the greatest area is served is at Himrods, N. Y., a point about 15 miles south of Watkins, N. Y., the canal terminal at the southern extremity of Seneca Lake. Soft coal taken from the Pennsylvania R.R. at Himrods Junction destined to points on the line of the New York Central between Buffalo and Albany, is carried by the New York Central over its Pennsylvania Division northward to Lyons, thence east and west of Lyons to all points on the main line. This all-rail route practically parallels the canal route via the Cayuga-Seneca and Erie canals from Watkins.

The route of the anthracite movement also closely follows the route of the canal. Via the Lehigh Valley R.R., anthracite is delivered to lines serving the territory intermediate to Albany and Buffalo at Weedsport, Geneva and Canastota, N. Y. Via Delaware, Lackawanna & Western R.R., the point of interchange is at Syracuse and Utica. Over the New York, Ontario & Western R.R., the interchange may be made at Oneida and Utica. Excepting Canastota and Oneida, all of the interchange points named are ports on the canal system. On Lehigh Valley traffic via Geneva, the coal is carried through Ithaca, the canal terminal at the southern extremity of Cayuga Lake.

The source of the greatest bituminous production in Pennsylvania is said to be in the Clearfield District. Altoona, Penn., is about the geographical center of this area. From Altoona to that section of New York State between Albany and Buffalo and as far north as Oswego, the average rail haul is about 317 miles. On the assumption that the average car-mile movement is about 20 miles per day, an average 317-mile haul would require about 30 days per car per round trip.

An annual movement of 9,813,000 tons is an average monthly tonnage of 817,750 tons. This tonnage, on the average loading of 50 tons per car, would require 16,355 cars per month for its transportation. As it takes a car 30 days to make a round trip, that number of cars must be constantly in service.

Suppose, however, instead of routing the bituminous coal via the all-rail route into New York, it was hauled by rail to Watkins, N. Y., and thence transported by canal into the same consuming areas.

Watkins is about 190 miles from Altoona. At 20 miles per day a car may make a round trip between Altoona and Watkins in 20 days. It requires 30 days via the all-rail route. Therefore, the same amount of coal could be transported from the bituminous fields to Watkins for distribution via canal in New York State with two-thirds the number of cars required by the all-rail movement. This car saving would amount to over 5000 cars per month.

The Scranton-Wilkes-Barre District is about the geographical center of the Pennsylvania anthracite fields. The shortest rail mileage from the anthracite region to a point of connection with the canal via each of the five hard coal roads is:

	Miles
Via Delaware, Lackawanna & Western to Ithaca	113.0
Via Lehigh Valley to Ithaca	128.0
Via New York, Ontario & Western to Utica	169.2
Via Delaware & Hudson to Schenectady	194.0
Via Erie to Rochester	254.0

As a distributing medium, the routes via the Delaware & Hudson, the Erie, and the Ontario & Western do not seem practicable insofar as the average rail and water haul to the territory between Buffalo and Albany via these routes greatly exceeds the haul through the Lehigh Valley and Lackawanna railroads connecting with the canal at Ithaca. In demonstrating the ability of the waterway to transport the anthracite tonnage, therefore, the shortest and direct routes only are taken into consideration.

Twenty-Three Days for Round Trip

From Scranton to the section of the state between Albany and Buffalo and northward to Oswego, the average all-rail haul via the Lehigh Valley and Delaware, Lackawanna & Western railroads is approximately 231 miles. On a 20-mile per day car movement a round trip would average 23 days. The anthracite tonnage under consideration aggregated 20,789,404. This represents approximately 1,732,450 tons per month. On the 50-ton per car basis, this volume would require about 34,649 cars per month. Since it takes an average of 23 days for a round trip, 26,565 cars must therefore be constantly in service in order to transport this volume of tonnage.

If the anthracite tonnage were carried by rail to the point of interchange with the canal, an average rail haul of 120 miles is involved. The 20-mile per day car movement would entail 12 days per round trip. This results in a car saving of nearly 50 per cent. and would conserve over 13,000 cars per month.

A utilization of the canal for the transportation of anthracite and bituminous coal to the extent indicated would therefore result in a conservation of over 18,000 cars monthly, and the equipment thus conserved might transport 900,000 tons of coal per month to other territories not accessible via water routes. During the seven months' season of navigation, the conservation of so large a number of cars would augment the railroad facilities to an extent greater than demand for the distribution of the 20,000,000 tons which the Fuel Administrator states cannot be transported on account of the car shortage to territories where it is sorely needed.

The 317-mile average all-rail haul on the annual bituminous tonnage creates a ton mileage per month of 259,226,750 ton-miles. On the anthracite tonnage with an average all-rail haul of 231 miles, the ton mileage monthly would be 400,195,950 ton-miles.

If the bituminous were routed via canal through Watkins, the ton mileage would be decreased to 155,372,500 ton-miles. A canal routing via Ithaca on anthracite coal would decrease the anthracite ton mileage to 207,894,000 ton-miles. This represents a monthly ton-mile decrease of 296,156,200 ton-miles and during a seven months' season of navigation would total 2,073,093,400 ton-miles.

The coal traffic of the rail lines for a seven months' period of canal navigation would aggregate about 17,850,000 tons. Let us consider whether the canal can physically accommodate this large tonnage volume.

The canals are limited in their capacity only by the quantity of water utilized in operating the locks. Between the Cayuga-Seneca and Erie divisions of the improved canal system there are four locks, two combined at Seneca Falls, one each at Waterloo and Cayuga. It is known that the available water supply will permit the passing of boats through these locks at least once every half hour. The lock chambers on the enlarged canal can accommodate five of the old-type 240-ton boats with their towing tug at one time. Operated 48 times a day, they may accommodate 240 boats with a carrying capacity of 57,600 tons per day. During the season of canal navigation, the Cayuga-Seneca canal is capable of transporting 12,376,000 tons or almost 75 per cent. of the total tonnage of the rail lines.

This estimate is based on the utilization of the Cayuga-Seneca canal exclusively, while it is quite prob-

THE solution of the coal problem confronting the majority of New York State industries is in their own hands. A maximum utilization of the canal facilities and the fullest measure of coöperation and support on the part of shippers is all that is necessary. In the protection of their own interests, as a measure of relief to other territories not accessible by water routes, and as a patriotic duty, the canal should be used to the very limit of its capacity. This map describes the rail and canal routes cited in Mr. Wotherspoon's article.

able a large coal traffic might be developed through other ports of transshipment, such as Syracuse, Utica or Weedsport, which are on the Erie Division. In view of the ability of the Cayuga-Seneca Division to transport 75 per cent. of the rail-borne coal traffic during the season of navigation, there is no question but the remaining 25 per cent. could be cared for through other rail and canal routes. It seems evident that the improved canal system can readily accommodate the entire bituminous and anthracite coal tonnage.

It is apparent that a utilization of the canals would materially relieve the coal and car shortage, but there are still other benefits that may be realized by the diversion of this volume of coal from the rail to the canal route.

Exclusive of the actual shortage of cars, the inability of the railroads to move cars promptly is a perplexing problem confronting railroad managers. It cannot be disputed that a conservation of 18,000 cars per month, made possible by the use of the canal for the coal traffic, would appreciably relieve the condition. Since an engine may haul perhaps 100 loaded coal cars, the conservation of locomotives would amount to 180 monthly. The benefits which would arise from the adoption of the plan would be almost incalculable.

When every foot of track in yards and terminals is at a premium, the withdrawal of 18,000 cars per month for seven months in the year releases over 850 miles of track for other service. This is the equivalent of 850 miles of new track and its value is beyond reckoning.

Use of Canal Means Economy in Costs

The third advantage to be derived from a utilization of the canal for coal transportation and what perhaps is of the greatest interest to the consumer is the economy in transportation costs. The average rail rate on bituminous coal from the Clearfield District to the area in New York State between Buffalo and New York is $2.02 per ton. For the average haul of 317 miles this rate yields a ton-mile rate of 6.3 mills. The Pennsylvania R.R. publishes a rate of $1.48 per ton on soft coal from the Clearfield district to Watkins for transshipment. This rate yields 7.7 mills per ton-mile.

It is believed coal may be profitably transported in large volume via the canal at a rate of 2 mills per ton-mile. The average water haul from Watkins being 165 miles, an average canal rate from Watkins would be 33c. per ton. A 33c. canal rate plus the rail rate of $1.48 from mines to Watkins makes a through charge of $1.81, exclusive of terminal charges. These are an unknown factor but should not materially increase the through charge if modern and economical transshipping machinery were provided.

Eliminating terminal charges, however, it is seen that the joint rail and canal route creates a saving in the cost of transportation per ton on bituminous coal of 41c. and this, in spite of the fact the rail rate to Watkins exceeds the average rail rate to points between Buffalo and Albany by 1.4 mills per ton-mile. If the rate to Watkins was constructed on the 6.3 mills per ton-mile basis yielded by the average all-rail rate, the result would be a rate from the mines to Watkins of $1.21 and it would increase the saving in the rail and canal route to 68c. per ton.

The average rail rate on anthracite coal from Pennsylvania fields to the territory in question is $1.947 per ton. The average rail haul is 231 miles. This yields a ton-mile rate of 8.4 mills. The hard-coal roads do not publish transshipping rates to points of interchange with the canal that are appreciably lower than the local rate as is the case via Pennsylvania R.R. from the Pennsylvania bituminous fields to Watkins, N. Y. However, if rates were put into effect from the anthracite region to Ithaca, based on the average 8.4 mills per ton-mile all-rail anthracite rate, on the average rail haul of 120 miles, the result would be a rate of $1.108 per ton. A two-mill per ton-mile canal rate on the average canal mileage of 113 miles from interchange points to territory between Buffalo and Albany yields a rate of 22.6c. per ton. This combination would make a through rail and canal rate of $1.334, or 61.3c. less than the all-rail rate exclusive of terminal charges.

Would Require Constant Service of 1062 Boats

The foregoing shows that the utilization of the rail and canal route would result in a saving in the transportation cost of 68c. per ton on bituminous coal and 61.3c. per ton on anthracite coal. On the aggregate bituminous and anthracite tonnage for the seven months this saving per ton would amount to over $11,000,000.

The problem of supplying a sufficient number of boats is the only obstacle in the way of the immediate utilization of the rail and canal route. It, however, is not difficult of solution. The average canal haul to the territory between Buffalo and Albany from the various possible points of transshipment is about 115 miles. Assuming boats will proceed 4 miles per hour, on the average, a round trip can be made in three days at the most. A movement of 17,850,000 tons of coal during the season of navigation means a daily tonnage of 85,000 tons. To transport such amount of coal each day would require 354 boats of the 240-ton type. On the basis of a three-day schedule, the traffic would require the constant service of 1062 boats. The census made by the Superintendent of Public Works during 1917 showed there were approximately 675 canal boats in service. These, to a great extent, were boats of the old type, unsuited for the carrying of grain or other high-grade commodities. They are, however, well adapted for the coal trade.

If all the present boats were utilized, the movement of the total coal tonnage under consideration would require approximately 387 additional boats of a 240-ton capacity. The type of boat required is simple in design and cheap of construction. A sufficient additional number of wooden boats could be built with little or no delay. Should the new barges be of larger dimensions a less number would be needed.

That the industrial interests of New York State once recognized the opportunities afforded by the canal in the transportation of coal is apparent from the statistics of canal commerce of a few decades ago. Over a million and one-half tons of coal have been transported on the canals of New York in a single season.

Why this commerce passed from the canals to the railroads is readily explained. The first cause, no doubt,

was the lack of modern and properly equipped terminals on the canal. A second factor was the convenience offered big consumers by the railroads in providing private sidetracks, thus enabling the factories to unload at their plant. A third and most potent contributing cause was the inefficient and undependable service provided by the individual boat owner. Big shippers found the boat owner here today and gone tomorrow. When there was an urgent need of boats none were to be had. All of these expensive and unsatisfactory conditions, abetted undoubtedly by railroad competition and discriminatory railroad rates, forced the coal traffic from the state waterways.

In the season of 1917, despite the urgent need of manufacturers and the inability of the railroads to adequately serve their needs, but 234,941 tons of coal was carried on the canals, and practically none over the Cayuga-Seneca Division.

The transportation situation now existing demands that the commercial and manufacturing interests awaken to the peril that threatens them. The railroads must be augmented by every available means of transportation if they are to survive the burden imposed on them and efficiently serve the nation at this most critical period. The improved canal system of New York State is the finest substitute for rail transportation available.

There is no reason why a large portion of the bituminous and anthracite coal consumed in the state should not be transported by the canals. The conditions influencing the routing of coal via the rail routes have been entirely overcome in the construction of the new canal. Terminals are available for service at practically every port of the canal system. They have been or will be equipped with devices for the speedy and economical handling of the traffic. If the coal traffic warrants special machinery it can be provided. Coal may be unloaded from barges, loaded to cars and switched to industries at a comparatively small cost. The state and Federal laws provide for this.

If it could be assured that the coal consumed in New York would be routed via the canal, no reason exists why boats capable of transporting coal to the canal's capacity should not be speedily constructed. Under capable management the requirements of all could be adequately and efficiently served. The coal-carrying boats, to render the maximum of service, should be under some central ownership or control. The railroads now voluntarily offer to coöperate with dependable water lines. Destructive railroad competition need no longer be feared. If rates are discriminatory, the state and Federal commissions are empowered to take summary action.

With the routing of coal through the canal assured, and with the necessary boats in existence, the only facilities then lacking would be temporary storehouses, coal trestles, or other structures or devices which would permit the cheap and prompt transfer of coal from car to barge. No difficulties exist in the providing of these facilities to men who earnestly take up the proposition.

In the case of export coal, it is believed canal barges may transport coal from transshipping in central New York to shipside in New York harbor, thus eliminating transshipment and lighterage now required in the exportation of coal through New York and appreciably relieving the harbor congestion.

Work of Labor Divisions of War Administration Coördinated

Upon the recommendation of the Advisory Council, created to report on the handling of industrial relations growing out of the war, the Secretary of Labor has arranged for the coördination of the industrial service (labor) activities being developed in the various purchasing and supervisory offices of the war administration. Simultaneously a number of new bureaus have been established and will assume the coordinating functions.

A well-developed industrial service division is in operation in the Ordnance Department and similar organizations are being worked up in the other purchasing and supervisory branches of the War Department as well as in the Navy Department and the Shipping Board. These bodies are all developing plans for accomplishing similar results in their own given departments. In some cases they might, if not coördinated, work to cross purposes, and in any of their activities exchange of views on methods is desirable. The necessary machinery for getting together is now provided by the action of the Secretary of Labor. The following new bureaus are established to effect the desired coordination:

1. Adjustment Bureau—to deal with disputes.
2. Condition of Labor Bureau—to administer conditions of labor within business plants, such as safety, sanitation, etc.
3. Information and Education Bureau—to promote sound sentiment and to provide appropriate local machinery and policies in individual plants.
4. Women in Industry Bureau—to correlate the activities of various agencies dealing with this matter.
5. Training and Dilution Bureau.
6. Bureau of Housing and Transportation of Workers.
7. Bureau of Personnel (which may possibly be fused with the Information and Education Bureau).

The present United States Employment Service will act as the coördinating bureau on the procurement of labor.

For Our Forthcoming Success Number

Genius is the nice adaptation of means to ends. It does not so much consist in size as in ingenuity and suitability. We wish our readers to send us accounts of the way in which they have solved their puzzles. If this was not done in elaborate and costly ways, so much the better, for most of us have not the wherewithal to attempt either elaborate or costly devices.

We are looking for kinks and schemes which saved money, increased output, avoided troubles and protected life and limb so that by publication those methods may save for our readers what they saved for the writer. It will be a pleasing task to write the record of some success for our Success Number and, moreover, *Coal Age* is quite willing to pay for it. So if there is a successful performance on your mind, let *Coal Age* have it so that it may spread the good tidings and incidentally furnish the writer with some spending money. Photographs and drawings of the methods adopted will be more than welcome. The Annual Success Number will be issued Apr. 13, and all manuscript should be in our hands not later than Mar. 25.

Supporting the Roof in Coal Mines—II

By R. D. BROWN
Harrisburg, Ill.

SYNOPSIS—*Illustrates designing of timber sets by formula, working out several cases, covering round and square timber. The different methods of timber preservation are discussed and the advantages and disadvantages noted. The cost of timbering is tabulated; also the safe loads for square beams and the comparative strength of various woods.*

TWO general principles, or conditions, affect the design and erection of timber sets. First, the weight to be supported is an unknown variable quantity; second, the scarcity of skilled labor may make the adoption of a simple standard design necessary for both economy and safety. The design of the common three-piece set, illustrated in Figs. 7 to 11 inclusive, is not ordinarily based on mathematical calculations. However, if the expected weight may be approximated, the size of the section, or diameter of collar, may be computed by the use of the following formulas. For round timber collars the formula is

$$W = 0.065S\frac{d^3}{l} \qquad (1)$$

in which

W = Safe load in pounds;
d = Least diameter of collar in inches;
l = Length of clear span in feet;
S = Safe unit fiber stress for seasoned timbers in pounds per square inch.

Safe unit fiber stress for seasoned white oak is 1200 lb. per sq. in. For other kinds of wood, the safe unit stress may be found by using Table III, which gives the strength of various kinds of wood compared with white oak. The safe unit stress for green timber is approximately 65 per cent. of that of seasoned timber.

For sake of illustration, let it be required to design the beam for an oak set which must support a maximum weight of 12,500 lb., length of span to be 8 ft.

$$d = \sqrt[3]{\frac{lW}{0.065S}} = \sqrt[3]{\frac{8 \times 12{,}500}{0.065 \times 1200}} = 10.86, \textit{ say } 11 \textit{ in.}$$

For round timber posts, the rule in mine timbering is to make the minimum diameter of the post, in inches, equal to its length in feet. For example, in order that a 6-ft. post shall present equal resistance to bending and crushing, the diameter of its small end must be 6 inches.

For squared timber collars, the formula is

$$W = \frac{bd^2S}{9l}$$

in which

W = Safe load on the collar in pounds;
b = Width of collar in inches;
d = Depth of collar in inches;
l = Length of collar between supports in feet;
S = Safe unit stress in pounds per square inch.

The values of W, S and l are known and, by assuming the width, the value of d is easily calculated; or, by assuming the depth, the value of b may be calculated. Other conditions being equal, the depth of the beam should be greater than the width for practical economical sections.

To illustrate, let it be required to design a rectangular oak beam to support 3 ft. of loose slate in a 12-ft. entry, assuming the timber sets to be 4-ft. centers and taking the weight of the slate as 160 lb. per cu.ft.

$Weight = 3 \times 12 \times 4 \times 160 = 23{,}000$ lb.;
$S = 1200$ lb.;
$l =$ say 10 ft.;
Assume $b = 8$ in.;

$$d = 3\sqrt[2]{\frac{Wl}{bS}} = 3\sqrt[2]{\frac{23{,}000 \times 10}{8 \times 1200}} = 14.68, \textit{ say } 15 \textit{ in.}$$

TABLE III. COMPARATIVE STRENGTH OF VARIOUS KINDS OF WOODS

Kind of Timber	Comparative Strength When Used as a Beam; the Strength of White Oak Being Taken as Unity	Comparative Strength When Used as a Post; White Oak Being Taken as Unity
White oak	1.00	1.00
Red oak, No. 1	0.95	1.00
Red oak, No. 2	0.90	0.90
Hickory	1.00	1.00
Longleaf yellow pine	1.00	0.90
Shortleaf yellow pine	0.75	0.90
Norway pine	0.65	0.80
White pine	0.60	0.70
Spruce	0.75	0.80
Cypress	0.50	0.80
Hemlock	0.50	0.80
Chestnut	0.70	0.80
Cedar	0.60	0.70
Douglas fir	0.65	0.90

TABLE IV. SAFE LOADS FOR SQUARE TIMBER BEAMS

Length of Span, Feet	Safe Loads in Pounds for Oak Beams with Uniformly Distributed Loads									
	6x6	7x7	8x8	9x9	10x10	12x12	14x14	16x16	18x18	20x20

24	.....	.....	.....	.....	.....	9,600	15,240	22,760	32,400	44,440
25	.....	.....	.....	.....	.....	.....	14,640	21,850	31,100	42,670

NOTE.—The loads given in heavy figures are the safe loads based upon the extreme shearing stress of 100 lb. per sq.in.; and should not be exceeded for shorter spans, to avoid failure of the beam by shearing. Safe loads are for seasoned timber; for green timber use two-thirds of the value shown. For loads concentrated in the center of the span, use one-half the safe uniformly distributed load. Safe loads for rectangular beams may be obtained from the table for square beams, by direct proportion of width to width. The load for a 10 x 12-in. rectangular beam is five-sixths that of a 12 x 12-in., etc. Safe loads for timber beams of other species than oak may be obtained by direct proportion. The weight supported by each species is directly proportional to the allowable unit stress. For a comparison of the strength of various kinds of timber based on the allowable unit stresses, see Table III.

Preservation of Timber Sets

In most localities woods suitable for use as mine timbers are becoming more scarce and costly. Substitutes must be found, or the wood available must be treated to prolong its life. The cause of mine-timber decay is generally an invisible fungus growth, which establishes itself on the timber and rapidly develops in the cool, damp atmosphere. Fully one-half of all mine timbers fail through decay before failing mechanically.

There are two kinds of decay—dry rot and wet rot. Dry rot is the decay caused by a fungus growth attacking the timber internally with little outward sign of deterioration. Wet rot is decay commonly caused by alternate wetting and drying, and attacks the sap wood or outside of the timber first. Timber kept permanently wet will last many years because the air bearing the fungus growth cannot obtain an entrance into the pores of the wood. Peeling and seasoning will arrest the rapidly growing fungi, but a preservative should be used to effectively increase the life of the wood.

The advantages of the use of preservatives are: (1) Treated timber will have a longer life than untreated and, under ordinary circumstances, will prove more economical; (2) the dangers of falls of rock are lessened because of fewer renewals.

The disadvantages of the use of preservatives are: (1) The first cost is great; (2) since the timber must be seasoned before treatment capital is tied up; (3) the strength of timber is decreased by preservatives; (4) preservative treatment is expensive, unless a plant is specially equipped and is operated extensively; (5) coal tars used as preservatives may add to the inflammability of the wood.

In the various methods of treatment all wood must be properly seasoned, or the treatment will not be effective, as the preservative will not be able to penetrate into the pores of the wood, to remain as a permanent preservative. The three common methods of treatment are painting, absorption and penetration.

Painting consists in the simple application of the preservative with a brush, or, in cases, by dipping the timber momentarily in a preservative solution.

The absorption process consists in placing the timber in a tank of preservative, either hot or cold, and allowing the liquid to penetrate into the crevices and pores of the wood. In order to make the treatment more effective, the liquid should be heated to a temperature of about 212 deg. F. The heat will drive off the air and some water from the wood and allow a deeper penetration. After the timber has remained in the hot liquid for some time, it should be taken out and placed in a tank of cool liquid, or be allowed to cool off in the original tank.

The penetration process is used in applying the same chemicals, as in the absorption process; but the application is made under pressure which, with the aid of heat, causes the preservative to penetrate deeper into the heartwood. As this form of treatment requires a large and expensive plant to operate economically, it is hardly suitable for the treatment of small quantities, which are necessary for most coal mines.

The preservatives used are: (1) Coal tars and creosotes, these being the most common and in many ways the most efficient preservatives; (2) metallic salts, such as zinc chloride, copper sulphate and mercuric chloride, these being excellent preservatives but easily leached out by water; (3) coal-tar derivatives, such as phenol, which is mixed with metallic ammoniates in the Aczol process; and carbolineum, which is a mixture of zinc chloride and a certain coal distillate.

Creosote and zinc chloride have proved most satisfactory in actual tests, and are used most extensively in the absorption and penetration processes, while carbolineum is more generally used in brush treatment.

TABLE V. COMPARISON OF ZINC CHLORIDE WITH COAL-TAR CREOSOTE FOR MINE TIMBERS

Factor	Zinc Chloride	Creosote
Inflammability	Less than untreated timber	More inflammable at first, less later
Corrosion of spikes	Will corrode spikes	Not corrosive
Volatility	Nonvolatile	Volatile—affects mine air
Leachability	Leaches; do not use in damp places	Does not leach
Life of timber	About 2½ times untreated	About 3½ times untreated
Cost of treatment	Less than creosote	Approximately twice that of zinc chloride

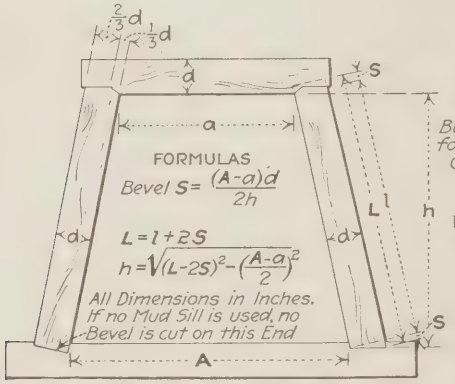

FIG. 7 DETAIL OF A FRAMED TIMBER SET

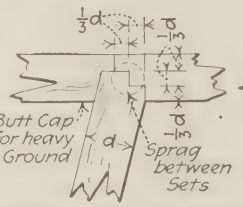

FIG. 8 Detail of Joint for a Framed Set in Heavy Ground

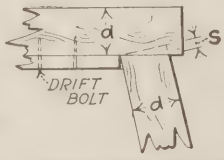

FIG. 9 Detail of Joint for a Common Framed Set

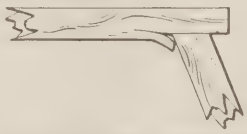

FIG. 11 Example of Framing which has failed under Weight (Point of Leg should have a Bevel Cut)

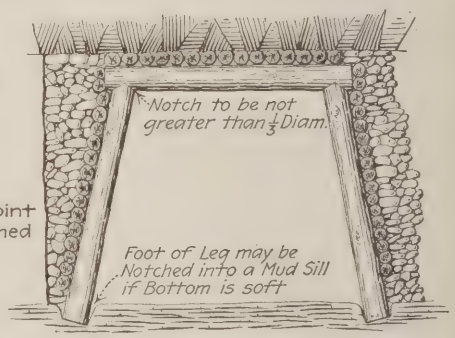

FIG. 10 WELSH TIMBERING

The cost of placing wood sets varies with the following conditions: (1) Cost of the timber on the ground; (2) methods of placing, depending on conditions such as hitches to be cut into the roof or rib, the amount of gob to be moved and the character of the roof overhead; (3) size of the timber. With larger sizes, a gang of men will be required, instead of two men usually working together; (4) amount of lagging used.

If the timber gang is to work efficiently, all materials and necessary tools should be delivered promptly when needed. A superintendent should always be close at hand to direct the erection of each set. Whenever a gang is employed underground, some individual is willing to shift his particular part; intelligent supervision is the only cure for this evil, so common to mine work.

TABLE VI. ACTUAL COSTS OF PLACING TIMBER SETS

Size of Collar	Size of Legs	Approx. Weight, Pounds	Cost f. o. b. Mines	Cost in Place
24-in. yellow pine	24 in.	5,040	.....	$15.00
18 to 22-in. pine	18 to 22 in.	4,150	$12.00	34.50
12 x 12-in. pine creosoted	12 x 12 in.	1,575	10.56	15.70
12 x 12-in. x 10-ft. oak	12 x 12-in. x 7 ft.	1,340	7.92	13.06
10 x 10-in. oak	10 x 10-in.	1,240	7.90	12.30
12-in. by 17-ft. oak	No legs	.....	3.20	8.86
8-in. by 12-ft. oak	8-in. by 6-ft.	.....	1.60	3.35
8-in. by 18-ft. oak	8-in. by 6-ft.	.....	2.90	6.09

TABLE VII. SHOWING THE COMPARATIVE SIZE OF WOOD AND STEEL CROSS-BARS OF EQUAL STRENGTH; ALSO OF REINFORCED-CONCRETE BEAMS IN PRACTICAL SIZES 10-FT. SPAN

Diameter of Round Oak Timbers, Inches	Safe Load Round Oak Timbers, Pounds	Dimensions of Sawed Oak Timbers, Inches	Size of Steel I-Beam Depth in Inches	Weight of Steel Beam in Lb., per Ft.	Dimensiosns of Reinforced-Concrete Beam, Inches
6	1,697	4x6	3	5.5	8x10
7	2,695	4x7	4	7.5	10x10
8	4,022	6x7	5	9.75	10x12
9	5,727	7x8	5	12.25	12x13
10	7,856	6x10	6	14.75	12x14
12	13,575	8x12	8	18.00	12x18
14	21,556	8x14	9	25.00	12x22
15	26,515	10x14	10	25.00	.....
16	32,178	12x14	10	40.00	.....
18	45,816	14x16	12	40.00	.....
20	62,847	14x18	15	42.00	.....

NOTE.—The loads assumed in Table VII are the uniform safe loads for round oak bars; fiber stress 1,200 lb. per sq.in.; safety factor about six. All bars whose dimensions are found on the same horizontal line are approximately of equal strength. For bars of other species of wood, increase the dimensions of the oak bars given in Table IV, by multiplying by the factor found in Table III.

General Specifications for all Mine Timbers—All timber shall be cut when the sap is down, preferably in the months of September to January inclusive. All timber not sawed shall be peeled, unless otherwise specified. Timber must be sound and free from incipient decay. Seasoned timber shall show no signs of decay and shall be free from worm holes.

Specifications for Round or Split Props, Posts and Bars—The following listed kinds of wood will be classed as No. 1: White oak, red oak, black oak, post oak, ash, hickory, locust, longleaf yellow pine, shortleaf yellow pine, douglas fir, hard maple, elm and woods of equal strength. All soft woods, such as white pine, cedar, spruce, cypress and gum, shall be classed as No. 2. No timber shall have a diameter of less than 4 in. If the minimum diameter is specified, and the timber is tapering, the diameter of the small end may be ½ in. less, if the diameter of the large end is proportionately larger. If the stick of timber is made by splitting from a larger section, no diameter or sectional dimension shall be less than the specified minimum. The lengths of posts shall not vary more than 1 in. No timber will be accepted if a line projected from the center of one end of the stick to the center of the other end does not fall entirely within the stick.

Specifications for Sawed Props, Posts and Cross-Bars—The grading for sawed timber will be the same as for round timbers. All timbers must be sawed to the size specified, with no variation of more than ⅜ in. All timber shall be sound, free from decay and show no knots larger than 4 in. in diameter, in the center of any stick; and no knot greater than 2 in. in diameter.

(To be concluded)

Compensation Paid Pennsylvania Mine Workers During 1916

Tabulations of the accidents causing death and disability to workers in and about the anthracite and bituminous coal mines of Pennsylvania, for the year 1916, have been compiled from workmen's compensation agreements filed in the Bureau of Workmen's Compensation and from accident reports submitted to the Bureau of Statistics.

Fatalities and serious accidents in which compensation agreements have been filed, or where the cases were not compensable under the law, are not included in the tabulations. The tables do, however, include compensable cases for fatalities in which it was necessary for the employers to pay only funeral expenses.

These compensation tables indicate that there were 792 fatalities in the anthracite and bituminous coal fields during 1916, while all accident reports received by the Bureau of Information indicate that 1112 workers were killed in and about mines during the same year. The difference in two totals represents open cases and cases not compensable under the law, or cases otherwise classified for compensation in the Workmen's Compensation Bureau.

Anthracite Field—Compensable Accidents in 1916—There were 491 workers killed in the anthracite field for whom workmen's compensation was awarded during 1916, and 9413 workers injured and disabled for periods exceeding 14 days and paid compensation. The average medical cost per accident was $20.14. The amount of compensation paid and awarded during 1916 for fatality cases amounted to $1,260,804.

The amount of compensation paid for disability cases during the year 1916 was $410,845, and it has been estimated that the amount required to carry these 1916 disability claims to completion would be $56,602. The total amount of compensation paid and awarded in the anthracite field during 1916, and estimated to complete disability claims, was $1,728,251. The estimated medical cost for all compensation accidents in the anthracite field, during 1916, was $199,468. The total number of dependents of workers killed and injured in and about anthracite mines during 1916 was 5409.

Bituminous Field—Compensable Accidents in 1916—There were 301 workers killed in the bituminous field, for whom workmen's compensation was awarded during 1916, and 10,710 workers injured and disabled for periods exceeding 14 days and paid compensation. Two women employees were injured in the bituminous field and disabled for periods exceeding 14 days. They were paid compensation. The average medical cost per accident was $18.92. The amount of compensation paid and awarded during 1916 for fatality cases amounted to $771,748.

The amount of compensation paid for disability cases during the year 1916 was $516,493, and it has been estimated that the amount required to carry these 1916 disability claims to completion would be $37,795. The total amount of compensation paid and awarded in the bituminous field during 1916, and estimated to complete disability claims, was $1,326,036. The estimated medical cost for all compensation accidents in and about bituminous mines during 1916 was $208,329. The total number of dependents of miners killed and injured in the bituminous field during 1916 was 10,179.

Anthracite Field—Noncompensable Accidents in 1916—There were 16,979 workers in and about the hard-coal fields injured during the year 1916 and disabled for periods less than 14 days. One of these injured workers was a woman. The total number of days lost by workers disabled for periods less than 14 days amounts to 96,711. The wages lost by workers disabled for periods less than 14 days amounted to $227,629. The average medical cost for each accident was $5.52. The average number of days lost per accident was 5. The average wage loss per accident was $13. The total estimated cost was $93,727.

Bituminous Field—Noncompensable Accidents in 1916—There were 17,510 workers in and about bituminous mines injured during the year 1916 and disabled for periods less than 14 days. One of these injured workers was a woman. The total number of days lost by workers disabled for periods less than 14 days amounted to 110,710. The wages lost by workers disabled for periods less than 14 days amounted to $299,951. The average medical cost for each accident was $5.03. The average number of days lost per accident was 6. The average loss per accident was $17. The total estimated medical cost was $88,072.

A NOTED SPEAKER has said "Books are better than gold." Take the hint and read your trade paper. The subscription price is a bagatelle compared with the benefits you will derive from it.

Anthracite Coal Stripping—IV

By THOMAS F. KENNEDY
Scranton, Penn.

SYNOPSIS—*This article deals with the calculation of the quantities of overburden and coal. Three methods are in use for determining these quantities. The first and most common gives fairly close results; the second is rapid and forms a good check upon the first; the third involves extra work but gives a closer approximation to actual quantities than either of the others.*

AFTER the economic stripping limit has been staked out upon the surface and the necessary elevations have been taken, preliminary estimates of quantities of overburden and coal are next determined, in order to furnish to the contractors information for bidding. In making the estimates of quantities in place, the engineer cannot furnish minutely accurate figures, but only an approximation. In other words there is no absolutely correct method of calculating the volume of overburden or tonnage in a stripping problem.

All formulas used in estimating volumes assume the solid to be bounded by planes, while the actual bounding surfaces are irregular, curved and undulating. This is true of a bed of coal which rolls and generally has not only irregular and undulating top and bottom bounding surfaces, but also an overburden which likewise possesses similar characteristics. In determining the amounts of the various classified materials, the accuracy of the estimates depends upon the thoroughness of the prospecting, the number of proving holes, the ability of the driller in judging the thicknesses of the various strata (when a churn drill is used), recording the results, and finally the method of calculation.

Methods of Estimating Overburden

To estimate the quantities of overburden and coal in a stripping problem there are several good methods in practical use. The most common of these are the average end area (vertical method), and the average thickness and contour sections (horizontal method), which will be described in detail. The explanation of the methods that follow applies only to preliminary estimates of quantities in place, while the final estimate operation will be described later.

The average end method, which is used by many estimators in calculating volumes in excavations, cuts and fills, dumps, etc., is the most common method of determining the quantity of overburden in stripping work. In order to explain clearly the application of the average end method of determining the volume of overburden, a typical problem in stripping will be assumed. Referring to Fig. 1, a plan and several cross-sections of a proposed stripping are used in the quantity calculations. By studying the plan and cross-sections, it will be seen that the following data must be obtained in the field—namely, all topographic features, the proper location of each borehole, the surface elevations of each borehole and breaks, borehole sections and all other information that might be used in determining the stripping limits.

The surface elevation and section are written alongside of each borehole. In the explanation of this method of calculation only a limited number of boreholes, with their surface elevations and sections, are shown upon the plan. Several elevations on the bottom of the coal bed in the faces of the chambers abutting the proposed stripping area are shown.

After a thorough study of the problem, the overburden limit is determined and delineated upon the plan, as described by the writer in *Coal Age*, issue of Jan. 5, 1918. The calculation of the overburden is then considered.

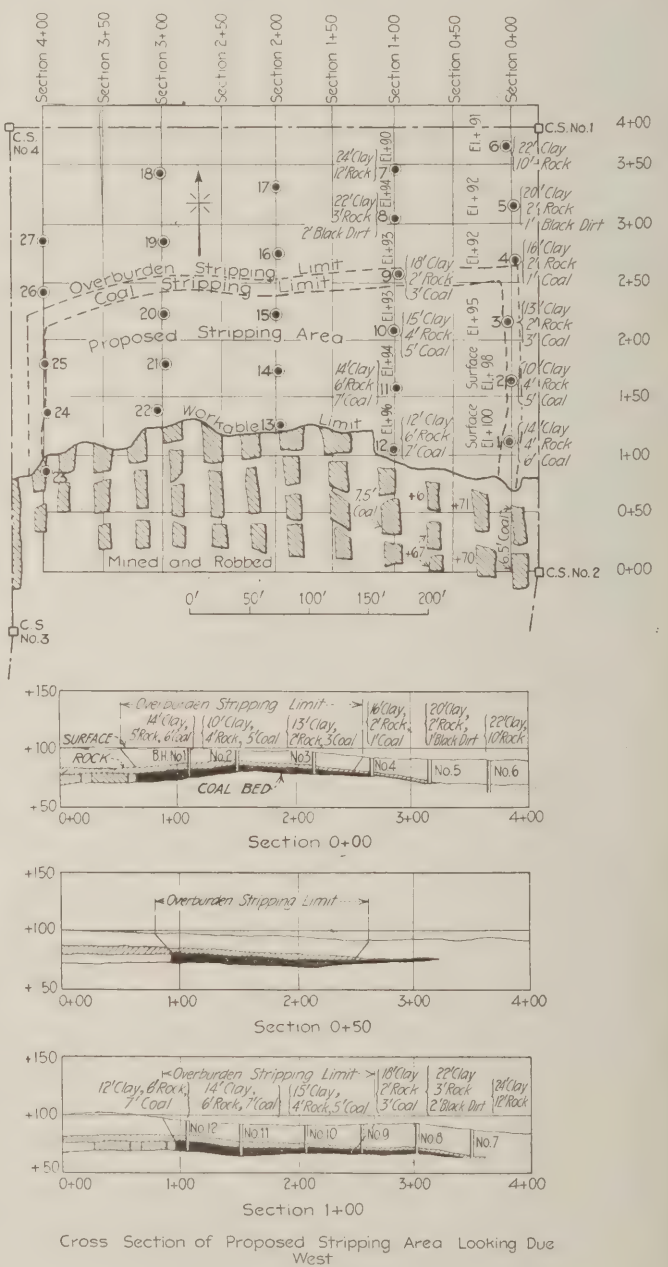

FIG. 1. AVERAGE END METHOD OF CALCULATING OVERBURDEN

The scale of the plan should be either 1 in. = 25 ft. or 1 in. = 50 ft., depending upon the size of the strip-

ping area, a small area requiring a large scale while in a large proposition the smaller scale may be used. The large scale produces closer results. As will be noted, the scale of the accompanying plan and cross-sections is 1 in. = 100 ft., used only for descriptive purposes.

The longest dimension of the stripping area is seen to be east and west. The cross-sectioning of the area at

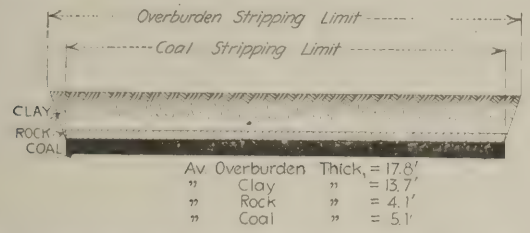

FIG. 2. AVERAGE THICKNESS METHOD OF CALCULATING QUANTITIES OF OVERBURDEN AND COAL

right angles to the longest dimension is most desirable, because more sections can be obtained for calculation purposes, incidentally producing the most probable volume value and reducing the probable error to a minimum. The choosing of the cross-section interval depends upon the variation in thickness of the overburden, which information is furnished by the borehole sections.

If the thickness is uniform throughout the proposed area, a cross-section interval of 50 ft. is good enough for close calculation purposes; but when the sections show a varying thickness, a distance of 25 ft. should be used. The cross-sections as constructed are drawn to a scale of 1 in. = 10 ft. vertical and horizontal in the usual manner by using the surface elevations of the boreholes and breaks and borehole sections. Cross-sections 0 + 00 and 1 + 00 are plotted from the borehole information, and section 0 + 50 is plotted by interpolation of sections 0 + 00 and 1 + 00. The overburden stripping limit and slope line are drawn upon the section which shows the area of overburden to be excavated and the portion of the coal bed to be stripped.

Determining Volumes of Clay and Rock

The volume of overburden between sections 0 + 00 and 0 + 50 is then determined by multiplying the average of the overburden areas of the two sections by the interval distance, 50 ft. in this case. When the material to be excavated is classified, the volumes of clay and rock are obtained by running the areas of the clay and rock separately, and applying the percentage ratio to the total volume of overburden. The area may be obtained by dividing the overburden into triangles, trapezoids, etc., or by using a planimeter, which is good enough for close results. When the planimeter is employed three readings at least should be taken and the mean average used. The volumes between 0 + 50 and 1 + 00 are found in the same manner and the total quantity is the summation of the sectional volumes. In stripping contracts classification of overburden is noted, so that the number of cubic yards of clay and of rock should always be calculated.

The most practical way of estimating the tonnage of a stripping is the foot-acre method. The tonnage in any coal bed depends upon the area of the bed, the coal thickness and the specific gravity of the coal. The specific gravity can be calculated by procuring various representative samples of the coal from the drillings and weighing the combined amount in the air on a delicate scale and then weighing it immersed in water, noting the loss in the weight of the coal. The specific gravity is then found by dividing the weight of the coal in the air by the loss of weight of the coal in the water. The specific gravity of anthracite coal will vary from 1.3 to 1.8, the average being about 1.5. The total number of long tons in place is found from the following formula:

$$X = \frac{(43{,}560)(sp.gr.)(62.5)(T)(N)}{2240}$$

in which

X = Number of long tons of coal in place;
43,560 = Number of square feet in one acre;
$Sp.gr.$ = Specific gravity of coal;
62.5 = Weight of 1 cu.ft. of water in pounds;
T = Average thickness of coal bed in feet;
N = Number of acres of coal to be stripped;
2240 = Weight of 1 long ton in pounds.

In making the estimate of merchantable or marketable tons of coal, the following important factors should be considered—namely, coal impurities, fuel and breaker losses, dockage and other allowances, characteristic of each individual stripping. In a virgin coal stripping 80 per cent. marketable seems to be an average figure, while in a mined-out territory it will drop as low as 50 per cent.

The second way of determining the volume of overburden is the average thickness method. The total volume of the overburden is found by multiplying the mean

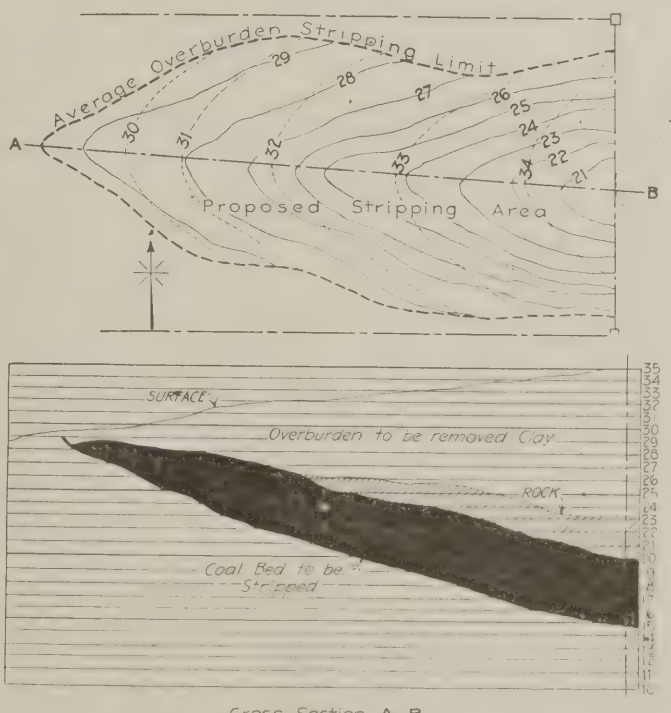

FIG. 3. CONTOUR METHOD OF CALCULATING OVERBURDEN

area of the areas included in the overburden and coal stripping limits by the average thickness of the overburden, as obtained from borehole sections. Referring to Fig. 2, the average overburden thickness is 17.8 ft., the average thickness of clay 13.7 ft., and the average thickness of rock 4.1 ft., so that the number of yards of

classified material can be obtained from the above percentages.

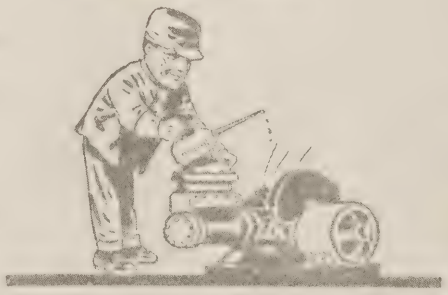
In discussing the third way, or contour method of overburden calculations, a problem is shown in Fig. 3. From the borehole data and other information the internal contours of the coal bed are shown in full lines, while the external surface contours are drawn in broken lines. The contours are delineated every foot for close calculation. The overburden stripping limit shown is the average limit of the overburden and coal stripping limits. It will be assumed further that the area to be stripped extends to the west property line.

The volume of the overburden is estimated in the following manner: The volume between contours 20 and 21 (see cross-section *AB*) is obtained by multiplying the mean area of the areas included by contours 21 and 20 and the west property line, by the contour interval, 1 ft. in this case. The volume between contours 21 and 22 is obtained in the same manner. The total volume is the summation of the horizontal sectional volumes. The amounts of clay and rock are obtained as described in the second method above. This method is the horizontal slicing of the overburden through the contours, while in the first method the average end areas constitute the vertical slicing at certain cross-sectional interval distances.

In conclusion it might be said that the first method, the most common one in use, should be taken advantage of because the cross-sections must be plotted for other general information and the results are fairly close. The second method is quick and serves as a check upon the first, while the third entails extra work in drawing contours but furnishes the closest estimate of volume. All three methods produce the required practical results.

(To be continued)

Legal Department



CHATTEL MORTGAGES—TERMINATION OF LEASES—A coal company could give a valid mortgage covering book accounts and personal property to be acquired in the future, as well as existing property. The right of a lessor of premises used as a coal yard to forfeit the lease because of the lessee's default in paying taxes as agreed was waived where no attempt to declare a forfeiture was made until eight or nine months after the default occurred. And a rendering of statement for rent and acceptance of payment thereof waives any right to forfeit the lease arising before the rent accrued. (New Jersey Court of Chancery, Commercial Trust Co. vs. L. Wertheim Coal and Coke Co., 102 Atlantic Reporter, 448.)

RIGHTS UNDER WATER-TRANSPORTATION CONTRACT—Where a Great Lakes transportation company contracted with a coal-mining company to employ certain of its steamers on all their west-bound trips in carrying the coal company's product, for three seasons, and, by reason of several years' previous practice under such arrangement the coal company's business had been so built up that water transportation was essential to its profitable operation, and it appears that other vessels would not be available as substitutes, the law raises an implied obligation on the part of the transportation company to continue operation of the boats during the life of the contract, and the coal company is entitled to restrain the transportation company from disposing of its boats in such manner that the contract would be broken and such company would not be financially responsible for the damages sustained by the coal company in consequence of breach of the agreement. The contract having been made with full knowledge of war conditions in Europe, the courts will not deny the coal company relief because a sale of the vessels might be highly advantageous to the transportation company. (United States Circuit Court of Appeals, Seventh Circuit; Great Lakes & St. Lawrence Transportation Co. vs. Scranton Coal Co., 239 Federal Reporter, 603.)

THE WAIL OF THE PUMP

By RUFUS T. STROHM

I'VE got no pull, an' I'm out of luck,
An' I don't know a friendly soul
To take my part, which is why I'm stuck
Way down in this blasted hole;
An' here I sit in the blightin' dark
An' clatter an' clank an' clump;
But take my word that it ain't no lark—
This bein' a common pump.

With now and then a squirt of oil

I DO my angels-could-do-no-more,
An' I do it night an' day,
A-helpin' the chaps that drill an' bore
In makin' the bizness pay.
I'm a homely duffer, but goodness knows
That I'm always on the jump;
Still, no one pays any heed, I s'pose,
Because I'm a common pump.

THE life that the hoistin' engines lead
Is a cinch compared to mine;
They're rubbed an' groomed like a racin' steed
Till their brass an' brightwork shine;
But all I git is a chanst to toil
In the dirty, inky sump,
With now an' then just a squirt of oil,
For I'm but a common pump.

Getting word of praise before Gabriel blows his trumpet

IT'S true my looks is agin me, bo,
For my coat is grime an' rust,
But here's a thing that you may not know—
I've a heart inside my crust;
An' before ol' Gabriel ups an' plays
That blast on his brazen trump,
I'd like to hear just a word of praise
Let fall for the common pump.

Mining Engineers Consider Industrial Relations

By R. DAWSON HALL
Associate Editor, "Coal Age"

SYNOPSIS—*The American Institute of Mining Engineers devotes a session to coal, a session to nonferrous metallurgy, one to mining and milling, one to iron and steel, one to petroleum, and two, the most animated of all, to employment problems.*

THE new era in which we find ourselves was well marked at the recent meeting of the American Institute of Mining Engineers. It is an era of social questions. One wonders what the founders of the institute would have thought if out of nine sessions seven had reference to seven different phases of mining while two related to the human factor in the industry.

Our predecessors would be surprised to find that engineers brought up to regard the material side of their profession as all absorbing now allowed the immaterial side of their industrial activities to take paramount place in their consideration. The institute is being changed rapidly by forces from without. We are no longer able to overlook the problem of the human factor in mining.

Some people take no small satisfaction from the fact that we are rising to a better conception of human relations. Unfortunately, it seems more likely that our welfare work is but a poor substitute for the mutual understanding of earlier years. The laboring classes are becoming a segregate class of men with different ideals, psychology, reactions and purposes to the employing class. So long as this exists there is need for industrial diplomacy.

Need for Greater General Cultural Equality

The only complete cure is to so educate the workingman that he will have similar ideals, psychology, reactions and purposes. This alone will make the ambassadors unnecessary. Two men cannot associate unless they have similar viewpoints, and the only satisfactory solution is one which succeeds in implanting in both classes the highest type of ideals. There will certainly be no true democracy till the employer and employee, when thrown together, can discuss their common interests with mutual comprehension.

It seems that in this unification and ultimate unity lies success, and not in any skilled pourparlers between segregated classes. As the workingman becomes relatively less literate and less cultured than his employer, the employer and the employer's family will necessarily segregate themselves more completely from the workingman. Decreased literacy and decreased culture is sure to follow such a separation, and the segregation will gradually become more and more complete till the conditions in Europe, and especially in Central Europe, will follow. There the respective classes talk almost different dialects.

We need above all things a cultural equality without which the people of the nation cannot possibly live a common life. This disposition of persons to separate into cliques arises from their cultural inequality. The uncultured man is as much repelled by the cultured man's life as the cultured man is repelled by the life of the uncultured.

When the institute met at the Engineering Societies Building, 29 West 39th Street, New York City, Feb. 18, for its 116th meeting, it found the Coal Session at the head of the program and Edwin Ludlow, president of the Lehigh Coal and Navigation Co., presiding.

The papers were read by title and then a synopsis was given, usually by the author. The first paper presented was a valuable article on "The Drifton Breaker," by E. P. Humphrey. A most interesting paper by R. E. Hobart, mechanical engineer of the Lehigh Coal and Navigation Co., followed. It was entitled "The Economy of Electricity Over Steam for Power Purposes In and About the Mines." The author compared the cost before and after electrification. With steam the cost of power was 13.7c. per ton, with electricity a trifle under 7c. The charges were practically cut in two.

Electricity Saved Costs and Raised Output

However, it must be remembered that the tonnage was larger after the introduction of electricity, and the larger tonnage had probably some effect on the lower cost of power. But this larger tonnage is, at least in large degree, creditable to electrical operation. In this connection the author of the paper said: "As the use of electricity permitted more efficient work and less loss of time from repairs, drownouts, etc., the coal hoisted increased from 343,665 to 435,073 tons per year." The saving, figuring on a basis of 435,073 tons per year at the cost per ton for steam and electric power respectively, figured at $29,149 per annum.

In an animated discussion it was pointed out that the electric current costs at the colliery had no item as large as that credited to the running of the air compressor. The electrical advocates suggested that a plant where nearly 40 per cent. of the electric current went to the running of an air compressor could not be regarded as a real electrical plant. They hinted that a more complete electrification might well have shown even better results as the losses on the compressed-air lines were much greater than those on electric current.

On the other hand it should be observed that the lift demanded of the steam hoist was 581 ft. and of the electric hoist 266 ft., not one-half as much. Hoisting, however, did not constitute a large percentage of the burden. In the electrical plant it cost only 15 per cent. as much as the whole load. What it cost with the steam plant is not revealed. It may have been much more.

Objection was taken to the fact that no equipment prices were given. The author declared, however, that

new equipment had to be bought when the site of the shaft was changed, and the question of what net profit could be obtained by replacing old equipment with new did not arise. A change of some sort was necessary. In the course of the discussion Eli T. Conner testified to the economy effected by the introduction of electricity in a plant under his charge.

W. P. Frey's paper on the "Briquetting of Anthracite Coal" was also one furnished from the experience of the Lehigh Coal and Navigation Co., which under broad-minded management is giving the coal industry the full benefit of its experience. W. P. Frey is fuel engineer of the company. The paper stated that as a result of replacing the coal-tar pitch binder by hydrolene, or "asphaltum" as the Standard Oil Co. prefers to term it, the company has been able to turn a losing venture into a winning one. Still the cost of the briquetting is quite large, silt at $1 a ton making briquets costing $3.35 after every item of expense is charged.

Use of Large and Small Percentage Binders

The "Dutch-oil process," as it is called, has the advantage that it livens the combustion of the more completely carbonized anthracite, when that material is briquetted. The cornstarch-asphaltum binder, described by Burke Baker in his discussion, can have that effect only in moderate degree, but then many anthracites do not need it and none of the bituminous coals require any help from added bituminous matter.

The Dutch-oil process improves the heating qualities of the anthracite. A binder with less oil does not improve the fuel in an equal degree, but again some fuels do not need that improvement—they have a coal content with more available hydrogen and they have a lower ash percentage. At this present time it is not well to make a selection without a full knowledge, seeing that both binders have such excellent points.

It was said in the discussion that where 7 to 10 per cent. of losses were sustained in the handling of anthracite at the yards the degradation of briquets was less than 1 per cent. It was also stated that by the Dutch-oil process briquets could readily be made with 5 per cent. of hydrolene instead of 7 per cent., but as a result they would be less easily consumed.

The objection to the original coal-tar process was said to be the necessity for complete dehydration of the coal, but with the masticator used in the Dutch-oil process 2 or 3 per cent. of moisture in coal does no harm as saponification takes place with advantage.

"Heating of Coal in Piles," by C. M. Young, was neither read, briefed nor discussed, as Mr. Young was not present as promised. G. S. Rice gave an illustrated address in place of an abstract of his "Review of the Coal Situation of the World." He showed maps and photographs of scenes illustrating the foreign coal fields. A map of France showed the distribution of coal before the war in the various French *départements.*

It was evident that the French coal was used in the *départements* near where it was mined. British coal was largely used near the ports and German coal near the frontier. This map brought A. H. Storrs to his feet. He said it evidenced the fact that even before the war there was a minimum of cross-hauling in France, and he urged that in America, at least during the war, an attempt be made by careful zoning to prevent unnecessary cross-hauling.

The article by C. F. Wang on the "Pen-Hsi-Hu Coal and Iron Co., South Manchuria," was discussed, but not at great length. It shows clearly how the introduction of machinery is no solution of difficulties unless it is accomplished by skillful and sympathetic management. As one man put it: It does not do to put Occidental machinery in Oriental hands and expect that it will do all that it is doing in the Occident. It is necessary to provide Occidental management if the machinery of the West is to do what is planned for it. The East has its guilds and its ways. "East is East and West is West."

Mr. Wang tells us in his paper without comment or hysteria, "There are about 1500 miners in the coal mine alone." Probably this includes all the mine workers. Just below he says, "The daily output for 1917 is about 1200 tons," which is an output of 1200 long tons from 1500 men working in No. 1 pit in 15 ft. of coal, in No. 2 pit in 12 ft. of coal, and in No. 3 pit in 7 ft. of coal. Of course, the coal pitches heavily, about 20 deg., and has some heavy partings, especially the thicker coal. But even granting these drawbacks the tonnage is distressingly low.

Then again, Mr. Wang without comment tells us that the No. 1 coal before washing gives 8442 calories and after washing only 8200 calories, that before washing the sulphur content is 0.709 per cent. and after washing 1.16 per cent. The ash is lowered, however, by washing, from 11.30 per cent. to 8.56 per cent.; the fixed carbon is increased from 70.88 to 79.50 per cent. The volatile matter is lowered from 17.72 to 14.94 per cent. As a result the fuel ratio is changed from 4 to 5.321.

Whoever heard of a coal that changed the nature of its vegetal content in this manner by the mere process of washing? One would think that the process must surely be one of distillation, not of mere gravimetric displacement. Of course, it is possible that by some strange freak of nature the coal in the slate might be more bituminous than that in the clean bed; but if so, how so? It is certainly a mysterious matter.

Cheap Labor Gets Out Coal for $3.76 per Ton

The costs per long ton—for apparently the long ton is meant—are $3.76. The wage of the men is not given, but it is doubtless extremely small. The miners work 12 hours and are hurried along by that piece system which all authorities, from Tubal Cain to Taylor, are convinced gives the best results. Something is wrong, however, or the cost would not be so high.

We are told to fear these Chinese with their fearsomely low rates of pay. We hear every little while the story that we must pay American workingmen less or be swamped by the yellow peril. As a matter of fact, we do not *pay* our workingmen big wages—they *earn* big wages. Their large product assures them of it. When Chinese laborers do an American laborer's stint they will earn good wages, for they will get in proportion to their production. Can anyone wonder that men who work as inefficiently as these Chinese are at the ragged edge of poverty? Were it otherwise, economic law would be a fraud and a deceit.

(*To be continued*)

Ash Influence on Fuel Value of Small Anthracite Coal*

By FRANK G. PHILO

THE value of coal as fuel depends not alone upon the total number of heat units, or B.t.u. per pound, but upon the fraction of the total heat contained which can be produced under actual conditions of combustion and operation. The B.t.u. value of one coal as represented by a calorimetric determination may be higher than a second actually, but the lower B.t.u. coal often shows a higher actual fuel value. This can be seen when it is considered that the calorimetric determination does not include the moisture in the coal, as fired, the amount and composition of the ash, whether it contains excessive slag or clinker-forming constituents, or there are present such impurities as sulphur compounds, which in spite of their heat-producing properties are often the cause of partial corrosion of the boiler, the breeching and the bunkers.

The sample of coal tested by the calorimeter is usually burned in an atmosphere of pure oxygen, a condition much different from that in practice, where an atmosphere of only 21 per cent. of oxygen exists. It follows that the most practical way to determine the relative fuel value of different coals is to burn a considerable amount of each grade upon the grates and in the furnace under operating conditions and note the characteristics accompanying each grade.

Tables I and II and the charts, Figs. 1 and 2, show the results of tests during which over 20,000 tons of No. 3 buckwheat coal were fired and over 500 chemical analyses were made.

The coal used was fired into the same type of furnace and upon the same "sawdust" grate, having small circular air spaces ranging from $\frac{3}{32}$ to $\frac{1}{8}$ in. in diameter. The area of the air spaces represented about 8 per cent.

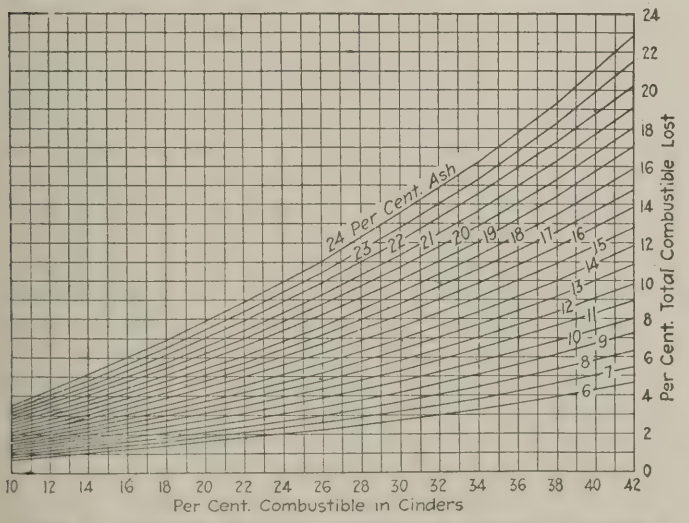


FIG. 1. CURVES WHICH DESIGNATE ASHPIT LOSSES

of the total grate area. Forced draft was used, and an average pressure of 1 in. of water. As practically no coal fell through the small openings, the fuel losses in the ashpits represented these, due to the combustible carried with the ash at cleaning periods, which, in this plant, occur once every six hours. It was found practically impossible to economically burn out more combustible after it had been burned until it represented about 18 per cent. of the material left on the grates after "pushing back." This fixed ratio of combustible to refuse mainly accounts for the rapid rate in which

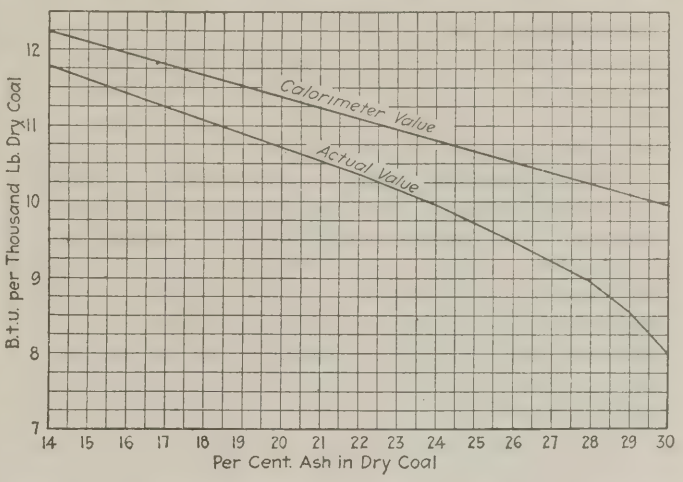

FIG. 2. CURVES SHOWING ACTUAL AND CALORIMETER VALUE OF FUEL

the losses in the ashpits increased with the higher ash coals. The percentage of the total combustible lost was calculated from the following formula:

$$\textit{Per cent. total combustible lost} = \frac{(\textit{per cent. ash in dry coal}) \times (\textit{per cent. comb. in dry refuse})}{\left((100 - \textit{per cent. ash in dry coal}) - (100 - \textit{per cent. combustible in dry refuse})\right)}$$

With anthracite as fuel, the value of the combustible in the refuse is almost the same as that of an equal weight in the coal fired, so no correction was applied.

TABLE I. COMPARISON OF THE CALORIMETER VALUE AND ACTUAL VALUE OF DIFFERENT ASH COALS *

Per Cent. Ash in Dry Coal	Calorimeter Value per Lb. Dry Coal B.t.u.	Actual Value per Lb. Dry Coal B.t.u.	Act. Val. / Cal. Val. Per Cent.
14	12,220	11,755	96.2
16	11,920	11,420	95.8
18	11,640	11,080	95.2
20	11,350	10,714	94.4
22	11,080	10,348	93.4
24	10,800	9,936	92.0
26	10,510	9,459	90.0
28	10,240	8,949	87.4
30	9,950	8,000	80.4

* The "actual value" of a pound of coal is here taken to mean the difference between the total B.t.u. contained in 1 lb. of dry coal fired and the B.t.u. in the combustible in the dry refuse per pound of dry coal fired.

To simplify the calculation of ashpit losses the curves in Fig. 1 were plotted, based on the formula given.

TABLE II. CALORIMETER AND ACTUAL VALUES OF DIFFERENT ASH COALS AS COMPARED WITH 14 PER CENT. ASH COAL AS A STANDARD

Per Cent. Ash	Calorimeter Value (Cal. Val. of 14 Per Cent. Ash Coal) Per Cent.	Actual Value (Act. Val. of 14 Per Cent. Ash Coal) Per Cent.
14	100.0	100.0
16	97.5	96.9
18	95.3	94.1
20	92.9	91.0
22	90.7	88.3
24	88.4	84.5
26	86.0	80.5
28	83.8	76.1
30	81.4	68.1

*Reprinted from "Power."

The tables and curves will be found useful in calculating the penalties to be imposed for high ash when coal is to be purchased on specification. Although the actual values given will not apply to all sizes and kinds of coal, the actual-loss curve will be about the same. Of course, in computing the economic value of the different coals, due allowance must be made for the transportation costs, cost of handling the coal and refuse, and the increased depreciation and maintenance charges against the grates and stokers that accompany high ash and clinker. The reduction of the capacity of the boiler and the furnace must also be borne in mind, especially in plants where the boilers are required to operate at high overloads.

Third Liberty Loan Soon To Be Issued

The third Liberty Loan will undoubtedly exceed in amount not only its two predecessors in this country, but any single war loan or other loan ever offered in the history of the world. The program of the Treasury is of course subject to such change as the rapidly changing conditions of the war may warrant.

No loan of such proportions can be successfully absorbed unless the entire nation responds to the offering and unless every citizen prides himself on the practice of self-denial to the end that he may subscribe to the limit of his ability. The number of subscribers to the last loan has been estimated at 10,000,000. Proportionally for the new loan it must exceed 15,000,000, or contain one in six at least of all the men, women and children in the country.

It must be obvious from the foregoing that Americans individually will need to squeeze the dollar they spend on themselves as they have never yet done before. Luxuries and extravagance must go completely out of fashion; should, in fact, be considered little short of treachery. Shabby clothes and old hats must be worn longer, diet be cut to the wholesome essentials, and we must no longer hire others to do for us those things which we can do for ourselves.

As a belligerent this country has already outgrown the "business as usual" stage of thought as well as of practice. There is not enough capital, labor, coal, transportation or raw material to go round if those industries which are not essential to the conduct of war are continued at their normal productiveness. A vast multiplication and expansion of the essential industries is only possible when other unessential industries are bled white of capital, labor and materials to support the increase in the activity of the essential industries. Every unessential industry which continues in operation must be considered as bidding against the nation for its life's blood.

The complexity of the modern industrial organization has helped to confuse the popular mind regarding the function of money. There is a widespread assumption (1) that money is a miracle worker and can make good for the nation as a whole the shortages in labor and materials which it seems to correct in individual cases, and (2) that some virtue attaches to the keeping of money in circulation by promiscuous expenditure.

In England these fallacies have been successfully assailed in connection with the War Savings Movement. In that country it is termed the "gospel of goods and services," and we may translate it into American as a "gospel of labor and materials."

Labor and materials are the only things that count in support of the fighting machine and they cannot be bought if they don't exist. At any given time there is only just so much of these vital necessities available in the country as a whole for all the many purposes of industry. Every unessential industry which burns coal deprives the essential industries by just so much of the supply available for their purposes. So does every housewife who burns an unnecessary hodful in her kitchen range[1]. Every man who buys a new overcoat is bidding against Uncle Sam who is buying overcoats for soldiers. And every dollar spent on a luxury is helping to support an unessential industry in the competitive consumption of essentials. Money spent on Liberty Bonds gets as wide and as immediate circulation as that spent on candy or theater tickets, but it goes to support industries which produce those things which the Government needs.

But if it is true that, in the last analysis, labor and materials are the only things that can be of any value in the support of our fighting machine, it is also true that the only economy of these things which counts is present economy. We cannot increase the present supply of these things with the thought that we might have used more of them than we did a year ago. The only food or clothing or fuel or munitions of interest to our soldiers and sailors is that which is available today. Past savings of these things have all been absorbed.

The war must be waged entirely on present savings. Hence the imperative necessity for thrift, not only on the part of those who have never before put aside anything, but also on the part of those who normally would be spending the income from past savings. The latter especially must be made to feel that in living on such incomes they are simply exchanging their own past savings or those of their ancestors for the present savings of others, in other words, competing with Uncle Sam for these present savings. It is their duty in the present situation not only to practice self-denial in the matter of consumption but if possible to support themselves by some occupation of value to their country and turn over their private incomes to the Government in the form of Liberty Bond investments.

It is every citizen's double duty to produce more and consume less, not only that he may have greater individual savings with which to invest in the Government's securities, but also that he may help to increase the aggregate of labor and materials (the war surplus) which the Government may purchase with the proceeds of these securities.

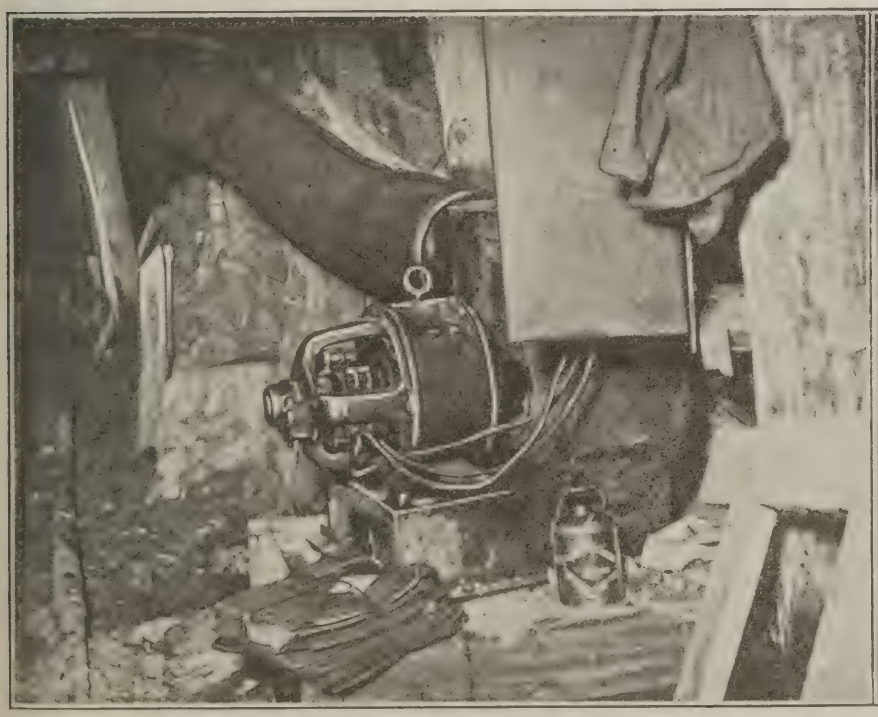
To inspire the average citizen with zeal for his twofold effort, to justify to his mind his unaccustomed sacrifices for the common good, it is highly necessary always that his realization of the issues involved in the war be strengthened and that on the one hand he should visualize more perfectly the power, ambition, cruelty and arrogance of the enemy, and on the other the vastness of his country's needs, its tremendous preparations and the heroism and self-sacrifice of its defenders.

[1]This is only true when the miners are working steadily and the coal is hauled by an overoccupied transportation agency. A hodful of coal burned on a mine tipple by a company that has cars only three days a week is not taken away from the war and does not injure the nation.—Editor.

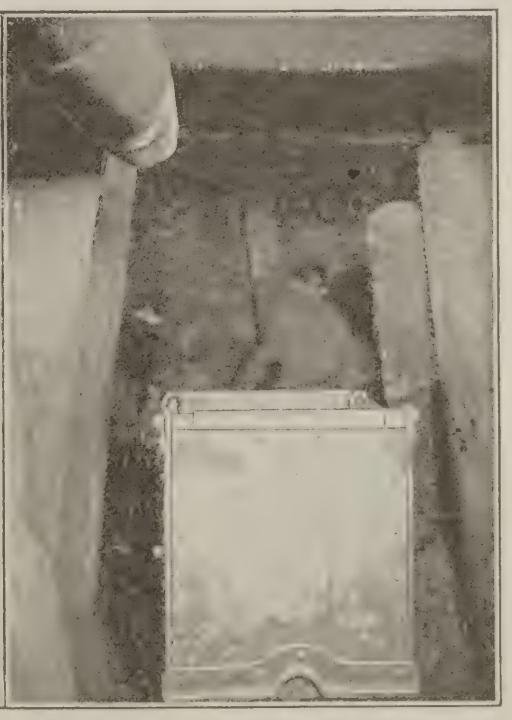
New Apparatus and Equipment

Securing Better Mine Ventilation

One of the great causes of waste in underground operations has been lack of ventilation. Operators are learning that by supplying better and more air to the men the output is increased, costs are lowered and the general health of the men is improved.



The most successful development in mine ventilation has been found in the use of specially treated canvas tubing, which makes a satisfactory air duct and meets all the necessary requirements. It is light, easily and quickly installed, combines toughness with flexibility, and satisfactorily stands the severe conditions of mine work. The Bemis Brothers Bag Co., of St. Louis, Mo., has recently introduced its Flexoid tubing, and it is used by a number of operators both in the United States and in foreign countries with excellent success. Flexoid tubing is made by saturating a strong canvas with a special preserving compound that protects the fiber from dry rot, acid water and the action of the weather. No tools are required to make the coupling, which consists of two contracting rings with flanges sewed in each end of the tubing. The coupling is made by inserting one ring inside the other and placing the rings parallel so that the flanges catch the ends and hold them



SUSPENDING A 100-FT. SECTION OF FLEXOID TUBING

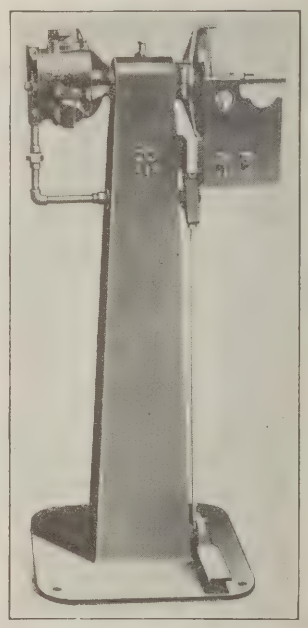
fast. The tubing is supported from a wire attached to sprags placed at 15-ft. intervals in the roof. Suspension hooks, furnished with each section, are placed in brass eyelets in the seam and the other end of the hooks slipped over the wire. "Blasting pieces" are provided so that the extension of the tubing may be carried up to the face of the drift, and, when the time for the blasting arrives, the extended portion can be quickly removed. The blasting piece has special snap hooks that attach the piece to the wire and provide a simple fastening that is easily handled.

Portable Scoop Conveyor

A new type of portable belt conveyor which has found a ready market is manufactured by the Portable Machinery Co., Inc., of Passaic, New Jersey.

The machine is operated either by electric motor or gasoline engine and is known as the scoop conveyor because the conveying belt receives its material from a scoop which can be pushed into or completely buried in the material to be conveyed.

The object of the scoop conveyor is to provide a portable machine that can be readily handled by one man for the purpose of loading and unloading, stacking and reclaiming loose materials such as coal, coke, ashes, crushed stone, sand and gravel.



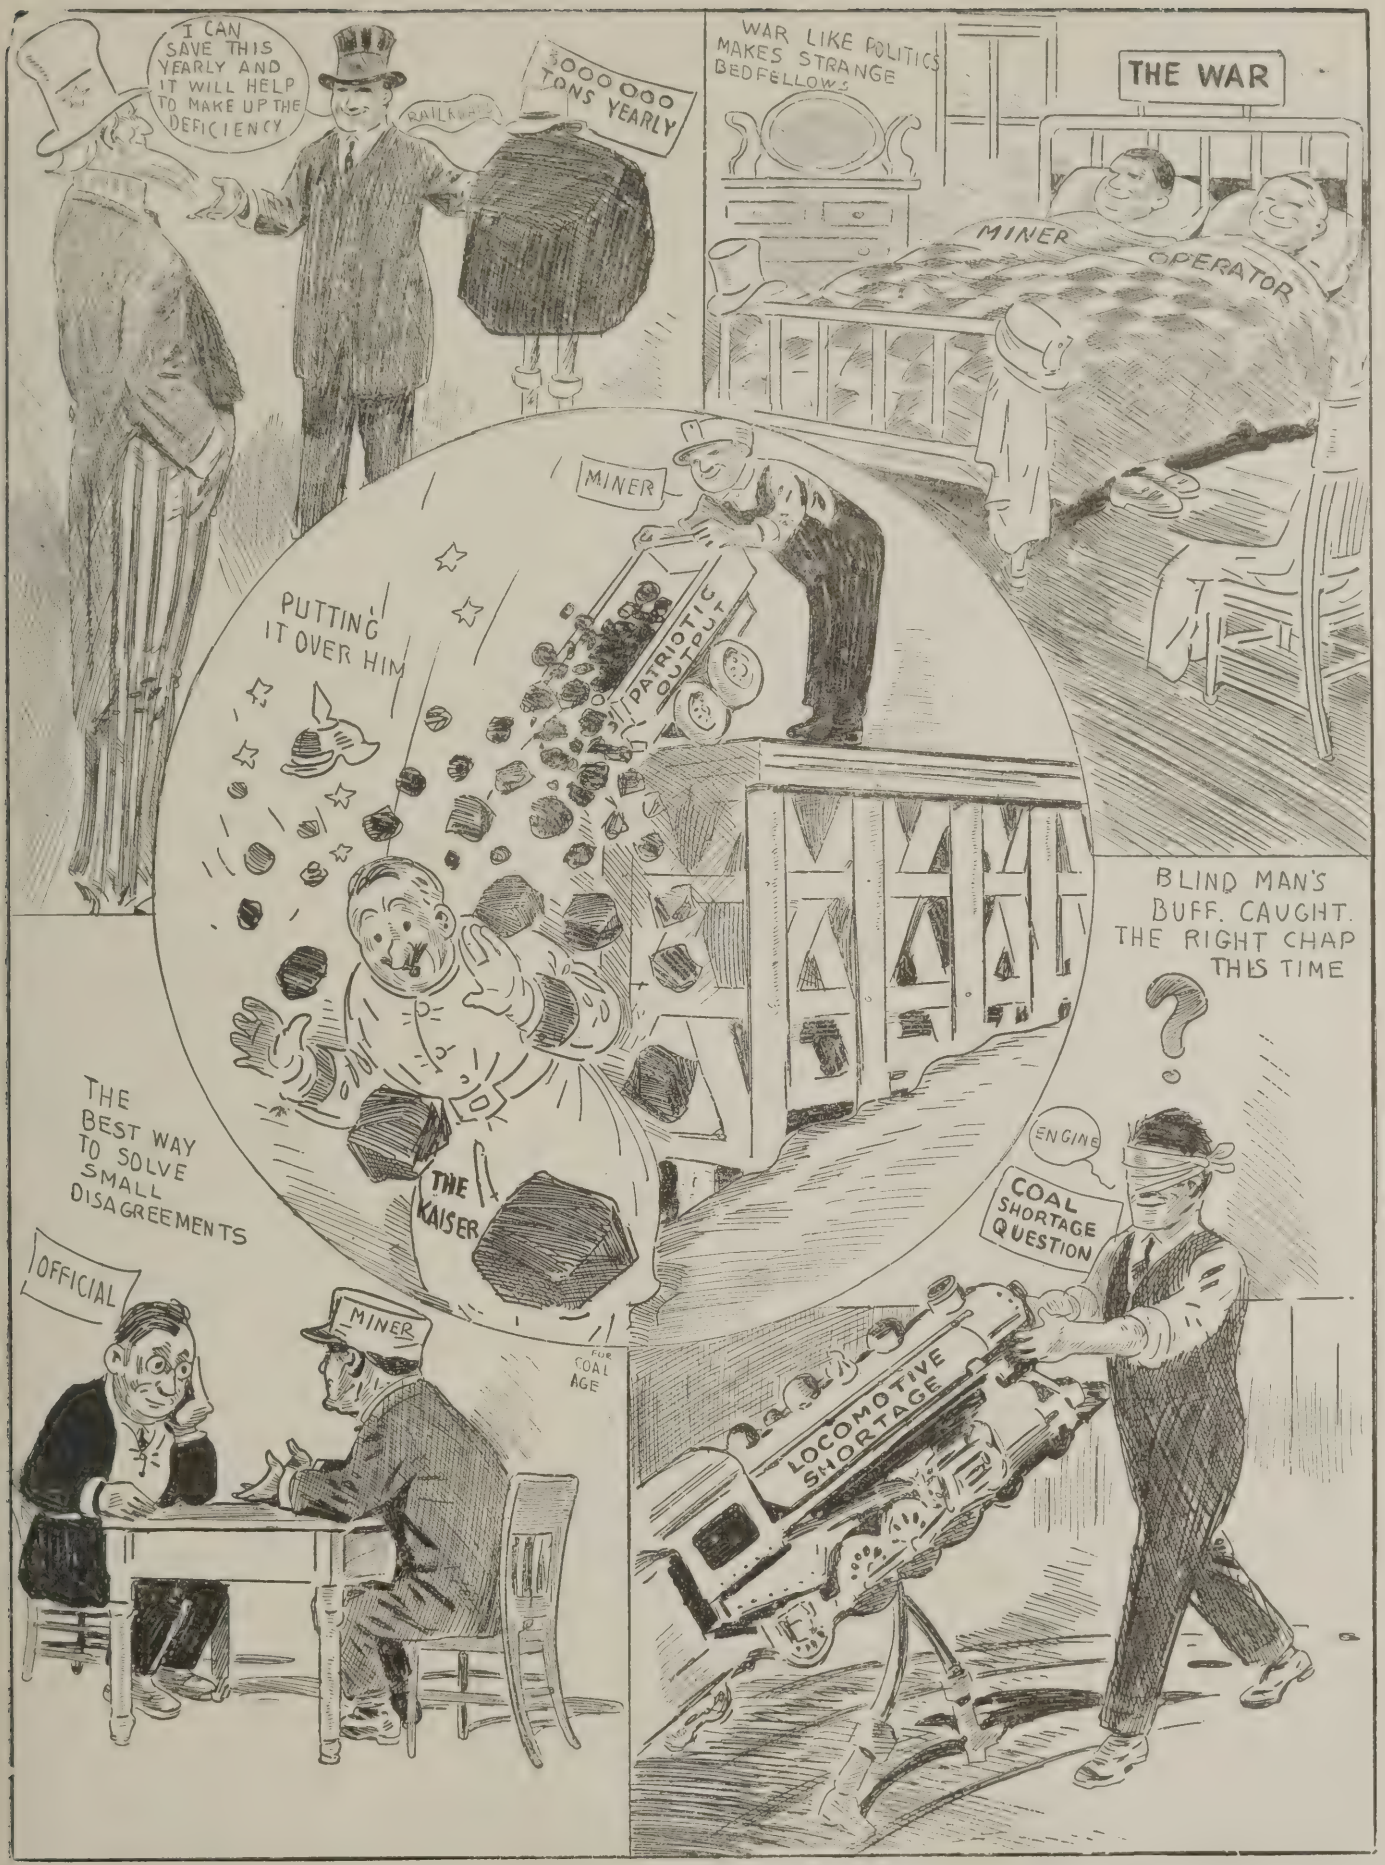
NEW TYPE OF PORTABLE BELT CONVEYOR

From the accompanying illustration it will be noticed that the scoop conveyor has a wide range of application. The manufacturers claim that it will handle sacks, packages, boxes and various manufactured products and that one man with this conveyor will handle loose materials at the rate of 1 ton in 1½ minutes.

Keeping cars and trucks moving and cutting cost of hand shoveling is a necessity under present-day operating conditions, and a large number of well-known manufacturing concerns are already using from 1 to 10 of these machines for this purpose.

New Grinder for the Drill-Sharpening Shop

Better results are obtained from drilling machines if adequate attention is given to the forming of bits and shanks on rock drill steels. Properly designed machine sharpeners forge both bits and shanks so that these are formed perfectly and gaged accurately. A punching machine enlarges the hole in hollow steel to its proper size. But one thing remains, the squaring off of the drill shank.



Imperfectly made shanks —that is, shanks not square on the end—are the chief cause of drill piston breakage. This is an expensive item not only in the cost of replacement but also in the time that the drilling machine is out of commission. Furthermore, with imperfect shanks it is not possible to take advantage of the full force of the piston blow, and drilling speed is retarded.

As a help in securing shank perfection, the Ingersoll-Rand Co. has developed the "Little David" pedestal grinder, an illustration of which is shown herewith. This tool, like the sharpener and punching machine, operates on compressed air. It is light in weight, readily portable and requires only a planking support. The powerful three-cylinder motor operates in a bath of oil.

A single foot lever controls the machine, leaving the blacksmith free to hold the steel with both hands. Ordinarily the grinding wheel used is 8 in. in diameter with a 1-in. face. As a further convenience the spindle is fitted with a No. 2 Morse taper socket to take a rose reamer for countersinking the hole in the end of the shank. This operation guards against cutting the water tube of the drilling machine.

This grinder also finds employment in truing the edges of drill bits, pointing picks and grinding other tools around the blacksmith shop. The complete machine weighs 195 lb., is 44⅝ in. high and occupies a floor space 17 x 20⅜ in. It operates satisfactorily with air pressures of 60 to 100 lb. per square inch.

At a Mine in Pennsylvania 3¼ tons of coal are mined for each employee when all names on the payroll, in whatever capacity, are considered. In the coke region one man is employed for every coke oven. Assuming that there are four dependents for each worker, the population to be provided for in mining camps can be approximately determined.

How the Coal Age Cartoonist Sees the High Lights in the National Coal Situation

Ice Gorges Cause Serious Damage

To break up the recent heavy ice gorge in the Monongahela River in the vicinity of Brownsville, Penn., it was necessary to resort to the use of dynamite. Brownsville is in the heart of the coal-mining industry of the Monongahela Valley, and when the first ice gorge broke it caused much damage to the coal interests of that region. A second gorge that formed soon after the first added considerably to the havoc wrought by the masses of drifting ice.

The towboat "Alicia," valued at $50,000, and owned by W. Harry Brown, a large coal operator, was caught in one of the ice jams and put out of commission.

TOWBOAT CAUGHT IN ICE JAM

Every effort will be made to save the boat after the ice has run out. An idea of the condition of the Monongahela River during one of these ice jams can be had from the accompanying illustration.

A partial list of the damage caused by the forming of these ice gorges is as follows: Maxwell tipple of the H. C. Frick Coke Co.; swept away; loss estimated at $9000. One heavily loaded coal barge owned by the H. C. Frick Coke Co.; sunk; loss, $3000. Delworth tipple of the H. C. Frick Coke Co.; swept away; loss placed at $9000. Knob tipple of the Pittsburgh Coal Co.; wrecked; loss, $5000. Three abutments, a supply house and 75 ft. of steel track, together with two loaded coal barges swept away, owned by Reliance Coal and Coke Co.; loss placed at $15,000.

War-Time Conditions Bring About High Fatality Record in Coal Mines

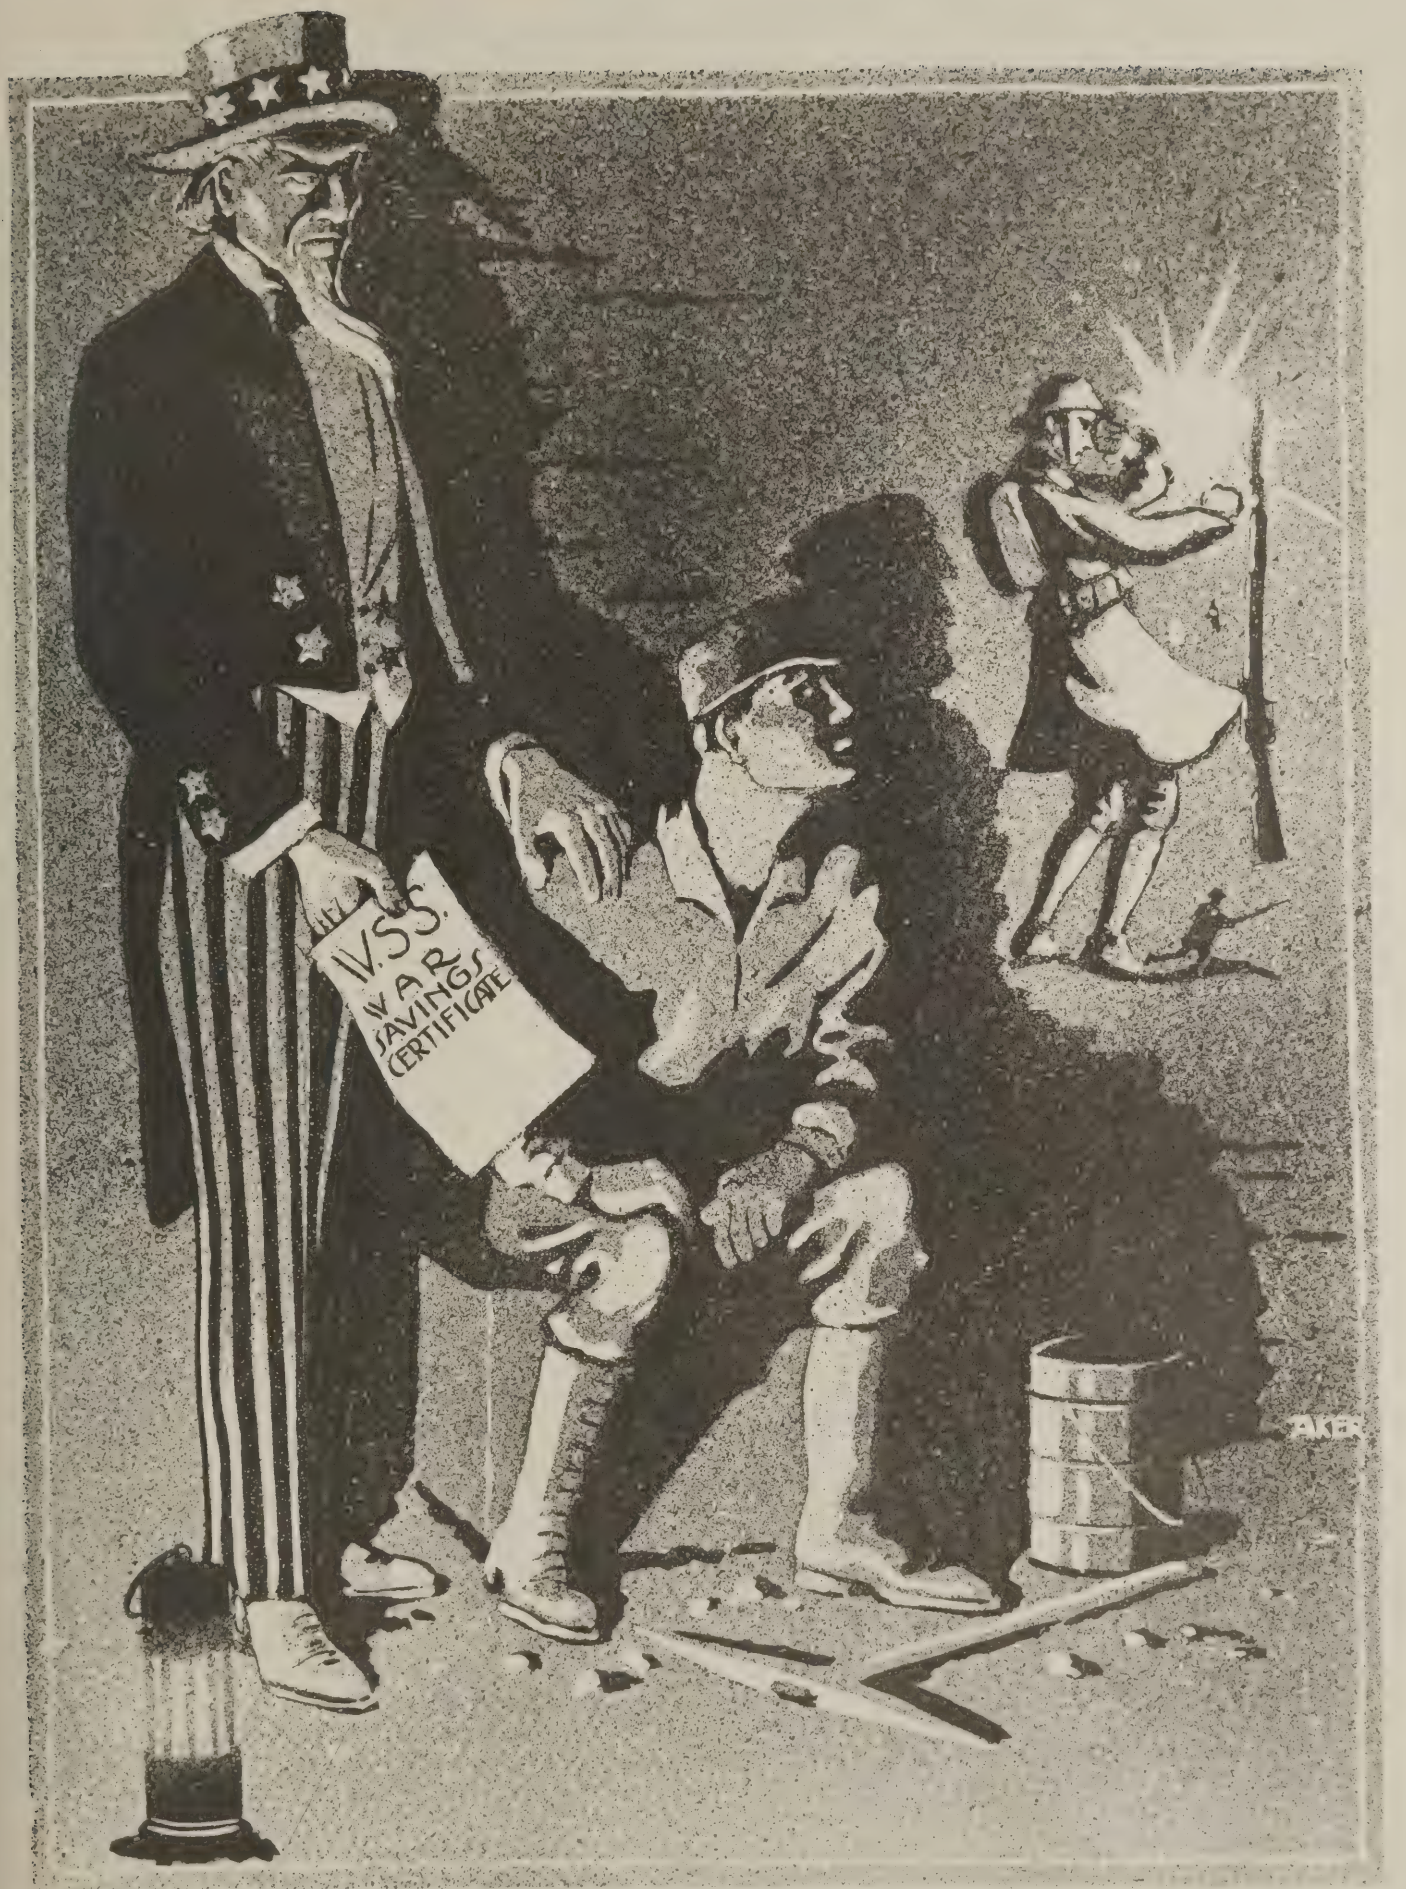
The demoralization forced upon the coal-mining industry by war-time conditions is said by the Bureau of Mines to be responsible for the highest fatality record from accidents in that industry in the last seven years. During the year 1917, there were 2695 men killed in coal mining, which is an increase of 470 over the previous year. Said Secretary of the Interior Lane, in speaking of this matter recently:

At least, temporarily, it gives a black eye to the splendid efforts of the Bureau of Mines in its campaign with the miners and mine operators for safer conditions. Until the war struck us there had been a constantly decreasing death rate which was much gratifying to the men of the Bureau of Mines as well as to myself. There had been the utmost coöperation between the industry and the bureau, and it had begun to appear as if we had passed those disgraceful days when human life was cheaper than a mine mule.

Although the war has changed all this for the time being, it is still our duty to analyze and see if we cannot correct some of the conditions even during the war, for a single life saved is not only humane, but a step toward victory. The unfortunate death toll of last year is undoubtedly due to the fact that the industry has been speeded and retarded spasmodically throughout the year. There was the unusual demand for coal, the uncertainty of prices at the mines, the failure at times of the transportation facilities, and the changing of markets to avoid long unnecessary hauls, the difficulty in obtaining experienced men to offset enlistments, the draft, and miners voluntarily returning to their countries in Europe to take part in the war. All these factors combined against the best efforts of the operators to produce coal in sufficient quantities to keep the country supplied with the necessary fuel, and also to have the safety conditions which we expect.

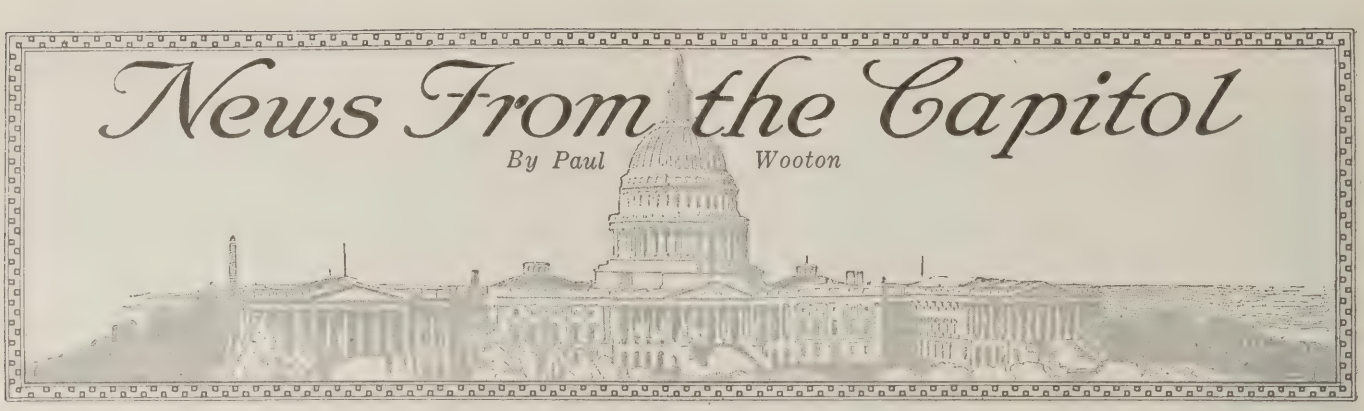
The speeding up of the mines at times, under the circumstances, was conducive to a high death rate. Mines found themselves short of labor and compelled to employ new and inexperienced men from other fields. Many of the experienced mine foremen and safety engineers had either enlisted or been drafted into the army, or obtained more remunerative employment elsewhere, with the result that less experienced foremen had to be placed in charge of some of the workings. With the exceedingly large demand for coal, it was not possible for the operators and others concerned to give as much attention to accident prevention at the mines as in recent years under normal conditions.

Mines which have not been able to obtain an adequate supply of coal cars have been operated only part time, which again is not conducive to safe conditions. This has resulted in an increase of certain dangers, especially those due to gas, dust and falls of roof, which would not obtain in the case of the mines operating full time. An active mine will ordinarily be kept in better condition than one operated only part time.



The remedy, therefore, both for a sufficient supply of coal and greater safety for the men lies in a continuous, steady flow of coal from the mines, without these overstraining bursts of speed and these part-time operations that led to a neglect of the usual precautions in the mine.

I am satisfied, from what the industry has done in the past, that this year with the bettering of the conditions over which the operators have had no control, there will be a greatly increased production of coal and without an unusual sacrifice of life. Given the proper encouragement and cooperation, the coal-mining industry will not fail.



Coal Handled by Milwaukee Dock Companies During 1917

The following table shows the amount of coal handled by the various companies at Milwaukee during 1917:

	Anthracite, Tons	Bituminous, Tons	Total Tons
Milwaukee-Western Fuel Co	567,381	1,199,604	1,766,985
Lehigh Valley Coal Sales Co	166,347	.....	166,347
Philadelphia and Reading Coal and Iron Co	25,175	.....	25,175
Kanawha Fuel Co	8,500	.....	8,500
Central Coal Co	.....	.....	.....
Youghiogheny & Ohio Coal Co	.....	217,006	217,006
Gross Coal Co	109,654	59,112	168,766
Callaway Fuel Co	28,145	20,307	48,452
Wisconsin Coal and Dock Co	.....	271,808	271,808
Milwaukee Coke and Gas Co	.....	1,093,335	1,093,335
Illinois Steel Co	.....	10,646	10,646
Milwaukee Gas Light Co	.....	121,241	121,241
Joseph Schlitz Brewing Co	5,545	23,553	29,098
A. F. Gallun & Sons	.....	7,039	7,039
North Side Coal Co	11,791	1,907	13,698
Grand total	922,538	3,025,558	3,948,096
1916	853,217	3,737,167	4,590,384
1915	1,085,745	3,785,076	4,870,821
1914	1,044,912	3,891,128	4,936,040

Uncle Sam Needs Your Savings To Feed, Clothe and Protect Your Boy "Over There"

[Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Union Trust Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 307, Union Trust Building, Washington, D. C., while at the capital.—Editor.]

Weekly Production Statistics

Better car supply during the week ended Feb. 16 allowed the bituminous coal mines of the country to pull decidedly away from the low production average of December and January. The production for that week amounted to 11,084,000 tons, according to the estimate made by the United States Geological Survey. Beehive coke production also increased markedly. It was 557,000 tons for the week ended Feb. 16. Anthracite shipments were 35,486 cars as compared with 32,011 cars during the week preceding. Byproduct coke production was 381,973 tons. For the week ended Feb. 9 the bituminous mines were operated at 64.4 per cent. of their capacity. Practically 28 per cent. of the loss was due to unfilled car orders.

Domestic Consumers Advised To Buy for Next Winter's Requirements

There is a tendency on the part of some to believe that the coal situation is a past issue, now that the weather has moderated. It is pointed out at the Fuel Administration, however, that this is in no way the case. While the acute demand for domestic coal is easing off somewhat, there is every reason to believe that the problems presented by the coming year will be more difficult to solve than were those of the coal year about to close. The industrial demand for coal is sufficient to take every pound of coal produced. Domestic consumers, it is believed, will do well to lay in their actual requirements of coal as early as they can secure them. Every effort will be made, however, to prevent overstocking. The retailers are expected to contribute importantly in this effort. It is feared that the experiences of the domestic consumer during the unusually hard winter just passing will tend to a general desire to hoard coal for next winter.

New England Not Receiving Enough Coal

It was the fear of losing labor rather than an increase in coal supply that caused New England to follow closely after the Federal Administrator in suspending the fuelless day order. The demand for labor outside of New England, where six days full time was assured, was having a demoralizing effect on industrial organizations in New England states. The absolute requirements of New England were fixed at 1000 carloads of coal daily. During the first half of February, however, statistics show that receipts have not averaged over 300 cars daily. On only one day during that period did the aggregate receipts at all the New England gateways reach 500 cars. An improvement in delivery during the latter half of February is expected as a result of improved weather conditions. The ice in Long Island Sound is giving less trouble, presaging increased deliveries from southern tidewater ports.

Zoning Plan of Fuel Administration Rapidly Assuming Shape

The Fuel Administration's zoning plan is rapidly assuming shape. A tentative program, which will follow in a somewhat general way the proposal of the railroads, is being concluded. The zones, however, will be considerably broader than are those in the plan submitted by the railroads.

It is now clear that there can be no great limit set on the movement of Lake coal to the Northwest, but the all-rail movement from West Virginia and eastern Kentucky for that section of the country will be cut off. The supply of smokeless coal for Illinois and Indiana will be very largely curtailed. The only way that it will be possible to move coal from one zone to another will be by special license. Every effort now is being made to fix exact boundaries for the various zones. This is complicated by the fact that some of the zones will be broader in the summer than after Oct. 1, when weather conditions will necessitate some restrictions.

Another important element entering into the fixing of the boundaries is reports from the railroads as to their ability to move the coal as prescribed. Director General McAdoo has directed his operating office to report at the earliest possible moment on this phase of the matter. The zone boundaries must be fixed before Apr. 1, so that purchasers may know where they may buy and operators be informed as to the territory from which they may accept orders.

Director of Bituminous Coal Distribution

Carrying out his plan for the placing of coal distribution in the hands of practical coal men, J. D. A. Morrow, the manager of distribution for the Fuel Administration, has secured the appointment of A. W. Calloway as director of bituminous coal distribution. Mr. Calloway is president of the Davis Coal and Coke Co., at Baltimore, and occupies the same office with the Terminal Railroad and Coal Co., of Pittsburgh. Competent coal salesmen and shippers will be placed in charge of various subdivisions of Mr. Calloway's work.

New Prices To Be Announced by April 1

All applications for price revision now pending are to be acted on by the Fuel Administration before Apr. 1. The matter of dirty coal also is to receive prompt attention as is the recognition of different qualities of coal. Accompanying an announcement to this effect, made to "relieve uncertainty on this score as far as possible before the beginning of the new coal year," was a statement that is exciting considerable comment. It is: "The Fuel Administration believes that it has devised a speedy and accurate method for using the cost information which it has in hand, and that it has worked out the fundamental principles which should guide it in considering applications for modifications of coal prices."

No Change in Distribution of Anthracite During 1918

Anthracite distribution during 1918 will be the same as during 1917, insofar as Fuel Administration officials now know. Statements to the effect that no anthracite is to be permitted to go to the Lakes for transportation to the Northwest or to be handled by rail to any of the Western states were declared to have been unauthorized. In fact, a delegation of anthracite men, who visited Washington a few days ago, was authorized to take orders on the basis of the same distribution as was made last year.

First of So-Called "Nonessential" Industries Is Restricted in Use of Fuel

Particular significance is attached to the order of the Fuel Administrator which limits the use of fuel for the production of window glass to 50 per cent. of the amount manufactured in 1917. This is expected to be the forerunner of further curtailments of unnecessary activities which require the use of fuel. Fuel Administration officials have wracked their brains on the multitude of problems growing out of any determination as to what are nonessential industries. As a consequence, they avoid application of the term "nonessential" whenever it is possible. The agreement with the window-glass manufacturers is indicative of the new line of procedure in the attack on the nonessential-industry question.

For several months, special surveys of certain industries have been in progress. One of the developments of this reconnaissance was that the window-glass industry was likely to manufacture 50 per cent. more common window glass in 1918 than would be required. A conference with manufacturers developed that the majority was willing to reduce production 50 per cent. under the condition that all competitors would be bound by the same restriction.

Figures compiled by the Fuel Administration show that the curtailment of window-glass manufacture will save 500,000 tons of coal during this year and will keep 18,000 carloads of merchandise off the railroads. By extending to all industries the policy that no fuel is to be used to manufacture any greater quantity of finished products than are actually needed this year, and by effecting widespread economies in the use of fuel, a repetition of this winter's shortage of coal can be avoided. Fuel Administration officials do not expect coal production from Apr. 1, 1918, to Apr. 1, 1919, to exceed by more than 5 per cent. the production during the twelve months preceding. For this reason no reliance is being placed on increased production, but every effort is being made to prevent the use of fuel in the manufacture of a surplus of products not needed during the current year.

Would Discontinue Special Assignment of Railroad Cars to Mines

A radical change in the method of supplying the railroads with coal probably will be made in the near future, it is believed here. That all concerned may have a chance to be heard, the Fuel Administrator has called a general conference for Mar. 1. Since the disposition of 175,000,000 tons of coal is involved, it is expected that the conference will bring to Washington a large number of coal operators, railroad officials and others interested. The National Coal Association has recommended that railroad fuel be supplied by the district representatives of the Fuel Administration and that the special assignment of railroad cars to mines be discontinued.

Brief Washington Notes

By reducing the number of stops made by electric cars, the Fuel Administration predicts a fuel saving of 1,500,000 tons of coal a year. This is the latest important step taken by the conservation division.

The additional $1.35 a ton allowed on export and bunker coal will apply only when such coal is placed aboard foreign bound vessels. An interpretation of the bunker coal ruling by the Fuel Administrator prohibits the billing of coal at the special bunker price until the coal is actually aboard.

January's coal production is 5,000,000 tons short of the production attained in January of 1917. The showing was even worse than that during December. The Geological Survey, which gives out the figures, attributes "this alarming depression" to an "unprecedented congestion of the transportation system of the country induced in part by unusually severe weather."

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The anthracite region has been having quite a few strikes. The United Mine Workers unfortunately cannot excuse itself and deny its responsibility for them, as its men are now among those who are striking. We plead with them to leave such matters to the Conciliation Board for decision. Their interest and the interest of the country seconds this appeal. The conciliation board is not partisan, and it is best to leave adjudication where it rightly belongs.

The bituminous regions of central and western Pennsylvania are just now showing a better spirit than the anthracite region. The biennial convention of District No. 5 of the United Mine Workers met at the Moose Temple, Pittsburgh, Penn., on Feb. 22, and when some delegates sought a readjustment of the slate-handling question and of some other working conditions in the district, their action was quickly squelched by voting the "previous question."

WESTERN PENNSYLVANIA MINERS WORKING WELL.

The scale is settled; the men are making better pay than ever before—when they work—so why even appear to violate a contract duly made which the companies have repeatedly revised, whenever new conditions involved new disadvantages to the wage earner?

The Czecho-Slovaks, who form 40 per cent. of the mine workers of the district, and, with the Poles, form 60 per cent., introduced and succeeded in passing a resolution petitioning President Wilson "to continue to stand firmly for the emancipation of the Czecho-Slovaks from the rule of the Teuton-controlled Hapsburg monarchy"—a most excellent resolution.

A vote was taken and the delegates were found in favor of spending $5000 for an educational campaign among the miners for the establishment of coöperative stores. Hitherto the Miners' Wage Scale Committee has consisted of the district president, the vice president, the secretary and the executive board. It was decided that henceforth seven other members would be elected to represent the seven subdistricts.

ILLINOIS ROUGH HANDLING DISLOYAL WORKMEN.

In Illinois, the mine workers are thoroughly imbued with the war spirit. It fares ill with any who are believed to be lacking in it, as is well instanced by what happened to Henry Martini when he refused to give back to Victor Saccaro the job he occupied before he left for service in the navy.

It is said by District Attorney Knotts that an investigation by Federal authorities failed to find any evidence that Martini was disposed to be unpatriotic. It is said that the matter was nothing more or less than a labor dispute, into which patriotism did not enter except as a reason for continuing at work. However, if Martini really said that the man should look to the navy for work, he cannot be exonerated.

The Peoria meeting is exhibiting the excellent spirit of the Illinois miners. The union in that state has subscribed for $350,000 of Liberty Bonds, of which $100,000 are already delivered. They expect to buy in all $500,000 worth of these bonds. The organization in the state has roughly $2,000,000 put by.

In Alabama the union has ordered the mine workers back to work and an arbitrator has been appointed by the Federal judge. The "big stick" of the Fuel Administration will probably smooth out all difficulties.

The delegates of District No. 18 met at Fernie, B. C., on Feb. 19. The district includes all southeastern British Columbia and the Province of Alberta. During the past year its authority has been extended by the unionization of the mining camps north of Edmonton, along the Canadian Northern and Grand Trunk railroads. The miners at the Drumheller mines are highly incensed at the action of the Northwestern Mounted Police in bringing up a machine-gun to keep order in that district.

The Scottish miners at a conference in Glasgow, Scotland, on Feb. 22, decided against the Government man-power bill, under which more miners would be called into the army. The New South Wales Government intends to nationalize all the mines in the state and has agreed to supply the states of Victoria, South Australia and West Australia with coal for five years.

National Board of Labor Called

Feb. 17, the first 10 members of the new National Labor Board were named; five of these represent the employers and five the employees. The National Industrial Conference Board and the American Federation of Labor were to choose two other representatives on the board. On Feb. 27 the latter selected Frank P. Walsh, of Kansas City, Mo., formerly chairman of the Industrial Relations Commission.

The representatives of employers are: Loyal A. Osborne, New York, vice-president of the Westinghouse Electric and Manufacturing Co., and chairman of the executive committee of the National Industrial Conference Board; Charles F. Brooker, Ansonia, Conn., president of the American Brass Co.; W. J. Vandervoort, East Moline, Ill., president of the Root & Vandervoort Engineering Co.; L. F. Loree, New York, president of the Delaware & Hudson Railroad Co., chairman of the board and executive committee of the Kansas City Southern Railroad Co., president of the Hudson Coal Co., Northern Iron and Coal Co., and Schuylkill Coal and Iron Co.; C. Edwin Michael, Roanoke, Va., president of the Virginia Bridge and Iron Co.

The representatives of the workers are: Frank J. Hayes, president of the United Mine Workers of America, Indianapolis; William L. Hutcheson, president of the United Brotherhood of Carpenters and Joiners of America, Indianapolis; J. A. Franklin, president of the Brotherhood of Boilermakers and Iron Shipbuilders of America, Kansas City, Kan.; Victor Olander, representative of the International Seamen's Union of America, Chicago; T. A. Rickert, president of the United Garment Workers of America, Chicago.

Labor Shortage in Hard-Coal Mines

Complete figures just tabulated show that the anthracite mine workers numbered 153,534 at the beginning of this year, divided as follows:

Occupation	Number of Men	Per Cent.
Miners	42,485	27.67139
Miners' laborers	22,705	14.78826
Company men, in mines	41,271	26.88070
Company men, outside mines	41,695	27.15685
Other mine workers	5,378	3.50280
Total	153,534	100.00000

With more mine workers there can be an increased production of anthracite. With the present labor supply it will be difficult to raise shipments much above the 77,133,000 tons reached last year.

Before the war, the number of anthracite mine workers was 177,000. In 1914, the number ran up to 180,899.

With the two wage increases last year, the wage scales since Dec. 1 last have been the highest ever paid in the anthracite industry. Every mine worker is now able to find employment at full time for six days a week, with the pros-

pect that such favorable labor conditions will continue indefinitely. How important this is will appear in the fact that taking a ten-year period to 1916, the average time which the breakers ran was only 221 days per annum.

Frequent Troubles in Anthracite Region

The anthracite region seems to have altogether too many strikes, and the Industrial Workers of the World cannot be blamed, at least, with some of them. Fortunately, the strike at the Enterprise colliery came to an end Saturday, Feb. 16. W. L. Connell, the owner of the mine, had assured District Board Member Hollister and other union leaders that the difficulties would be satisfactorily settled and on this score the union officials recommended the men to return to work. If Mr. Connell does not do what is expected, there is still the Conciliation Board.

In our issue of Feb. 16, it was recorded that the 1100 men and boys at the Archbald colliery of the Delaware, Lackawanna & Western R.R. Coal Department went on strike from Feb. 4 till Feb. 7. They struck again on Feb. 20 and returned to work Feb. 23. There is to be no change in working conditions.

On Feb. 19 the National colliery of the same company, located near Scranton, Penn., went on strike, 1900 employees being laid idle by that fact. Up to Feb. 24, the strike was not settled and no committee had taken up the grievance with the company officials, according to S. D. Dimmick, the assistant manager of the company.

On Feb. 19 a strike occurred at the Centralia colliery of the Lehigh Valley Coal Co., near Mount Carmel, in the lower anthracite region. The disagreement is about a requirement of the company that certain breasts, where about 20 men are employed, shall have two manways instead of one, one on each side of the breast. The men do not object to the order but they want pay for providing the second manway.

When the men refused to make the second manway without additional compensation, the company decided that it would not work the part of the mine where it desired to put two manways to a breast. The mine workers either quit the mines from preference or were compelled either to quit or work the two-manway places. The United Mine Workers of America took up the dispute with the company but without result, and a strike finally occurred. The men are breaking their agreement, of course, though it seems they were not hasty in doing so.

The miners wanted two-manway pay till the Conciliation Board ordered otherwise. The company, in the event of a favorable decision, would then have had to collect from the miner the excess money paid him, which might have been hard. The company elected to stand by the contract, which provides that the Conciliation Board shall decide the question and that the pay shall be regulated for the whole work under dispute both before and after award. On Feb. 22, James Matthews, the district president, got the men to agree to return to work and let the Conciliation Board decide on the merits of the controversy. However, on Feb. 26, Tuesday, the strike was still in full operation. The output of the colliery is about 2000 tons a day, the men numbering about 800.

The mine workers do not like the changes in the dues as made in the international constitution. These were made necessary by the lawsuits in which the union was involved and by the bonds it was necessary for the union to put up. The change becomes effective Apr. 1. The constitutional provisions which change the dues of the local unions from 25c. to 50c. per month for each member run as follows:

"Sec. 12—The local dues to be paid by each member shall not be less than 75c. per month, together with such assessments as may be levied by the different branches of the organization.

"Sec. 13—Every local union shall pay direct to the international secretary-treasurer a per capita tax of 50c. per month per member and such additional assessments as may be levied by an international convention, referendum vote of the members or in accordance with Section 25 of Article 9, payment of per capita tax to be based upon the amount of dues collected each month by the local union."

Unfortunate Dispute in Alabama

Both John P. White, the labor chief in the Fuel Administration and Rembrandt Peale, the operators representative have been sent to Alabama to settle the strike which threatened to spread by sympathy to mines which were not directly affected by the controversy. As Mr. Peale wrote the agreement in question, he is in close touch with all developments.

The problem for the Fuel Administration is whether to compel the furnace companies, which had the strikes, to abide by a contract that they have never accepted. It is quite possible that the Fuel Administration will decide that its will is law and must be obeyed. It used the big stick on the smaller companies, and they agreed to abide by the terms of an agreement of which they did not approve. It is hardly likely that it will tolerate the refusal of the larger companies to sign, or abide by, that contract.

At the same time the men working for the smaller companies which have signed the scale do not appear willing to abide by their agreement. They work longer or shorter hours at their pleasure instead of abiding by their pledge. The steel corporations have given their men no less than six raises in pay recently. They have concededly done more than anyone else to promote good conditions. Must they also accept a provision they regard as tantamount to recognizing the union?

By Feb. 18 the number of strikers had increased to 15,000, the Yolande, Rock Castle and Searles mines going on strike on that date, thus extending the strike to three new companies. The next day the Edgewater mine of the Tennessee Coal, Iron and Railroad Co., with 900 men, closed down. On Feb. 20, Frank J. Hayes, the president of the United Mine Workers of America ordered the coal miners in Alabama to return to work pending a settlement of the differences with their employers.

The Fuel Administration reported on Feb. 23 that H. C. Selheimer, of Birmingham, was selected as umpire. His appointment was approved by President McCormack, of the Alabama Coal Operators' Association and President Kennemer, of the Alabama branch of the United Mine Workers of America. The appointment was made by Federal Judge W. V. Grubb, of the Northern district of Alabama. The Administration has indicated that the mines are all in operation as usual, pending a settlement.

Apparently Mr. Sellheimer has not been approved by the Tennessee Coal, Iron and Railroad Co. and the Republic Iron and Steel Co., but only by the coal operators' association, to which apparently these companies do not belong. They are not signatories to the contract. If they are brought to time it will be not under the agreement, but under the fiat of the United States Fuel Administration.

Mine Workers Take Public Action

The mine workers of late have been taking concerted action to secure their ends as ordinary citizens. They have just as much right to do this as engineers, bankers or lawyers. There is no reason why all action of mine workers shall be in direct relation to their industry. However, one might take some exception to the activities recorded below. Perhaps they are not well advised, but much public and political activity is subject to just such criticism. Mine workers are as much entitled as other groups to make mistaken decisions.

At a mass-meeting of miners from Shamokin, Kulpmont, Ashland, Centralia and Mount Carmel a drive was started to raise a fund of $3000 with which to engage the service of an engineer to ascertain the physical value of the Shamokin and Mount Carmel Transit Co.'s trolley line, from which special rates to miners were recently withdrawn along with the six-for-a-quarter tickets and upon which a 6c. fare has been established.

The actions of the company have caused the mine workers to make vigorous protests to the Public Service Commission. Prominent attorneys have been employed by the mine workers, and it is the purpose of the miners to ascertain the value of the road, and in this way to prove that the increase in fare is not justified.

Make It a Little Easier for Weak-Kneed Patriots

THE weakest link in the whole national chain in this war is transportation by land and by sea. The greatest need is to strengthen this link. To do so will take much money, but with the Interstate Commerce Commission holding down railroad rates who knows what will happen when the war is over. Conditions may be even worse with the railroads than they were before the war started. We would all like to buy railroad stocks and bonds if only we knew that the money expended would come back to us. Many good patriots would be willing to buy them if they received interest equal to that paid on Liberty Bonds, or even no interest at all. All they are looking for is to conserve their capital.

Somehow we do not like to give away our money to the railroads. We are accustomed to give it to hospitals and the Red Cross, but we are not ready to buy stocks and bonds with the almost certain assurance of loss. Something must be done to finance the railroads either out of Liberty Bonds or from some other source. The public will not buy railroad securities till they become secure, and they can never be secure so long as they are the victims of politics.

The Manager's Idle Moments

UNFORTUNATELY, the mines in the bituminous regions are not working steadily. The idleness, however, gives the manager a chance to put his plants in order; and the necessity for keeping day men at work, as a means of preventing migration, affords a reason for employing the day hands at the mines for this purpose even when no coal is dumped.

There is therefore an opportunity to prepare for the days ahead. It will go hardly with the manager if his mines are laid idle for some internal cause when he has railroad cars on his sidetrack. The men will be discontented and leave him, his allotment will be cut down, and the mine owners will look for a more efficient man.

Consequently, the whole problem of mine management should be scanned again. Shortage of men has modified that problem immensely. Perhaps the haulage problem can be solved by closing down certain headings and openings. There is no cross-hauling at the mines, but there is something almost equally bad. In many places coal is being hauled from one section of the mine past another section that could be arranged to take care of the whole tonnage needed.

Most mines would be helped by greater concentration. The supervision problem is an important one. Most people regard the boss as a man who drives people to work. There is truth in that view, but it is also true that he is the man who helps men to work. He is the "liaison" officer at a mine. He coördinates effort. The mine workers need him. They are entitled to his services.

No mine operation should lag for the lack of immediate authority. When the mine is large and rambling time is lost trying to get word to the boss, where, in a smaller mine producing the same tonnage, he is readily at hand. By concentration of its work many a mine crippled for lack of supplies could be enabled to operate efficiently. It could keep up its haulage conditions to a high degree of efficiency by reducing the length of road kept in operation.

Some companies have too many mines working. They would do better if they concentrated their effort on a few and ran them intensively. The equipment on hand would go further, and much water that is now pumped would automatically flow out of the swags to the drift mouths or the sumps. The machines would do more work, and the few roads maintained would be in better running condition.

Take a careful view of your duties and cut all red tape. The present conditions demand drastic remedies, and we must rise in every way to the occasion. There must be a lopping of nonessentials in our industrial operation. Because we needed more elbow room when men were plentiful is no reason for trying to use that elbow room now. Because we hoped that we could find men to operate a new drift is no reason why we should try to run it now that the men have not materialized. Every problem is a new problem. There are new conditions which modify it. It should not be solved as if the old conditions still existed, but on the conditions now surrounding it.

Are We a Nation of Individualists?

ONE of the evident signs that we are approaching an industrial and economic crisis is the amount of criticism that is being showered on those in charge of Government activities, nearly all of which at present relate to the war. The attempts to blame these various inefficiencies on individuals are being made on all sides. It was only natural in this confusion that army officers and Government officials in general should be the first to receive the blow, for we have always held the theory that Government officials were far more inefficient than our business men.

The number of applications from private manufacturers for the help of "efficiency engineers," which has so largely increased lately, is indicative of a realization on the part of many of our manufacturers that their methods also are not what they should be. The people who are applying for help are in many cases no worse off, as far as their methods are concerned, than others who have not yet discovered how badly they are doing their work.

The whole subject seems to resolve itself concretely into the fact that our business and industrial systems

are not suited for times like these, when it is necessary to combine all our energies and exert our full driving power toward the achievement of one supreme object.

We should not be surprised that this is the case, for our economic theory has never contemplated teaming up all the industries of this country for one object, but has rather discouraged that idea and encouraged individual competition of the most strenuous kind. In other words, we are a nation of individualists who have never really seriously contemplated coöperation for the common good.

When this problem of coöperation is suddenly put up to us, as it has been by the war, it is not surprising that our business men, trained in the individualistic school, should be entirely unfitted to solve the problem. Moreover, it might be expected that the men who have been most successful in individualistic, competitive business, in which profit was the main aim, should be actually the ones least fitted to establish a scheme of business and production for the benefit of the community. This is a new problem to them, and one altogether outside of their experience.

It is to be granted that such business men may have individually great driving power, but this very excess of driving power in individuals or corporations is likely to make the confusion all the worse, unless a means of coördination is established which will keep the driving power of the individuals or corporations in proper balance.

What to Do First

IT IS said that we are preparing to produce for the war in France much more than we can ship to that country. If that is true, we are riding to a fall. If we cannot find a way of placing the products we are making, we may as well spend some of our efforts on our domestic needs.

First of all come, of course, the merchant marine, the docks for the construction of vessels, the channels to reach those docks, the towns for the ship workers and all that will assist in the construction of ships. Then we need to spend money on railroad locomotives and cars. We cannot in the short time available do much toward increasing the capacity of our railroads other than in regard to terminal facilities, but these should be of the best.

Motor-truck transportation should be allowed to replace horse transportation, and this will keep the automobile factories busy. As we have now to supply the Allies with grain without help from Russia, Australia and India, it is essential that we have increased grain-handling facilities so that none of our bountiful harvests shall be lost by lack of provident care. Consequently, grain-elevator service will probably have to be developed. Furthermore, we should enable our lakes and canals to serve our transportation needs more fully.

Unfortunately, governments are apt to take an interest only in what are stereotyped government activities. Until the United States took over the railroads it did not seem to care a jot that the industry was going progressively to destruction. That was a matter left to the railroads, as if the railroads were not one of the essential limbs of the nation, a limb which could not suffer without all the other members suffering with it. Even now the railroads do not seem to be getting the consideration they deserve.

The innate militarism of mankind resolutely sets itself against seeing war as a great big business to be conducted on business principles. It is not merely shot and shell, but the conduct of a national life that is demanded; and we must look ahead to see that the indirect sources of our power are not forgotten and allowed to become inept even though they happen to look unmilitary and quite indirectly of assistance in the war. The transportation matter should have been carefully considered when we were "being kept out of war." Then was the time when we should have been fostering an arm which keen observers had noted for years was progressively becoming paralyzed. A diagnosis would have been quite easy to any who resolutely set himself to find the cause.

These needs must always be kept in mind. The wealth of the country must be carefully directed so it will help in solving them. Money should be guided to the civilian industries which need speeding. The Government should not only forbid the sales of stock in nonessentials, but it should indicate to the public those lines of industry which will need financial encouragement and investment if the war is to be won with minimum difficulty. Steel and byproduct plants need some such a word of encouragement from the Government authorities. Unfortunately, too many of the elective princes of our country show a positive aversion to industry because they have not set their seal upon it. Trade is vulgar and only statecraft, politics and the waging of war, they feel instinctively, should occupy the time of those who are given the work of governance.

So it comes we act like the young cub who was given charge of a company store. The first day he took charge he bought $400 of perfumes. With due pushing, such a line would hardly have been sold out in 10 or 15 years. Yet a week after he was out of flour. The essentials of living had not appealed to him. Some of the makers of our nation have an equal failure to understand the basis of our national existence.

Fuel Administration Striking Its Gait

LIKE most hastily constructed organizations that are given unlimited powers, the Fuel Administration in Washington has been a mushroom affair. Little by little system has developed out of chaos, until now really effective work is being accomplished.

Coal operators will no longer have occasion to fear the consequences of ill-advised regulations promulgated by men inexperienced in coal mining. A carefully selected committee composed of some of our best-known mining engineers is now preparing the data on which prices are based. Mr. Lesher has a world of information that is proving invaluable to those perfecting zoning plans. Mr. Morrow, in bringing to his aid men like A. W. Calloway and H. N. Taylor, is doing a service that cannot help but foster the confidence of the industry. Coal men will likely have to make many sacrifices and put up with numerous aggravations. However, these recent moves at Washington cause us to feel that injustices will not be rendered.

DISCUSSION BY READERS

The Fuel Situation

Letter No. 1—It is a well-known fact that the little things in life are the most decisive and often exert a powerful influence for good or bad. Too often it happens that our devotion to minor matters obscures the broader vision that is so necessary for the successful management of large undertakings. But the greater and more influential the part we play in our everyday life, the less is our mind absorbed in the consideration of unimportant details, which should always be subordinated to the main proposition.

The fuel situation, today, which has been fully set forth in *Coal Age*, is a large proposition, requiring the broadest vision possible. To meet the growing complications incident to the production of coal at the mines and its transportation to market and distribution to points where it is most needed, the Government, some time since, organized a Fuel Administration, whose avowed purpose was to increase the production of coal, and to insure the nation an adequate supply of fuel to meet the increased demands for the war.

Work Confronting the Fuel Administration

Kindly permit me to submit to the readers of *Coal Age* the question of whether this policy has been carried out by the Fuel Administrator. Personally, I am inclined to think that he has confined his attention more to the curing of some of the many prevailing evils in the coal industry, rather than overlooking these, for the time, and giving his entire attention to increasing the supply of coal.

It is true there have existed many hindrances and, to relieve the congestion of traffic and increase the means of transportation of coal, embargoes on freight have been proclaimed and industries have been forced to observe workless days. The price of coal to consumers has been reduced and jobbers' "gouging" commissions curtailed. Statistics show that more coal is being produced, today, than ever before; and, to assist in its distribution to where it is most needed, producing and consuming zones have been established for the purpose of avoiding cross-hauls.

Notwithstanding all this, however, the nation is today suffering from a serious shortage of coal. While it is easy to charge this unhealthy state of affairs to the inefficiency of the Fuel Administration, we must admit that it is another matter to blazon the path to effitiency. We are all critics at heart and, while this is largely justified in respect to the present emergency, we must admit that what the nation needs is constructive criticism. It must be remembered that it is wrong to pull down unless we can rebuild something better.

In respect to the work to be performed by the Fuel Administration, it is only possible to suggest, in a general way, that the closest attention should be given to big things, while matters of minor importance are left to shift for themselves. Let the Administration strive to adopt an expansive and liberal policy, keeping clearly in mind the need of increasing the production of coal, and transporting and distributing the output to the centers where it is most needed.

Let us hope that there will be the heartiest coöperation on the part of the Administration, the coal mines and the railroads, which alone will enable them to increase their services to the nation. The great cry of the country today is "service," and what is needed to accomplish this is the larger vision and comprehensive grasp.

Boston, Mass.

Working the "Rooster Coal"

Letter No. 1—Replying to the inquiry of Mine Foreman, *Coal Age*, Feb. 16, p. 349, asking for information in regard to the working of what is known as "rooster coal," which occurs, in many districts, in connection with the Pittsburgh seam, let me say that I have had some experience with this coal, in a district where it was probably above the average both in thickness and in quality.

In the district to which I refer, the rooster coal reached a thickness of 4 ft. in places, but would thin out to 2 ft., perhaps not 50 yd. away and, at times, the thickness would vary that amount in a single room. My experience with this coal is that it is most variable also in quality and, frequently, half of it must be thrown out as being unmarketable. The result was that, in this locality at least, the seam would hardly pay to work separately.

The section of the seam, as given on page 349, is almost identical with that in the locality I have mentioned; but the drawslate varies much, reaching a thickness of 4 ft., in places, and again thinning out to 6 in. I have known the shales overlying the drawslate to vary from 8 ft. in thickness to barely 3 ft. in some places. Indeed, I understand that the two seams almost come together, in certain sections, but I have never found it so in my own experience.

Variable Conditions Forbid Roomwork

Referring to the question of the feasibility of working this seam, I would not say that it is ever practicable to do this in driving the rooms, chiefly because the roof above the rooster coal is quite variable, consisting of a hard sandrock, which is frequently replaced by shale.

It is well to observe here that the shale separating the two seams does not make a good roof in rooms. I have even seen it start to break on a narrow entry and it became necessary to take down the loose material up to the rooster coal, in order to avoid frequent roof falls. In one instance that I recall, we were obliged to handle 6 ft. of this shale roof over a sidetrack where it was impossible to support it, although the place was well

timbered with center posts set between the tracks. This made a large amount of rock to handle and was expensive.

Although the method we employed in working these seams resulted in recovering hardly more than 60 per cent. of the rooster coal, I do not know that it could be improved. Briefly discribed, it was as follows:

When the heading had advanced far enough, No. 1 room was turned in the lower seam. This was driven up in the usual manner and when it was finished the miner pulled the rails back a distance of about 30 ft. from the face and drew the props, allowing the roof to fall in that space.

ROOSTER COAL WORKED OUT RETREATING

This being done, the miner cleared a passageway to the edge of the fall so that a car could be pushed close up to the slate. A shot was then put up in the rooster coal, which was allowed to fall on the slate. Frequently, it was possible to load this coal directly into the car, from the top of the fall, while at other times it was necessary to throw the coal to the bottom before load ing.

No. 2 room was worked in about the same manner, except that the pillar between rooms Nos. 1 and 2 had to be drawn. This was done by making about two cuts of a Goodman shortwall machine. I have seen 12 to 14 pillars taken out before the top rock would break above the rooster coal. At other times, however, I have known it to come down on top of the coal.

Permit me to say, in closing, that I consider this method as practicable as any that can be employed and would only suggest one change. That is, if possible, the headings should be driven up their full distance before any rooms are turned. Then drive six rooms abreast at the inby end of the heading. When these have reached their limit start to draw the last pillar and follow this with the others in order, carrying the gob line at an angle of about 45 deg. with the heading.

I believe this plan would be a considerable improvement over the previous method, as it would be impossible to recover the entry stumps more completely, as quickly as the pillars are finished in the rooms. There may be places where it would be possible to drive entries and rooms in the rooster coal, but this has not been my experience. THOMAS HOGARTH.

Heilwood, Penn.

Shaft vs. Slope Opening

Letter No. 6—This discussion recalls to my mind the serious difficulty I once experienced in trying to keep a slope open in the summer time. There were continual falls of roof taking place, owing to the rapid decay of the timbers caused by the alternate dry and wet condition of the slope at that time of the year. Much trouble was caused also by accumulations of ice in the winter time. I will not go further into detail than to say this slope was driven on the dip of the seam.

My experience in operating slope mines has been such that I have no hesitancy in saying that two shafts are much to be preferred to two slopes, when opening a mine. There may be conditions, of course, when a slope opening would naturally be chosen, especially in the working of an inclined seam that outcrops on the property. However, in all cases where the seam is level and lies at a reasonable depth below the surface, my preference is for a shaft opening.

In respect to the expense of sinking, there will be more rock to handle in sinking a shaft 10 x 20 ft. and 118 ft. deep than when sinking a slope, on an inclination of say 30 deg. and having a cross-section of 6 x 10 ft. The slope would be practically 236 ft. in length. When the shaft is once down and properly timbered, however, it will not only cost less to maintain and cause less delay in hoisting than a slope opening, but will afford the quickest means of ingress and egress to and from the mine.

In the operation of a shaft mine, I would arrange to lower and hoist men at the hoisting shaft, until such time as the output of coal was sufficient to keep the engines running continuously throughout the shift. In that case, the men would be hoisted at the second opening, which should be equipped with means for that purpose. LUMEN.

West Leisenring, Penn.

Electrically Driven Mine Pump

Letter No. 1—I have been much interested in the inquiry of John Martin, *Coal Age*, Jan. 26, p. 214, in which he describes the difficulties experienced in the operation of an electrical mine pump.

Mr. Martin attributes these difficulties to the fact that the 5-in. discharge pipe of his pump extends but a short distance from the pump and then connects with an 8-in. pipe line. This is a very similar arrangement to the installation in the mine of which I have charge, and which has given the best of satisfaction. For this reason, I believe that the difficulty, in Mr. Martin's case, arises from other causes.

In our mine, I am operating an electrical pump having an 8-in. suction and an 8-in. discharge, the latter being connected, at a little distance from the pump, with a 10-in. pipe line. This installation, however, differs somewhat from that described by Mr. Martin, as our slope has a grade of only 6 per cent., instead of 25 per cent., as in his case; but the slope is 2700 ft. long, while Mr. Martin's is only 800 ft. long. Therefore, while we are working against a static head of 162 ft.. as compared with the 200-ft. head, in his case, yet, the greater length of our pipe line will increase the friction head so that the two cases are practically the same in this respect.

As I stated previously, we have experienced no trouble whatever, except at one time when the pump was started with the discharge valve closed, and the result was that the driving rod of the pump was broken and the shaft bent.

Allow me to suggest that, in my opinion, Mr. Martin's difficulties may arise from one or both of two causes: Either (1) the pump is too light for the work it is required to perform and, owing to the inertia of the water column when the pump is started, the piston rod is bent or the journal casting broken; or (2) it may be that the foundation on which the pump rests is too light or insecure, allowing the pump to shift its position slightly, which would throw it out of alignment and produce the results he has described. I hope these suggestions may be of service to Mr. Martin.

McIntyre, Penn. SAMUEL JONES.

Shotfiring re Explosion

Letter No. 5—The recent discussion, in *Coal Age*, relating to shotfiring in mines, has called forth the interesting question of the inflammability and explosibility of the gases produced by the combustion of black powder, and this led to the present discussion of the relation of shotfiring to the possibility of starting an explosion in mines and, incidentally, involved the question of reducing the circulation of air in the mine at firing time, with a view to utilizing whatever extinctive effect the gases produced in blasting might have, as claimed by John Verner, *Coal Age*, Nov. 3, p. 774, and Jan. 5, p. 33.

Some years ago, I had occasion to investigate this subject and reached results that may be of interest in this connection. I first tried to obtain samples of the air, at the faces of rooms where shots had been fired but a few moments previous. In this attempt, I was not successful in securing satisfactory examples for analysis and it became necessary, therefore, to depend upon experimental work performed in the laboratory.

Experiments with Black Powder

In the experiments that were conducted, charges of black powder alone and the same powder mixed with various quantities of fine coal dust were fired. As a result it was found that the gases given off by the explosion, in some cases, would burn readily and even explode when mixed with air. The results of these experiments were published in the Transactions of the American Institute of Mining Engineers, Vol. 41, p. 454.

The combustible gases, which may be present in the fumes from black powder, originate from three sources: (1) The gaseous products of the explosion may contain insignificant amounts of combustible gas, even when the composition of the powder is such as is required to make its explosion complete. (2) The heat of the explosion may distill certain volatile combustible constituents of the coal. (3) When black powder is fired in the presence of fine coal or dust, the result is much the same as what would be obtained if the powder contained an excess of carbon. In that case, the nitrate would not be present in sufficient quantity to furnish oxygen enough to burn all the carbon to carbon dioxide and a certain amount of the monoxide would be produced, which is combustible.

What the Experiments Show Is Possible

While such experiments do *not* show that combustible gases are invariably given off when black powder is exploded in the presence of coal, they *do* show that the explosion of the powder, under such conditions, may produce gases that are combustible. Indeed, the gases resulting from the explosion of black powder alone, under apparently uniform conditions, are not of constant composition; and, as has been shown, the presence of combustible gases resulting from the explosion depends on the composition of the powder and the coal.

But, since the presence of combustible gas will aid the explosion of coal dust, it follows that an explosion may occur, as has been suggested in this discussion, because of the possibility of such gases being produced when coal is blasted in a close place or heading. This is particularly liable to occur when a blownout shot projects its flame into the gases and dust produced by a previous shot.

Many explosions have taken place, in Kansas, under circumstances which strongly indicate that powder fumes were concerned in the explosion. It is the custom there for shotfirers to work rapidly and sometimes several shots are exploded at nearly the same time. The holes are heavily charged with powder, and the conditions are favorable to the production of explosive gases.

In 1909, an explosion, in which powder smoke was supposed to be concerned, occurred in an Illinois mine. At that time, 182 shots had been fired and but four remained when the explosion took place. The explosion was attributed, by the mine inspectors, to the excessive use of powder in blasting the coal.

C. M. Young,
Assistant Professor of Mining Research.
Urbana, Ill.

Letter No. 6—Opinion, generally, seems to favor an increased circulation of air at the time of firing shots in mines, instead of reducing the quantity of air in circulation at such times. For my part, I cannot understand how it would be safe practice to fire shots in a mine generating gas, when the ventilating current has been reduced. Nevertheless, John Verner contends that this has been done with good results.

Practice and theory have always agreed that it was proper to maintain a good circulation of air in the mine, sufficient to remove all dangerous, explosive, or noxious gases as quickly as they are formed and thus keep the mine healthy and safe. We are taught, and it is common practice where the shots are fired by shotfirers after all the men have left the mine, to begin that work on the end of the air.

Reasons for Maintaining a Good Air Supply

It has been explained that where a good ventilating current is maintained the smoke and gases produced in firing will be swept out of the mine and the places in which shots are yet to be fired will be kept clear. It has even been suggested that the circulation, in certain sections of the mine, be temporarily increased by regulating the air passing into those sections where shots are yet to be fired. When the work is finished the normal circulation in such sections is restored.

It is reasonable to believe that, in a mine generating gas, a reduced circulation of air will result in a greater accumulation of gases in the working places, and this condition would certainly be conducive to an explosion taking place when shots are fired. Aside from this, however, shotfirers should not be asked to work in a reduced air current, which is always a menace to health if not to safety.

In regard to the inflammability of the gases produced in the explosion of powder, I have frequently tested this fact by igniting the gas in the crevice of a shot. It seems to me that this illustrates fairly well the condition that would exist at the working face if the circulation of air is reduced.

The same result is obtained whether dynamite or black powder is used and, sometimes, it is possible to ignite the gas produced by permissible powder. I have seen mice overcome by the deadly effect of these gases when venturing to crawl into what remained of an auger hole where a shot had been fired.

R. J. Pickett, in his letter, *Coal Age*, Feb. 9, p. 301, has referred to the dangerous practice of tamping holes with dummies filled with fine coal dust. I agree with him that this could not be done when the shots were fired with a needle and squib and the tamping had to be done more carefully. State laws, the instructions of powder companies, and one's own common sense warn against such practices.

It is poor argument to condemn the use of permissible powders when so little attention is given to properly preparing shots. These points cannot be too deeply impressed on miners whose prejudices are often deeply rooted.

In Indiana, in mines where no machines are used, I am informed that the prevailing practice is to shoot the coal off the solid and, if this is true, there is all the more reason for tamping the holes properly their entire length. The fuse should be of sufficient length that it can be lighted after the hole has been tamped fully to the face of the coal. W. H. NOONE.

Thomas, W. Va.

Examination of a Mine

Letter No. 3—It would appear from the letter of Robert A. Marshall, *Coal Age*, Feb. 2, p. 256, that the mining law of Colorado requires the fireboss to make but one examination a day, which is done before the men enter the mine in the morning. According to his statement, on returning from breakfast the fireboss is supposed to do whatever work the mine foreman may find most urgent.

In my opinion, that is not a safe plan to adopt in the operation of a gaseous mine. It is my belief that any mine generating gas or dust in dangerous quantity should require the entire time of the fireboss, who should make a separate examination of every working place in the mine while the men are at work. He should also make a separate report of such dangers as he may find in going about the mine the second time.

When making his second round the fireboss is very apt to find men who are violating the mine regulations or some requirement of the mining law. He should, in every case, report the names of such offenders to the mine foreman, as the health and safety of the workers and the security of the mine depend on the strict compliance of the men with every requirement of the law.

THE SECOND EXAMINATION IN PENNSYLVANIA

The Pennsylvania Mining Law requires a second examination to be made by the fireboss while the men are at work in their places. It is the custom there for the fireboss to start to make his second round immediately on his return from breakfast.

This time, he examines each working place where the men are at work. He not only examines the place for gas and to ascertain the condition of the roof, but gives any needed instructions to the men, in respect to setting timbers and mining coal with safety to themselves and others. The fireboss also takes note of what material is on hand in each place and orders any further material that may be needed.

I heartily agree with Mr. Marshall in his suggestion that we should do everything in our power to sidetrack the Grim Reaper, who constantly lurks about the mine seeking his victims. Where danger is discovered it is the fireboss' duty to withdraw the men from the place or remove the danger promptly. When a place cannot be made safe at once, a danger signal is placed at all entrances to the place and the men are withdrawn and not permitted to return to work, until it is again made safe. All such dangers must be reported promptly to the mine foreman, whose duty it is to give immediate attention to the removal of the danger.

Dubois, Penn. ROBERT WILLIAMS.

Danger and Discipline

Letter No. 1—Referring to the fact that the fatality rate in coal mining has exceeded the tonnage rate, during the past year, the statement is made in an editorial, *Coal Age*, Jan. 12, p. 67, that "there is little question but that greater discipline would result in reducing that fatality rate." I can heartily indorse this sentiment, but wish to add that there is a wide difference between discipline enforced in the mine, and the posting of "safety rules," which are so frequently ignored.

It is not difficult for even the casual observer to see that coal mines are being operated today under strained conditions. The miner is urged to dig all the coal he can and, in order to assist him in doing this, discipline is neglected and safety rules are too frequently suspended in the effort to increase the daily output of the mine.

NUMEROUS CAUSES OF LAX DISCIPLINE

Mine officials charged with the enforcement of safety rules become lax and, as a result, the miner takes many chances. The patriotism of the miner should lead him to employ every energy in producing coal, but patriotism does not call for the neglect of mine discipline and the setting aside of safety rules.

Owing to the unprecedented demand for coal and the scarcity of men, the miners' wages have been increased. This has drawn many inexperienced men from the farms to work in the mines. The result is that the standard of competency has been lowered and the fatality rate is bound to be increased.

In addition to the employment of many incompetent men in the mines, the tendency of experienced miners to take advantage of the leniency of mine officials in respect to mining rules and regulations helps to increase the number of mine accidents.

Because an experienced miner can put out a good turn of coal he is not disciplined for his disregard of safety rules, which not only endangers his own life but is a menace to others. Seemingly, little attention is given to the fact that one careless act, through lack of discipline, may result in the loss of several lives, and days of idleness when the mine must be shut down.

Mine officials appear willing to take these chances, claiming that they have to relax the discipline of the mine, for a time, during the present scarcity of labor and the great demand for coal. They say this is necessary in order to keep the men they have and get others.

Glancing over a mine inspector's report recently, I noticed that the question was asked, "Does the foreman enforce rigid discipline?" This question was followed by an unfilled space. Upon my calling the inspector's attention to the item, he remarked, "Practically, there

is no discipline in many of the small mines, now. In order to get and keep men, discipline has been thrown to the four winds in many instances." In response to my statement that "Soon the accident rate will be increased in the mine," he replied, "That is already true, today."

No one will attempt to deny that the effect of suspending rules of safety, for any reason whatsoever, will be to destroy all order and system and increase the accident rate. To require a strict observance of mine rules today, and permit their violation tomorrow, as some mine officials are doing, is equivalent to having no rules at all.

Necessity of Enforcing Safety Rules

While miners are frequently a little stubborn, my experience is that most of them are willing to obey rules of safety where they are consistently enforced in the mine. But, they are quick to take advantage where there is any laxity observed in the enforcement of such rules. My observation leads me to believe that, in a number of instances, the foreman is more to blame than the miner, because of his slack and inconsistent methods. But almost without exception the blame for an accident is laid on the miner.

To illustrate this fact, let me assume that the superintendent is pushing the foreman for an increased daily tonnage. In turn the foreman urges the miners to load more coal and, to do this and assist the boss to the extent of his power, many a miner neglects a piece of bad top that should be timbered before he loads his coal.

The miner takes a chance and starts to load his coal but is caught by the fall of the loose piece before he has finished the car. It may be that the boss came into the man's place while he was loading and observed the danger, but said nothing except to express his satisfaction at the number of cars being loaded. I want to ask, Where would the blame for such an accident rest—on the miner or on his foreman?

John Rose,
Dayton, Tenn. Former District Mine Inspector.

The Handling of Men

Letter No. 6—To my mind, the efficient handling of men is an important factor in coal mining, especially under the present labor conditions. To be successful in getting the most out of men and keeping them satisfied and contented, a foreman must be a good student of human nature. In dealing with his men he must use tact and diplomacy.

The coal-mining industry employs workers from all quarters of the globe. In our mines are found English, Scotch, Welsh, Irish, French, Swede, German, Russian and Italian workmen. In a few instances Chinese coolies from the Far East and Mexicans from beyond the Rio Grande are employed. These representatives of different nationalities each possesses characteristics peculiar to his race and often presents a marked contrast with the qualities of the American miner.

To deal successfully with these men, the foreign miner must be treated largely from his own standpoint or way of thinking and acting. Many individuals of the same nationality manifest certain traits peculiar to the section of the country from which they hail. Some may come from the north of England, others from the plains of Italy, and these present quite different characteristics. While the Englishman has a roundabout method of dealing, the Italian has a more decisive way and requires being treated accordingly. All have their prejudices and moods. The man who presented no difficulty yesterday may seem to be quite impossible today.

The foreman is often compelled to deal with these men not as he ought to, in view of their acts, but as his judgment and tact will suggest. Agreement with opinions and tastes, in some pososible respects, and the tactful changing of the subject when one cannot agree, will go far toward producing harmony and success. Patience is the mine foreman's greatest asset. To keep the confidence of these men the foreman must be absolutely genuine and sincere at all times. The successful foreman can never ride roughshod over his men. He must be human in his dealings with them. The methods of war have no place in a coal mine if the best results are to be obtained. Let every foreman study to please his men and he will find them more willing to please him and do his bidding.

Smithton, Penn. Robert Littlehales.

The Old Guard

Letter No. 1—A Foreword that appeared some time since in *Coal Age* [Vol. 12, p. 309] impressed me deeply at the time. It spoke of "recompensing loyalty" in faithful employees who, after a lifelong service of devotion to one company have been set aside for younger men, regardless of the fact that the experience and counsel of the older men are valuable assets in the economical and safe operation of the mine.

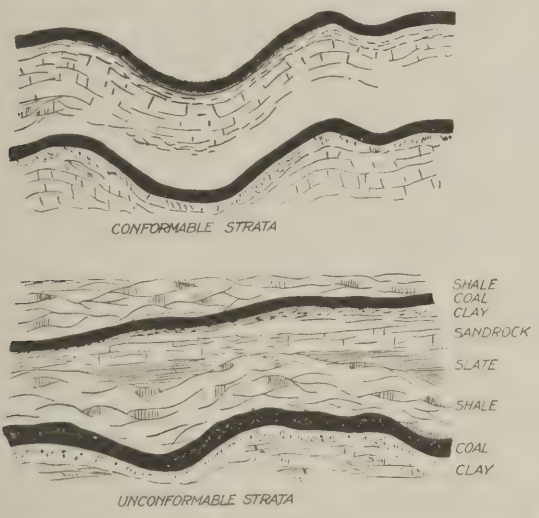
The truth conveyed in this Foreword, which might well have been entitled "The Old Guard," was forcibly brought home to me recently while shopping in one of the large department stores in a near-by city. In this store I observed two or more gray-haired men who had seen their 40 or 50 years of service and had probably been retired, only to be placed again in the harness owing to the urgent need when the war crisis had called younger men to the colors.

These members of "The Old Guard" were willingly doing their bit and serving beyond their time, as a loyal act to their employers. It occurred to me that the same loyalty to service would be displayed by more than one veteran in the mine service, and that their experience and knowledge of mining conditions would be valuable.

If "The Old Guard" render efficient service in the store, why is it not possible to secure the same efficiency by placing "The Old Guard" at the mines in positions where their mature judgment would be of service. The younger men can learn much from the experience of those who are older, and greater safety and economy would result. My suggestion, for the present emergency at least, is to put the "The Old Guard" back again in harness where they can render efficient service in work of which they are capable.

Berlin, Penn. Joseph A. Graves.

INQUIRIES OF GENERAL INTEREST



Conformity in the Coal Measures

I desire to ask for information in regard to the general correspondence of local dips and rises in two seams of coal separated by from 40 to 80 ft. of intervening strata. For example, when a dip or rise is found in the working of a lower seam is it reasonable to expect that a corresponding dip or rise will be encountered, at the same point, in an overlying seam? Or, say where a well-defined basin exists in one seam, would it be expected that a similar basin would be found in another seam lying a considerable distance above the first?

I would like to hear from men who have had experience in working seams overlying or underlying others that have been previously worked, and who have observed in regard to the occurrence of similar elevations or depressions in both seams at the same point.

Clarion, Penn. J. W. S.

Two seams lying in the same formation, although separated by 50 or 100 ft. more or less are very apt to present similar features at the same point in the seam. For example, as illustrated in the upper half of the accompanying figure, a general roll forming a syncline

IDEAL SECTIONS IN THE COAL MEASURES

or an anticline in the formation is very liable to affect both seams, but this is not always the case. As shown in the lower half of the same figure, it sometimes occurs that the intervening strata are unconformable between the two seams, in which case the configuration in the upper seam will not correspond to that in the lower seam.

The question of correspondence in the physical features in two seams, the one overlying the other, will depend on what has taken place between the time when the lower seam was deposited and that when the upper seam was laid down. There may have been a period of disturbance in the interim between the deposition of the two seams.

The disturbance may have elevated certain portions of the lower seam and depressed others, forming anticlines and synclines in the strata. Following this period of unrest, the upper seam is laid down on the disturbed formations, in which case its bedding would be practically level, where synclines and anticlines occur in the lower seam.

Again, during the period of the deposition of the two seams, there may have occurred a general elevation of the strata so as to form a land surface, and, before the laying down of the second seam, this surface may have been eroded by geological agencies such as wind, water, or ice, whereby a configuration results that is entirely distinct from that existing in the lower formations. Somewhat later, a sinking of the strata occurs and the upper seam is deposited over this area, which has been thus changed by erosion, and unconformity results.

It is evident that any disturbance occurring after the deposition of the two seams will affect both alike, and the same dips and rises that occur in the one seam will be found in the other. But, should such a disturbance occur during the period separating the deposition of the two seams, as has been described, the upper seam will not generally be found conformable in all respects, with the configuration of the lower seam.

The accompanying figure illustrates the two conditions, showing, respectively, conformity and unconformity in the strata enclosing two seams of coal. As previously stated, the former condition is the more common. Especially is this true throughout the bituminous coal fields, where there has been less faulting of the strata and violent disturbance that would give rise to unconformity.

We know that this question of the correspondence of dips and rises in two contiguous seams will meet with a hearty response from the many practical mining men who are interested in the Discussion department of *Coal Age*, and shall be glad to learn the results of their observations and experience.

Elevation of Outer Rail of Track

Can you give me a simple rule for ascertaining the proper elevation for the outer rail of a mine track?

Springfield, Ill. MINE SURVEYOR.

Stretch a line, as a chord of an arc, on the inside or gage line of the outer rail of the track, allowing 17½ in. in the length of the line, for each mile per hour in speed of hauling. The middle ordinate of this cord will be the required elevation of the outer rail. Thus,

For a speed of 4 mi. per hr., length of chord is 5 ft. 10 in.
For a speed of 6 mi. per hr., length of chord is 8 ft. 9 in.
For a speed of 8 mi. per hr., length of chord is 11 ft. 8 in.
For a speed of 10 mi. per hr., length of chord is 14 ft. 7 in.

EXAMINATION QUESTIONS

Utah Mine Foremen's Examination, Held at Price, Nov. 7, 8, 1917

(*Selected Questions*)

Ques.—If the total pressure upon a ventilating door is 400 lb. when the water gage is 2½ in., what is the area of the opening; and what is the height of the door if its breadth is 5 ft. 6 in.?

Ans.—A water gage of 2½ in. corresponds to a pressure of 2½ × 5.2 = 13 lb. per sq.ft. The total pressure on the door being 400 lb., the area of the opening is 400 ÷ 13 = 30.77 sq.ft. The breadth of the opening being 5½ ft., its height is 30.77 ÷ 5.5 = 5.59 or, say 5 ft. 7 in.

Ques.—Compare the perimeters and areas of the following airways: One airway is circular and 7 ft. in diameter; another 6 ft. by 5 ft. in section; and a third 5½ ft. square. State which of these airways you would prefer, and find the velocities, in feet per minute, when an air current of 12,000 cu.ft. per min. is passing in each.

Ans.—The circular airway has a perimeter of 3.1416 × 7 = say 22 ft. Its sectional area is 0.7854 × 7^2 = 38.48 sq.ft.

The perimeter of the rectangular airway is 2(6 + 5) = 22 ft. Its sectional area is 6 × 5 = 30 sq.ft.

The perimeter of the square airway is 4 × 5.5 = 22 ft. Its sectional area is 5.5 × 5.5 = 30.25 sq.ft.

When passing 12,000 cu.ft. of air per min., the velocities in these several airways are as follows:

Velocity in the circular airway, 12,000 ÷ 38.48 = 311.85 ft. per min.

Velocity in the rectangular airway, 12,000 ÷ 30 = 400 ft. per min.

Velocity in the square airway, 12,000 ÷ 30.25 = 396.69 ft. per min.

For the purposes of ventilation, the circular airway is preferred, because it gives the largest sectional area for the same rubbing surface; and it will therefore pass a large quantity of air for the same unit pressure, than either the rectangular or the square airway.

Ques.—What method of ventilation lessens the danger of an explosion and reduces friction?

Ans.—Splitting the air current in a mine reduces the danger of an explosion, by distributing the air to the different sections of the mine in proportion to their needs. At the same time, the velocity of the air current at the working face is reduced, with the result that less mine dust is carried in suspension in the air and the gases produced in each section are conducted at once to the return airway and carried out of the mine without passing into the other sections. In this system, a local explosion of gas or dust occurring in one section is not liable to be transmitted to another section of the mine.

Also, by dividing the air current into two or more splits, the same quantity of air is circulated at a less velocity, which greatly reduces the friction of the air and lessens the power necessary to produce the circulation. While splitting the air current does not reduce the danger of a local explosion occurring in a working place, it does reduce the danger of that explosion being extended throughout the workings of the mine and producing a mine explosion.

Ques.—If 13 cu.ft. of air, at the ordinary temperature and pressure, weighs 1 lb., how many tons of air is passing through a mine in 8 hr., where the current measures 52,000 cu.ft. per min.?

Ans.—The weight of air passing through the mine in 8 hr., in this case, is

$$\frac{8 \times 60 \times 52{,}000}{13 \times 2000} = 960 \text{ tons}$$

Ques.—What should be done in case of accident to a ventilating fan or its driving machinery?

Ans.—Notify the men and withdraw them from the mine as quickly as possible. In the meantime, keep the fan going at a moderate rate, if possible, until all the men have reached the surface. Use every means to keep up the circulation of air in those sections of the mine where a longer time is required to withdraw the men. To do this, short-circuit the air in other sections where the men have been withdrawn.

In a large mine, where considerable time will be required before all the men can reach the surface, it may be possible to install a steam jet in the upcast shaft. Or, perhaps, a wind cowl can be constructed at the top of the downcast shaft, or at the mouth of the slope, to deflect the surface wind into the mine, where there is a strong prevailing wind on the surface. This work, however, must not interfere with efforts to get the men out of the mine as quickly as possible.

Ques.—A current of 3000 cu.ft. of air is at the explosive point; how much fresh air must be added so as not to get a cap on the safety lamp?

Ans.—Assuming that this air current is charged with gas to its maximum explosive point when it will contain 9.46 per cent. of gas, the quantity of gas in this current is then 3000 × 0.0946 = 283.8 cu.ft. per min. The lowest percentage of gas that can be detected on an ordinary safety lamp, as an unbonneted Davy lamp burning sperm or cottonseed oil, is 2 per cent., although some firebosses have difficulty to detect less than 2½ per cent. of gas. Estimating on the lower percentage, the total volume of air and gas when a cap is just discernible on the lamp, would be, in this case, 283.8 ÷ 0.02 = 14,190 cu.ft. per min. The quantity of air to be added to produce this result would then be 14,190 — 3000 = 11,190 cu.ft. per min.

Again, taking 2.5 per cent. as the basis of estimate, the total volume of gas and air in circulation when a cap is first discovered on the lamp, would be 283.8 ÷ 2.5 = 11,352 cu.ft. per min.; and the quantity of air to be added, in that case, would be 11,352 — 3000 = 8352 cu.ft. per min.

COAL AND COKE NEWS

Harrisburg, Penn.

Reports that Governor Brumbaugh is considering the idea of an extra session of the Legislature have caused numerous suggestions as to legislation to be included in the call. It has been 12 years since an extra session was held, and one would cost about $500,000 or more, according to its length. Among the suggestions made to the Governor are waterways for carrying coal and mine-cave legislation. Several delegations from the anthracite regions have called at the Governor's office during the past week, urging the Governor to include a remedy for the mine-cave evil in his call, should he decide to convene the Legislature.

Suggestions that the Fuel Administration fix a premium of about 10 per cent. for quality, in addition to the new price of $3.05 for coal at the mines, was made on Feb. 20 by Representative Louis T. McFadden, representing the 14th Pennsylvania district in Congress. Mr. McFadden is quoted as saying:

"Now that the Fuel Administrator has fixed a price for coal at the mines of $3.05 a ton, there should be added to the price he fixes a premium of about 10 per cent. for quality coupled with a condition that any producing company shipping coal of poor quality should be penalized for so doing.

"This premium would be incentive to the operator to bring his coal to the highest possible standard. When he has so done the railroads would be relieved of carrying much of the refuse that is now being carried and which is of no use to the consumer when he gets it."

It is pointed out by operators in the central Pennsylvania district that under the new price ruling of Dr. Garfield, where the price of run-of-mine steam coal is set at $3.05 net, there is no longer any extra allowance permitted on smithing coal. The rule now is that smithing coal must be sold at the price of prepared coal in the district where it originates, and as there is no prepared coal shipped from the central Pennsylvania steam-coal districts, the price of central Pennsylvania smithing is now $3.05 net at the mine, or $3.20 jobbing.

Coal operators in the Pittsburgh District have again taken up the question of higher prices per ton and are now working on a uniform system of cost sheets on which to base an application to Washington for a higher price. For the benefit of mines using electrical power, the matter of curtailing power from the West Penn Power Co. and other companies to less essential industries is under consideration.

Plans were outlined at a conference of fuel administrators from the central and western counties of this state on Feb. 23, to accelerate production and equitable distribution of bituminous coal for Pennsylvania industries. Many vital war industries are hampered by lack of bituminous. At the same time it was decided to begin a clean-coal campaign at the mines.

J. P. Cameron, bituminous distributor, addressed the conference. He told the fuel administrators that his office was compiling data of the capacity of the mines, points of distribution, and such other details of the coal industry as will enable him to arrange a plan of equitable car distribution, so that each mine will operate on the ratio of its capacity. At present many mines operate every day, while others in the same district only work one or two days each week. It was the unanimous opinion of the conference that the advance in the price of soft coal from $2.45 to $3.05 a ton has stimulated production, many mines having resumed operation after being closed for several months.

B. Leopold, county fuel administrator at Altoona, told the conference that during the coal crisis of several weeks ago the loyal support of the railroad officials and employees enabled him to supply fuel to homes and industries. This, he said, was in defense of the Pennsylvania Railroad and its employees. One of the developments of the conference was that more than 110,000 tons of coal are mined annually in the winter season by farmers, who are agriculturists in the summer months and miners in the winter. These men refused to operate their small mines at the prices fixed by the Government.

With the price at $3.05 a ton, hundreds of farmers have agreed to resume work in mines employing less than a dozen men. The fuel of the farmer-miners is used solely for domestic consumption. However, every such mine that is not producing throws a heavier burden on the large producers.

Millions of dollars worth of culm banks are disposed of by a decision of the Supreme Court in the equity proceedings of W. L. Kramer, of Pottsville, against John Slattery, of Port Carbon. By the decision independent coal companies which years ago deposited culm on lands now owned by big coal corporations still own the culm, even though the land on which it rests has changed hands.

Kramer asked the county court for an injunction against Slattery, an independent coal operator, to prevent the latter from using certain culm claimed by Kramer. The county court refused the injunction, but the Supreme Court orders a hearing, after stating the law, and places the costs on Slattery. G. T. O'Donnell & Co., of Philadelphia, who claimed possession of the big culm banks at Loyalton, did not press their contention when the case was called in court on Feb. 23, the announcement being made that the case was discontinued. This leaves the big culm banks in possession of T. D. Bergen, of Pottsville. It was asserted by the Philadelphia concern that they had made arrangements to buy the banks from Bergen for $150,000 and that the check for the first payment was handed over. Bergen, however, asserted that the check was never cashed and the preliminary agreements were not carried out.

PENNSYLVANIA

Anthracite

Mahanoy City—A committee of 70 representative citizens has decided to build a hospital here for injured miners. An organization has been effected with Councilman John Adams as president and D. Hiram Morgan as secretary.

Shamokin—Every colliery in the Shamokin-Mount Carmel district was in operation on Feb. 22, the first time in history that the miners worked on Washington's birthday. Record production was reported by company officials. Foremen met the men at the shafts and slopes as they left the mines and thanked them for their patriotism.

Scranton—Following the announcement on Feb. 20 that the Government had fixed standards for the anthracite coal operators, and expected that in the future every colliery in Lackawanna County would turn out a cleaner and better grade of coal, Tudor R. Williams, fuel administrator, has ordered six breakers closed until such time as they can at least approximate those standards. Mr. Williams has stated that three or four others now being investigated will be closed unless changes in their methods of preparation are made. He would not divulge the names of the operators who had felt the strong arm of the Government, because, he said, he hoped they would make immediate effort to obey the law.

Notice has been served on St. John's Catholic Church, by the Delaware, Lackawanna & Western R.R., Coal Department, that it will soon begin mining operations under the edifice and that if the congregation desires to purchase the pillars as a means of safeguarding the property it should act immediately. The entire property is valued at $250,000.

Kaska—The Kaska colliery of the Alliance Coal Mining Co. will be reopened this spring and will be operated with Harwood power furnished by the Lehigh Coal and Navigation Electric Co. This colliery was closed down some years ago when a disagreement between the railroads made it hard to get a car supply.

Zehner—The East Point Coal Co., operator of the Pound Creek mines near here, is without a breaker and is sending run-of-mine coal to market.

Jeddo—The G. B. Markle Co. is erecting a steel washery at its No. 4 breaker, which will increase the output about 500 tons daily.

Ashland—The reclamation of the old Bickel colliery at Lavelle, near here, abandoned more than 20 years ago, began Mar. 1, when the Laurel Hill Coal Mining Co., controlled by Wilkes-Barre capital, put into operation its big breaker, the most modernly equipped in this end of the anthracite region. The breaker has been erected at a cost of $100,000. The reopening of the long abandoned colliery is to be followed by the reclamation of other abandoned mines in which there remain hundreds of thousands of tons of coal in supporting pillars and in the underlying veins.

Audenried—The Lehigh Valley Coal Co. has purchased outright about 260 acres of coal land from the New York & Lehigh Coal Co. The purchase was effective Jan. 1 and anticipates the expiration of a lease in April, 1918, which the Lehigh Valley Coal Co. bought from George H. Meyers & Co. in 1892, and under which it has been mining coal in the tract since that time. The coal mined from the tract is taken to the Spring Mountain breaker at Jeanesville for preparation.

Bituminous

Indian Head—The properties of the Indian Creek Collieries Co., controlled by Vernon F. Taylor, of Indiana, has been sold to Pittsburgh capitalists. The property includes 800 acres of coal land, 20 miners' houses, the Indian Creek mine and other buildings connected with it. The new company has started improvements on the property and is installing a modern electric plant. The consideration was not made known.

Vintondale—The floods during the past week closed several of the mines along Black Lick Creek. In most cases the mines are on the north side of the creek while the towns are built on the south side. During the night several of the bridges connecting the mines and the towns were washed away and the mines were idle for a few days because no men could get over the creek to their work. Temporary bridges were soon constructed and in a few days the mines were working full capacity.

Pittsburgh—The annual meeting of the mine foremen and firebosses examining boards for the various bituminous districts of Pennsylvania has been called for Friday, Mar. 8, at the Seventh Avenue Hotel, Pittsburgh. The meeting will be attended by about 100 of the leading mining men of Western Pennsylvania.

Dubois—William Black, a Luthersburg miner, is in the local hospital for treatment of horrible burns about the head, face and especially the eyes, caused by the explosion of a carbide light. Mr. Black touched a light in his lamp and the gas exploded in his face. It is feared that his sight may be permanently destroyed.

WEST VIRGINIA

Charleston—The Wolf Den Coal Co., with a mine at Shallmar, on the line of the Western Maryland R.R., expects to ship coal some time in March. Due to delay in receiving equipment development work had been held up.

Horner—The Stone Coal Co. is now shipping from its new mine near here.

Accoville—The operation of the United States Block Coal Co., located on Coal River, have been taken over by the Carbon Hill Collieries Co.

Mullens—The Norfolk & Western Ry. has been ordered by the West Virginia Public Service Commission to extend a spur track to the Trace Fork Coal Co.'s mine at Trace Fork. The coal company has to pay for putting in the siding and maintaining it.

Bluefield—The commissary of the Pocahontas Fuel Co. at Switchback was burned recently. The building was totally destroyed, and the loss is estimated at $25,000. A short-circuit is said to be responsible for the blaze. This is the second time this company's store and stock has been burned. The company is confronted with a problem, as there is no building at Switchback large enough to store the goods necessary to supply the miners. A modern brick store-and-office building is under construction.

Tunnelton—The Car-Diff Smokeless Coal Co., which has been developing a mine in the Upper Freeport vein of coal on a tract of about 800 acres, acquired a few months ago by it at West End, near Tunnelton, Preston County, West Virginia, is now ready to ship coal. The company expects to start shipping about 300 tons a day and increase as development increases. The plant is on the Baltimore & Ohio R.R. at the west end of the Tunnelton tunnel.

ILLINOIS

Virden—Twenty-eight cases of powder exploded at the Royal colliery here on Feb. 22. Four men were killed.

Marissa—W. F. McMurdo of Marissa, E. F. Winkler, of Belleville, August G. Koesterer of Freeburg and George Wombacher of Mascoutah have been named as a committee to issue licenses to mine owners and superintendents for the use of explosives and have begun issuing them.

Witt—Fourteen suits brought by local property owners against the Peabody Coal Co. for damages caused by the settling of the surface of the ground when the company removed the props from the Witt mine have been settled by the payment of $4000 by the company to the plaintiffs, who divided it according to the amount of damage each had sustained.

Troy—The Donk Brothers Coal and Coke Co. is experimenting with storage battery motors in its No. 3 mine here. They are intended to take the place of mules in the gathering of cars from the rooms.

Edwardsville—Prospecting is being done on a tract of about 12,000 acres in Pin Oak and Edwardsville townships, preliminary to important development work. It is understood that at least four shafts will be sunk. The tract is convenient to the Illinois Central in the vicinity of Mont and Kuhn Station, the Clover Leaf east of Edwardsville and the belt line south of Edwardsville. Circuit Judge William P. Early is interested in the enterprise.

Chatham—The new Solomon coal mine will be opened soon. It is estimated to produce from 3000 to 5000 tons of coal a day when mined to full capacity. A seam of coal 7 ft. thick is available. From 500 to 600 men will be employed.

Lincoln—The mine of the Lincoln Mining Co. will be wrecked and business suspended, as announced two weeks ago. An effort was made by business interests of Lincoln to save the mine for the benefit of the city's growth and development as an industrial center, but it was found that the expenses of checking the fire raging in the mine would exceed the profits of the company. Accordingly, the work of razing the mine buildings and of sealing the shaft, after a temporary delay during which it was hoped to save the industry, were continued.

Springfield—Four miners were killed in an explosion in a mine of the Citizens Coal Company. The dead are Ray Hiner, Henry W. Heichel, Thomas Reilley and Ernest Cox. All four of the men were shot-firers and were buried in the explosion. It is not known what caused the explosion. But little damage was done to the property of the mine.

Springfield—Evan D. Jonn, state director of mines and minerals, has announced the following itinerary of the Miners' Examining Board for March as follows: Duquoin, Mar. 7; Christopher, 8; Harrisburg, 9; West Frankfort, 11; Herrin, 12; Belleville, 14; Collinsville, 15; Litchfield, 16; Springfield, 19; Pana, 20; Danville, 21; LaSalle, 23; Peoria, 25; and Canton, 25.

Virden—Four men were killed by a powder explosion in the Royal Colliery mine here when 28 kegs of powder exploded. It was being hauled in the mine on a car and it is understood that it became ignited either from an overheated journal or some similar cause.

Springfield—Four shotfirers were killed in an explosion in the Citizen's Coal Co mine here on Feb. 23, in the early morning hours. They were buried beneath the wreckage. Three others in the mine escaped. The property damage was small. The cause of the accident is unknown.

INDIANA

Terre Haute—Fire recently destroyed a $30,000 tipple and mining machinery of the Jackson Hill Coal and Coke Co. Manager J. C. Kolsom reports that the company will rebuild at once, and that its output has been lowered 2000 tons a day as a result of the fire.

Linton—The Greene Valley Coal Co. has changed its principal place of business from Terre Haute to Linton.

KENTUCKY

Pineville—A runaway of 37 mine cars at the Elliott branch mine of the Federal Coal Co., at Pineville, Ky., resulted in the wrecking of a number of cars, spilling of coal all about the tipple, and damage to the tipple to such an extent that it became necessary to shut down the mine for several days.

UTAH

Hiawatha—The Black Hawk mine of the United States Fuel Co. produced Feb. 1 what is believed to be a record breaking tonnage for the Rocky Mountain district. On that day 3358 tons of coal were loaded into 60 new cars of the Utah Railway Co., there being an average of 112,000 lb. or 56 tons to each car. During the month of January the mine produced over 50,000 tons of coal, an unusually high record for Utah.

Foreign News

Sydney, Australia—The government of New South Wales has agreed to supply the States of Victoria, South Australia and West Australia with all the coal they need for a period of five years. The New South Wales Government intends to nationalize all the coal mines in the state.

Personals

Loyall A. Osborne, of New York, vice president of the Westinghouse Electric and Manufacturing Co., and chairman of the executive committee of the National Industrial Conference Board, has been appointed, by the Secretary of Labor, a member of a committee on industrial peace during the war. This committee, which consists of five representatives of employers, five labor leaders and two public men, will provide a definite labor program in order that there may be industrial peace during the war, thus preventing interruption of industrial production vital to the war.

LOYALL A. OSBORNE

George Carter, formerly chief coal inspector for the G. B. Markle Co., of Jeddo, Penn., has been appointed Federal Coal Inspector for the lower end of Luzerne County, Pennsylvania.

J. B. Hart, president of the Hartland Colliery Co., of Clay, W. Va., is temporarily managing the affairs of the company since the death of M. McDonald Price, who was general manager of the company's mines in Coal & Coke R.R. territory.

W. H. Thompson, for many years prominent in the heavy electric traction work of the Westinghouse Electric and Manufacturing Co., has resigned to accept the position of works manager of the Fairmont Mining Machinery Co., of Fairmont, W. Va., makers of coal-mining equipment.

Charles M. Means, consulting mining engineer, with offices in the Oliver Building, Pittsburgh, Penn., has opened a New York office at 90 West St. Mr. Means, who is well known to the coal-mining industry, has delegated all office work to a member of his staff, and spends most of his time in the Pittsburgh office.

F. O. McGuinness, for some time northern sales manager of the Bader Coal Co., and manager of the Buffalo office of the company, has resigned to become the purchasing agent of several coal-consuming concerns, with office in Buffalo. In consequence of the resignation the office of the Bader Co. will be closed.

Douglas Bunting, mining engineer for the Lehigh and Wilkes-Barre Coal Co., Wyoming Division, will succeed General Superintendent Newbaker when the latter leaves for his new post with the Berwind White Co., on Mar 1. **Arthur Lewis**, now with the G. B. Markle Co., at Jeddo, will take the position vacated by Mr. Bunting.

E. J. Newbaker, division superintendent of the Lehigh & Wilkes-Barre Coal Co., Wyoming Division, Wilkes-Barre, Penn., has resigned his position, effective Feb. 28. After Mar. 1, he will be associated with the Berwind-White Coal Mining Co., and will have headquarters in their offices, in the Commercial Trust Building, Philadelphia.

Thomas Haulton, of Pittsburgh, Penn., chief electrician and master mechanic for the United Coal Corporation and subsidiary companies, has resigned, effective Mar. 1, to accept a similar position with the George M. Jones interests in Ohio, with headquarters in Toledo. Mr. Haulton will be succeeded by his assistant, **James A. Malady**, of Elizabeth, Penn.

Henry G. Davis, of Kingston, Penn., formerly identified with the mining department of the Lackawanna Coal Co., has been named superintendent of the Wilkes-Barre division of the Lehigh & Wilkes-Barre Coal Co.'s collieries. The appointment was announced by C. F. Huber, president of the company, at a banquet tendered in honor of E. J. Newbaker, who recently resigned. Mr. Davis left the Lackawanna company's employ on Feb. 21.

Obituary

Elias Phillips, for many years a state mine inspector in central Pennsylvania, died Feb. 21 as he was entering the Adams Express office at his home in Dubois, Penn. He was in apparent good health to the moment of his death, and his decease from acute dilation of the heart was a severe shock to the community. Mr. Phillips at the time of his death was 58 years of age. He leaves a widow, three brothers and two sisters. Tis inspection district was known as the 4th Bituminous, and covered parts of Clearfield, Jefferson, Clarion and Clinton and all Elk and Cameron counties. Mr. Phillips was a practical miner, having swung a pick in his earlier years. In later years he had by frugality and good judgment become possessed of a comfortable competency.

George W. Theiss, president of the Theiss-Bygate Co., large coal operators of Pittsburgh, Penn., died Feb. 22, at the Eye and Ear Hospital shortly after he had taken a stroke on a street car while bound for his office. Mr. Theiss had been in the coal business in Pittsburgh since 1885 and was identified with several large operating companies there. He was a former vice president and director of the Monongahela River Consolidated Coal and Coke Co. and a director of the Pittsburgh Coal Co. He was also a director of the Duquesne National Bank. He is survived by his wife and one son.

John B. Hamilton, formerly a resident of Columbus, Ohio, who was prominent in coal mining circles, died at Los Angeles, Cal., recently at the age of 84 years. He was born in Scotland and came to America when four years old. He was the organizer of several mining ventures in the Buckeye State.

John F. Hunter, general manager of the Clover Bar Coal Co., Ltd., Edmonton, Alta., died suddenly of heart failure on Feb. 16 at the age of 45. He came from Winnipeg to Edmonton in 1910, where he engaged in the coal business and was one of the largest shareholders of the Clover Bar Coal Co. He leaves a widow.

Col. Reese A. Phillips, aged 55 years, former general manager of the Delaware, Lackawanna & Western R.R., Coal Department, died at his home in Scranton, Penn.,

on Feb. 22. Colonel Phillips started with the company as a breaker boy, and gradually advanced until he became general manager of the mining department. He directed the interests of the company until a few years ago.

Industrial News

Washington, D. C.—The executive committee of the International Railway Fuel Association has offered the services of the association to the conservative division of the fuel administration for such use as can be made of them.

Youngstown, Ohio—President S. Kerr, of the Sharon Steel Hook Co. announces that the construction of an additional blast furnace, a byproduct coke oven plant and houses for workmen are contemplated, but no definite action has been taken by the company.

Lexington, Ky.—The Garey Coal Co., 144 Short St., Lexington, recently organized by W. M. Hayes, C. E. Duff, J. T. Garey and others, to install a coal mine at Chavies, Ky., will receive bids in April for machinery for an open type of mine; daily capacity, about five cars.

East Pittsburgh, Penn. — The Westinghouse Electric and Manufacturing Co. announces the removal of its office from Phoenix, Ariz. to Tucson, Ariz. Its representatives, J. H. Knost and W. G. Willson, will have headquarters in the Immigration Building at the latter point.

Birmingham, Ala.—Operations have begun at the new shaft mine of the Birmingham-Tuscaloosa Coal Co., at Shiras, in the Blue Creek field, about 30 miles from Birmingham. The opening is on the Louisville & Nashville Railroad, and work has been in progress since last November.

St. Louis, Mo.—Five assistants to H. N. Taylor, fuel administrator for St. Louis, have been appointed by Federal Fuel Administrator Garfield. They are D. F. Cushing, Des Moines, Iowa; Charles Markham, Kansas City, Mo.; J. G. Puterbaugh, McAlester, Okla.; J. W. Hinton, Ada., Okla., and W. H. John, Bridgeport, Texas.

Columbus, Ohio—The Reliable Coal and Supply Co. is the name of a new retail concern located at West Broad St. and the Hocking Valley tracks. J. W. Bresnahan, formerly with the West Virginia Coal and Coke Co., is in charge as secretary and treasurer. Carl M. Deardorf is president. The authorized capital is $15,000.

Columbus, Ohio—The Hocking Valley Ry. Co. has been allotted about a dozen locomotives which were manufactured for Russian delivery. These locomotives are now in the railroad shops having finishing touches put on before being put into service. They will increase the efficiency of the road's motive power to a large degree.

Charleston, W. Va.—Government engineers are listening to the river coal men and boat men in considering plans for new locks and dams in the Ohio and Monongahela Rivers, as it is being urged that new locks should be made at least 700 ft. long, so that they can take through a complete coal tow without breaking it up.

St. Louis, Mo.—A judgment for $6000 has been given in the St. Clair County Circuit Court against the St. Louis & O'Fallon Coal Co. in favor of Mrs. Marguerite Eichhorn, of Belleville, for the death of her husband, Louis Eichhorn, in the so-called "Nigger Hollow" mine. She sued for $10,000. The company has filed notice of appeal.

St. Louis, Mo.—The Western Fuel Distributers Association, consisting of 26 jobbing concerns in St. Louis, which has been in existence since last summer, decided to disband this week in view of the fact that the jobbers' commission has been eliminated by Dr. Garfield. There were about 35 jobbing concerns in St. Louis, with a capital of about one-half million dollars invested.

St. Louis, Mo.—The ten municipal coal stations, which have been in operation since early in December, from which coal has been distributed to the poor at 16c. a bushel, were closed Mar. 1. The experiment is regarded as a success and the Board of Estimate and Apportionment has been asked to include in next year's budget an appropriation of $25,000 for the coal station next winter.

Indiana, Penn.—According to the annual report of State Mine Inspector Thomas S. Lowther, for the year 1917, there were 5,818,138 tons of coal produced with a total number of 5777 persons employed. There were 21 fatal accidents or a production of 277,054 per fatal accident. There were 11 new mines opened and an increase in production of 577,016 tons. The district comprises about one half of Indiana County.

Columbus, Ohio—Vigorous objection to lake shipment priority orders was made by county fuel administrators at the meeting held with Homer H. Johnson, Ohio Fuel Administrator in Columbus last week. A resolution protesting against any such orders, unless provision is first made to supply Ohio consumers with coal, was adopted. The national fuel administration at Washington will be advised of the action taken.

St. Louis, Mo.—The City Plan Committee of East St. Louis has recommended that the city grant to the Polar Wave Ice and Fuel Co. a permit to develop as a coal terminal 3½ blocks of property recently purchased by the company near the east approach to the Municipal free bridge. The plan is to install large concrete coal bumpers, sheds and tracks, from which to serve the business section of St. Louis with motor delivery.

Sedalia, Mo.—The coal dealers of this city have petitioned State Administrator Crossley that the Missouri zone to which Illinois coal is to be distributed be extended to include Pettis County. The western boundary of the zone is now just west of Jefferson City. Normally about 75 per cent. of the coal consumed in Pettis County comes from Illinois, and the dealers declare the supply from other sources is inadequate.

St. Louis, Mo.—The Coal Service Bureau is preparing to launch a "buy-early" campaign. Posters and literature will soon be issued urging householders to purchase their next winter's supply of fuel during the early spring and summer. State Administrator Crossley has given assurance that all the energies of the administration will be lent to the campaign and the St. Louis Fuel Committee will appoint a committee to coöperate.

Frankfort, Ky.—The Kentucky Railroad Commission has heard the protests of the Paducah Board of Trade, Mayfield and Fulton, Ky., relative to the increase in rates on western Kentucky steam and domestic coal. Steam coal was recently increased from 60 to 90c. a ton, and the railroads are endeavoring to increase the rate on domestic coal from 80 to 90c. a ton. The hearing was at the Paducah Board of Trade rooms.

East Pittsburgh, Penn.—The Westinghouse Electric and Manufacturing Co., has recently secured the exclusive sales agency for the United States for Frankel solderless connectors, widely used for joining electrical wires and cables. Manufacturing facilities have been increased by the Frankel Connector Co., in order to care for the new business to be secured through the Westinghouse sales organization. The Westinghouse company will act also as a distributor of Frankel testing clips.

Jefferson City, Mo.—Every town and city in Stone County, Missouri, will be "off" of coal next winter. Dr. C. D. Craig, fuel administrator for the county, has notified State Administrator Crossley that the entire county is pledged to wood until the war is over. There is an abundant supply of wood in the county and wood-chopping bees will be held during the summer. Dr. Craig says that by next fall the woodsheds of the county will have enough stovewood piled up in them to do for the winter.

St. Louis, Mo.—P. H. Greenlaw, Secretary of the Fifth and Ninth Districts Coal Bureau, has been appointed distributor for those districts, which supply most of the fuel needs of St. Louis. He will be in direct charge of the output of the two districts under the supervision of Dr. H. G. Honnald, of Chicago, fuel distributor for Illinois. Missouri Fuel Administrator Crossley and the St. Louis Fuel Committee have contended that the distribution from the Fifth and Ninth districts should be in the hands of a St. Louis man.

St. Louis, Mo.—St. Louis coal jobbers met Thursday, Feb. 21, and voted to dissolve their organization, the Western Fuel Distributors' Association, because of the order of Fuel Administrator Garfield abolishing the profit of 15c. a ton which they have been receiving since the Government fixed the prices. A suggestion that the organization join with the national organization in fighting the order was vetoed or account of the expense that would be involved. St. Louis jobbers expect to be forced out of business unless the order is rescinded or modified.

Hazard, Ky. — Due to the freight-car shortage, over 75,000 tons of coal which could have been shipped out last week was held up, according to a report of District Fuel Administrator A. R. Hord, who stated that the report of the week showed that the companies of the Hazard field were able to fill approximately 470 cars, while only 208 cars were received on average days. About 44 per cent. of the amount that could be shipped was actually moved. Mr. Hord stated that it was not a real shortage of cars, but a shortage of cars at the mines, due to the inability of the railroads to move the coal.

Rockdale, Texas — Henry G. Butler & Sons, of Hillsboro, Texas, have purchased 1238 acres of lignite lands near Rockdale, in Milam County, and will soon begin mining operations there on a large scale. The land purchased lies about 9 miles southwest of Rockdale and has long been recognized as virgin lignite fields, heavy veins having been found as near as 25 ft. of the surface. Of the land purchased, $30,000 was paid for a tract of 629 acres and $24,000 for another adjoining tract of 609 acres, giving 1238 acres in one solid block. Announced plans of the Hillsboro firm contemplate building a railroad from the nearest point on the International and Great Northern R.R., a distance of about 5 miles, and installing large steam shovels for stripping purposes.

Milwaukee, Wis.—To insure service and every possible assistance to the various departments of the U. S. Government in Washington, D. C., the Cutler-Hammer Manufacturing Co. has arranged to locate H. W. Knowles, of their New York office, permanently in Washington for the period of the war. Mr. Knowles entered the service of the Cutler-Hammer Manufacturing Co. shortly after graduating from Cornell University in 1912. He spent nearly five years in the shop, engineering department and sales department at Milwaukee. Since May of last year he has been connected with the New York district office, Hudson Terminal Building. The Washington Cutler-Hammer branch will have its headquarters at The Bradford, corner 18th and K Sts., telephone, Main 8426.

Cincinnati, Ohio—Members of the Cincinnati branch of the National Coal Jobbers' Association met at the Hotel Sinton on Feb. 21 to consider what action should be taken by them in connection with the plan of the Fuel Administration, as reported, to eliminate the jobbers' profit and, therefore, the jobber. The elimination of the permitted 15c. profit now allowed jobbers would force the operators to sell direct to large consumers, and to leave small consumers to their own devices, in the opinion of Cincinnati jobbers, thus causing considerable distress by leaving small consumers without means of getting coal. Fred Legg, of the Logan and Kanawha Coal Co., presided as president of the Cincinnati jobbers. A telegraphic protest was sent to Washington, and the jobbers will await the result of conferences which have been held with Fuel Administrator Garfield.

Cincinnati, Ohio—The stimulus given by Washington to the cause of water transportation has been felt more directly in the Ohio Valley, perhaps, than anywhere else in the country, and action looking to more extensive use of the river, especially in coal transportation, is being planned by several organizations, notably the Ohio River Imporvement Association and the Chambers of Commerce of the several principal cities along the river. A company with a capital stock of $600,000, with a fair return on the investment to be guaranteed by the Federal Government, has been proposed, and another plan contemplates Federal control of such a company. All interests agree that Federal support is necessary for the success of a venture large enough to handle traffic on a large scale, and to compel railroad coöperation, lack of which has been one of the chief causes of the decline of river traffic during the past generation.

Cincinnati, Ohio—The United States Circuit Court of Appeals, after hearing the arguments of all interests involved, is considering an application of the Central Trust Co., of New York, trustee of the bonds of the Continental and of the Kanawha & Hocking Coal and Coke companies, for instructions from the court as to the proper manner of making collection from the Hocking Valley Railway Co. of judgments against that company obtained by the New York Central Railroad Co., owner of the bonds, aggregating $2,500,000.

MARKET DEPARTMENT

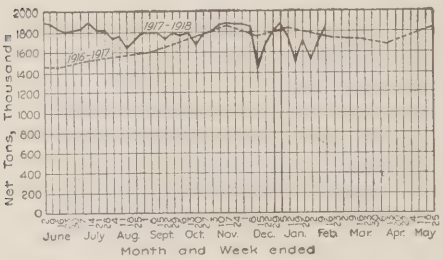
Weekly Review

This Winter's Coal Troubles Almost Over—Transportation Improved, Though Cars Are Still Short at Mine—Trade Awaits Announcement of New Prices

A SURE sign that fuel troubles are almost over for the present is evidenced by the fact that the country as a whole is now laying plans for next season's requirements instead of worrying about immediate needs. Even the situation in New England shows signs of improvement, better weather having enabled the movement of more coal from the southern tidewater ports via all-rail and Long Island Sound. Beyond Portland, however, the ports are still closed by ice. The shortage of vessels also continues to be a deterrent.

Though transportation conditions in general show marked signs of betterment, much of the freight congestion having been cleared away, there are still well-founded complaints of a shortage of empty cars at the mines.

Receipts of anthracite at tidewater are more plentiful; but the demands for this, as well as for any grade of coal, are still strong. Bituminous coal is extremely short. The output in January was the lowest for any month since September, 1914, owing to inadequate car supply and railroad congestion. "Give us more cars, and we'll flood the country with soft coal," say the bituminous operators; and statistics show that they can do it.



Prices for the most part are based on contracts entered into before the Federal price regulations went into effect, and there is little, if any, spot coal offered. No new contracts are reported, the trade evidently waiting for the announcement of the new price schedule promised before Apr. 1.

The anticipated elimination of the jobbers' commission has caused much criticism, as it is considered that this branch of the trade performs an important function.

Great care is still necessary in distribution and consumption, as no large reserve stocks of coal exist. Bunkers and bins were scraped bare during the past three months, and coal will neither be cheap nor plentiful this year.

COAL PRODUCTION

Production returned almost to normal during the week ended Feb. 16. The total bituminous output, including lignite and coal made into coke, is estimated at 11,084,000 net tons, nearly a million tons greater than in the preceding week. The average production per working day was 1,847,000 tons, as compared with 1,753,000 tons, the daily average for February of last year. The performance per working

day was better than at any time since early December, except during New Year's week. Indeed, because New Year's week contained but five working days, last week's total production exceeded that in any week since Dec. 8. Beehive coke shared in the recovery experienced by the bituminous industry as a whole. The total production for the week is estimated at 557,000 net tons, an average per working day of 93,000 tons.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Jan. 26	Feb. 2	Feb. 9	Feb. 16
Bituminous, shipments, 121 roads	181,471	170,552	181,586*	199,136†
Anthracite shipments, 9 roads	33,406	34,482	32,011*	35,486†
Beehive coke shipments, 4 roads	10,408	9,655	10,470*	11,425†

*Revised from last report. † Subject to revision.

Atlantic Seaboard

BOSTON

Situation less acute and Monday holidays discontinued. Naval collier turned over to Fuel Administration opens gate to manufacturers for limited supplies. Large tonnage still being distributed for domestic use. Army quartermaster's department helps secure ships for New England. Receipts by water gradually increase, but far behind requirements. Railroads still on narrow margins and large textile and other plants are able only to get coal for a few days at a time. Panama R.R. colliers to stay in coastwise service for the present. Rail shipments very disappointing. Several mines previously shipping on "New England order" are having output diverted on Government requisitions. Outlook not very hopeful for spring shipments unless more bottoms are secured.

Bituminous—"Blue Mondays" are given up and those industrials having coal on hand have resumed operations on a normal basis. Many of the very small plants have been able to get fuel for a week or two ahead, but the larger the plant the more difficult it is to be assured a continuing supply. Mills burning 1 to 3000 tons weekly are patching along from day to day with the liberal use of culm and other substitutes, but unless arrivals show material increase there will be small chance of steady operation. What hope there is lies with the different departments at Washington, where officials are enough interested in the output of various New England plants to bring pressure to bear upon the authorities who have the disposition of ships. It is impossible to get sufficient supply all-rail under present conditions. Cars are taking six weeks to reach destination from the mines in many cases and all hope of early relief in that direction has long since been given up. It is fair to say, however, that the general situation is less acute, due largely to the mild weather and partly to somewhat better receipts of water coal. In Boston, deliveries have been resumed to all steam users, although in Portland, Maine, Springfield and Worcester, Mass., there is still great anxiety over the immediate future. The quantity of bituminous available for retail distribution is small, although domestic requirements have priority over practically everything but railroads. Local fuel committees vary in their handling of the problem, but all of them will go to most any lengths before permitting a factory to shut down at the expense of hundreds of operatives.

The naval collier "Jason," 10,500 tons, turned over to the New England Fuel Administration, by Secretary Daniels, for one trip, was a boon to manufacturers who are working on Government contracts. Practically half the cargo was distributed to munition plants and others rated 80 to 100 per cent. on army or navy requisition and centers like Lowell and Lawrence were spared a period of enforced idleness. Several mills elsewhere were closed until this supply reached them, and almost the entire balance was used to help the Boston & Maine R.R. in operation. This one cargo accomplished a great deal of good, coal being sent from it as far as Rockland and Newport, Maine, and to St. Albans, Vt. The eagerness with which applications were received showed that consumers all over New England were but waiting for the slightest sign of encouragement to make their demands heard. The fact that the fuel authorities are actually distributing on a comprehensive scale is leading many to conclude that a large volume of coal is likely to be handled in this way for several months to come and consumers of all kinds are anxious to get their names on the "emergency list." So long as receipts continue on the basis of last week, there will be enough to keep a large proportion of the "essential industries" at least in partial operation.

Retail dealers are unable to supply the demand for bituminous for household use. Should this continue it will have a material bearing upon the situation. People are finding out that even the high volatiles can be used and until some encouraging program of anthracite distribution is adopted, there will be many who will try to secure soft coal while it can be had. It is being made plain that New England's supply is dependent more than anything else upon ships, and the appearance of any surplus of bituminous in dealers' yards will be the signal, it is believed, for active buying on the part of the average householder.

The war department, through the quartermaster-general and its interest in the output of New England mills, is a most powerful factor in getting coal for this territory. Officials at Washington are now somewhat impressed with the slogan, "No coal, no supplies"; and within a few days the shipping control committee has put at Mr. Storrow's disposal the "Proteus," 11,000 tons, the "San Francisco," 8300 tons, and the "Angasea," 4300 tons, all available for prompt loading. At best, however, these ships can hardly make more than three trips a month, if that, and the tonnage thereby added is only a help. Several more moves of the same order are necessary to keep industries here up to normal efficiency.

To Feb. 16 receipts since Jan. 1 aggregated only 739,000 tons, while current needs are at least 2,000,000 tons a month. At this rate the individual reserves which have kept many plants running will soon melt away. A railroad which has always considered it unsafe to have on hand less than 60 days' supply in winter is now dependent upon emergency deliveries through the Fuel Administration.

At the same time receipts here have gradually increased beyond the January figures; the difference is that consumers in general have far less on hand. Every week sees a larger number of manufacturers and utilities joining in the demand for current supply.

If the delegations of labor men and textile manufacturers accomplished nothing else at Washington they secured a promise that the Panama R.R. colliers would continue in the coastwise service. Two of them will bring 25,000 tons every week, or approximately 100,000 tons monthly. While that is not an overwhelming supply its regularity is a real factor. It enables distributors to spread the coal over a wider area and therefore serve the greatest possible number of cases. Could there be several more such units the problem would be simpler.

Rail movement is not improving to the extent relied upon. The long hauls to which a large proportion of cars for New England is subjected have a bearing on the number allowed to come in this direction. As Government needs become more urgent, because of other mines falling in arrears, operations hitherto passed over by the authorities are now receiving their full share of department requisitions. This is particularly true of mines designated to ship to New England on the Garfield-McAdoo orders of Jan. 3, and it is true that mines called upon to ship a percentage of foreign railroad fuel now have that percentage increased. The net result is reduced shipments all-rail for consumers not railroads or directly concerned in war activities.

The wholesale trade is in a helpless state. The standing of the "jobber" is apparently subject to later developments and to what extent the "zoning system" is to be adopted remains undetermined. No program of distribution is outlined and a new "season" is supposed to open a month hence. Nothing has been heard about contracts the past week, there being a decided lull in that respect. For all the eager inquirers there is no answer at this writing.

L. A. Snead, of the U. S. Fuel Administration, visited Boston last week on his country-wide tour of investigation. He explained his errand to the press and stated his belief that a rational system of distribution would soon be in effect.

Anthracite — Domestic sizes are very scarce and even the retailers in most favorable position are without anything like a continuous supply. A large volume of silt and other classifications of "anthracite" help swell the tonnage, but are of advantage only to steam plants that are especially equipped to burn this kind of fuel in connection with bituminous. Shipments coastwise are also intermittent, loading at Philadelphia and New York being hampered by light receipts.

NEW YORK

Local situation shows improvement. Jobbers up in arms against Garfield's proposed order eliminating them. Strong opposition develops and consumers enter the fight. Plans considered for preventing a repetition of this winter's shortage. Car supply improves.

Anthracite—The local situation has been enlivened this week by a number of conferences concerning the future of the coal business in this city, some reports of civic and business organizations and the beginning of the Board of Aldermen's inquiry looking to future prevention of a coal famine such as existed in this city this winter. In addition one of the Brooklyn retail dealers has submitted a plan whereby a consumer can be prevented from hoarding coal; in other words, it is a plan for proper distribution of coal.

A week of moderate weather has resulted in a slight improvement in the anthracite situation. Demand has not been as urgent, but dealers find a waiting market for all the supplies they can get. Movement toward tidewater from the mines is somewhat better, but even at that there is no surplus at the docks and the retail dealers have little in their bins. Everybody is being cautioned against a too optimistic view of the situation and are told to be conservative in the use of fuel for some time to come.

With a view of preventing a repetition of this winter's conditions, L. A. Snead, one of Dr. Garfield's assistants, who has been placed in charge of coal distribution, held a conference here on Washington's Birthday with a committee of wholesale and retail dealers. Plans were discussed which provide for the storing of coal during the summer by the retail dealers, this coal to be used in an emergency. Details concerning these plans will not be made public until they are submitted to Dr. Garfield. It is known, however, that they provide for the storing of the coal in a spot where it will be available without towing it through waters that might be filled with heavy ice. Another matter discused was Dr. Garfield's proposed order affecting jobbers. The retail dealers expressed themselves as being decidedly against the decision of Dr. Garfield and were asked to submit a brief setting forth their views to the Fuel Administrator.

The Merchants' Association, through its Committee on Inland Waterways and Water Storage has asked the War Department to make a survey of the Delaware & Hudson Canal and the Morris & Essex Canal with a view of resuming their use as anthracite coal carriers. The Broadway Association has submitted a report to Mayor Hylan recommending among other things an enlargement of the bins of apartment houses, hotels and manufacturing plants to accommodate larger supplies of coal.

The inquiry of the Board of Aldermen's committee which started on Monday of this week, is expected to develop a plan by which the city can go into the coal-selling business. It was said by one of the witnesses that by licensing the dealers and buying and selling coal the city could stabilize the price and in that way benefit the public. It was also testified that during the four weeks ending Feb. 16 the coal delivered to cellar dealers amounted to 41,536 tons.

In the proposed plan for the proper distribution of coal suggested by the Brooklyn dealer an authorization card is issued for each building or subdivision thereof; 1000 lb. of coal shall be the maximum seasonal allowance for every 1000 cu.ft. of building, and 1000 lb. of coal shall be the maximum seasonal allowance for every 1000 sq.ft. of exposed wall area.

Taken as a whole, the New York market shows an improvement. Receipts, with the exception of one day when there was a heavy storm, show daily increases and most dealers have been able to take care of their trade in fairly good shape. Unless there should come a severe storm or intense cold weather no serious condition as the trade experienced a few weeks ago, is expected again this winter.

There continues to be little change in the anthracite steam coal situation. Owing to the moderate temperatures, consumption has not been heavy and dealers have a little more freedom in delivery.

Current quotations, per gross tons, f.o.b. Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buckwheat	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous — Jobbers are thoroughly aroused over the proposed order which will practically put out of the coal business about 10,000 jobbers throughout the country and who, it is estimated, handle about 85 per cent. of the coal supply. The jobbers doing business in this market are bending every effort possible to secure a change or a cancellation of the proposed order, which, it is said, Dr. Garfield has decided to issue, or in ascertaining some means whereby, without violating the rulings of the Fuel Administration, they can continue in business and maintain the trade which had been built up, probably after many years of hard work.

With this latter idea in view a largely attended meeting of jobbers was held at the Whitehall Club on Monday of this week (Feb. 25), which was addressed by Gibbs L. Baker, a Washington, D. C., attorney, and who is the Washington council for the Wholesale Coal Trade Association of New York. Mr. Baker explained in detail the Fuel Administration law and what the proposed order, if issued, would mean. He said that he was of the opinion that with the order promulgated, the only way the jobber could remain in business and not violate the law was to act as a purchasing agent for the consumer, by making an agreement to purchase the coal at the fixed Government price, the consumer to compensate the purchasing agent for his services. It was further explained that the purchasing agent must have the orders for the coal before attempting to make the purchase from the mine operator.

It was suggested that Dr. Garfield be asked to fix a definite percentage per ton, or other compensation to be paid said purchasing agent and that licenses be issued for such agents.

Local conditions show some improvement. There is no surplus supplies at the docks, but receipts have been larger. Demand continues heavy and all coal received here is apparently under orders as free coals remain out of the market.

Production which was reported as showing a 15 per cent. increase for the week ended Feb. 16 was slightly interrupted this week by floods; but these were not as serious as expected. Several mines, however, were closed because of high water.

Car supply is better, the mines along the Pennsylvania lines reporting about 10 per cent. of their requirements being received while those along the Baltimore & Ohio got about 20 per cent. of their needs. The mines along the New York Central received about 60 per cent. of their requirements. Some operators say that with 60 per cent. of the full car requirements available they would be able to flood the market with coal.

Nothing is heard regarding the making of new contracts for the coal year beginning Apr. 1, and it is the belief of many dealers that few, if any, will be signed, the operators deciding apparently to sell their product to anyone who desires it. The same rule, it is believed, will apply to the railroads, although it is expected the mine producing the quality of coal desired by the roads will naturally receive sufficient cars to furnish the coal needed.

Many plants in this vicinity continue to be short of supplies, but there is not the worry over future receipts that existed a couple of weeks ago.

The order issued by State Fuel Administrator Wiggin under date of Jan. 1 providing for six lightless nights each week was rescinded on Monday of this week to take effect Mar. 1, but Mr. Wiggin reminds the public that the order from Washington calling for two lightless nights each week, Sunday and Thursday, remains in force. Mr. Wiggin also rescinded his order of Jan. 2 in regard to reductions of light and heat for buildings.

PHILADELPHIA

Anthracite improvement continued by better weather. Demand still exceptional, with receipts fair. Authorities insist on good preparation. Public lessons in fuel conservation. Dealers annoyed by calls for statistics. Opposition to April reduction. Bituminous shipments short. Future promises improvement. Much coal confiscated. New price meeting with favor. Brokers at sea. Government distribution plans cause interest.

Anthracite—Springlike weather early in the week and quite liberal shipments, especially from the largest operating company, caused the dealers to think the winter's troubles had passed. Some of the smaller yards where the tonnage is not heavy were rapidly catching up with their deliveries. Late in the week another cold wave started the cry for coal all over again. Nevertheless conditions in general are much easier than at any time since last October, and the retailers as well as the fuel authorities are giving much thought to the new coal year, which commences Apr. 1. Mr. Lewis seems determined not to allow the present large number of 230 yards to be increased, and again expressed the wish that they could be reduced to a dozen large, well-equipped plants scattered through the city.

This week the preparation of coal has been given more attention and publicity than for many months. Federal Trade Agent Sherman A. Cuneo is on the trail of dealers and anthracite operators who would disregard the orders against poorly prepared coal. Special efforts are now being made to have the coal properly prepared, inasmuch as the State Fuel Administrator is out with a strong statement to the public advising them to "store coal in the summer, the quicker the better." He says he is determined to spread his buy-coal-early propaganda so efficiently that more cellars than ever will be filled with next winter's supply during the spring and summer, when railroad conditions are ideal.

Dealers who accept inferior coal from the shippers will be obliged to prepare it properly and charge the cost of it to the operators. The battle for good coal is on and Mr. Potter assures the consumers they can safely buy it from now on. Already the inspectors are active and this week numerous dealers had shipments condemned and were forced to rescreen and otherwise prepare it before delivery

to the consumer. The news reached the city this week that the fuel authorities in Luzerne County had closed down six small breakers because of failure to heed the injunctions to cleanly prepare coal.

The committee has also issued rules covering the amount of small coal allowed in the sizes from pea down as follows: Nut coal not to exceed 3 per cent. No. 1 buckwheat; pea coal not to exceed 3 per cent. No. 2 buckwheat; No. 1 buckwheat to be free from No. 3 buckwheat; No. 2 buckwheat to be free from dirt through $\frac{1}{16}$-in. mesh. Smaller sizes to be considered dirt in these four sizes if exceeding the limits named.

This week the retail trade received letters from Chairman Lewis advising of word from Washington to the effect that local dealers will probably receive during the year commencing Apr. 1, 1918, the same amount of prepared coal and from the same sources, as in the corresponding period beginning Apr. 1, 1917. Then they are asked to supply promptly exhaustive figures showing all shipments in sizes and naming the shipper from April, 1916, to date. Most dealers are disgusted at being compelled to furnish so many details of their business, requiring as it does many extra hours of clerical work. While these calls for information have been many and varied, they are always responded to.

No definite information is obtainable as to whether there will this year be the usual spring reduction of 50c. per ton. In this connection it is important to bear in mind the statement made in the letter of Dr. Garfield to President Wilson, recommending the increase of 35c. in anthracite prices on Dec. 1 last, which letter was issued as a part of the order signed by the President. This statement is as follows: "In this connection I desire to say that it is my expectation to order the reduction in anthracite prices which has been regularly given, beginning Apr. 1, 1918." Despite this the dealers are decidedly against it, for as soon as such an announcement is definitely decided upon the dealers will be flooded with more orders than they can handle. With no positive assurance of what tonnage to expect and with the advance of 10c. each month for five months, they claim they would be placed in the same false position as last year. It is known that the various coal exchanges are opposing the reduction. Chairman Lewis, too, in answer to the question whether consumers could expect lower prices, tersely answered: "I hope not. It would result in great confusion." The question of reducing the gross margin of $2.50 allowed retailers is still under discussion, but as yet the committee does not feel justified in reducing it.

While the agitation is on over the April prices many dealers are taking the opportunity to endeavor to align themselves with new shippers, beginning with the new coal year, with the hope that they may possibly be able to add at least another shipper to their list. While the calls of this kind are increasing of late, little encouragement is given, as no one knows at this time just what regulations the Government will put into effect.

Once more the question of reducing the number of prepared sizes to two has bobbed up. This time it was started by the recent convention of the retail coal men in Baltimore, who went on record as favoring it. It would be an innovation if the Government should order this change, which it is declared could be made with little trouble, as the screens for the new sizes are mostly on the ground, since the fiasco when the operators attempted it about two years ago.

Complaints from West Philadelphia consumers that local dealers are charging over $10 a ton were analyzed by the local administrator and in each case it was found that with everything added, including jobber's commission of 20c. and independent's premium 75c., the rate could be justly charged under the law. There are some who claim the greatest questions before the fuel administration are the premiums allowed the independents and the commissions to brokers.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5 90	$6 05	Buck	$3 15	$3 75
Egg	4 80	6 00	Rice	2 65	3 65
Stove	5 05	6 35	Boiler	2 45	3 55
Nut	5 15	6 40	Barley	2 15	2 40
Pea	3 75	4 65			

Bituminous—The receipts of bituminous are still meager, with conditions about as they have been for a week past. The one encouraging feature is that the improvement in car supply that began about ten days ago gives evidence of continuing, but most mines are still without an adequate supply. As has been the rule for some time, the operators are receiving the greatest number of cars to load for railway fuel and priority orders. Some operations complain that they have received barely any cars for free loading and claim it is unjust to confine them to orders of this kind, as they are thus compelled to neglect their commercial trade which has taken them years to build up.

All coal, except such as is still under contract, is now being sold at the new Government price of $3.05 per net ton, including smithing coal, which now comes under the same price-fixing order. As times goes on the new price seems to meet with more general satisfaction, and it is thought it will do a vast amount of good in stimulating production. The brokerage trade also is using this price as a basis for their sales, with the commission added, but there continues to be much confusion among the commission trade regarding their status after Apr. 1, following the Fuel Administration order as to this feature of the trade. So far there have been no indications that the larger operators who, while maintaining sales offices of their own also sell a portion of their tonnage to brokers, will sell brokerage coal at less than the $3.05 price. While there is much anxiety on the part of the brokers, we seem to feel that before Apr. 1 the situation will be adjusted to their satisfaction, as they have always formed a most essential part of the bituminous trade.

The news that the Government is working on a comprehensive plan for fuel distribution, by dividing consumers into four classes, was received here with a great deal of interest. It is understood the plan is being worked out jointly by the Fuel Administration, the Shipping Board and the Army and Navy Departments. It is presumed also that any such scheme as they adopt will conform to the plans already developed for shipping according to the zone in which the coal is mined. The zoning committee for this district is still busily at work in their office here, but progress has been much slower than expected, as the further they get into the subject the more complicated it has become.

It is also rumored that under the new shipping plans there will be a heavy curtailment of lake tonnage, especially that portion destined for re-shipment to the Far West, such as the Dakotas, which section of the country will be expected to draw their supplies from the mines in near-by states.

This week the United States District Attorney caused the arrest of the local sales agent of a West Virginia mining company, claiming that sales had been made at prices in excess of the Government maximum. The outcome of this case will be closely watched, as it is thought it will bring out rulings on many technical points of the price-fixing order which have not been clearly understood from the beginning.

The demand for coke continues to be far in excess of the supply, especially since the production for January was much below normal. However, it is thought that with better conditions as to price prevailing at the mines there will be a corresponding increase shortly in this branch of the trade.

BALTIMORE

Roseate statements from Washington about improved coal tonnage are not reflected in supplies here, where industries are barely skating through. Many schools still closed for lack of coal.

Bituminous—The coal trade here fails to reflect through actual fuel supplies the optimism of the roseate statement made from Washington at the outset of the present week that milder weather has brought an almost normal tonnage movement. For this territory the story is told at the diversion points of the Government in West Virginia and western Maryland, where Government preferential orders so far exceed the coal awheel at the eastern gateways that there is little or no chance for directly consigned industrial contract coal to get through unchanged from its original marking. In this city numerous industries are just barely getting enough coal to operate, and a number have undoubtedly curtailed production through lack of fuel. The fuel administrator's local committee is still hard pressed at times to find enough fuel to go around to meet even the worst needs. One of the oddities of the past week was that at times there was much more coal on tracks here for export than for all other business combined, and yet this coal could not be loaded because there were no bottoms to receive it and much of it had been standing at tide for two weeks or more. Because it was export-price coal and could not be sold locally without a big loss, it had to remain idle while local industries went without fuel. The jobbing interests here are still at sea over Garfield's commission-eliminating order, except that they feel that it will put jobbers out of business. Legal advice has been generally sought and the whole affair is likely to be plunged into the courts shortly.

Anthracite—Supplies here have been a little easier, but the demand is far in excess of the supply. Much milder weather brought less urgent call, and there was not so much necessity to divert industrial coal for domestic use. Thousands of homes here are still without coal of any kind, however. The lower grade schools of Baltimore have all been closed since before the Christmas holidays. Mayor Preston has appealed to Washington for fuel so the schools can be reopened, but while relief has been promised the coal has not as yet arrived.

Lake Markets

PITTSBURGH

Operators disappointed by continued poor car supplies. River open and supplies adequate locally. Opinion on prospective new price regulations.

Railroad conditions in the past week have been decidedly disappointing from the viewpoint of the coal operator, whom the reports of constantly improving traffic conditions had led to expect a large increase in car supplies. Instead, there has been practically no increase, and some mines have fared worse in the past week than previously. That the railroads have improved their own position is not denied. Doubtless they have done so by clearing up much of the congestion caused by loaded cars, but they have not improved the position of the shipper, who does not receive materially larger supplies of empties than formerly.

The Monongahela River continues open and coal is coming down rather freely, the mills depending on river coal now having little difficulty. With mild weather demand for domestic coal has slackened and there is not much difficulty in that quarter, so that the local situation is in fairly good shape. R. W. Gardiner, district distributor, has had added to his territory the mines on the Pan Handle division of the Pennsylvania. This covers the branch of the Pittsburgh seam that runs due west from Pittsburgh into Ohio.

The coal market is narrow, scarcely any free coal coming into the open market. It is ruled that when diversions of coal occur by order of the Fuel Administrator the recipient shall pay either the set price, plus the brokerage if a broker figures, or the contract price in case the coal had already come under the ownership of the original buyer, against a contract enforceable at law. The market remains quotable at the set prices: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, subject to the addition of brokerage up to 15c., in case the sale is made by a regular broker.

There has been much discussion in local coal circles of the announcement that Apr. 1 prices will be revised and brokerage, to be added to the set price, eliminated. Some jobbers state that they are well satisfied with the prospect, thinking it probable that in the near future there will be a good supply of coal and some producers will be quite willing to pay a commission. In one quarter the prediction is even made that the open market will eventually decline below the set price. In the past, while consumers have not objected particularly to the paying of a brokerage, the difficulty has been to find the coal to sell him.

TORONTO

Coal situation still serious. Shipments coming in freely but insufficient for demand. Dealers generally refuse new orders. Local deliveries difficult and expensive.

The coal situation remains serious, several days of severe weather having greatly increased the demand. Coal is coming in freely at the boundary, and as the movement from there to Toronto is given preference over all other freight, considerable supplies are arriving. Dealers, however, generally refuse to accept orders on the ground that receipts are insufficient for new business and the filling of accumulated outstanding orders. In some cases coal is obtainable where purchasers are able to arrange for delivery, but the price is almost prohibitive, as teamsters in some instances charge as high as $3 and $4 per ton, as they are frequently obliged to wait for hours at the yards before they can

obtain loads. The city bureau is giving out small lots in cases of extreme necessity, but supplies for this purpose are so limited that many applicants are turned away.

Nominal quotations per short ton are as follows: Retail anthracite egg, stove, nut and grate, $9.85; pea, $8.85; bituminous steam, $9, slack, $8 to $8.50; domestic lump, $10; cannel, $11. Wholesale f.o.b. cars at destination, three-quarter lump, $7 to $7.50, slack, $6.85 to $7.

BUFFALO

Return of mild weather helps the situation, but actual scarcity continues in all sorts of coal. Difficulty is laid to the railroads. Jobbers uneasy over last price order.

Bituminous—The supply is not good, but the situation improves slowly, owing to warmer weather. It is not likely that the scarcity of the past month or two will return right away, though the uniform report from the coal offices is that it is as hard to get a car of coal as it ever was. This section does not appear to have suffered much from the shortage. Some jobbers say that such factories as did run short occasionally would have done so anyhow, in order to make repairs and the like.

The main reason for the coal shortage—the lack of cars—does not appear to be improved, and it is still confidently affirmed that no regulation of the consumption or distribution can accomplish anything permanent till the car supply is better. The heavy snow is gone, and the zero weather is probably past for the winter; but with normal weather the movement is not enough to meet the demand. During the zero weather the car movement ran down alarmingly.

The latest coal order appears to have dropped the former regulation for thin vein slack and lump and now only mine-run is recognized. The mine price of $3.20½ recognizes no sizes, so no screening will be done of course. The Buffalo price will be $4.30½ on Allegheny Valley rail rate, $4.40½ on Bessemer district rate, $4.45½ on Pittsburgh rail rate, all per net ton f.o.b.

Anthracite—The supply has not been what it should be lately, but with the disappearance of freezing weather the consumption has dropped off about half and the distributors manage to keep ahead of the demand. It is a hard matter, with the consumers making it as bad as they can by ordering much more coal than they need.

DETROIT

Partial relaxation of restrictions follows easier condition in coal supply. Detroit pool will continue operations.

Bituminous—Favorable weather conditions throughout the week, with temperatures that have removed considerable of the snow, are reflected in a marked improvement in transportation conditions. Much of the freight congestion has been cleared away, permitting freer movement of coal shipments on roads south and southeast of Toledo. The result is an easier feeling among consumers of domestic and steam coal, with a satisfactory improvement in supply.

Because of the better condition of affairs, the Michigan fuel administration has partly rescinded the regulations that were put out Jan. 25. The order restricting operation of business places, stores, office buildings and other establishments to nine hours a day is revoked. Mr. Prudden, however, recommends that its observance be continued in smaller towns of the state. He retains in effect the rule restricting electric lighting and illumination Sunday and Thursday nights, and advises everyone to use coal as sparingly as possible.

Detroit's terminal coal pool is to be continued in operation. This announcement was made by Ford R. Cate, chairman of the pool committee, following conference with other pool representatives in Cleveland. Mr. Cate says many of the objections raised against the pool plan have been cleared away and that the records show the Detroit pool's efficiency was greater than that of similar bodies in other cities.

Anthracite—Shipments of anthracite are coming to the city in small volume, but improvement in weather conditions contributes in making the supply provide for a larger number of householders than heretofore, by making a smaller daily consumption possible in domestic heating plants. The coke supply continues scarce and not very much wood is available for fuel use, the larger part of the supply being green.

COLUMBUS

Continued mild weather still further relieves the stress of the fuel situation in Ohio. Railroads are hauling a larger tonnage.

The coal trade in Ohio has been in a much less precarious condition because of a larger tonnage being handled by railroads and reduced requisitions to take care of the domestic trade. Both factors have combined to relieve the strenuous situation that prevailed during the zero temperatures. Private users now have sufficient stocks, and manufacturing plants are able to accumulate a surplus. On the whole the situation is in much better shape, although another protracted cold snap would cause much inconvenience.

The retail trade is still attracting the attention of fuel committees in the various counties. Retailers are often compelled to limit deliveries to small lots and are prohibited from giving each customer all that is wanted. But there are many fewer cases for the county committees to investigate and stringent transportation orders are not now necessary. Retail prices are firm at the levels which prevailed for some time. Pocahontas is scarce and the same is true of anthracite.

Steam coal is also coming into the market in larger quantities. Practically all plants which were compelled to reduce production or suspend are now in operation. Schools now have sufficient fuel and some surplus stock. In fact steam business is in pretty fair shape, considering the war conditions and emergencies. Railroads are taking a large tonnage for the movement of trains.

Production in the state during the past week has been fairly good. Floods in the Hocking Valley have not passed, and the output in that district is estimated at 75 per cent. of normal. Jackson and Pomeroy Bend districts are producing about 65 to 75 per cent. of normal. In eastern Ohio the railroad situation is still bad and the output is correspondingly curtailed. About half of the coal loaded in that district is used for railroad fuel. In Massillon and Cambridge the output has been slightly increased.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.70	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

Milder weather has checked demand, but the supply of coal remains extremely limited. Great care is necessary in distribution and consumption.

While milder weather now prevails, and the demand for coal has not been so insistent, yet the trade has been compelled to issue warnings to the public that the winter is not over, and that the greatest care must still be exercised in the distribution and consumption of coal in order to avoid possible suffering should colder weather return. An announcement from some official source that the coal supply in Cincinnati is now ample, and that all demands can be taken care of, was promptly contradicted by leading members of the trade, who declared that the supply is still so limited, as compared with consumption, that there is no reserve whatever; and that should severe weather be experienced the city would be precisely where it was a few weeks ago. The movement of coal from the mines has been improved since the melting of the snow and the better traffic conditions generally, but bunkers and coal bins were scraped bare during the past two months. As consumption is still heavy among industrial concerns, there has been no reserve whatever accumulated. Prices, for the most part, are based on contracts entered into before the Federal price regulations went into effect, and there is little spot coal offered. Should mild weather continue, there is every reason to believe that there will be a chance to get things straightened out; but there is no chance for cheap or plentiful coal this year, coal men declare.

LOUISVILLE

Coal movement shows considerable improvement in western Kentucky field, better car supply and better movement. Eastern Kentucky field improving slowly, due largely to car shortage.

There has been much improvement shown in the movement of western Kentucky coal. One Louisville house during the week received 20 cars at one time, the largest volume of coal received at any one time in months. The labor situation in the western Kentucky district is now somewhat better than it has been, while the car supply is greater and the traffic movement faster. Local dealers have been well supplied, and practically every small dealer has two to four cars in his yards.

In the eastern Kentucky field conditions are little different from a week ago. There has been some slight improvement in the car supply and movement of cars, but labor is scarce and traffic conditions are not such that the production has shown any material increase.

Prices on all grades of coal remained unchanged during the week, but it is possible that some new prices may be announced in March to meet requirements of manufacturers and for summer stocking.

Inquiries have started coming in relative to prices on new business from manufacturers, who are now beginning to run short on their contracts, which are generally arranged to expire about Apr. 1. Heavy summer stocking is also expected from the thousands of residents who were caught without coal this year, and who have been telling the coal dealers what they expect to do this summer. However, no one apparently knows what conditions will be in the late spring, and the Fuel Administration is not figuring on summer prices this early in the year, but endeavoring to get the whole country fairly well supplied first.

The local demand for coal from the retail standpoint has been fairly active, but apparently consumers are endeavoring to run out on as little coal as possible, while awaiting a lower market. Numerous orders are coming in for 1½-ton lots. Heretofore dealers were in the habit of charging one-half of the ton delivery price, plus an extra charge of 25c. on half-ton deliveries. However, the Fuel Administration has refused to allow the dealers to make this extra charge for half-ton lots, and as a result many retailers are refusing to deliver less than ton quantities, figuring that it is unprofitable business to deliver half-ton lots on the present basis.

BIRMINGHAM

Inquiries for lump coal not so insistent, but steam demand has not slackened. Production hampered by local strikes. Car supply reported good.

While domestic dealers are still urging shipments from the mines, the demand is not insistent, as all retailers now have stocks on hand and the mild weather is holding down consumption.

Inquiries for steam coal continue strong and there are no indications of any adequate relief being afforded by increased production, even if the output was normal, which is not the case at this time. There is an ample supply of cars, but the shortage of labor and irregularity on the part of mine operatives curtails production materially.

The strikes called at a number of the larger mines of the district by union leaders, which have been in effect at some collieries for two weeks or more, seriously lowered the output of the district, but conditions are now improving rapidly and the indications are that normal complements of men will report for work during the present week.

Coke

CONNELLSVILLE

Disappointment at car supplies. Coke shortage 100,000 tons weekly. Railroads clearing congestion rather than furnishing empties. Light market offerings.

Car supplies in the Connellsville region last week averaged little, if any, better than in the two weeks preceding, and this week opened with somewhat lighter supplies than at the beginning of last week, only about 60 per cent. on the Monongahela R.R., against 70 per cent. Monday of last week, this being a poor augury for the rest of this week. It appears, therefore, that there have now been three weeks of shipments averaging 280,000 tons a week, which is about 100,000 tons a week less than conservative estimates of the amount of coke regularly required to supply the blast furnaces dependent upon the region. As to the proportion of foundry coke to requirements there are no precise estimates. With the widespread inquiry in the open market for foundry coke, coupled with the fact that the leading foundry coke producer has had very light car supplies for weeks past, the position is rather complicated.

Coke operators were decidedly disappointed last week at the poor car supplies, after nearly a fortnight of very favorable railroad weather, and this week the feeling is turning to one of discontent. For a time operators were patient and were quite willing to accord the railroads a fair amount of time in which to get into good running order with the favorable weather that has prevailed, but now the appearance is that the railroads have been putting their whole effort upon moving cars through and paying little attention to getting back empties. Doubtless they have greatly reduced congestion on their lines, but this does shippers no good when they cannot ship increased quantities of material.

The market is a narrow one. There is scarcely any coke offered, loaded on Pennsylvania or B. & O. equipment. Frequently there are offerings of P. & L. E. cars, but few consumers are in position to take coke thus loaded. These, however, generally find a place for any coke that is offered. The market remains quotable at the set prices: Furnace, $6; 72-hour foundry, selected, $7; crushed, over 1-in., $7.30, per net ton at ovens.

The Connellsville "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 16 at 240,772 tons, an increase of 16,627 tons, and shipments at 285,359 tons, an increase of 9452 tons.

Buffalo—The jobbers in the coke trade find it practically impossible to obtain a supply from the regular ovens, as to do so would be to obtain it at the Government oven prices of $6 and $7 per ton. So far none seems to have been sold in this territory at those prices. The furnaces all depend on their contracts for their supply. Jobbers sell quite an amount of byproduct coke to all sorts of consumers, for the purpose of piecing out the coal supply. Prices run from $1.50 for the lowest form of coke breeze to about $3 for the assorted sizes. The demand far exceeds the supply.

Middle Western

GENERAL REVIEW

Prominent coal jobbers see danger ahead if the contemplated price differential is eliminated between producer and jobber.

The decision of the Federal Fuel Administrator to wipe out the spread of 15c. per ton that has existed between the producer and jobber is causing much speculation and considerable discussion throughout the Middle Western section. For several months it has been no trouble for the producer to get all for his product that the Government would allow him to charge. His sales office, however, had to be careful, or else his organization would become loaded with orders that could not be filled, because of the constant placing of embargoes by transportation companies. Many producing operators who have always maintained an expensive sales organization have felt that there should be no differential, and that they should be allowed as much for performing the same service as the jobber got, 15c. per ton. If the jobber is to maintain a place in the coal industry it would seem that it would be necessary that he become allied with some producing company, and arrange to handle its coal, or at least a portion of it.

The market throughout the Middle West is somewhat relieved because of the improvement in transportation, the direct result of the warm weather that has prevailed during the past week. The domestic demand appears to be easy, but there is a strong market for any grade of coal among the manufacturing industries. The trade feels that the crisis is past and that there will be a decided improvement in the situation.

CHICAGO

Warm weather saves domestic fuel and improves transportation.

The tense fuel situation that has prevailed for weeks has been relieved by the advent of milder weather. Household requirements averaged less than they have for any previous week since Dec. 1. Industries have been able to buy more Illinois and Indiana steam coal than at any other similar period for a long time. Many large industries have been on a hand-to-mouth ration for months, and have been able to get only an occasional car—when it happened to escape the eye of some fuel administrator, either at destination or en route.

No noticeable improvement in the supply of coal from the East is evident. The receipts of Eastern bituminous coal are particularly limited, with a little better supply of hard coal from that direction.

A determined movement now seems to be under way to get a better supply of Eastern coal for Chicago. The Chicago Association of Commerce and the Building Managers Association are working in harmony with the retail dealers toward this end.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La-Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50
Domestic lump	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Egg or furnace	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Small egg or nut	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Stove	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Chestnut	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Pea	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	.....

MILWAUKEE

Springlike conditions improve the coal situation. Future supplies to be closely controlled.

The close of February finds the coal situation in this section of the country much easier. The return of warmer weather has relieved the tension of apprehension engendered by the prolonged cold spells of the past; and dealers and consumers are seemingly satisfied that the days of trial are over, for the present at least. Transportation conditions are growing better daily and coal is going forward to the interior more freely. Roadway conditions in the city and vicinity are still poor.

Anthracite, which was pronounced sold up two weeks ago, is still being delivered, and cases are reported where people who had been refused hard coal on former orders had been voluntarily offered anthracite by dealers. This would indicate that the anthracite stock had been too strongly conserved under the stress of continued below-zero weather.

The failure of Illinois to furnish its usual quota of coal at this season of the year has increased the draft upon stocks at Lake Michigan docks to such an extent that they will have to be supplemented liberally if vital industries are to be maintained until the opening of Lake navigation about Apr. 25. At a conference in the office of W. H. Fitzgerald, state fuel administrator, which was participated in by representatives of every dock company on the west shore of Lake Michigan, it was decided that about 40,000 tons will be needed to accomplish this end. A telegram to that effect was accordingly sent to the Federal Fuel Administrator at Washington, D. C. The coal desired amounts to 850 carloads, divided as follows: 300 cars Youghiogeny or splint screened lump; 350 cars Hocking screened lump, and 200 cars Hocking or No. 8 screened lump

ST. LOUIS

Coal more plentiful from Standard fields, owing to warmer weather. Railroad facilities show little improvement. Car supply not good and working time consequently short. No outside coals coming in.

Whether conditions in this territory have eased the local situation, and there is apparently plenty of Standard coal to take care of normal requirements. In a general way storage coal is being acquired by both dealers and steam plants.

Railroad facilities are not so good as were to be expected in view of the weather, and in some instances coal has been delayed for four or five weeks. The terminal situation shows little signs of improvement. There is some improvement on all roads, except the Louisville & Nashville and Illinois Central. The Illinois Central still shows a lack of efficiency in the handling of full loads and the return of empties to the mine.

The Carterville field shows some improvement, but not to the extent that any great tonnage of this coal is coming into this market. The railroads are still drawing heavily on that tonnage, and the Government requirements seem to increase instead of diminish. Working conditions are fairly good.

In the Mt. Olive district there is plenty of domestic coal for the St. Louis market for the first time in many months, largely because the equipment is restricted to St. Louis proper and that on the short-line roads equipment is somewhat plentiful.

The railroad tonnage still continues heavy from this district, and the demand for the Omaha & Western territory is good. Close by, however, there has been a falling off in the demand.

The condition in the Standard field is somewhat complicated on account of the car supply, but shows improvement in a general way. The Mobile & Ohio is short of equipment. Much of this is in the south and there is lack of motive power to bring it north.

Retail conditions are easy, and the coal situation in this territory is one that does not occasion any worry on the part of those charged with its supervision.

The prevailing market, per net ton, f.o.b. mine, is:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard

Williamson & Franklin Co. rate is 87½c.; other fields, 72½c.

General Statistics

NORFOLK & WESTERN RAILWAY

Below is a statement of the coal tonnage from mines on the Norfolk & Western Ry. and from other railroads, for the month of January, 1918:

From	Net Tons
Pocahontas field	958,057
Tug River field	208,122
Thacker field	207,397
Kenova field	94,139
Clinch Valley field	127,802
Other Norfolk & Western fields	14,283
Total Norfolk & Western fields	1,609,800
Williamson & Pond Creek R.R.	123,118
Tug River & Kentucky R.R.	43,796
All other railroads	91,802
Grand Total	1,868,516

COAL AGE

Vol. 13 NEW YORK, MARCH 9, 1918 No. 10

THE COMING TEST

BY FLOYD W. PARSONS

THE Government is fully aware that a lack of transportation facilities is the danger point in our war activities. This restriction on our efforts is certainly going to be removed. We will soon have ships, locomotives and cars. Also, each passing day will see the further development of a national transportation plan that will soon put America on an efficient coöperative basis.

What relation has all this to coal mining? Just this:

With plenty of locomotives and cars available, will our coal mines meet the test that will surely be put upon them? The Nation proposes to spend 15 billion dollars for war in 1918. This is all in addition to our peaceful pursuits. It means the consumption of millions of tons of coal more.

WE HAVE boasted of our coal-production capacity. "No cars" has always been our answer to those who charged there was deficient output. The last nine months of this year we will have to average better than 62 million net tons monthly to meet the known demand.

The request of the Fuel Administration that coal miners be placed on a preferential list has been denied by the military authorities. More men will be taken by Uncle Sam. Already close to 40,000 miners have been enlisted, and competent men to fill the vacancies created are not secured and trained in a day.

Is the industry properly organized to draw labor from less essential fields if the need becomes urgent? Individualistic action does not get far these days. Powerful concerted effort alone counts. Watch must be kept on other industries as never before. Wage advances in other lines will quickly reduce mine labor.

THE mines are not exactly the place for women. However, we must remember that five men are needed here to supply each soldier in France. Two million men at the front mean a withdrawal of 12,000,000 men from productive industries.

It follows then that we are withdrawing from peaceful and constructive pursuits for war work one-third of the total number of wage earners in America. How else can we supply the labor deficit thus created if not by drawing from the ranks of the 26,000,000 idle women in the country? Such help might not be used largely underground, but it could be employed in most lines on the surface. Objections worth considering in normal times are out of order now; we must finish the job on hand no matter what the cost.

THERE is but one way for the coal-mining business to avoid landing in the lap of Government ownership, and that is by making good in such substantial fashion that all criticism of coal production will be stilled. Let us ship clean coal. Every per cent. additional ash in the nation's output means an added requirement of 126,000 railroad cars, without any increase in heat values. Let us not relax the observance and enforcement of safety measures. Remember 1917 showed an increase of 21 per cent. in mine fatalities! Let us keep mine development ahead of requirements—see that at least one-eighth of the tonnage comes from narrow work. Let us also keep up repairs and increase productive capacity by the installation of every machine or mechanical device that will serve that end.

The test may come sooner than we expect. Are we ready?

IDEAS AND SUGGESTIONS

Mine Telephone Systems

BY FRANK HUSKINSON
Lafayette, Colo.

It is important that a coal mine should possess a reliable telephone system, one that makes connection also with the outside works. In fact such a system is a necessity.

The saving in time and money which such a system effects by reliably transmitting routine orders or instructions when there is a temporary suspension of power, a shutdown of some part of the plant, an accident, or an emergency affecting either life or property, justifies many times over the investment required.

Mine telephone systems usually consist of several instruments connected to one pair of wires (or one wire and the ground), forming a party line. Local-battery magneto telephones are used, and signaling is effected by a code of rings. The severe conditions encountered underground because of moisture, gases, acidulous water, etc., make it necessary to provide un-

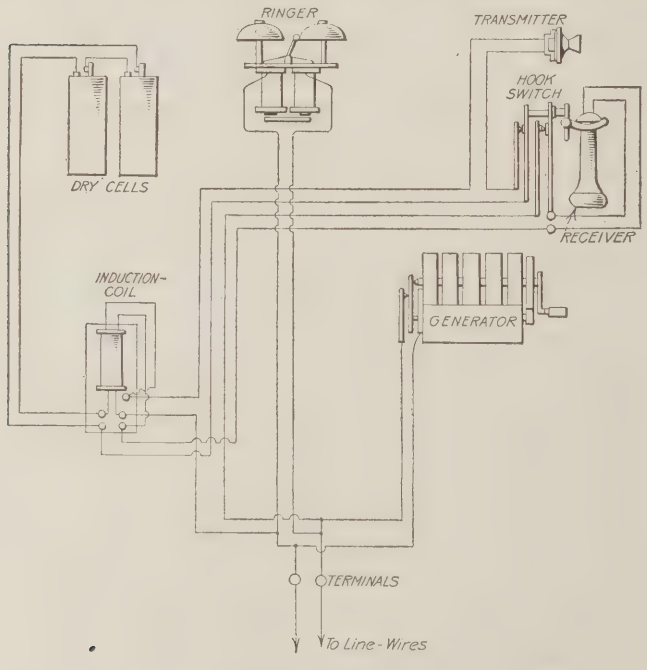

FIG. 1. CONNECTIONS AND PARTS OF STANDARD MINE TELEPHONE

usually well-protected telephone instruments for this service. For use aboveground a standard wall or desk telephone is practical.

All telephones underground are inclosed in a heavy metal case, which is fireproof, moisture-proof, and foolproof. The gongs on all mine telephones are extra large and loud-sounding; they emit a distinct ring which can be heard a long distance. In Fig. 1 is shown the connections and various parts of a standard local-battery magneto mine telephone.

With the local-battery magneto telephone system any number of instruments can be connected in multiple to one pair of wires. It is not advisable, however, to connect more than 8 or 10 telephones to the same set of wires, as it will make the ringing code of signals too complex. Also, in case of trouble, it is more difficult to locate.

In mines where there are a number of telephones it is advisable to have the instruments separated into

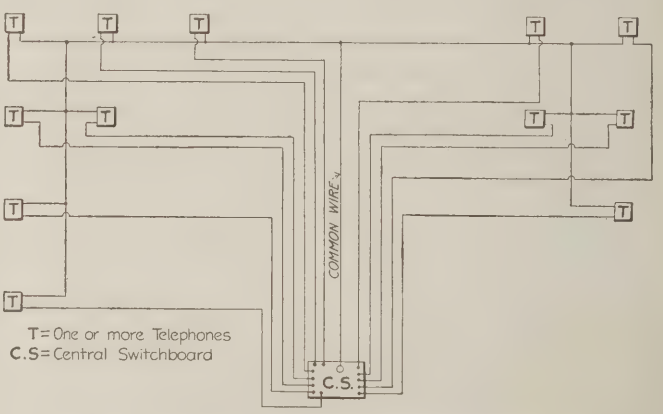

FIG. 2. WIRING DIAGRAM, TELEPHONES AND SWITCHBOARD

groups of one, two, or more, each group having one line wire to the central switchboard, also one line wire to the common wire that runs from the switchboard to each group of telephones (see Fig. 2). The use of the common wire is to save material. It gives as satisfactory service as though there were two line wires from each group of telephones. In a system with several telephones connected to one pair of wires, each station may call and talk to any other station on the line without the aid of a switchboard and operator; also, in this system, where the telephones are in groups the lines from these groups run to the surface and are centralized upon a switchboard. Any one group of telephones may be operated independently and without the services of the switchboard operator. The object of the switchboard is to make a connection between any two telephones in different groups.

An injury to a telephone, an open-circuit or a short-circuit in a section of the line will not interfere with the operation of the rest of the system, and it is a more simple matter to locate any trouble in the system than if all the telephones were connected to one pair of line wires.

The telephones used in the local-battery magneto system are equipped with two or three dry cells. The current furnished by these cells is used for talking purposes only. The current for ringing the bells on the other telephones on the same line and also for signaling the switchboard is generated by the hand generator,

more commonly called the magneto. The current thus generated is alternating and has nothing to do with the talking and hearing parts of a telephone. The dry cells similarly have nothing to do with the ringing of the bells.

Local-battery magneto telephones will operate on a circuit consisting of one wire and the earth, but this is not recommended. For various reasons ground-return circuits are objectionable, especially in mines where electricity is used, since the telephones become noisy owing to foreign currents. The metallic circuit is to be recommended in all installations. This is more expensive to install, but the difference is more than offset by the reliability and efficiency gained.

There is a tendency to neglect telephone lines. The idea is prevalent that almost any kind of wire and material is good enough for a telephone line. This is a mistake. Telephone-line construction should receive as much attention as any other class of wiring; telephone lines underground should be carefully and securely installed to insure satisfactory results. The use of No. 12 weatherproof iron wire is recommended for all underground installations. The wires should be supported on porcelain knobs or glass insulators. Care should be taken to insulate and secure the lines from contact with other lines or pipes that may parallel or cross them. In the case of power lines that parallel telephone lines for any considerable distance, the foreign currents caused by induction make the telephones noisy. To

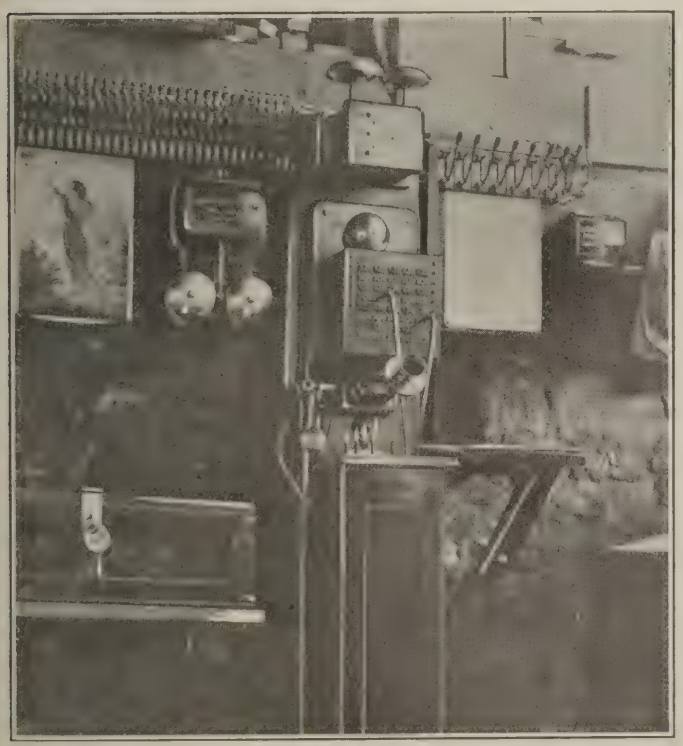

FIG. 3. MINE TELEPHONE SWITCHBOARD

diminish this noise it is necessary to transpose the telephone lines at frequent intervals and keep them as far away as practical from the power lines.

All joints in telephone lines should be securely made, soldered and insulated. In Fig. 3 is shown a satisfactory mine telephone switchboard that is in use at one of the largest mines in the State of Colorado. This system was the only system that ever gave satisfactory results at this mine. The switchboard has 15 drops, and two sets of connecting plugs. At the left is the fuse, lightning arrester and terminal board. To this board all the various line wires come, and in case of trouble it can easily be determined from this point just what line the trouble is on. The fuse is then taken out, thereby cutting off the line that has the trouble on it.

When a call comes in on the switchboard the drop falls out, closing a local bell circuit. This bell rings until the drop is restored by inserting the plug. The operator answers the call and makes the proper connection. At the right of the switchboard are several small single-pole switches, the object of which is to connect all or part of the various groups of telephones at night, or whenever the switchboard operator is absent.

This installation is located in the electrical repair shop, and the calls are taken care of by the shop foreman in the day time, and at night the switches are put in, thereby connecting all the telephones together, allowing any station to call and talk with any other station without the services of the switchboard operator.

A Convenient Table for Draftsmen

By P. A. Arnold
St. Marys, Penn.

In figuring areas from maps, either by scale or planimeter, the accompanying table will be found convenient and quite a time saver. Requests for areas of tracts of land and also sections of underground workings continually come to the engineering department of any large coal company.

This table is, of course, small in itself; but nevertheless it is a short cut in calculating that which is not often tabulated and ready for use.

An explanation for the use of the table is hardly necessary, but to illustrate: Suppose one wishes to find

TABLE OF AREAS

Number of Square Feet and Number of Acres per Square Inch at the Following Scales

Scale	Square Feet	Acres
100 ft. = 1 in.	10,000	0.2296
200 ft. = 1 in.	40,000	0.9183
300 ft. = 1 in.	90,000	2.0661
400 ft. = 1 in.	160,000	3.6731
500 ft. = 1 in.	250,000	5.7392
600 ft. = 1 in.	360,000	8.2644
700 ft. = 1 in.	490,000	11.2488
800 ft. = 1 in.	640,000	14.6924
900 ft. = 1 in.	810,000	18.5950
1,000 ft. = 1 in.	1,000,000	22.9568
¼ Mile = 1 in.	.....	40.0000
½ Mile = 1 in.	.....	160.0000
¾ Mile = 1 in.	.....	360.0000
1 Mile = 1 in.	.....	640.0000

the acreage of a piece of land which by measurement shows 12.7 sq.in. of area, the scale of the map being 200 ft. to the inch. He refers to the table and finds that 1 sq.in. at the above scale is equal to 0.9183 acre, and that therefore 0.9183 × 12.7, or 11.66+ acres, is the required answer.

In the Building of Fires in locomotives, a considerable saving of wood and coal can be made if the following method is used: On top of the grate place a layer of dry shavings 1 in. thick. On top of this place a layer of 4 or 5 in. of coal, and on top of the coal another layer of dry shavings 1 in. thick. As this method of laying the fire prevents the passage of air through the material, it is necessary to make an opening down the center of the fire for the passage of air. The bottom layer of shavings prevents coal from falling through the grate, therefore saving fuel and preventing it igniting in the fire pan and shortening its life.

The Utilization of Anthracite Culm

By M. S. HACHITA
Chemist, Lehigh Valley Coal Co., Wilkes-Barre, Penn.

THE insistent demand for more coal during the past year, and particularly this winter, has been beyond the capacity of the mines to supply. This inability to increase the output has taught the anthracite operators to practice a more strict economy at their power plants, to stop all wastage of fuel, to prevent leakage of steam and to utilize a byproduct that was previously considered as waste. In accord with this idea, the Lehigh Valley Coal Co. has perfected a method by which the anthracite culm mixed with bituminous coal can be utilized as a commercial fuel.

It is due to the foresightedness and unfailing enthusiasm of F. M. Chase, vice president and general manager of the company, that the utilization of anthracite "slush" has become an accomplished fact. The slush mixture has brought out another factor which was heretofore never thought of—that is, the evaporative power of this fuel does not depend entirely on the heat content of the coal, but directly upon the mechanics of a more complete combustion. This is clearly shown by the results of tests made on stationary boilers and on locomotives.

Culm Formerly Considered Useless

In the mining and preparation of anthracite a certain amount of fine material is produced which is known as culm, slush or silt. This is material which passes through a screen of $\frac{1}{8}$- or $\frac{1}{16}$-in. mesh and is so fine that, heretofore, it was considered as a useless byproduct of the industry, except in some instances where it is taken into the mine and deposited in old workings in order to support the roof. It is also used to a small extent in making briquets. Aside from these uses it has been a nuisance to the operator, as he experienced great difficulty in disposing of it.

This material contains approximately 80 per cent. of combustible matter. It therefore has a fuel value approximately equal to that of commercial anthracite. In 1913 the Lehigh Valley Coal Co. conducted a series of experiments at its Spring Brook boiler plant, near Hazleton, Penn., with the view of utilizing this culm.

For this purpose were arranged four cylindrical boilers, 33 in. in diameter and 30 ft. long; one smoke stack, 33 in. in diameter and 33 ft. high; a total grate area of 132 sq.ft., having an air space of 19.8 sq.ft., or 15 per cent. of the total area.

The feed water was measured in three barrels, elevated 10 ft. above the ground. Directly under these were five barrels, connected in series, into which the measured water was discharged. The water was fed into the boilers by means of an injector. The steam was exhausted into one of the stacks through a 2-in. pipe. The pressure of the steam was maintained at 60 lb. throughout the tests. Forced draft was produced by means of a small fan, with a pressure of $\frac{1}{2}$-in. water gage. The temperatures of the feed water and air were recorded; that of the stack averaged 750 deg. F. The amount of CO_2 in the flue gases was determined by the Orsat apparatus.

TABLE I. ANALYSES OF FUEL

	Hygro. Moist.	Moist.	Volatile	Carbon	Ash	B.t.u.
Coking coal	0.0	0.71	24.48	60.07	14.74	13,005
Noncoking coal	4.90	2.14	25.06	62.45	10.35	13,210
Culm	8.50	1.85	4.40	68.70	25.05	10,772
Spring Brook boiler fuel	0.0	3.25	2.99	75.80	17.96	11,304

In this test the fuel consisted of culm and bituminous coal. These were weighed on a platform balance before being fired, and the ashes were weighed after each test.

From Apr. 23 to 26 inclusive the fuel was fired in alternate layers of soft coal and culm, also a thorough

TABLE II. ANALYSES OF ASHES

	Moisture	Volatile Matter	Carbon	Ash	B.t.u.
"A" Coking coal	0.79	1.45	33.73	64.03	4,834
"B" Noncoking coal	0.99	3.84	45.10	50.07	7,216
"C" Culm	1.32	1.09	54.04	43.55	7,888
"D" Anthracite boiler fuel	0.67	1.51	38.23	59.59	5,642
"A" 30 per cent.—"C" 70 per cent., run-of-mine	0.96	0.77	40.83	57.44	5,904
"A" 50 per cent.—"C" 50 per cent., run-of-mine	1.12	2.01	39.75	57.12	6,048
"A" 70 per cent.—"C" 30 per cent., run-of-mine	0.84	0.72	31.24	67.20	4,428
"A" 30 per cent. pulverized "C" 30 per cent.	0.78	1.28	35.41	62.53	5,383
"A" 50 per cent. pulverized "C" 50 per cent.	0.67	1.26	32.15	65.92	4,768
"A" 70 per cent. pulverized "C" 30 per cent.	0.32	0.34	17.03	82.31	2,628
Noncoking coal 50 per cent. "C" 50 per cent.	0.57	1.80	43.52	54.11	6,662
Noncoking coal 70 per cent. "C" 30 per cent.	0.78	2.20	42.77	54.25	6,591
Noncoking coal 80 per cent. "C" 20 per cent.	0.50	1.28	42.03	56.19	6,453

mixture of both fuels in various proportions. It was soon discovered that the thorough mixture of culm with bituminous coal was the better method, and it was therefore used throughout the tests. Tables I and II show the analyses of the fuels used in the tests and also of the resulting ashes.

In order to determine the basis for comparison, each fuel was burned alone. Table III shows the results of these tests. The figures in the first column were obtained from burning coking coal alone; the second column, noncoking coal alone; the third column, culm alone. To compare these figures directly, the temperatures of the draft were corrected to 60 deg. F., and the fuel is calculated on a dry basis.

The first series of tests consisted of 30, 50 and 70 per cent. of run-of-mine coking coal mixed with 70, 50 and 30 per cent. of culm from the Hazleton shaft colliery. The results of these tests are found in columns E, F and G. Since the soft coal contained a great many lumps, the large pieces were crushed with a hammer, and the biggest ones in the mixtures were not larger than the size of egg coal. Both fuels were thoroughly mixed in the proper proportions with shovels before firing.

After the foregoing tests were over, the soft coal was crushed to pass through a 1-in. screen. It was then mixed with culm in the same proportions as before and fired. The results of these tests are found in columns H, I and J. At the conclusion of these tests, the old Spring Brook boiler fuel was fired to determine the relative values in evaporation of the water. The results of this test are found in column D.

Results of Second Series of Tests

The second series of tests consisted of noncoking coal mixed with the culm in the following proportions: 50, 70, 80 and 100 per cent. of bituminous with 50, 30, 20 and 0 per cent. of culm. The results of this test are given in columns B, K, L and M.

The figures on line 16 show the number of pounds of water evaporated from and at 212 deg. F. per pound of dry fuel, the temperature of the draft being corrected to 60 deg. F. After deducting the water evaporated by the soft coal in the mixtures, the remainder is credited to that which was evaporated by the culm (see line 17). It will be noticed that the best results were obtained when the culm was mixed with pulverized coking coal. The amount of water evaporated, shown in column J, was 5.92 lb., or 99.38 per cent. of the water evaporated by the soft coal alone, which was 5.957 pounds.

The reason why coking coal is better adapted to mix with culm lies in the fact that the coking coal fuses at a comparatively low temperature and the fusion takes up the particles of the culm, forming a homogeneous mass of fuel which burns uniformly. It was also noticed that the mixture was easier to burn than was soft coal alone. This is due to the fact that when soft coal alone is burned, the fuel bed becomes a hard mass requiring considerable poking to effect complete combustion, whereas in the case of the mixed fuel the coked mass is more easily handled by the fireman as it breaks up into small pieces with less labor, thereby increasing the speed and quality of the combustion. The noncoking coal on the other hand does not fuse and therefore burns independently of the culm. It will be observed from the results of these tests that the culm can be commercially utilized in a furnace where bituminous coal is now being used, such as large factories, railway locomotives and ocean liners.

In September, 1917, the Lehigh Valley Railroad Co. tried the formula of mixed fuel on its stoker engines running between Hazleton and Lehighton, a distance of 26.2 miles. Both Standard and Street stoker engines were used. The train consisted of 50 cars of coal taken from the Hazleton region to Lehighton, the return to Hazleton being made with 65 empty cars.

The condition of the tracks between the points above mentioned was such that all the haul to the east was down grade while that to the west was up grade. All eastbound trains stop at Hazle Creek Junction and inspect and test air brakes. On leaving Hazle Creek Junction, the hand brakes were applied 100 per cent. Both hand and air brakes were used to control the train from Hazle Creek Junction to Black Creek Junction, the grade being such that both devices were required in order to control the train between the points mentioned. The hand brakes were released at the latter

MIXING PLANT AT HAZLETON, PENN.

junction and from there on east the train was controlled by air brakes.

On the return trip from Lehighton, the engine pulled the train to Penn Haven Junction by its own power. At this point one engine helper was added to the train on the rear. This helper was necessary on account of the grade up to Black Creek Junction, at which point a second engine helper was required to push the train against a heavy grade up to Hazle Creek Junction. This made a total of three engines to the train. At the latter junction the second engine was taken off and the train proceeded to Ashmore with two engines, where the first engine helper was also taken off. This description is made to show the physical condition of the tracks on which the tests were conducted.

When the train first started from Hazleton on the first trip, the fireman seemed to have a little trouble in maintaining the steam pressure. This was due to two causes; first, the fireman was not used to this grade of fuel, and second, the stoker apparatus on the locomotive was not in good working order. As a result the mixed fuel was not properly distributed in the combustion zone and the thickness of the burning fuel bed was not sufficient to obtain the full burning capacity of the coal. However, the fuel burned well and the pressure of the steam was maintained between 140 and 185 lb. until the

train was pulled into Hazleton, thus completing the first trip.

The second trip was started late in the afternoon of Sept. 28, using the same engine. A representative of the Standard stoker firm was present on this trip and adjusted the defects in the stoker. The train, consisting of 50 cars of coal, was pulled out of Hazleton in the usual manner with the stoker in proper working condition and with the same fireman as on the first trip. Profiting by the experience gained on the first trip, no trouble of any kind was met with in maintaining the working pressure of the steam, which was between 150 and 185 lb. The return trip was made with 60 empty cars and the run proved entirely satisfactory.

The third trip was made on the evening of Sept. 29 with the same engine, this time burning pure soft coal. This was done in order to compare the evaporation of water per pound of different fuels burned. The train consisted of 49 cars loaded with coal, with a gross weight of 3100 tons, and the return was made with 50 empty cars weighing 960 tons. During this trip the engine consumed 128,550 lb. of water at 58 deg. F., while the weight of the fuel burned was 26,550 lb. This is equivalent to 4.84 lb. of water at 58 deg. F. evaporated per pound of fuel.

The fourth trip was made on Sept. 30 with the Street stoker engine No. 341. The fuel used in this test consisted of 30 per cent. of culm and 70 per cent. of stoker coal. As it was Sunday there were only 38 cars of coal available. These weighed 2287 gross tons. The return trip was made up of 70 empty cars weighing 1222 tons. The fuel burned well, producing plenty of steam. The total amount of water evaporated in the run was 117,800 lb. at 58 deg. F., while 18,550 lb. of mixed fuel was consumed. This is at the rate of 6.35 lb. of water evaporated per pound of fuel.

The fifth trip was made on Oct. 1 on hand-fired engine No. 337, burning a mixture of 40 per cent. culm and 60 per cent. of run-of-mine coking coal. The load consisted of 50 cars of coal weighing 3394 tons, and the return was made with 66 empty cars weighing 1200 tons. The fuel burned well and the working pressure of the steam was maintained throughout the trip. The total amount of water evaporated during this trip was 126,250 lb. at 58 deg. F., while the consumption of fuel amounted to 20,550 lb. This is equivalent to 6.14 lb. of water evaporated per pound of mixed fuel.

Table IV is a tabulation of the evaporation tests made on the different engines with the various fuels.

It will be noticed in Table IV that the fuel burned on engine 351 contained more heat units than that contained in the mixed fuel used on the other two engines. Yet the amount of water evaporated by this locomotive is much less than the other engines Nos. 341 and 337, both burning mixed fuel having a less theoretical quantity of heat.

A reduction of the amount of smoke now being produced by ocean steamers can be accomplished through the use of a mixture of soft coal and anthracite culm; furthermore the use of such a mixed fuel would not only reduce the amount of smoke but also the cost of the fuel

From experiments, the best results can be obtained from 30 per cent. of culm thoroughly mixed with 70 per cent. of pulverized coking coal. This proportion of the fuel mixture will produce a heat efficiency equal to or greater than that produced by the same weight of soft coal. This is due to the fact that, as pointed out above, the mixed fuel burns more evenly so that the volatile matter in the soft coal has a better chance for more complete combustion. As a consequence, the mixed fuel, containing the above proportions, produces approximately 50 per cent. of the smoke made by bituminous coal only. The more culm the mixture contains the less will be the smoke produced.

The culm contains more ash than does the average bituminous coal, but this disadvantage is more than balanced by the fact that when mixed in the proper proportions it gives a better combustion and consequently produces more available heat than is produced by burning soft coal alone. This fact has been ascertained by experience.

Soft coal consists of two chief combustible ingredients—namely, fixed carbon and volatile hydrocarbons. The hydrocarbons contain approximately 85 per cent.

carbon and 15 per cent. of hydrogen. The evolution of hydrocarbon from soft coal is begun at a comparatively low temperature. This means that when a shovelful of soft coal is fired the quantity of smoke emanating from the smoke stack will be noticeable immediately. The reason for the appearance of this smoke lies in the fact that the volatile constituents in the fuel come out rapidly while at the same time the supply of oxygen in the combustion zone becomes so deficient directly over the fresh fuel that a greater part of the volatile combustible matter is distilled, liberating the carbon in a free state in the combustion zone; and as this travels toward the flues and thence to the smoke stack, its temperature falls. Under these conditions the carbon particles, thus distilled, condense and each particle attracts others to it and becomes larger and larger. Finally the resulting "flakes" have grown so large relatively that they become collectively visible as smoke.

Each particle of smoke that passes through the flues means that so much heat is lost. This is the actual condition found today on railroad engines using soft coal. The incomplete combustion of the volatile constituents in the bituminous fuel was responsible for the low efficiency of water evaporation in engine 351 given in Table IV. A cure for this defect in soft coal has been found in the anthracite culm mixture.

The culm consists of approximately the following sizes: Over 20 mesh, 50 per cent.; over 40, 22 per cent., and through 40, 28 per cent. The culm is unlike other grades of anthracite in that it is extremely fine; and when it is mixed with slack or stoker coal the subsequent handling would not disturb the homogeneity of the mixed fuel. Again the culm has per unit weight a larger surface exposed for combustion than barley, rice or buckwheat coal. Consequently the culm burns more quickly and evenly than commercial anthracite.

TABLE IV. TESTS OF DIFFERENT ENGINES WITH VARIOUS FUELS

	Engine 351	Engine 341	Engine 337
Kind of fuel used	100 per cent. soft coal	30 per cent. culm, 70 per cent. soft coal	40 per cent. culm, 60 per cent. soft coal
Weight of water used	128,550 lb.	117,800 lb.	126,250 lb.
Weight of fuel used	26,550 lb.	18,550 lb.	20,550 lb.
Water evaporated per pound of fuel	4.84 lb.	6.35 lb.	6.14 lb.
Temperature of feed water	58 deg. F	58 deg. F	58 deg. F
Heat contained in each pound of fuel, B.t.u.	13,689	12,783	12,755
Fuel efficiency based on evaporation of water with 100 per cent. bituminous coal	100 per cent.	131 per cent.	127 per cent.

ANALYSES OF FUEL

	Hazelton Shaft Culm, Per Cent.	Soft Coal, Run-of-mine, Per Cent.	Soft Coal Stoker, Per Cent.
Moisture	2.15	0.75	0.32
Volatile matter	7.40	34.25	23.78
Fixed carbon	64.45	55.80	62.60
Ash	26.00	9.20	13.30
Total	100.00	100.00	100.00
B.t.u. (dry coal)	10,617	14,181	13,689

Since coking coal and culm were used in these tests, the burning fuel produced a mass of porous, spongy coke; and being porous, the coked mass burned out in a comparatively short time. Right at this point it was observed that the culm and the bituminous coal in the mixture burned at the same rate. With an addition of anthracite culm in the soft coal, the mixed fuel contains less volatile ingredients than does raw bituminous. Furthermore, with a fuel consisting of one-third culm and two-thirds soft coal, every two particles of soft coal has as its neighbor a particle of culm. Consequently the soft coal particles have a greater opportunity to obtain oxygen in the combustion chamber necessary for a more complete combustion. Thus the culm in the mixed fuel reduces the excess of volatile matter, which, if not diluted, will be distilled and a part of it expelled from the stack as smoke. The function of the culm addition to the bituminous coal, therefore, is to give the volatile constituents of the soft coal a more complete combustion, thereby preventing the emission of unburned hydrocarbons and securing more heat.

At the conclusion of the runs made on the different engines the railroad company decided to build a mixing plant. Construction began on Oct. 11, 1917, at Hazleton, Penn., and was completed in eleven days.

Upon arrival the bituminous coal is unloaded into a pit, from which it is raised to the plant by means of a dragline. After passing over the bar screens, with ⅞-in. openings, the coarse material is fed onto a crusher where it is sufficiently reduced to pass through a screen of 1-in. mesh. Both the screenings and the crushed coal are then dropped into a bin. The silt is brought from the slush bank at the Hazleton shaft operation in 5-ton cars and dumped into a bin at the plant.

The material from each bin is then gravitated to a revolving table located directly under the bins. The proper amounts of bituminous coal and slush are scraped from the tables and both ingredients drop onto a third revolving table where they are thoroughly mixed. It is again scraped off and discharged onto a chute; thence to elevator buckets where the mixed product is loaded into the cars from which the soft coal was unloaded. The machinery is driven by a 50-hp. motor.

The present capacity of the plant, under normal conditions, is approximately 100 tons per hour, but it is the intention of the company to make slight alterations this spring so that the capacity may be increased to from 150 to 200 tons per hour.

In Lighter Vein

High Cost of Mule

An Englishman came to this country some years ago on a visit. He was impressed with many things he saw, but particularly with our vast mineral resources, and expressed his opinion that he would like to invest in American coal lands. This news received good circulation, and soon he was presented with many opportunities for investment.

After going over sheaf after sheaf of legal and engineering data of a certain operation, he bought. One day the idea seized him that he might go and look over his purchase. Arriving at the mine, he saw a driver using his persuader on a mule, and the general appearance of the place prompted the following remark from the Englishman: "Say there, driver, quit abusing that mule; he cost $40,000."

Coal Conservation

By DAVID MOFFAT MYERS
Advisory Engineer, United States Fuel Administration, Washington, D. C.

SYNOPSIS — *The coal shortage does not necessarily call for a power and heat shortage. If coal now available to the factories of the country were burned in such a manner as to extract from it the greatest amount of power possible, they would be confronted by no lack of fuel. The practice of true conservation, use without waste, can avoid the necessity of further interruptions to industries.*

THERE is an enormous and needless waste of coal in the United States. Coal is literally being thrown away in industrial plants, simply because it has been cheap, while coal in Italy is costing $100 per ton and people in our own country are freezing because of coal shortage. Factories essential to the proper conduct of the war will have to shut down unless scientific methods for boiler management throughout the country are adopted, and unless private homes coöperate with and are guided by the Fuel Administration. The popular support accorded to Mr. Hoover and his food-saving campaign has made possible the great results accomplished. The same loyal support of Dr. Garfield and his conservation program will relieve the present shortage of coal. The new program is to "Hooverize" coal.

The factory power plant has heretofore been neglected. It has not received the close analytical attention which the management has bestowed upon the other departments of its business. In these other departments the intake and output are carefully and continuously recorded and exhaustive studies made to discover those means which will result in the maximum efficiency of production. The United States Fuel Administration warns all plant owners and managers that if they do not apply to their power plants the same degree of intelligent skill and attention which have produced high efficiency in other phases of their business, there will again come a time when it will be necessary to shut down a part of the industrial plants of the country on account of a shortage of fuel.

When that time comes some owners will by intelligent effort have succeeded in obtaining a high efficiency of operation in their steam plants. Others will still be running with great wastefulness. Strict limitation in the distribution of coal will be necessary. Obviously it will not be fair to the efficient plants to shorten their coal supply, while the bad plants continue to waste. All plants, then, may be classified by the Government either as "efficient" or "wasteful," and this classification used as a basis of coal distribution and limitation. Quick and concentrated action alone on the part of plant managers will prevent serious shortage, and this threatened regulation and limitation. Now is the time to get your plant into the "efficient" class.

The power plant of the factory has been neglected largely because even when run with a tremendous waste of coal the cost of that coal constituted an extremely small portion of the total cost of production of the commodity manufactured, often less than 1 per cent. Hence, managers have neglected their power problems and have concentrated their attention on the more costly items of production, such as labor, material and machinery, and in these departments they have effected great economies by the application of scientific analysis and reform.

It is now imperative that they immediately shoulder the task of bringing their power, light and heating equipment and operation up to the highest plane of efficiency made possible by the best engineering practice.

Two considerations, that is, two factors, govern the efficiency of any process. These two factors are excellence of "equipment" and of "operation," and the resultant efficiency is equal to their product.

The efficiency of a steam plant is the product of the efficiency of its physical equipment, and this of the methods by which it is run. Thus you may have a good boiler and furnace, but if the fireman doesn't operate them properly your coal will be burned wastefully; you will obtain less steam than you are entitled to for the coal consumed, and the efficiency of the combination of equipment and operation will be low. On the other hand, it is possible to obtain a big saving by good handling of mediocre apparatus.

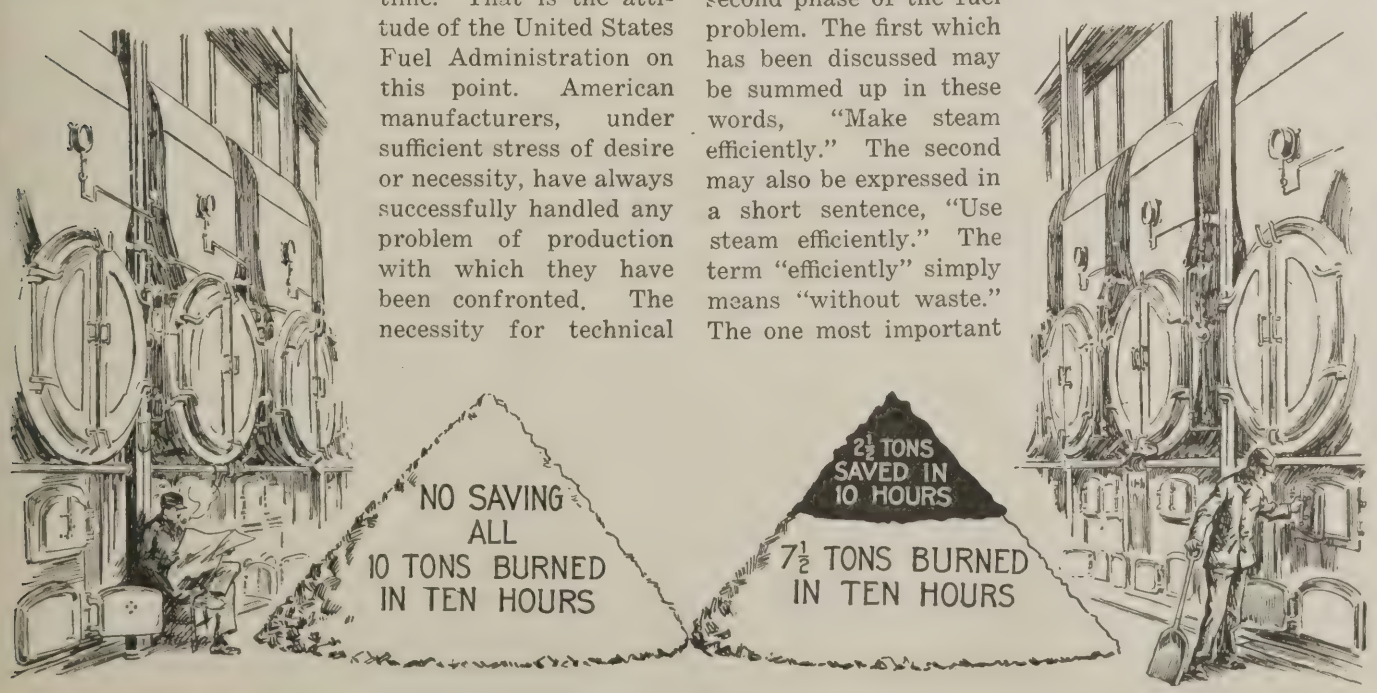
Efficient Firing Means Greater Steam Production

For example, in one plant investigated the steam production was increased 50 per cent. with the same amount of coal. Not a dollar was spent to improve the equipment, but the fireman was taught how to operate his furnace efficiently. As soon as he learned the new method of firing his pay was increased so that he was given the necessary incentive to continue the improved performance. A simple accounting system was installed so that at the end of each day both the fireman and the manager knew how many pounds of steam had been produced for each pound of coal. This figure which had been six, now became nine, so that one-third less coal was used than formerly. This meant good money in the pocket of the factory owner.

The above plant is typical of hundreds, and similar economies can be effected all over the country. This example is quoted to show how immediate savings can be made without delay for improved power equipment.

It will be necessary, ultimately, to tackle both ends of the situation, that is, both the equipment and the operation of industrial plants. But there is a right way to start the work, and this right way is first of all to get the highest efficiency obtainable from the present existing furnace, boiler and engine equipment. This means learning how to operate the present plants so that the saving of some 50,000,000 tons of coal per year may go into immediate effect.

The first thing for every plant owner to do is to ascertain how many pounds of water are being evaporated per pound of coal. In 99 plants out of 100 this information is not at present available. It will therefore be the specific business of the plant owner to make it available. This entails accurate measurements of coal and water. There are a number of good and sufficiently accurate devices on the market for accomplishing these objects. Continuous records of the feed water and a system of observing the furnace combustion by means of flue gas analysis should be employed. Primarily flue gas analysis indicates the quality of the combustion taking place. If the combustion is faulty, it should be corrected. The services of a chemist are not required. Any person of average intelligence can operate the hand machines, and there are automatic analyzers on the market, some of which give a continuous record of furnace performance. Fuel engineers are thoroughly familiar with the various types of apparatus, for this purpose, and if necessary their advice should be obtained. In every plant, the water fed to the boiler can, and should be, measured continuously and accurately. There are no excusable exceptions to this rule. When the owner has ascertained the number of pounds of water made into steam per pound of coal, his next duty is to find out whether this is the best that can be done with his equipment and if not, how the result can be improved.



If an owner wishes his equipment to be classed as an efficient plant, so that he may receive the preference in coal delivery if shutting down of bad plants becomes necessary, then let him find out from the best sources of information how to test his boilers and make them more efficient.

Plant owners should at once call in the best authorities on steam and fuel economies. The large savings that will be accomplished by following the advice of truly competent fuel engineers will put additional income into the pockets of the plant owners. Experience has shown that this practice always brings profitable results. Ignorance of fuel economy requirements cannot be considered as an excuse at this critical time. That is the attitude of the United States Fuel Administration on this point. American manufacturers, under sufficient stress of desire or necessity, have always successfully handled any problem of production with which they have been confronted. The necessity for technical knowledge, almost always involved, has not stopped them. They not only have weeded out the requisite knowledge from its sources but what really counted was their ability to apply it effectively to produce results. The present problem is no more difficult or complex than those which have gone before.

The illustration below shows graphically the saving that can frequently be made by the ordinary fireman in a single day of ten hours if he uses the correct methods of handling his boiler and furnace. Thus one fireman can save 750 tons of coal in a year for Uncle Sam. Some can save more. But that is not all. The plant owner receives ordinarily the full benefit of the saving the fireman makes by virtue of his skill and faithfulness. In the above instance, one fireman might earn for his employer $\$750 \times 5 = \$3750$ a year in coal saved. It is only fair to divide these profits with the fireman. Furthermore, a fireman being human will probably lose his interest and the employer his profits unless a fair division of these profits are accorded to the man upon whose direct efforts the saving depends. Firemen's bonus systems have been developed to meet this situation.

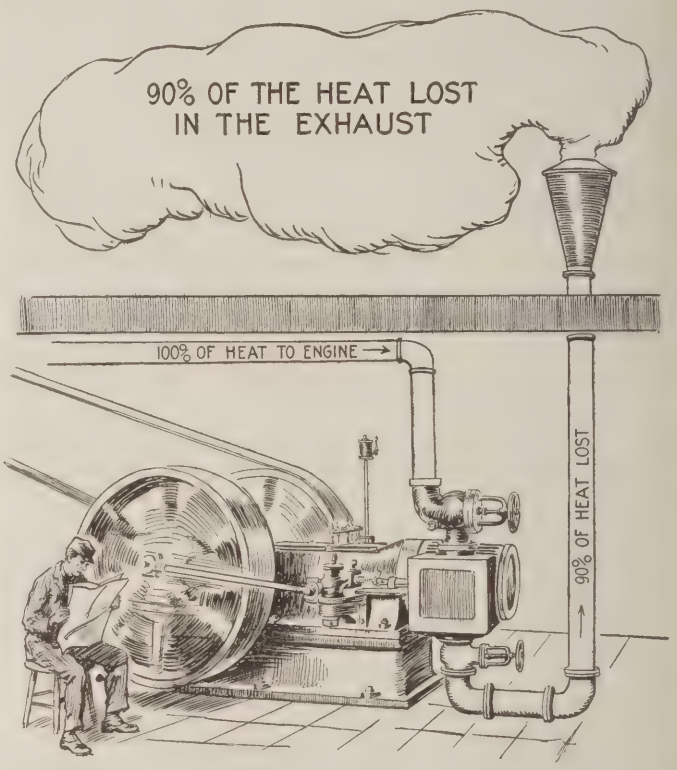
A power plant is a factory. Its output is power, heat and light, and like any other factory it should be so designed and operated as to give the maximum of these commodities for a minimum expenditure of raw material, which in most cases, is coal. These conditions call for a thorough investigation of the entire plant to determine the location and extent of all preventable waste of steam and fuel. And then, when all the indicated corrections are accomplished the power plant, like any factory, must be put under a daily system of accounting and supervision to insure the maintenance of its efficient performance.

This is nothing more than common sense. Yet not one power plant in a hundred can render a true account of the production obtained from the coal consumed. Neither do the owners know how much, in terms of steam, power, heat and light should be produced for each pound of coal properly used. Yet this knowledge is available to those who seek it. Now comes the second phase of the fuel problem. The first which has been discussed may be summed up in these words, "Make steam efficiently." The second may also be expressed in a short sentence, "Use steam efficiently." The term "efficiently" simply means "without waste." The one most important

factor on this side of the factory problem is the utilization of the exhaust steam. After passing through an engine, although the pressure of the steam is reduced, it still contains 88 to 97 per cent. of its original heat.

Hence, all exhaust steam possible should be utilized in order to prevent a tremendous waste of fuel. If conditions are such that all of the exhaust cannot be used then install more efficient engines, or turbines, to reduce the production of exhaust to a point where it will just supply the demands for heating and process work. Never blow away exhaust steam to the atmosphere. This is of the utmost importance. Millions of tons of coal are being wasted in clouds of exhaust steam. Conversely, never use live steam for heating when exhaust steam can be employed.

More Horsepower with Same Coal Consumption



Let me give you an example of the failure of a factory plant "to observe these laws." One hundred and twenty boiler horsepower of live steam was being used for heating and process work while the company was buying electric power to run its machinery. Upon the recommendation of the consulting engineer, who was called in to investigate and report on the conditions of steam and fuel economy, a Corliss engine driving an electric generator was installed. The steam from the boilers now went to the engine, the exhaust from which was sufficient for all heating requirements. Enough power was produced by the engine entirely to displace the formerly purchased electric energy. All direct steam from the boilers was cut off from the heating system. Thus an additional 100 electrical horsepower was generated purely as a byproduct of the heating system, and the coal consumption remained the same as when this amount of electric current had to be purchased in addition to the coal for heating.

Conversely, the exhaust steam from an engine will furnish heating steam not only for its own building, but may have enough to supply several surrounding buildings. There has been developed a system known as "block-heating," whereby one central power plant, economically and efficiently operated, supplies steam heat to entire blocks of city business buildings, thereby doing away with a number of small wasteful boilers and their necessary multiple attendance. The exhaust steam is transmitted through carefully covered piping, and the heat loss in transit is practically negligible. Such a system is obviously advantageous.

In some small plants where a large waste of exhaust prevails, and where conditions do not permit its utilization, coal will usually be saved by electric power from a public service or water power company. Public service companies can perform a great service to the country, if they will coöperate with private plant owners, and make special rates for electric current, so that the small plant owner can afford to buy electric current, particularly during the non-heating season, and in many cases at night. This can usually be done to the advantage of the public service company.

The steam-using public must learn the value of exhaust steam, and that a heating system which requires 100 b.-hp. of steam may have a steam engine inserted between the boiler and the heating main, and obtain nearly 100 mechanical or electrical horsepower in addition to the required heating, with no increase in the consumption of coal. In cases where this can be done continuously no central power station can compete with the private plant for efficiency in the production of power, light and heat.

The amount of coal required to produce an electrical, or mechanical, horsepower-hour varies all the way from a little over 1 lb. to 8 or 10 lb. This consumption which has such a wide range of values depends upon the mechanical equipment of a plant and the skill employed in its operation. Thus, speaking first of equipment, it is true that there are certain kinds of steam pumps which use as much as 150 lb. of steam per horsepower-hour; certain engines which use as much as

60 lb. of steam per horsepower-hour, whereas it is possible by electrifying the steam pumps to reduce their steam consumption to 15 or 20 lb. per horsepower-hour, and the main power producers in the form of modern engines and turbines under favorable conditions can produce a horsepower-hour for 8 to 15 lb. of steam instead of the 60 lb. which is now consumed by many engines in actual operation.

This wide range in the steam economy of prime movers combined with a difference in coal consumption of some 25 to 50 per cent., as governed by the degree of intelligence with which boiler and engine plants are operated together with a great waste and needless production of exhaust steam, indicates roughly the enormous saving of coal which is possible in the industrial plants of the United States, if their equipment and operation is raised to standards made possible by the best known engineering practice.

This country has been wastefully and heedlessly drifting along the lines of least resistance, until all of a sudden this war crisis has called for a radical change of policy.

Previous to this period, all improvements in power plant efficiency were impelled by a desire to save money. That is why the public service corporations have better

plants than power equipment of the usual factory. Their coal cost constitutes roughly 50 to 60 per cent. of their total cost of operation, whereas this item with a factory may be less than 1 per cent. of its total cost of production.

But the new reform which is now to begin will be impelled not by the incentive of expense reduction, but by an infinitely stronger and more vital force—the force of necessity. Unless efficient equipment and efficient methods are installed, there will not be coal enough to run the industries. Make your plant efficient or shut down. That is the new, the present, aspect of the fuel problem.

Heating of Coal in Piles*

By C. M. Young, E. M.
Assistant Professor of Mining Research, University of Illinois, Urbana, Ill.

Bituminous coal piled in heaps or bins frequently undergoes a process of spontaneous heating as the result of the absorption of oxygen. It seems probable that the first absorption of oxygen by coal which has not previously been exposed to the air may occur as a condensation or a combination of oxygen in some form which does not result in the production of carbon dioxide, but slow combustion soon begins. The absorption of oxygen is accompanied by an increase of temperature, and this by an increased rapidity of absorption; hence the dangerous condition proceeds from bad to worse, until the kindling point is reached, unless the process is interrupted.

A dangerous rise of temperature can be prevented by excluding oxygen, by increasing the bulk of coal in proportion to its surface exposed, or by circulating enough air to dissipate the heat produced. The storage of coal, in practice, varies from almost complete exclusion of oxygen, by storing under water, to such freedom of access as exists when the coal is stored in open piles.

Oxygen available for absorption by coal is supplied by the air in the interstices between lumps and by additional air which may enter the pile through circulation. The size of the coal largely affects both of these supplies; for if the fragments are small the spaces between them constitute a small percentage of the total volume, and little oxygen will be available unless the circulation of air brings in a fresh supply, while with large fragments the percentage is relatively large; circulation also is much easier through a pile of coarse lumps. In the case of lump coal, although a large amount of air may be present, the exposed surface is comparatively small and there is little opportunity for the absorption of oxygen to be so rapid as to cause dangerous heating. Attempts have been made to prevent heating by allowing a sufficient circulation of air to carry off the heat generated; obviously this method cannot be applied to fine sizes or mixed sizes.

When storing coal at the University of Illinois, an attempt has been made to use so much fine coal and to pack it so thoroughly as to prevent circulation of air, while also reducing the original air in the pile so as to prevent heating. This method has been fairly successful, but in some cases the piles have heated. An investigation made when a pile was opened for the removal of portions which had begun to heat indicated that heating had occurred only in those parts of the pile which contained comparatively small proportions of fine coal.

To confirm the impression given by the appearance of the pile, samples of coal were taken from the spots where heating was evident, and from neighboring regions in which there was no evidence of heating. These samples were then sized on screens ranging from 2-in. to ⅛-in. round hole, giving the following results:

Size, In.	Heated Region Per Cent.	Heated Region Cum. Per Cent.	Unheated Region Per Cent.	Unheated Region Cum. Per Cent.
Over 2	0.0	.....	0.0	.....
1–2	32.6	32.6	6.3	6.3
½–1	36.4	69.0	22.9	29.2
¼–½	12.2	81.2	24.8	54.0
⅛–¼	7.4	88.6	18.5	72.5
Below ⅛	11.4	100.0	27.5	100.0
	100.0	.....	100.0	.....

It appears from this examination that the portions of the pile in which fine sizes were present in large proportion did not contain sufficient oxygen to heat the coal to any noticeable extent. The close packing had also so obstructed circulation that little fresh oxygen could have been brought in even if the temperature had been raised to such an extent as to favor circulation of air.

This indicates that one comparatively safe way to store coal is to use enough of the fine sizes to occupy the space as completely as possible, and to pack the coal tightly in order that the air space may be reduced and the circulation of air restricted. Apparently the most dangerous condition exists when the coal is of such sizes as to present a large aggregate surface for absorption, and at the same time leave sufficient air space to provide the oxygen required for heating; this condition is found in a loosely packed pile of mixed sizes.

*Presented at the New York meeting of the American Institute of Mining Engineers, February, 1918.

Production of Companies in Indiana County, Pennsylvania, in 1917

The following table has been compiled by Thomas S. Lowther, inspector for the twenty-fifth bituminous district, Indiana County, Pennsylvania, and gives the output in 1917 of the various producing companies in that district:

Company	Tons
Jefferson and Clearfield Coal and Iron Co	1,717,519
Pittsburgh Gas Coal Co	1,309,545
Russell Coal Mining Co	495,582
Penn-Mary Coal Co	439,020
Coal Run Mining Co	407,701
Clearfield Bituminous Coal Corporation	339,574
Tide Coal Mining Co	167,720
Empire Coal Mining Co	156,383
Seneca Coal Mining Co	152,975
Inland Coal Co	124,836
Idamar Coal Co	107,546
Meco Coal Co	70,000
Pennsylvania Coal and Coke Corporation	56,981
McCombs Coal Co	56,794
Glenside Coal Co	38,546
Dixonville Coal Co	36,369
Williams & Griffith	35,050
Savan Colliery Co	34,599
Marion Center Coal Mining Co	30,019
Clymer Brick and Fireclay Co	12,272
Jones Coal Co	9,086
Punxsutawney Coal Mining Co	8,578
Eliza J. Smith & Brothers	4,875
J. H. Bicknell	4,155
Estep Brothers Coal Mining Co	2,413
Total	5,818,138

New England Coal Dealers Association will hold its annual meeting Mar. 20 and 21, at the Municipal Building, Springfield, Mass. Secretary, C. R. Elder, Boston, Mass.

Supporting the Roof in Coal Mines—III

By R. D. BROWN
Harrisburg, Ill.

SYNOPSIS — *Steel roof supports are here considered. The advantages of steel supports are prominent and are noted fully. Standard designs are described and illustrated, and methods of setting them up in the mine are enlarged upon. A table summarizes the characteristic features of concrete, steel, untreated wood and treated wood when used to support top. Rules and limits for efficiency and good workmanship are specified. Concludes with discussion of cost of maintaining roadways under different conditions.*

STEEL, as a substitute for wood, will often prove the most economical, when permanency is desired, for supporting mine roof. The ultimate cost of the timbered roadway will depend on the natural conditions, the relative prices of materials and the life of the installation. The ideal condition is to choose a material of sufficient durability, which shall have the same life as the roadway without a renewal; the labor cost of renewals is usually very great, due to adverse working conditions. With temporary roadways timber can probably be used to advantage, if it is obtained at a reasonable cost. If timber is treated, its life will be increased greatly and the necessity of early replacement eliminated.

In general, we may say that if the life of timbering is to be greater than ten years, then wood will be found to be more costly than steel. If properly painted and cared for, steel will last a long time; it may be taken down and reërected, but the labor cost of doing this may offset any apparent saving, due to its length of life. Knowing, therefore, the estimated life of the installation, the cost of various materials and the local natural operating conditions, the type of construction adopted should be chosen to secure low ultimate cost. The chief advantages of steel timbering are as follows:

1. *Low Ultimate Cost*—The ultimate cost consists of first cost plus interest and maintenance. A low first cost will depend on the current price of steel at the time of installation and the natural operating conditions under which it is erected. The most potent factor is the price of steel, which may vary greatly in short periods of time. If the sets are painted before being erected, the maintenance cost will be negligible and will include nothing but periodic painting.

2. *Steel Is Not Inflammable*—The danger of a disastrous fire, such as may occur when wood is used, is practically eliminated by the use of steel. A fire which may originate in materials along the roadway, or in the coal itself, may cause complete failure of steel sets; but the probability of such an occurrence may be reduced to a minimum by intelligent supervision.

3. *The Sets Are Easily Erected*—Unskilled labor may be employed to erect the sets, on account of the simplicity of the design. Each set is an exact duplicate, therefore no time is lost in assembling.

4. *Adaptability of Design*—There need be no waste of material in designing a support for any weight, or any particular condition. Specified lengths are supplied to the manufacturer and each piece is so made that it exactly fulfills the duty for which it was designed. If the seam of coal is thin, the head room obtained by using a steel crossbar is greater than if a wooden bar is used. This may prove to be quite an advantage if the vertical clearance affects the capacity of the mine cars.

5. *Ventilation Is Not Affected*—The presence of wood in the mine will affect the purity of the air. If the timber is not treated, it will decay soon after being placed; if it is treated, the time of decay is simply deferred and in the meantime the air may be affected by the chemicals used as preservatives.

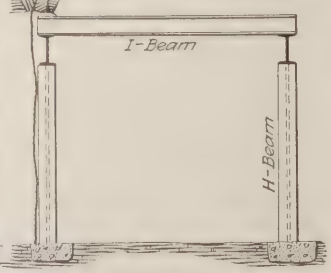

FIG. 16 I-BEAM BARS ON I-BEAMS, SUPPORTED BY H-BEAM LEGS

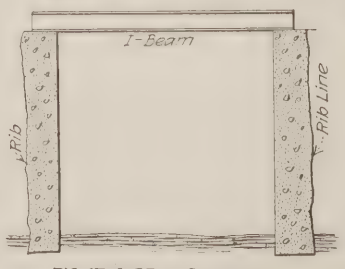

FIG. 17 I-BEAM BAR ON CONCRETE WALLS

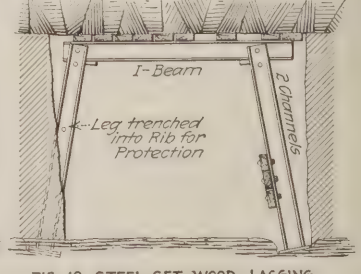

FIG. 18 STEEL SET, WOOD LAGGING

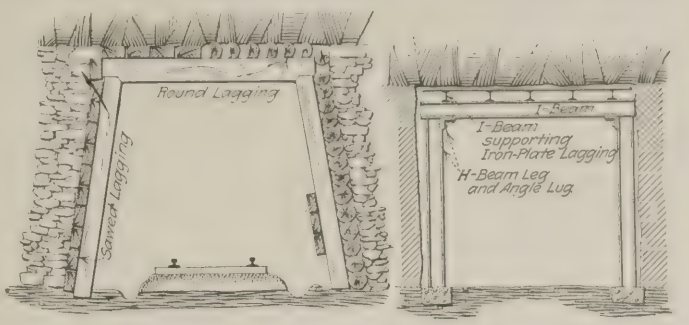
6. *Renewals Are Not Often Necessary*—The renewal of timber sets is usually a dangerous undertaking, on account of the weight of loose rock which must be supported during the operation, or else taken down before replacing the set. Only skilled labor should be used in making renewals. Steel supports may, therefore, be considered as a matter of insurance and safety.

The disadvantages of steel as roof supports are high first cost, their destructibility due to the action of mine water and their unadaptability to temporary construction. For main haulage roads, where the roof must be supported, these disadvantages are more than offset by the many advantages above enumerated; and, unless the price of the metal has increased disproportionately, steel timbering will be found to give the best results.



Standard Designs of Steel Timbering

There are several standard designs for steel timbering, as shown in Figs. 12 to 17 inclusive. Each has its merits and represents good practice. Ordinarily the I-beam collar and the H-beam legs, with bolted lugs, will prove entirely satisfactory; this set is simple, easily assembled and erected, but not adjustable. If two channel sections are used for each post their effective length may be adjusted, as shown in Fig. 12. Channel posts are more expensive than H-beam posts and require a special steel baseplate. If H-beam or I-beam posts are used, baseplates are optional, depending on the nature of the bottom. The legs of a three-piece set must be protected from injury or displacement by derailed cars. This may be done by using guards, or by setting the legs back into the rib (as shown in Fig. 18). The trenched recess is practical and should be used when not too costly.

With certain conditions steel I-beams may be used as collars or crossbars without legs; they may be supported on the coal, by hitching into the rib. This cannot often be done as the coal frequently rashes under the influence of the air, thus weakening the support. If the rib will not sustain the weight, concrete or brick walls may be erected, as a permanent and safe structure, to carry any weight which might come on them in the future. The expense of such an installation will usually be in excess of that of the standard three-piece set, but it has the advantage of being more stable, fireproof and permanent.

If the roof spalls freely, a tight lagging (as shown in Fig. 19) is necessary to prevent injuries from falling slate. The moving current of air may thus be kept from immediate contact with the roof, whereby its cutting action will be reduced. When steel sets are used, steel plate lagging (as shown in Fig. 20) will prove economical where conditions relative to corrosion will permit. The thickness of the plate should be decided in each case, but it should vary between a minimum of $\frac{1}{10}$ in. to a maximum of $\frac{1}{4}$ in. The life of the lagging should be the same as the life of the set; and if wood lagging is used with steel sets, the wood should be so placed as to be removed easily.

When steel or timber sets are used, the spacing of the sets and the design of the lagging should receive due consideration. When increasing the spacing of the sets, the strength of the lagging must be increased in proportion. With ordinary weights to be supported, where lagging is required, a spacing of six feet will effect a saving in both labor and material. If steel plate is used as lagging, a thickness greater than $\frac{1}{4}$ in. will make the cost prohibitive. A spacing of three-piece sets more than 2 ft. apart requires that longitudinal beams be placed over the collars to support the thin plates, which do not have sufficient stiffness to uphold the weight.

FIGS. 19 AND 20. DETAILS OF TIMBER AND STEEL SETS
Left—Timber Set with Tight Wood Lagging. Right—Steel Set with Steel Plate Lagging

These auxiliary longitudinal beams should be continuous over several collars to give them additional strength; they also support the weight of any loose slate if a set is accidentally removed.

The results of working out a definite problem involving various spacings are shown in Fig. 21. The conditions assumed are typical, common and within the limits of usual practice as to the weight cared for. If existing conditions differ greatly from those assumed in the chart referred to, separate calculations should be made.

Packwalls are built in longwall mines to support the roof along the haulage roads, as shown in Fig. 22. These walls are constructed of gob and mine waste, which accumulate from brushing and from falls of rock and slate. In order to build a permanent wall, the face

TABLE VIII. COMPARATIVE ADVANTAGES OF DIFFERENT MATERIALS FOR TIMBERING HAULAGE ROADS

Comparative Conditions	Material			
	Concrete	Steel	Untreated Wood	Treated Wood
Adaptability....	Can be used to suit almost any conditions	Adapted to all but wet places	Used universally	Not well adapted to wet places
Cost.....	First cost is great. Ultimate cost for long periods shows a saving.	First cost less than concrete. Ultimate cost shows a saving.	Least first cost. Greatest ultimate cost for long periods	Medium first cost. Ultimate cost shows a saving
Salvage value...	None	Small	None	None
Renewals.....	Permanent	Life of 15 to 20 yr.	Life 1 to 6 yr.	Life 4 to 12 yr.
Effect on ventilation.....	Aids	Does not materially affect it	Vitiates air when rotting	Affects air when first installed
Imflammability	Not inflammable	Not inflammable	Burns readily	Burns readily when creosoted. Not readily inflammable when treated with zinc chloride
Risk due to fire..	None	Fire will melt steel	Burns readily. Insurance and fire protection costly	Same as for untreated timber
Risk of accidents due to derailments, etc.....	None	If legs are not trenched they must be protected by shields of some kind	Legs must be protected	Legs must be protected
Risk to men making renewals, taking down rock, etc.....	None	Renewals in only a very few cases	Risk is continuous. Only skilled workmen may be employed on account of the danger	Renewals are not as frequent as with untreated wood, but the risk is about the same

should be laid up like rubble masonry thoroughly tied into the interior. The large flat pieces should be used to bond the face course to the main body of the pack, to prevent bulging when the weight comes on. The clearance between the wall and the roadway is generally specified in the mining law. In addition manholes may be constructed at frequent intervals for the safety of men using the haulage road for a traveling way.

Packwalls afford a lodging place for large quantities of dust, which may prove dangerous. It is difficult to remove this dust, and sprinkling is not effective if it is not done with a hose. Unless it is necessary to locally stow away large quantities of gob and slate, the cost of packwalls will make them impracticable. Filling areas worked out by room-and-pillar methods of mining, by flushing with sand or culm, has been practiced in the anthracite districts of Pennsylvania and in Europe. A caving roof may thus be supported. When necessary a roadway may be excavated through the filled areas, after the material has had ample time to settle. This roadway may be used to remove coal from pillars in the flushed area, or it may be maintained as a haulage-way.

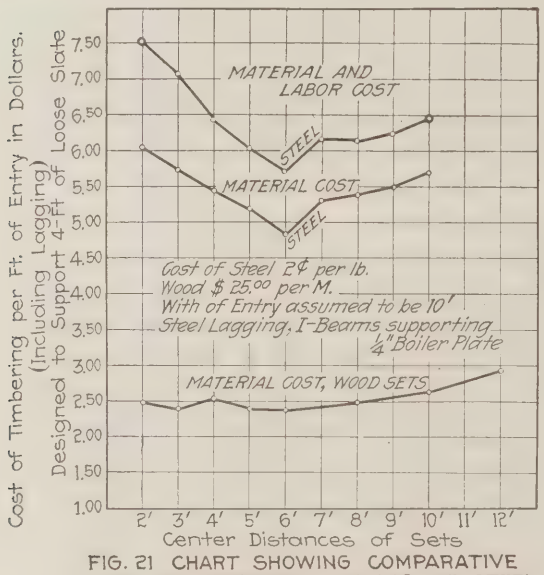


FIG. 21 CHART SHOWING COMPARATIVE COST OF DIFFERENT SPACING OF STEEL AND TIMBER SETS, 10-FT. SPAN

The lives of others depend on the judgment and workmanship of the timbermen, who should at all times keep this fact in mind and be governed by it while performing their duties around the mine.

Report any dangerous condition found along the roadway to the management.

If roof is reported dangerous and must be timbered, do not work under it until it is temporarily made safe by props or other means.

When retimbering or removing weight above timber sets already in place, proceed cautiously, removing only small quantities or pieces at one time. Secure any loose rock before attempting to go further.

If timber sets are being taken out for renewal, place a temporary set and remove the old legs only after the weight has been caught.

Always select a sound piece of timber of sufficient strength.

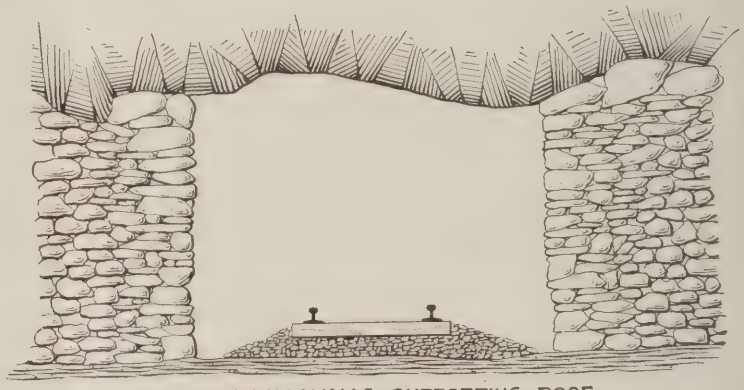

FIG. 22 PACK WALLS SUPPORTING ROOF

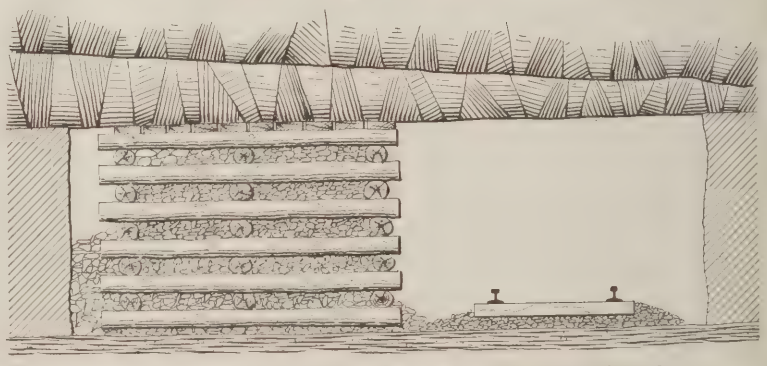

FIG. 23 TIMBER CRIB SUPPORTING LOOSE ROCK

Cribs, or cogs, are built of layers of timber laid together much as in building a loghouse; the interior is then packed with loose rock and slate around the logs. If properly built, cribs will take great weight, but they will not prove substantial unless the gob or slate is closely packed around the timber. (See Fig. 23.) Timbering of this kind is used to support large openings or thin pillars along haulage roads, where entries cross, or at roomnecks. The crib is commonly used where the roof is strong and breaks in large slabs, instead of shelling off in small pieces. If a squeeze or a creep develops and the overburden is not great, cribs are useful to preserve a roadway; in some cases the rock movement may be arrested, or else it may be sufficiently controlled to make it possible to maintain a safe roadway.

The following rules and hints are for the benefit of timbermen who work on haulage roads:

Green timber has only approximately two-thirds the strength of seasoned timber.

Collars should be wedged tightly against the legs to hold them in place until the weight comes on the set, but never wedge the collar at the center.

If there is any side pressure, the legs of the set must be inclined to make them stable.

Inclined legs or posts of a set should be well hitched at the top and bottom to prevent displacement.

The legs of timber sets should be trenched into the rib or otherwise protected in some instances; for example, on curves on haulage roads.

Never have timber or supplies left under questionable roof or in a place where it would be necessary to go under bad roof to obtain the supplies.

All material should be delivered to the place where the work is to be done before the timbermen report for work.

Proper tools in good working order are necessary for rapid and efficient work.

Before framing, square the ends of the legs. If the legs are to be set with a batter, do not cut the squared ends until the bevel is marked off and then make one cutting suffice.

Lay off the bevel as shown in Fig. 7 by using the following formula:

$$S = \frac{(A - a)d}{2h}$$

in which S is the bevel to be marked off.

Never use a bent or crooked piece of timber to support weight.

If the piece of timber is crooked at one end, it may be squared as follows: From the center of the straight end, lay off equal distances on the other end on opposite sides of the stick. A cut through these points will square the timber.

Never work near bare live wires.

All wiring near steel timbering must be insulated.

Steel beams are easily cut by first chiseling across about $\frac{1}{8}$ in. deep, next placing the beam over two solid supports with the chiseled groove midway between, and finally shooting a small shot of dynamite directly over the cut.

All material such as wood or steel beams and posts should be ordered in proper lengths to avoid waste of both labor and material.

Maintaining Roadways Without Timbering

In many cases it is unnecessary to support the roof along roadways if all loose rock is removed before it becomes dangerous; or if the roof is protected from the air by using a cement coating; or by maintaining an airway separate from the roadway, this airway to be cleaned periodically. Thus the problem of continuous maintenance may have more than one solution.

The cost of maintaining the roadway and also a separate airway will, with ordinary conditions, be from five to ten dollars per foot of entry for a twenty-year period. These figures are based on actual costs of cleaning air-courses in several mines where the roof was seriously affected. They include the cost of periodical removal of all loose and fallen rock, the cost of yardage on the additional entry driven and the construction of necessary crosscuts and also interest on all expenditures up to the end of the twenty-year period. Any disadvantage or additional power cost, caused by air-courses being choked with falls of rock or slate during early periods of operation, will be offset by the fact that later on less power will be required, due to an increase in cross-sectional area at the time most needed, when the length and the resistance of the air-course is reaching its limit.

The cost of maintaining the roadway and the air-course together will vary with different conditions, but the amount which may be spent annually in continuously protecting lives and property should not exceed a definite amount. We estimate that the least cost of effectively timbering 500 ft. of entry, 12 ft. wide, will be approximately $6930 for a twenty-year period. The annual expenditure for the maintenance of a safe roadway, which will amount to $6930 in twenty years with interest compounded annually at 5 per cent., is $209.30. Therefore, if the sum to be spent annually for the maintenance of 500 ft. of roadway is greater than $209.30, some form of timbering will eventually cost the least.

There is one other proposition to be considered, and that is the protection of the roof with a cement coating by the use of a cement gun. In some cases such a method of protection would be impracticable, but in others it has not only proved to be practical but also economical. A few failures have resulted from the use of too thin a coating, and it is recommended that this coating shall not be less than $\frac{3}{4}$ in. in thickness. If the cement will not stick to the roof, it may be found necessary to use metal lath secured tightly against the roof with steel pins, or supported on light I-beams. The object of the cement coating is to prevent the disintegration of the roof by exposure to the air current.

An Old Anthracite Landmark

The accompanying illustration shows one of the old anthracite landmarks near Wilkes-Barre, Penn.—the Woodward breaker of the Delaware, Lackawanna and Western R.R., Coal Department. It is located along the Susquehanna River at Kingston, about a mile west from the City of Wilkes-Barre.

Today this colliery employs about 1000 men and boys inside and around the plant, the capacity of which is 3000 tons a day of eight hours. The history of this old breaker must have been a most interesting one, the illustration suggesting many additions to the original building, which has spread out to accommodate the increasing demands made upon it from time to time.

WOODWARD BREAKER, DELAWARE, LACKAWANNA & WESTERN R.R., COAL DEPARTMENT

This is said to be the first breaker in the Wyoming Valley to work nine hours since the eight-hour day went into effect. This is being done every day, and the men at the mine say "they are doing their bit."

The last chapter in the history of this old landmark promises to be its most interesting one, for the Woodward breaker is to be replaced by a larger one of reinforced concrete. Some of the concrete forms are in and the new breaker is to be built around the old one. The colliery officials predict that not a week's work will be lost in the reconstruction work. The new breaker is to be of concrete and steel, much of the latter material being on the ground. The capacity of the new plant will be 4000 tons a day.

Mining Engineers Consider Industrial Relations—II

By R. DAWSON HALL
Associate Editor, "Coal Age"

SYNOPSIS—*Remarks on the New York meeting of the American Institute of Mining Engineers. The members held nine technical sessions, viewed interesting tunneling features in the subway construction and held a patriotic smoker in the Engineering Societies Building.*

AS STATED, the morning session of Feb. 18 terminated with the discussion of the paper of C. F. Wang, a paper which might have elicited extended comment had not the lunch hour intervened. The paper was more or less adequately discussed in the last issue, but one interesting feature still deserves comment. The company, the Pen-hsi-hu Coal and Iron Co., Ltd., whose operation Mr. Wang describes, increased its capital to $7,000,000.

This $7,000,000 plant is full of mysterious anomalies. The coke is still made by building a cone of coal, setting fire to it and shutting off the air by a covering of stone. Loading coal to the oven takes 10 men and getting stones for it five men. The covering and unloading of the coke takes 20 men and the water quenching one man.

Mountain Labored and Brought Forth a Mouse

They are two to three days building the oven and 10 to 10½ days coking the coal, and when the work is done by these 36 men working 12 hours a day, there is 70 tons of coke to reward their pains and to pay for their labor and for the labor of the mine workers. From each "oven" 96 to 105 tons are obtained each month.

Work as inefficiently performed as this coke-making is bound to result in coke of a high price even where wages are low. Countries which do business in a way so uneconomical of labor are sure to pay inadequate wages. Where the product of labor is small the wage must also be small, or economic law is a fraud and a deceit.

In the afternoon a visit was made to two parts of the subway; one near Times Square where shattered rock was encountered, and the other in Brooklyn where the material to be handled was a loose running sand. The problems were pointed out by competent guides. In each case there were tall buildings adjacent which could not with safety be subjected to the most insignificant settlement.

In the Times Square section a tunnel was being excavated under an old subway. Fortunately, the supports in the upper subway terminated with broad cast-iron baseplates. In consequence it was possible to excavate narrow ways under these supports, put girders in the place excavated and then, by further excavation, provide space for brick walls. These walls when erected could, by the insertion of iron shims, be made to carry the weight without the least semblance of subsidence. In the sand section twin tunnels had been driven by the shield method. It was purposed to connect them so as to form a station. Both tubes had to be cut. When cut neither would have enough strength to sustain the immense weight above it, for the shape would be too unstable. By careful forepoling a tunnel was driven over the top of the twin tubes. This heading was heavily timbered by 12 x 12-in. timbers. The end of the tunnel had in the main to be kept sheeted, otherwise sand in the front of the tunnel would have run into the excavation and the effect on the street and the buildings adjacent would have been disastrous.

The work was a revelation of careful tunneling where single eighths of inches in settlement counted, and where the material encountered, a beach sand, would run almost to an angle of 45 deg. to the horizontal. The upper tunnel was not completed at the time of the visit. After its completion the floor was to be gradually extracted and steel supports introduced to strengthen the tubes.

The first morning session was the annual business meeting and the new institute officers were announced: President, Sidney J. Jennings; vice presidents, Henry F. Drinker, Robert M. Raymond; directors, F. G. Cottrell, Hennen Jennings, George C. Stone, S. A. Taylor and Arthur Thatcher.

The amendment, which provided for more stringent standards of membership, passed by a vote of 1123 votes for, 59 votes opposing and 6 ballots invalid. The unanimity was not unnatural, as the requirements made were not unreasonably severe. Unless a finer screen is used than that now proposed there is no risk that any bona fide mining man will be rejected.

Coarse Screen and Bypass Lets Them All In

A member must be at least 27 years of age. He must have had six years of employment, graduation at a college being accounted as equivalent to two years of employment. For three years during that time he must have occupied a position of responsibility.

But though these restrictions are not severe a number of loopholes have been provided. Employment as a teacher is allowed to count as a position of responsibility in mining work, even though mining be not taught, but engineering, geology, metallurgy or chemistry. Moreover research work and scientific literary work is placed with teaching as a post of responsibility. Finally those who have done notable experimental work in mining, geology and metallurgy can be admitted without other qualifications. The institute is still a broad and democratic institution, open rather to talent than to mere success, and no one would wish surely to make it more exclusive.

The paper on "A New Method of Separating Materials of Different Specific Gravities" was an important event of the Tuesday morning session. This paper was read by H. M. Chance on behalf of the author, Capt.

Thomas M. Chance, who is now in the national service. Briefly, the method consists of the use of a floating medium having a specific gravity between that of the gangue and the valuable mineral. In a miniature apparatus the floating of coal from slate was demonstrated, the floating medium used being a mixture of sand and water.

With a centrifugal pump a circulation of water under small hydraulic head was maintained through a perforated plate in the bottom of the "jig" or apparatus. This made, Mr. Chance explained, a "true fluid mass" of sand and water, about 12 in. high, having a specific gravity of from 1.2 to 1.8. Above this there was about 6 in. of clear water, which was kept circulating by the centrifugal pump.

Coal and slate were put into the apparatus. The coal sank only to the level of the "fluid mass" of sand and water, while the slate sank to the bottom of the apparatus. By using heavier sands, a heavier medium may be secured. Preparations are being made to install an apparatus at one of the anthracite breakers. The work has not been carried into other fields as yet, though Mr. Chance was of the opinion that it might be applied to other separating problems upon further development. Material to be separated should be appreciably coarser than the sand used in the "fluid mass."

With Air Absent Floating Is Not Flotation

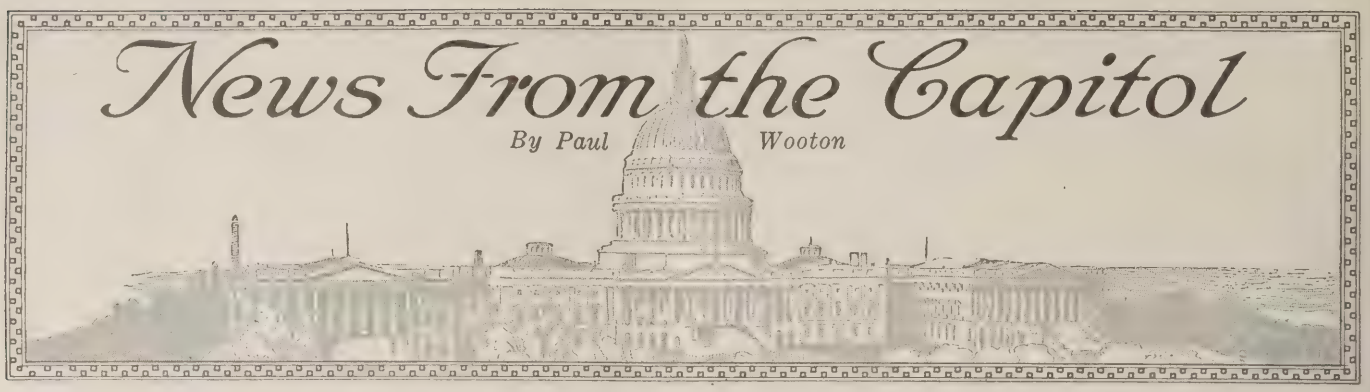
Discussion as to the patentability of the method brought out some humorous comment as to royalties and cost of the apparatus, J. Parke Channing adding the final quip in warning the inventor that he should be very careful not to let the least bit of air get into his centrifugal pump unless he were prepared to entertain a long lawsuit with the Minerals Separation, Ltd.

For lack of space, it is necessary to pass over the interesting sessions of the afternoon, held by the iron and steel section and the petroleum and gas section. Similarly all reference to the illustrated talk in the auditorium, on the "Devasted Districts of France," given under the auspices of the Women's Auxiliary, must be passed without comment. While the ladies went to the Metropolitan Museum of Art, Mark R. Lamb showed motion pictures of Bolivian tin mines. Later in the afternoon President-elect and Mrs. Sidney J. Jennings held a reception at their home.

In the evening a smoker with speeches, mostly serious, brought the members more closely in touch with each other. It was held in the Engineering Societies Building. Captain Hodder-Williams, of the British Army, now training prospective American officers at Columbia University, made a humorous speech, ending his remarks with an appeal for a discipline of the civilians in the rear equal to that of the army in the trenches. He said that the other Allies feared more that the men at home would weaken in their devotion and service to the nation than that the men at the front would fail to do their duty. He called on the men behind the lines to support all those measures making for an effective answer to the attacks of the enemy.

Other Allied speakers were Capt. E. E. Dulieux, representing France, and Lieut. Col. Boorman, of the British and Canadian recruiting organization, who said he hoped that if any members of the institute knew of slackers who had slipped into the country to avoid the draft they would inform the British recruiting agencies. Samuel A. Taylor, of the technical division of the Fuel Administration, spoke at length on the purposes of the administration, commending the work of H. A. Garfield most highly and saying that no one had put the cost accounting of coal mines on a more accurate basis than R. V. Norris, who was now a part of the Fuel Administration. He put the blame for the shortage of coal on the inadequacy of the railroad rates ordered by the Interstate Commerce Commission. He also said that the country would be divided into 20 producing and 11 consuming districts and that consequently during the war coal would not be "cross-hauled."

M. L. Requa, the head of the petroleum division of the Fuel Administration, deplored the restrictions under which administrators and bureaus worked. He said that all manner of subterfuges had to be used to do those things which Congress wanted the administrations to do, but for which it had, by an oversight, not provided the needed powers of accomplishment. He said that owing to the lack of railroad transportation there were 3 bbl. of oil needed for every 2 bbl. of railroad-tank capacity available.



W. L. Honnold, of the Commission for Belgian Relief, said that a minimum requirement for the support of the people of Belgium and of the occupied portions of France had been figured out. They are only getting 60 per cent. of that minimum at present. There has been expended for the relief work nearly $400,000,000, of which $180,000,000 has been provided by France, $91,000,000 by Great Britain and $91,000,000 by the United States. The people are in terrible need of clothing, as 80 per cent. of that commodity, outside of personal apparel, has been commandeered by the Germans. Even the wool mattresses have been taken.

For clothing $11,000,000 is needed. Only 40 per cent. of that amount has been supplied. Second-hand clothing would be most welcome. The situation daily becomes more serious, as we learn from the Spaniards and Dutch who now have the work in hand. Along the Dutch frontier still stretch three barbed wire fences 10 yd. apart, the middle one charged with electricity. The people, while they have faith in the outcome, are becoming terribly out of heart, and are suffering severely from lack of food and clothing while unable to break through the ominous line which separates them from Holland. W. G. Westervelt and W. O. Hotchkiss, of the War Minerals Committee, also gave short addresses.

(To be concluded)

On Getting Ahead

If you're not forging ahead, you're falling behind. There's no such thing in times like these as marking time or standing still. The Annual Success Number of *Coal Age*, to be issued Apr. 13, will embody the experiences of men who are moving forward. Every man in the coal-mining industry who has anything worth while to say ought to contribute a "get-ahead" article for this number—a story of success in men, material and methods. The "other fellow" will get as much inspiration and benefit from your story as you will from his. Copy, photographs and diagrams should be in our hands by Mar. 25.

Fuel Administration Makes Clear Its Attitude Regarding Jobbers

The United States Fuel Administration has received numerous protests from consumers, as well as from jobbers and other coal dealers, against the proposed revocation of the regulation under which jobbers are now allowed to add a commission, or margin, to the prices of coal at the mines.

These protests are based upon the false assumption that the revocation of that regulation will drive the jobber out of business.

The Fuel Administration disclaims any intention to eliminate legitimate jobbers from the coal business. It has not only recognized their importance to the conduct of the trade, but has announced its intention to so fix the prices of coal at the mines as to enable the mine operators to compensate the jobbers for their services. The Fuel Administration insists that bona fide jobbers will not be forced out of business by the proposed change. They will simply be compelled to look to the operator for their compensation as they were accustomed to do before the allowance by the Fuel Administration of the margin.

In view of the protests, however, the Fuel Administration has deemed it advisable to make a more detailed statement than it has done heretofore, of the circumstances that impelled it to take the proposed action.

Prior to the entrance of the United States into the war and for nearly three months thereafter, the jobber had always bought from the operator for less than the retailer could buy direct. In other words, the price to the retailer was the same whether he bought direct from the mine, or through the jobber. The so-called jobber's margin was an innovation.

After the Fuel Administration had been organized, and the President had fixed the prices of coal, the practice of allowing the jobber to add his commission to those prices was continued.

Under the regulations issued by President Wilson, Aug. 23, 1917, a jobber is defined as "a person (or other agency) who purchases and resells coal to coal dealers or to consumers without physically handling it on, over or through his own vehicle, dock, trestle or yard."

After several months of operation under the practice of allowing the jobber to add a commission, or margin, to the price of coal at the mine, it developed that this margin was being charged and collected in many ways not contemplated by the Fuel Administration. Agencies which, while technically jobbers, were not such in fact, or were closely affiliated with the operators for whom they acted, collected the jobber's margin, which thus became a mere increase in the profit of the operator.

One of the methods by which this profit was obtained by the operator was the practice of "swapping coal." Two operators would agree to act as jobbers for each other in the sale of their output, each collecting the jobber's margins.

Another practice was that of organizing subsidiary companies, the sole function of which was to act as the ostensible jobbers of the producing companies by which they were owned, and to collect the commission allowed by the Fuel Administration.

The effect of these practices was to add from 15 to 30c. a ton to the cost of coal to the consumer for services that were merely fictitious, and to give operators indulging in such practices a greater profit than that obtained by those of their competitors who employed bona fide jobbers. The business of the bona fide jobber suffered materially by reason of these practices.

Officials of the Fuel Administration felt that a continuance of the commission allowance to jobbers would be tantamount to a tacit consent to the operation of these fictitious jobbers. Effective supervision of the business of individual operators and jobbers, and investigation of their relations could not be undertaken by the Fuel Administration because of the expense and the amount of labor that would have been entailed.

After a thorough investigation of every phase of the situation, which included conferences with representatives of every branch of the coal business, the Fuel Administration decided that the only solution was to recommend to the President the revocation of the regulation allowing the commission or margin to the jobber, and as a substitute the fixing of prices of coal at the mine that will enable the operator to compensate the bona fide jobber for his services.

Engineering Department Hopes To Effect Fuel Economies

Acting on the belief that no other such opportunity to teach conservation of fuel ever has been presented, the Fuel Administration has established an engineering department which hopes to effect during the coming coal year economies which will save 50,000,000 tons of coal. The new engineering department is in charge of David Moffat Myers. A specialist in railway fuel will have charge of a campaign for coal economy on the railroads. Another specialist will direct work looking to economies in the industries. A third specialist will have charge of

a plan looking to the consolidation of steam and hydro-electric plants. More intelligent firing methods in the homes will be urged in coöperation with the Bureau of Mines.

The organization of the engineering department will be extended into each state. A fuel engineer is being recommended in each state. It is hoped to make this position a permanent one, so that fuel economy may be continued after the war.

Since the railroads and the industries use two-thirds of the coal produced in the United States, the most active efforts looking to conservation will be in that field. Having the power to favor plants which use their coal efficiently, the Fuel Administration has a tremendous leverage that will help toward securing compliance with its desires. As limitation of fuel probably will be necessary, plants with a high percentage of waste will be the more severe sufferers.

An order to become effective Apr. 1 will provide for sworn statements from consumers as to the amount of coal on hand, the amount ordered from dealers, the total amount used during 1917 and the amount necessary to meet the requirements of the coal year of 1918. The Fuel Administration has practically decided that such a course is necessary to insure equitable distribution.

Conference on Railroad Fuel Supply

A general conference on questions arising in connection with the supply of fuel coal to railroads was called by the United States Fuel Administration on Mar. 1. Representatives of coal-mine operators, eastern railroads, the office of the Director General of Railroads and the Fuel Administration attended.

The conference selected W. K. Fields, president of the National Coal Association, as chairman and began a general discussion of recommendations to the Director General of Railroads and the Fuel Administration designed to secure the following results: (1) To provide a definite and dependable supply of good fuel for the railroads. (2) To avoid excessive use of transportation in obtaining rairoad fuel. (3) To retain for other uses some coals of special quality which are now being used as railroad fuel coal. (4) To so distribute railroad fuel in connection with all other distribution as to obtain as nearly equal running time for all mines.

The matter of the distribution of coal cars to the mines was the subject of extended discussion, some of the operators contending that there should be no preferential allotment of cars, but that all the mines should share equally.

A committee was named consisting of one member from each of the railroads represented in the conference and one member representing each of the coal districts present, which should consider the questions they had been called to discuss and report its recommendations to the conference.

The railroads appointed the following committeemen: Delaware & Hudson, J. White Spray; New York Central, S. B. Wright; Erie, W. R. Collins; New York, Ontario & Western, Charles A. Draper; Norfolk & Western, George Dunglingson, Jr.; Lehigh Valley, F. L. Blendinger; Bangor & Aroostook and Boston & Maine, Frank C. Wright; Pennsylvania and Long Island, C. M. Sheaffer; Delaware, Lackawanna & Western, C. C. Hubbell; Canadian Northern, H. T. Rawlings; Central Railroad of New Jersey, J. F. Hinterleiter; Chesapeake & Ohio, D. T. Jellison; Baltimore & Ohio, W. L. Robinson; New York, New Haven & Hartford, George G. Yeomans; Philadelphia & Reading, E. B. Crosley.

The West Virginia coal districts named the following committeemen: Fairmont, C. H. Jenkins; Clarksburg, V. E. Goeke; Coal & Coke, R. B. Isner; Preston County, E. H. Gilbert; Scott's Run, S. D. Brady; Maryland, F. W. Wilchire; Irwin and Guyan, S. P. Hutchinson; Kanawha, W. M. Puckett; K. & M., Robert Buka; Smokeless, T. F. Farrell; Thacker, Keyser Hood.

Pennsylvania coal districts named the following: Mr. Field, chairman exofficio; Conemaugh, T. L. Eyre; New York Central, T. H. Watkins; Cambria, C. H. Jacobs; Reynoldsville, J. W. Trounce; Tyrone and Clearfield, Charles A. Owens; Somerset, Edward B. Chase; Broad Top, C. J. Langdon; Greensburg and Latrobe, W. G. Ireland; Irwin, S. B. Hutchinson; Somerset (Baltimore & Ohio), T. W. Guthrie; Pittsburgh, J. P. Walsh.

Weekly Production Statistics

Bituminous coal production decreased sharply during the week ended Feb. 23. Total production was 10,612,000 tons, as compared with 11,122,000 tons during the week preceding. Production of beehive coke increased to 568,000 tons. Anthracite shipments declined 10 per cent. Total forwardings were 36,612 cars. Production of byproduct coke totalled 403,296 tons, as compared with 381,972 tons during the week ended Feb. 16.

New Prices in Tug River Field

Forty cents has been added to the President's schedule of prices in the Tug River field. The new prices therefore are: Run-of-mine, $2.40; prepared sizes, $2.65; slack or screenings, $2.15. Fifty cents has been added to the old price in the Upper Clinch Valley district, making the prices there as follows: Run-of-mine, $2.50; prepared sizes, $2.75; slack or screenings, $2.25. Forty-five cents may be added to these prices by all operators who will comply with the Washington wage agreement.

Plan for Cheaper Domestic Fuel

What the Smithsonian Institution describes as a "practicable means whereby the householder eventually may obtain his domestic fuel supply at a fraction of what he now pays," is outlined in a report by Chester G. Gilbert and Joseph E. Pogue.

The gist of the plan lies in the fact that bituminous coal, instead of furnishing heat alone, can be made to yield five products—artificial anthracite, gas, ammonia, benzol and coal-tar—all of commercial value. It is proposed that the municipal gas plant, operated as a public utility, be enlarged so as to treat all the coal used by the community, with the production of the five products mentioned. Thus by centralizing the utilization of coal and employing all of the values contained in it, such great economies can be effected as to yield a really cheap domestic fuel, the authors state.

Anthracite Distribution Plan

Although no definite announcement has been made regarding the plan considered by the special committee of the General Committee of Anthracite Operators providing for an equitable distribution of anthracite this spring and summer, it is learned that a plan has been decided upon which is to be submitted to Dr. Garfield for his approval.

The committee, it is said, has had compiled figures showing the tonnages by sizes that were shipped between Apr. 1 and the present, and that by use of the shipments made between Apr. 1, 1916, and Apr. 1, 1917, will be able to notify the various state fuel administrators just how much coal will be shipped into their respective territories during the coal year beginning Apr. 1.

The proposed plan provides that each retail dealer will be supplied with order blanks by the Fuel Administrator, and that these blanks are to be distributed to consumers to be used when placing orders. By this means it will be possible for each dealer to distribute his supply of coal equitably.

Deliveries are to be divided into units; that is, all dealers are to deliver to each of their customers a unit which is to consist of a certain number of tons—say two tons or whatever other amount has been decided upon in any community—and no further delivery is to be made to that customer until such time as each customer willing to accept it has received a unit. As soon as each customer willing to accept it has received a unit, then a second unit may be delivered to any customer desiring it. The same procedure following the delivery of the first unit follows the delivery of the second unit.

When a consumer gets six tons he will be asked to accept 85 per cent. on the orders above that amount. It is hoped that in this way there will be the best possible distribution of fuel.

The proposed plan provides, however, that where, in any community, a different plan has been adopted which will accomplish the result desired by the Government, that plan will be satisfactory to the Fuel Administration.

Persons buying from more than one dealer without the permission of the local fuel administrator will be penalized, according to the proposed plan, and dealers who deliver more coal to any one person without similar permission than is represented by 85 per cent. of the amount necessarily used by such person in the year 1916-1917 will likewise be penalized. It is provided, however, that exception is made where the requirements are less than six tons. It is also provided that carloads may only be delivered to one consumer or divided among a number with permission of the local fuel administrator.

New Single-Deck Cage Hoist Record

The State of Illinois has an enviable reputation for good work in hoisting coal in shafts. Recently a mine in this state made a record by raising 5527 tons of coal in eight hours on a single-cage hoist. On Feb. 25, 1918, the American Coal Mining Co., of Brazil, Ind., broke this record by loading 5911 tons of coal in eight hours on a single-cage hoist. The American Coal Mining Co. states that when its No. 2 plant is completed and fully developed a much better record will be made. The company will do it, too, for the slogan on its letterhead reads, "Energy, economy, efficiency."

Explosives Act Leads to Savings

Important savings of explosives are being reported to Frances S. Peabody as a result of the operation of the Explosives Act. Mr. Peabody is in charge of the administration of this act for the Bureau of Mines. The strict accounting required by the law for all explosives has led to much more careful use, with the advantages that considerable saving has been made in explosive expense and the conservation of this much needed product.

Readjustment of Coke Prices

Important readjustment of coke prices has been made as follows: Pocahontas district, $8; Preston County, West Virginia (stations on Baltimore & Ohio R.R., Tunnelton to Grafton) and Meriden, Barbour County, $6.75 for blast furnace and $7.75 for selected 72-hour foundry; Indiana County, Penn., $8, if from washed coal exclusively from the lower bench of the upper Freeport seam with ash in excess of 10 per cent. or sulphur in excess of 9 per cent. If the ash is less than 10 per cent. and the sulphur less than 9 per cent., $8.50 may be charged; byproduct coke made at Chattanooga, run-of-oven, $8.25; crushed coke above 1 in., $8.75; selected foundry, $9.25.

Brief Washington Notes

W. M. Symmes, Jr., and G. T. Hoar, New York lawyers, have been added to the staff of H. D. Nims, who is in charge of the legal division of the Fuel Administration.

"Where cannel and bituminous coal are mixed," says the Fuel Administrator in a recent order, "the maximum price for the mixture shall be the mine price for the bituminous coal in the mixture."

All coal fields in Maryland and those in Mineral, Grant and Tucker Counties, in West Virginia, have been added to the producing territory over which John C. Brydon will have jurisdiction as district representative. Mr. Brydon's territory originally was Somerset County, Pennsylvania.

Producers of bituminous coal now under contract to furnish railroad fuel coal to the New York, Ontario & Western R.R. are required to give priority to the filling of these contracts under an order issued Mar. 4, by the Federal Fuel Administration. The order is intended to provide an adequate supply of coal to this road at all times and directs that the operators under contract shall ship and distribute coal regularly each week and in so far as is practicable in regular daily quantities.

The appointment of W. H. Groverman, at Minneapolis, Minn., district representative for the bituminous and anthracite coal supply on the docks of Lake Superior and the western shore of Lake Michigan, to serve as representative of all individual dock companies, was announced Mar. 4, by United States Fuel Administrator Garfield. Mr. Groverman will facilitate the apportionment and distribution of coal and supervise the prompt and equitable allotment of emergency orders among shippers.

To the Few Miners Who Still Drink: Save Your Money for Your Boy at the Front—

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The mine workers in the anthracite region are working along steadily. The Lehigh Valley Coal Co. has conceded the demand of its men at the Centralia colliery, at Mount Carmel, and will pay them hereafter, as demanded, for the driving of double manways to breasts.

The Lehigh Valley Coal Co. received an adverse decision from Charles P. Neil, the umpire of the conciliation board, on Feb. 25. That company at the Hazleton No. 1 colliery had steam locomotives at work and was paying the men 27.2c. per hour for this skilled work. The company decided to do away with the steam locomotives and replace them by electric, which require less skill in operation. It desired to pay the motor men 23.1c. per hour.

If there is no profit in a substitution of a type of machine requiring less care, attention and training there may be little incentive to make the change. It is the natural disposition of labor to oppose improvements unless labor gets the full benefit. However, no one can feel regretful that men getting only 27.2c. per hour are not to be replaced with men getting as little as 23.1c. per hour, for 27.2c. in these days is not any too large a wage.

ATTITUDE OF UNION MEN ON LIBERTY BREAD

Howard Heinz, the food administrator in Pennsylvania, has won over the representatives of the United Mine Workers of the Lykens Valley by his clear exposition of the necessity for the flour and bread orders of the Food Administration. He took the mine workers to a bakery and induced them to taste Liberty Bread. No wonder it looked good to them, for American war bread is a great deal more tasty than bleached-flour bread and much more nutritious.

The mine workers let Mr. Heinz know that there was no disposition to slack among them. To convince the mine workers that the food in the laboring man's dinner pail was not the only kind of food to be regulated, he took the delegates to a meeting of restaurant keepers. The mine workers are now rooting for Mr. Heinz.

In Central Pennsylvania the miners are worried that they are not to share in the increase in price, which was granted by the Fuel Administration for the purpose of relieving the necessities of the operators, and the Broad Top mine workers are opposing the reduction of wages of 10c. which they will automatically sustain Apr. 1 as the outcome of a contract into which they entered knowingly last fall. It seemed, on Mar. 5, as if there would be action taken by the convention toward a further revision of the existing contracts, though all changes are opposed by the international union, the public and the Fuel Administration as in bad faith and undesirable.

NO LONGER HARRIED WITH CAR-PUSHING PROBLEM

Apparently the pushing question is not the issue it was, and much of the expense for which an increase has been granted may have been in the elimination of the conditions at the mines which made the pushing of cars imperative and in the steady cost involved where coal is gathered from the face by men in the employment of the operating company.

W. O. Smith, on behalf of the United Mine Workers of America, is said to have visited Clay, Ky., and promised that on Mar. 1 offices would be opened by the union for the purpose of organizing the western Kentucky field and doubtless, in particular, the mines of the West Kentucky Coal Co., which is a nonunion organization. J. T. Moore, the Webster County fuel administrator, has written to State Administrator Bryan, informing him of the plans and asking for instructions.

The men who work in the No. 8-A seam of Ohio, a rider of the Pittsburgh, or No. 8 seam, want a scale made to cover that bed because it is thinner and more difficult to work. The bed is mined in No. 5 subdistrict, in Belmont, Harrison and Jefferson Counties. The mines involved are those of the Western Coal Co., the Massillon-Belmont Coal Co., the Ohio and Wheeling Coal Co., the North Belmont Coal Co., Theodore E. Jordan, W. C. Lough and H. W. Watson, William Beynon and W. C. Rouch. President William Roy, of subdistrict No. 5, offers the following scale to the conference:

	Loader	Cutter	Total
All coal over 4 ft	0.5815	0.1125	0.6940
All coal between 3½ and 4 ft	0.6300	0.1300	0.7600
All coal between 3 and 3½ ft	0.6875	0.1500	0.8375

MICHIGAN'S MINES HAVE LABOR TROUBLES

Michigan coal mines are small and inconsequential, but Michigan with a shortage of fuel, about as bad as that in New England, cherishes its coal mines as much as if they were large. Thus it is that Fuel Administrator Prudden has been much put about because the mine at Albion, Calhoun County, Michigan, has been idle for a long time with a bitter wage dispute in progress.

Acting Warden Frensdorf, of Jackson prison, has offered the services of prisoners to keep the mine going. But this offer, which if accepted would have caused a strike in all the Michigan mines, did not appeal to the authorities. President John C. Crutchfield, of the Michigan district organization, telegraphed International President Frank P. Hayes for permission to call a state-wide strike to secure the terms of the Washington agreement with 10c. a ton added. Needless to say, this request has not been granted.

Michigan's mine workers only number 2400 men, but they are frequently disaffected. The coal of the state is not of the best, the mining of the coal involves much labor, the thickness is uncertain and the profit of operation unusually dubious. All these facts have made the lot of everyone in the industry unfortunate.

KANSAS HAS UNHORSED PRESIDENT HOWAT

We publish in another column an account of the troubles in the Kansas district. The relation is from the point of view of the operator. He believes that a new attempt is being made to evade the penalty clause. It is only fair, however, to present the point of view of the mine workers.

Four of the Jackson-Walker Coal and Mining Co.'s clerks were discharged, we are told in a communication from another source. The offense was demanding a wage increase. The weighmen and office men then unionized and demanded the reinstatement of the four men. This being refused, they demanded a $1.40 daily increase for all their members. Alexander Howat has promised to defend their interests. It is also said that several big coal companies gave the weighmen and office men an increase in November when the miners received their increase, but that the Jackson-Walker Co. did not.

More recent information assures us that Kansas is no longer faithful to Alexander Howat. The men will not continue their strikes at his bidding. The Smith, Scott and White mines are working again, and the members of the new National Bookkeepers and Company Weighmasters Union wish that the companies who were employing them would permit them to accept the jobs they threw away. Alexander Howat is alleged to have published unveracious copies of the union agreements.

The various districts of the United Mine Workers have all made their contributions to the $800,000 fund to give bond for the judgment in the Coronado case and to cover the court costs and other charges. Missouri is, however, an exception. D. A. Frampton, the president of that district,

claims that the Missouri district was completely ignored and not consulted and that no one pledged a contribution. The committee appointed in proper form by the biennial convention to obtain this fund invited all the district presidents and secretaries to meet with it, and the Missouri mine workers certainly have no standing at all in refusing to pay the $10,000 requested of them. The other mine workers have without a single failure thrown into the fund the $790,000 demanded of them.

It is reported from Alabama that H. C. Selheimer, the arbitrator between the operators and their employees, will not arbitrate in the dispute between the Tennessee Coal, Iron and Railroad Co. and the Republic Iron and Steel Co., and their employees. Mr. Selheimer's work is to interpret disputes about the contract, and there is no contract in the case of these furnace corporations.

On Feb. 27 a new union of mine workers, to be known as the Independent Union of Miners of America, was organized at a Pueblo meeting of dissentients from the United Mine Workers of America. John R. Lawson, president of the Colorado State Federation of Labor, and former president District No. 15 of the United Mine Workers of America, comprising Colorado, New Mexico and Utah, is to be president of the new union.

He hopes to make it a national organization and to dispossess the United Mine Workers of America which, he claims, by crooked election methods, prevented his reëlection to the presidency of District 15. He has resigned from the Colorado State Federation of Labor. He could not hold office if he was to become an officer in an organization not affiliated with the American Federation of Labor.

The delegates to the convention demanded in a telegram that President Hayes of the United Mine Workers immediately remove President James F. Moran, the present incumbent of the presidential chair in District 15, and his right-hand man, Warren Pippin. When Hayes failed to reply, the vote for a new organization followed. At the headquarters of the United Mine Workers in Indianapolis it was said that the insurgent element was small and the new union not important.

The Drumheller mine workers in Alberta, Canada, are in bad odor with other parts of district No. 18, recently in session in Fernie, B. C. The local union of Drumheller suggested that the district as a whole demand that the coal companies supply all powder, tools, lights and washhouse lockers and pay all smithing charges. They proposed in their resolution that the director of coal operations be asked to establish a standard wage scale based on a $6 per diem rate for underground employees and $5 for top or outside workers. The convention turned a cold ear to all these proposals.

The delegates deplore the fact that the Drumheller local is opposing Commissioner W. H. Armstrong and has asked for his removal. On Feb. 24, they resolved unanimously that they had the "fullest confidence in his ability in filling his office of trust with honor and justice to all concerned." Prior to this the biennial convention decided that the Drumheller mine workers should be ordered by the union to return to work and representatives were sent to the Drumheller region to convey these instructions. But the Drumheller men were obdurate. An order from Premier Borden about the same time supported that sent by the union. Unfortunately some doubt was put on its authenticity, but the director of coal operations, W. H. Armstrong, declared that the order of the Premier was really authentic. The mine workers at Lovett, Alta., who went on strike Feb. 18 went back to work Feb. 22. On Feb. 28 the only idle mine workers remaining were those at the Rosedale mine, where the trouble commenced.

Clever Scheme To Burk Penalty Clause

Eight Kansas mines were down Feb. 16, with a total loss of production of 5000 tons a day. This is the largest loss of production due to strikes for two months. All of the strikes are of the same type; they are the result of activities of Alexander Howat, president of the Kansas miners, in opposition to the penalty clause of the contract. The Smith, Scott and Waite mines which closed in December, and the Packard-McWilliams-Tripp mine, shut down last week by the miners, are inactive because of controversies that come outside the contract, the miners alleging that they are not striking but have individually resigned temporarily.

The newest development which would seem ludicrous were it not so serious, is the effort of Mr. Howat to organize the office men and the companies' weigh bosses. A so-called union has actually been organized and Mr. Howat has been elected the national president. Miners are actually now striking in several mines refusing to work in establishments which do not employ union office men and weigh bosses. The first trouble of this kind was in the mines of the Jackson-Walker Coal Co., where the pit committee demanded the employment of union office men and weigh bosses.

H. N. Taylor, zone fuel administrator, has taken this matter up with the United Mine Workers, as well as with Dr. Garfield. Representatives of the mine workers are now in Pittsburg, Kan., trying to cool this matter down.

While the purpose of Mr. Howat in organizing the office men and weigh bosses cannot be officially announced, it is obvious what the effect would be if, by any chance, the weigh bosses should be organized. The striking of one man would obviously shut down the entire mine, since the miners could not work without the presence of the checker on their output. Consequently, only one man would have to pay a penalty; and two dollars a day would be insignificant compared with the $200 or $300 a day that the mine workers of a mine would have to pay under the penalty clause if they struck.

Union Attitude on Clean Coal

The attitude of the United Mine Workers of America on clean coal is best exhibited by an editorial entitled "As to Dirty Coal," appearing in the *United Mine Workers' Journal.*

In every contract entered into by operators and miners in every district under the jurisdiction of the United Mine Workers of America there is a provision penalizing the loading by the miners of any impurities with the coal that could, in reason, be kept out.

The enforcement of these penalties is, as much as ever it was, in the hands of the operators. Safeguards have been placed in the contracts to protect the miners against persecution on the part of petty bosses for personal reasons, and to protect active union workers from discrimination that might be made possible through the "dirty-coal" penalty clause.

The miners have absolutely no sympathy with those who load dirty coal. They recognize in that a local menace. The quality of the coal loaded, absence of dirt and other impurities determine the desirability of their product in the markets. Their opportunity to work is, in normal times, dependent upon the comparative cleanness of the coal they produce, in a competitive and often over-stocked market.

At a time like the present the miner may recognize that any kind of coal can find a ready sale; he also recognizes that the desirability of the coal he produces now will determine its standing in the market when the country returns to normal industrial conditions.

Therefore the miner, whose home is near the mine at which he works and whose entire possessions and interests are represented by that home, does not wish for any slackening in the enforcement of the disciplinary provisions of the contracts dealing with dirty coal.

The loading of dirty coal is, if anything, more reprehensible now than ever it was; not only does it menace the reputation of the value of the product of the mine and therefore the miner's opportunity to work, but dirt in coal today, when every industry is running at high tension, means inevitably a slackening of production; trains stalled; factories hindered.

We do not ask the operators to refrain from enforcing in full the penalties provided for in the contracts for loading impurities in coal. On the contrary, we believe it is to the interest of both operators and miners that not only the miners shall be required to keep their coal as free from impurities as possible, but that the operators, through their managers, also exercise the same care to try to do their part, on top, to keep coal clean, as they found it necessary to do in the not far-distant past, when the buyers exercised discriminating choice when ordering their coal supply.

EDITORIALS

What British Labor Wants

A SUBCOMMITTEE has been appointed by the British Labor Party to write out the demands of the British workman for reforms to be put in operation after the war is over. The demands are well written. Apparently the persons chosen were not animated with any fierce class hatred. They had ever in their minds, it would seem, the greatest good for the greatest number. Couched as their program is for the most part in sober, dignified language, it would not be well to discuss it in any other mood.

After declaring that all public utilities companies should be nationally and not municipally (much less privately) owned, the manifesto proceeds as follows:

"But with railroads and the generation of electricity in the hands of the public, it would be criminal folly to leave to the present 1500 colliery companies the power of 'holding up' the coal supply. These are now all working under public control, on terms that virtually afford to their shareholders a statutory guarantee of their swollen fortunes.

"The Labor Party demands the immediate nationalization of mines, the extraction of coal and iron being worked as a public service (with a steadily increasing participation in the management, both central and local of the various grades of persons employed); the whole business of the retail distribution of household coal being undertaken, as a local public service, by the elected municipal or county councils."

To those who accept the proposition that railroads and public-service corporations be nationalized and are disposed to believe that economy and progress would accrue under national management there is no difficulty in going one step forward and advocating the nationalization of coal mines. Coal is a necessity like railroads and public-service corporations.

In Great Britain it is probably a hard matter to find a place to open a new mine. Despite all the difficulties thrown around the building of a new railroad by the British Board of Trade, the Houses of Parliament and the landlords, it seems it might be almost as easy in Great Britain to locate and build a new road as to open a colliery. That being the case, in Great Britain coal-mine operation is as much a monopoly as railroad operation. If one is to be nationalized, the nationalization of the other inevitably follows.

It is not strange then that nationalization of coal mines is advocated. Perhaps it will be useless to point out instances where the coal from government mines has not proved as cheap as that mined by private corporations. It will be equally useless to show that the mines have not been better conducted. It will be unavailing to demonstrate that the rates of pay to the employees are no higher. Nor will any good be done by showing that public employees are quite often extremely dissatisfied with the terms of their employment. People who desire nationalization are rarely open to argument. The mine workers of central Pennsylvania assembled in Dubois in biennial session have demanded nationalization. One is confident that a little experience with it would work a ready cure. But, as has been said, argument is useless. Only those who have a disease appreciate perfect health, and till we experience nationalization of industry we cannot estimate what disadvantages it will entail.

The next clause of the manifesto runs as follows:

"And there is no reason why coal should fluctuate in price any more than railroad fares, or why the consumer should be made to pay more in winter than in summer or in one town than another."

It can readily be granted that with nationalization of coal mines the stimulation of higher prices is less needed to correct shortages of coal. The nation can and doubtless will conscript workers when it needs them. It need not pay therefore any more to get them. So why need the price of coal be raised when a larger tonnage is desired? If, however, the big demand calls for opening abnormal places where the coal is thin, contorted, disturbed, broken or unusually deep or wet, then it will be necessary to put a higher price on coal; but it will be granted readily that the price will not fluctuate as much as it does with unnationalized mines, for the price now has to rise on all coal to make the less favorable coal operable.

But the last clause, relating to uniformity of price without regard to seasons or locations, is not so easily accepted; for it would seem that nothing is more essential to the whole interests of mankind than some arrangement of price that will balance the seasonal variation in the use of coal. If the price is kept uniform, winter and summer, men will buy all their domestic coal in the winter; and to meet the demand in the cold weather huge storage facilities must be provided.

With nationalization Great Britain could manage to store large quantities of coal. If stored at the mines, the railroads and the coastwise boats would be glutted in the winter. Coal delivery by auto transport would be overworked in the towns at the same time. In the warmer months large numbers of railroad men would be idle, fleets of colliers would tie up and there would be little use for coal heavers or coal wagons. A large waste of equipment would inevitably result, and the problem of idle workers and the loss of national wealth consequent thereon would be large.

Nor is this all. Any scheme which depends on storage more or less remote from the point of use is subject to breakdowns. Not only may the equipment prove, as it has in the United States, inadequate to meet the demand, but there may be storms causing a failure of the railroads or the sinking of colliers. This would be a far greater menace here, however, than in Great Britain. Only a prudent householder with a reserve in his cellar is protected against such an event, and it seems that

only a variation in price will make men prepare against the unexpected interferences with coal transport.

But it will be argued that local storage and not mine storage is the cure. But this does not remove the problem, it only reduces it. A glut of coal truckage every winter still has to be confronted, the coal trucking equipment is still kept idle in the summer and there is still a risk that a heavy snow will block the streets.

Moreover, the size of the coal pile would be immense. It involves too large an area to be conceded within the boundaries of any city; the possibilities of fires are too great and the cost of storage is prohibitive if the coal is to be so stocked that fires will be entirely eliminated. Of course, we assume that the coal is piled deep, as it must be in a large city; and also that it is not like anthracite or Georges Creek smithing coal, which are little subject to fire.

After all, the man who supplies storage and who does without the use of his money for months is entitled to a concession. Let those who oppose the differential be required by law to put in a cellar and buy their coal in the summer. Let them run the risk of wanting to sell the property or of having the coal stolen or the house burned, and when all is done we believe they will not think that the man is unfairly rewarded who gets the rebate and who concurrently keeps the coalheaver, the coal trucker, the railroad employee and the mine worker busy during the summer months and uses equipment that would otherwise be idle; and uses it, moreover, when it gives a maximum service.

Some Advantages of Railway Electrification

THE country is now emerging from a coal famine that was not caused by a lack of productive capacity. It is freely admitted that the mines had enough capacity to meet requirements, with more or less of a margin to spare. It was the distributive agencies, the transportation lines, whose failure to meet the extreme demands placed upon them precipitated the abnormal shortage.

This is not written with the intent of belittling the work that confronted the common carriers or of maligning their performance. In fairness be it said that the task before the railroads was Herculean. There are, however, certain limitations of duty and performance beyond which rolling stock and locomotives cannot be driven. Unfortunately, also, adverse weather conditions—that is, extreme cold—exert a decidedly depressing influence on the performance of a steam locomotive. Radiation from the boiler is of no mean consequence, while trouble is liable to result from the freezing of water both in the tender tank and in various pipes. The thermodynamic efficiency of the locomotive power plant, always low, is especially so in severe cold weather.

The electric railway locomotive wherever it has been employed exhibits characteristics in marked contrast to those of the steam-driven machine. For various reasons, extreme cold increases rather than diminishes the hauling capacity of an electric locomotive, and this, together with the reliability of the electric motor, has resulted in increased performance for the same trackage of as much as 50 per cent. over steam operation. Had this increased capacity been available to the railroads during the past year or so there would have been no such congeston of freight as to demand the observance of "Heatless Monday" to untangle.

Another economic aspect of railway electrification lies in the savings of coal made possible. Where the ordinary steam locomotive will evaporate possibly 4 lb. of water per pound of coal consumed, the stationary plant will evaporate 9 to 10 lb. of water per pound of the same fuel. Furthermore, where the average locomotive will deliver one horsepower-hour to the tender drawhead for an expenditure of 30 lb. of steam, the stationary plant can deliver one horsepower-hour to the switchboard busbars for, say 15 lb. of steam; assuming that losses in transmission of energy from the busbar to the locomotive drawhead amount to 33 per cent., the consumption of steam per horsepower-hour delivered to this latter point would be equal to 20 pounds.

The savings in coal consumption which would be made possible through the electrification of American railways are thus estimated to amount to 100,000,000 tons per year. Nor is this all the saving. An increased hauling capacity would be made possible through a diminution of what might be termed the internal work of the roads. That is, railway fuel would not have to be hauled in such large quantities nor for so great distances as at present. Power plants where hydro-electric energy was not available would so far as possible be placed near the mines. Fuel would thus be transported only short distances, while high-voltage electric current would be transmitted long distances. This change would release large amounts of equipment for the movement of commercial fuel or commodities other than coal. It is estimated that at least 10 per cent. of all freight movement now consists of railroad fuel. Without increasing track or yard facilities in the least, therefore, electrification would increase the carrying capacity of the roads by a goodly fraction of this 10 per cent.

Of course, in any extensive railway-electrification project development of available water-power should not be neglected. Water-power, however, is unevenly distributed throughout the country, and it is probable that in the greater portion of the land it would be necessary to rely as now upon energy derived from coal. In the mountainous regions both East and West, doubtless large amounts of hydro-electric energy could be developed.

While the amount of coal with which Nature has blessed this country is enormous, it is by no means infinite. Up to now, so far as our land-transportation system is concerned, we have "wasted our substance in riotous living"—the amount of fuel we now burn yearly in steam-locomotive fireboxes would produce approximately three times the useful power it now does if burned under stationary boilers and its energy transmitted to the motors of electric locomotives.

Railroad electrification would therefore appear to offer the most speedy and effective means of increasing the capacity and efficiency of existing trackage and yard facilities. The results obtainable are well known, having been secured in several installations already made. It is to be hoped then that the alteration of the roads from steam to electric energy will proceed as rapidly as the necessary finances, materials and labor can be secured.

DISCUSSION BY READERS

Mining Equipment

Letter No. 1—For some time past I have been an interested reader of the Discussion and other departments of *Coal Age* and can testify to their helpfulness. It is in no spirit of criticism that I make the suggestion, however, that there are many items in which mining men are interested that are quite generally overlooked.

Take, for example, the subject of roller bearings and ball bearings for mine cars. We are fed up on information from the man who sells the equipment and furnishes us with catalogs, pamphlets, letters, costs, besides giving us the results of one or two days' tests in the mine. But let us hear from the man who actually has bought and used these bearings for one, two or three years. He is the man we want to hear from.

Those of us who may be contemplating the construction of new plants or the installation of new machinery or other equipment costing perhaps hundreds of thousands of dollars; or, it may be, considering a simple investment of a few thousand dollars in mine cars, would be glad to know the experience of others along the same lines. While projects are yet dreams, the discussion of their merits and demerits is most valuable to the prospective buyer.

What Purchasers Want to Know

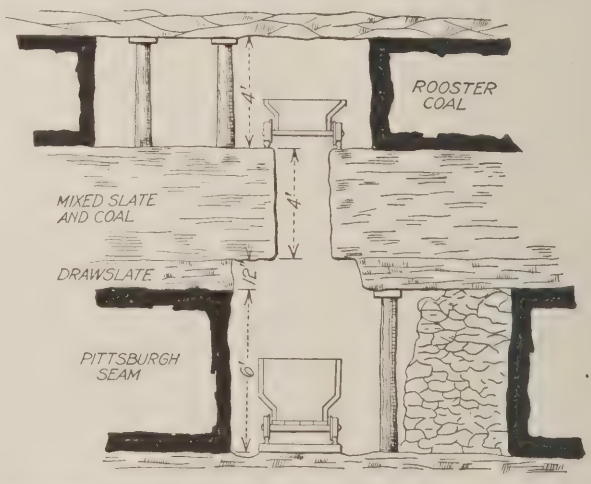
Then there is the storage-battery haulage locomotive. The words sound good but some of us have not been able, as yet, to get inside news as to their capabilities. When we inquire in regard to the haulage capacity, length of charge and cost we are told it depends on the type of battery used.

Ask the battery men and each one has the "best on the market," which same we knew before being told. It would be of greater interest to know from men who have used this equipment what work is performed, on what grade the machines can haul, and the upkeep per ton-mile.

One realizes that it is possible to take an unfair advantage of advertisers, by making comparisons of similar equipment under widely varying conditions; but the field of competition is open to all and the selection of valuable equipment, suited to one's conditions, is of prime importance to users.

The need of accurate information in respect to mining equipment, and its competing value in practice, was brought forcibly home to me recently. In our mines we are using two makes of cutting machines, one being an early type having none of the recent alleged improvements while the other was a modern, up-to-date machine. We had always supposed that the modern machine would prove to be a money-saver; but, as a matter of fact, its cost of maintenance, on a tonnage basis, was double that of the older type.

During the past two years I have been called upon to overhaul this plant and, among other improvements, I have installed a complete cost-record system in the supply house. This system shows the cost of supplies for each machine and class of equipment; and the results, dating back a period of six months, have upset many of our preconceived ideas in regard to the relative economy of certain portions of our equipment.



The information gained by thus tabulating the cost of supplies in detail have been of untold value in guiding us in the selection of future equipment. Especially was this the case, recently, when we came to order new cutting machines. The selection of the type of machine best adapted to our particular work and conditions was determined by a careful inspection of our record and previous experiences. We now have a third type of machine that we hope will prove more economical in upkeep, as based on tonnage mined.

Let me say, in closing, that reviewing my own past record as mining engineer in charge of construction work, and mine superintendent in five different states, I find that experience has taught me many things; but most important of all is the fact that there is yet more and still more to be learned every day of our lives.

Noblestown, Penn. PROGRESSIVE.

Working the "Rooster Coal"

Letter No. 2—Kindly permit me to submit my plan for extracting the rooster coal of the No. 8 Pittsburgh seam. Although the working of this seam is generally conceded to be a tough proposition, I feel sure that the

PROPOSED PLAN FOR WORKING THE ROOSTER COAL

following plan can be worked out successfully if proper care is observed in timbering the openings:

Drive all headings and airways 10 ft. wide, in both the Pittsburgh and the rooster seams, keeping the working faces in the upper seam a few yards in advance of those in the lower seam. The heading in the rooster coal, however, must not be driven directly over that in the Pittsburgh seam; but, as shown in the accompany-

ing figure, the upper heading is set over to one side, so that one rib in the upper seam corresponds to or is vertically above the center line of the heading in the lower seam.

Holes are shot in the strata separating the two seams, at intervals of 40 or 50 yd., or as found most convenient, to permit the coal mined in the upper seam to be loaded into cars running on the track in the lower seam. In the upper seam a low truck is used to transport the coal to the point where it is dumped through the hole in the floor and falls into the car standing beneath in the lower seam.

Same Plan Adopted in Driving Rooms

The same system is followed in driving the rooms as in driving the headings. The rooms are driven 20 ft. wide in both seams, keeping the working faces in the upper seam a few yards in advance of those in the lower seam. Here, also, one rib of a room in the upper seam is carried over the center line of the corresponding room in the lower seam. This system will afford a substantial roof and bottom for timbering in both seams. If desired, holes can be shot in the floor of the rooms in the upper seam, to permit of the loading of the coal mined in that seam directly into the cars standing on the room tracks in the lower seam.

All entry pillars should be made 50 ft. in width, while room pillars are 40 ft. wide. This is important, in order to afford ample support for the overlying strata and avoid the danger of a squeeze.

When the rooms are driven up a distance of say 200 ft. as a limit, the work of drawing back the pillars between the rooms must be started. The pillars in the upper seam should be brought back a little in advance of those in the lower seam, say 8 or 10 yd., which will probably be sufficient to induce a fall. Then cut into the lower pillar and split it to the face or fall, driving the place 10 ft. wide, thus leaving a stump 15 ft. wide on each side. These stumps must be drawn back together. If the line of pillar work is not kept uniformly straight much coal will be lost.

Both of the seams can be ventilated by the same air current, using the holes cut from one seam to another as crosscuts between the airways. J. H. Tipton.

Hooversville, Penn.

Letter No. 3—The queries put by Mine Foreman, regarding the practical working of the rooster coal associated with the Pittsburgh No. 8 seam, *Coal Age*, Feb. 16, p. 349, have interested me, since I have just been handling a similar proposition.

Having had a wide experience in working coal, both on the room-and-pillar system and by longwall, I am firmly convinced that the only method that can be economically applied to the working of these seams is the longwall method of mining. Before describing the application of this method to the working of the rooster coal, let me answer briefly the four questions asked by Mine Foreman, as follows:

1. In my opinion, it is not practicable or possible to work the rooster coal in rooms 24 ft. wide and, at the same time, comply with the requirements of the Pennsylvania Mining Law.

2. Assuming that the coal has been taken out from the Pittsburgh seam, which underlies the rooster coal and is separated from it by 4 ft. of mixed coal and slate, there is no doubt but that this loose material separating the two seams will have caved in the rooms. If that is the case it will be impossible to maintain safe conditions and properly ventilate the workings when taking down the rooster coal. The state mine law requires that there shall be a minimum of 150 cu.ft. of air, per man per min., and to maintain this circulation at the working face would be well nigh impossible under the conditions that would then prevail.

3. When it has been attempted to recover the rooster coal, in the room-and-pillar system, it has seldom happened that more than 30 per cent. of that coal has been removed.

4. The Pennsylvania mining law for the bituminous field (Art. 4, Sec. 6) requires the mine foreman to see that every working place is properly secured by posts or timbers. It is quite evident, however, that it would be impossible to comply with this requirement of the law if there was 4 ft. of loose slate lying on the floor of a room 24 ft. wide, especially when it is remembered that the roof of the rooster coal is 15 ft. above the floor of the Pittsburgh seam.

Recommends the Longwall System of Mining

It is with some satisfaction that I recommend the use of the longwall system of mining in both of these seams, since I have proved its practicability and have succeeded in recovering 100 per cent. of the rooster coal by that method.

Briefly stated, my plan has been to develop a considerable area of the Pittsburgh seam by the longwall method and, having done this, to work out the rooster coal on the retreating system, by applying the same longwall method, starting from the faces of the abandoned roadways in the lower Pittsburgh seam.

It has been found that, in the extraction of the coal in the lower seam, the roof settlement has been so gradual and uniform and rests so solidly on the waste material separating the two seams, that there is no difficulty in extracting the coal in the upper seam and obtaining a recovery of practically 100 per cent. of that coal.

Advantages Gained in Longwall Working

Among the advantages offered by the longwall system of mining may be mentioned the following: (1) A constant supply of pure air, as the current travels the working face. (2) Complete control of the roof settlement, assuming that the packs have been well built in the lower seam when working that coal. (3) Concentration of haulage and a maximum output from a minimum area of workings. (4) Fewer daymen required. (5) Cleaner coal is obtained, as the slate and other waste material is thrown back in the gob, the coal being loaded on a solid bottom, instead of on the top of the mixed coal and slate. (6) No large slate hills or runways to climb, but a level bottom. (7) The recovery of, at least, 99 per cent. of the rooster coal.

In closing, let me say that when the Pittsburgh seam and the rooster coal are worked in this manner by the longwall system of mining, there is an increase of over 50 per cent. in the tonnage per acre, over the usual room-and-pillar method of working.

South Burgettstown, Penn. Andrew Orr Bain.

Shotfiring re Explosion

Letter No. 7—In connection with the interesting discussion on this subject, allow me to give my experience in a Cape Breton coal mine, about twenty years ago. At that time I was taking a mining course in the Scranton Correspondence Schools or the experiment I made would never have suggested itself to me, although that is not to say that the schools were responsible for leading me into dangerous practices, or causing me to violate the mining laws of Nova Scotia, which were not then, however, as rigid as they are today.

Being employed as a shotfirer, I had a large section of rooms at the top of a headway. The mine was a new one and was only down a short distance, as mines go today. The ventilation was good and, no gas having been discovered in the headway where I worked, open lights were used. The rooms were 22 ft. wide. Three shots placed one in the center and one on each side of the face were used to bring down the coal, the charge being black powder. As no crosscuts had to be driven from the toproom it naturally went ahead faster than the rooms below where crosscuts were required.

Getting off the air, my place was a little close, and I began to hear second or after reports when I fired the two side shots together, which was the common custom. As time went on and I advanced farther from the air, the after reports grew louder. I knew, or thought I knew, the cause of these second reports having often heard them before. It was the explosive mixture of gases produced by the explosives used, and fired under conditions favorable to their explosion.

A Warning That Was But Partially Heeded

This was a warning to me to stop firing two shots together; but, after thinking the matter over, I decided that the danger point had not been reached and that it was an excellent opportunity to experiment under fairly safe conditions. I therefore continued firing the two shots together, until satisfied that the danger limit was near, as the after reports kept growing still louder as the room advanced and I stopped the practice, finally. Even then the last of the two shots, if fired before the fumes were allowed time to cool down, began to give a low after report, which satisfied me as to the cause of the after reports.

One day, after I had fired the middle shot the underground manager and the overman came in and, as usual, we had a social chat for some minutes. When they had gone I proceeded to fire the side shots. The force of habit being strong and without thinking what I was doing, I drew the needle from the second shot, before firing the other side. Seeing my mistake when too late and knowing that it would be dangerous to force it back in again, I decided to fire the two shots together.

Having never been in the habit of overloading my shots, I feared nothing but a loud and heavy after report. My fears were realized, for the sound and force of the after report was heard and felt far out on the lower levels. The two officials who had just visited me came running back up the headway to ascertain what had taken place. They did not find out the whole truth; but that was the last time that I fired two shots together, in the same room, and I advise all other shotfirers to stop the practice. Occasionally in the lower rooms there were after reports very low and at irregular intervals; but these rooms were better aired and the fumes were carried away quickly.

This experience leads me to differ from former Inspector Verner as to the condition of a place where shots are to be fired. I prefer the pure air when coal is being blasted. The gases liberated from the firing of explosives, especially black powder, form an explosive mixture much to be feared where the ventilation is weak and coal dust and heat are present in the mine atmosphere.

John Moffatt.

Dominion, Cape Breton, N. S., Canada.

Surveying and Mapping

Letter No. 4—The several letters that have appeared recently in *Coal Age* relating to surveying practices have struck a responsive chord in my heart, and I am led to offer a few suggestions.

Judging from what has already been written, there is apparently a similarity in the attitude of different engineers toward the methods they employ, and the attitude of automobile owners toward their own machines. Every owner of a car swears by (sometimes at) his car as being "the best on the market." In like manner every engineer, as far as I have observed, is willing to swear that his method of surveying and tabulating notes is superior to any in use.

Referring to the claims that have been set forth in regard to the respective advantages of the continuous-numbering system for stations, in mine surveying, and the system of numbering stations so that the number will indicate the distance of the station from a starting point, it appears to me that neither of these systems can claim absolute superiority over the other.

To my mind, one of the advantages of the continuous method or system of numbering stations advocated by W. L. Owen, *Coal Age*, Dec. 8, p. 960, is that any station number can be quickly found in the notebook where they occur in regular order. On the other hand, it might be more difficult to locate a given station in the notebook where the other method of numbering is employed.

Combining Two Methods of Numbering Stations

In my experience I have known at least one coal company to have used a partial combination of both of these systems. For example, all stations whether located in rooms, air-courses or headings were numbered in rotation as they were placed. In addition those located in headings also carry a distance number painted alongside of their rotational number.

Besides these transit stations, levels were run with a wye level, taking elevations at each 100 ft. and, occasionally, at intermediate points. These 100-ft. level stations were also painted 8 + 00, 9 + 00, etc., on the ribs. Eventually, however, the taking of distances at transit stations on the headings was discontinued, as it was found that the level distances answered all requirements in the mine or when inspecting the map in the office. I would say, however, that this method of leveling is hardly feasible in other than fairly flat coal seams.

In my opinion the most annoying and troublesome system for a stranger to encounter, in an unfamiliar

mine, is that in which the previous survey has duplicate station numbers, as when the first station in a pair of headings is numbered 1, the next 2, etc., and the same system is duplicated in the other headings of the mine. In that case a number on the mine map contains almost no information for a stranger in the mine when attempting to extend a survey previously made. The attempt, in some cases, is a positive nightmare. I recall but one worse case, which resulted from the numbers painted on the ribs not corresponding with the numbers printed on the mine map.

In regard to plotting true rib-lines, let me say that if the management believes in developing the entire work on transit sights, it is safe to assume that, having gone to this expense, it will see that all places are driven a uniform width, and the rib-lines can then be made with a ruling pen. Where a management is indifferent in this respect, it will generally be found that they do not care for any accurate delineation of the rib-line in the rooms. A ragged looking mine will then present a ragged appearance on the map.

In closing, let me say that, in running a large survey, I prefer the continuous vernier or azimuth system, using a transit graduated from zero to 360 deg., as well as in quadrants. By taking the azimuth, quadrant and needle readings, a triple check is obtained on the survey. However, when extending a survey and projecting lines straight ahead, in an entry, the continuous-vernier system has no superiority over deflection angles.

Albert, W. Va. J. A. SMITH.

Overlooking the Salaried Man

Letter No. 2—I was pleased to read the letter of George N. Lantz, *Coal Age*, Feb. 16, p. 344, again drawing attention to the unfair discrimination generally made in different classes of workers. Like Mr. Lantz, I read with interest the reference made to this subject some time since in *Coal Age*, and was sorry that it attracted so little attention at that time.

There is no need to dwell on the fact that the salaried employee, in any industry, occupies an unenviable position not equalled by any other class of workers. I do not refer, here, to that favored class of higher officials who have little reason to complain in respect to compensation for their time and labor.

The fact is well known to every observant person that there is a large middle class of faithful workers, who are paid small salaries that are seldom increased but remain the same, year in and year out. One is led to ask why it is that the services of this class of employees is not more generally recognized by those having power to alter their condition.

Here is a class of men, faithful and loyal to company interests and doing work that requires more or less ability and education. The failure on the part of employers to recognize, in a just and equal manner, the services of their salaried employees so that they will enjoy equal advantage, in respect to increased compensation, as the laboring classes, who compel recognition of their demands by organization, not only tends to produce dissatisfaction but destroys the efficiency of the former class of workers.

What remedy there may be for this condition remains to be seen. There appear to be two general causes to blame for the low regard of employers for their salaried workers: (1) The education and disposition of the salaried worker makes him hesitate to urge his claim for increased compensation. Modesty and pride alike keep him from advocating his rights and needs, and for this he alone is to blame. (2) The average employer regards it as a business principle to secure the most efficient man possible, and to pay him the least sum that will retain his services.

CHANCES OF ADVANCEMENT ARE FEW

In face of these two conditions, it is easy to see that the salaried man has few chances of advancement, except as opportunity may present itself in the offer of a better position. A vacancy may occur in the company, making promotion possible; or an offer may come to him from the outside, in which case the employer, rather than lose the services of a good man will generally be willing to increase his salary.

Good business management requires maintaining the overhead charges at the lowest possible minimum, and the compensation of salaried workers comes under this head. At the same time, the employer expects faithful and loyal service, and, to the credit of the salaried employee, it can be said that he gets it from the average worker of this class.

Another factor that enters into the proposition is the strong competition between industries supplying the same market, and employers are prone to compare the services of their own officials and their rate of compensation with what competing industries are doing in the same line.

In closing, allow me to say that, notwithstanding the fact that a man's services are only worth what he can get elsewhere, no one will deny the fact that salaried men should enjoy the profits of an industry in the same proportion as the wage earner, and this should not require the organization of that class of workers to secure recognition in that respect. KAPPA.

Ottawa, Canada.

Favoritism in Mine Management

Letter No. 3—Kindly permit me to reply to some of the statements of John Rose, *Coal Age*, Jan. 26, p. 213, who seems to think that I considered but one side of the question under discussion. I hope my letter did not convey that meaning to all readers of *Coal Age*, for it was not what I intended. My desire was to be fair to both sides, and to state only actual facts from my own observation and experience.

Referring to the suggestion that men who have been employed for a long time in a mine fall into ruts and use wasteful and expensive methods, let me say: Show me a mine where the officials have held office a number of years, and I will show you a mine that is paying the operator. On the other hand, in my experience, the mine that is constantly changing officials will generally be found to be running behind.

What Mr. Rose says in regard to a new man bringing new ideas and experiences is true; but it is my belief and opinion that, in nine cases out of ten, the company would have profited had he left those ideas and experiences where he gained them. No two mines are alike and must be studied separately.

To my mind, it should not require a new superintendent to discover whether the underofficials are keeping up to date and performing their duties in a most efficient manner. If the superintendent is worth while and equal to his job, his years of service have given him a better knowledge of the conditions existing in the mine than a new man could possibly gain for years to come.

Again, Mr. Rose quotes me as saying, "Many men do not take kindly to working under a new boss." The meaning I intended to convey was that many of the old men would fear that the new superintendent would give the best jobs and places to his own favorites whom he would bring with him. Such a fear would naturally make the old men suspicious of a new boss, until they came to know him and understand his methods.

Old and Disabled Miners

I regret to say that, in this county, there is little chance for a man to get "old on his job" in the four or five years that he ordinarily holds his place. In England, such a statement could hardly apply to men until they have been in service 20 or 30 years. But the mines in the old country, I claim, are as up to date as any of our mines in the States.

Again, in regard to "disabled miners," Mr. Rose's long experience in mines makes it unnecessary to remind him that there is much work that this class of men can do efficiently; and, while I would not object to his idea of pensioning such men instead of continuing to employ them where they could work, I believe that few companies would be willing to do this. The case mentioned in my previous letter was one where the man was not pensioned but was refused further employment.

Like Mr. Rose, I try to look at things broadly, but one cannot help seeing what is constantly occurring before his eyes. I freely admit that, as he suggests, changes in management are frequently necessary, but a change in superintendents should not mean a sweeping change in the working force employed in and around the mine.

The Coming of a New Superintendent to a Mine

A new man coming to take charge of a mine should study well the conditions before attempting to introduce new ideas and methods. This will take time, and, in many cases, the men must be educated to realize the advantages to be gained by adopting a new scheme with which they are more or less unfamiliar. Too often it happens that a new superintendent puts his plans into operation at once, and this gives him an excuse for placing his old men in good positions, because they are familiar with the methods he wishes to adopt.

In strong contrast with this condition, however, I have seen changes of superintendents when the old hands have been retained and their confidence won by the sincere manner in which they were treated. When a new superintendent secures the confidence of the underofficials, it is not long before he will gain, likewise, the confidence of every man in the mine, which is of the utmost importance in successful operations.

While there are exceptions, it is my belief that an old hand is frequently worth a dozen new ones. Only a few days ago I received a letter from the general manager of the mine where I was employed, in the North of England, 15 years ago. In his letter he mentioned the names of several of the underofficials that were there when I left and are still holding their positions. It is facts like these that argue against the necessity of making sweeping changes in our mines every few years.

Heilwood, Penn. Thomas Hogarth.

Examination of a Mine

Letter No. 4—For one, I could not agree with the description of the work of a fireboss given by Robert A. Marshall, *Coal Age*, Feb. 2, p. 256. Mr. Marshall states that, in Colorado, the duties of a fireboss, in his official capacity, end when he has completed his early examination of the mine, returned to the shaft bottom and entered his report in the book kept for that purpose. He is then said to turn the mine over to the mine foreman. On his return from breakfast, the fireboss reports to the foreman for instructions and, during the remainder of the day, performs whatever work may be required of him.

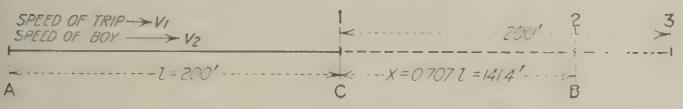
In my opinion, a fireboss should devote his entire time to the removal of any gases that he may have discovered on his first examination of the mine in the morning, and to otherwise making the places safe for work. To my mind, he is the proper person to do this class of work, as he understands better than anyone else the condition of the mine.

If the first examination of the mine shows no gas or other dangers to remove, the fireboss can well devote his time to the inspection of various details relating to the ventilation of the mine, such as erecting brattices where these are needed to conduct the air closer to the working face, inspecting breakthroughs to see that they are of proper size and the required distance apart, both in rooms and headings.

The fireboss is also charged with the duty of measuring the quantity of air in circulation at regular stated periods and recording this in a book kept for that purpose. These and other matters requiring attention, together with giving the needed instructions to the workmen, in regard to timbering their places and mining and blasting their coal, will fully occupy his time throughout the day.

Mr. Marshall's reference to the "Grim Reaper, who so unmercifully takes away many of our good miners," is well timed; and would appear to better advantage had he been able to set a higher standard for the fireboss' work in Colorado than that which he has described. Throughout his letter, Mr. Marshall has failed to make any reference to the responsibility that should rest on the fireboss for the examination of old abandoned workings where there is always a chance that the Grim Reaper is lurking.

To sum up, let me say that it is my candid opinion that as long as firebosses are made the goat and the importance of their work discredited, just so long will we hear of terrible catastrophes occurring in the mines. I want to repeat, here, what I have urged previously, in *Coal Age*, that the only way the death list or fatality rate in mining can be decreased is by the appointment of firebosses in all coal-mining states to act as and with the authority of assistant mine inspectors.



Poston, Ohio. James H. Taylor.

INQUIRIES OF GENERAL INTEREST

Haulage Problem Corrected

Kindly permit me to refer to the answer given in *Coal Age*, Feb. 23, p. 389, to the question of "Student," who asks for the distance that a boy will run, in delivering a note given him by the foreman, who was riding in the rear car of a trip 200 ft. long and told the boy to run forward and hand the note to the motorman.

In replying to this question, it was assumed that the running speeds of the trip (v_1) and the boy (v_2) are uniform and that the boy, starting from A (see accompanying figure), after delivering the note to the motorman at B, immediately starts to run back and reaches the rear car just as it arrives at C, the place where the locomotive was when the boy started from A.

To the casual reader, the question appeared easily solved by arithmetic, and verified by the formula given. A little investigation, however, shows that the solution offered has only considered one condition; namely, that the time which the boy takes to run forward to the locomotive, deliver his note and return to the rear car is equal to the time that the trip advances through a distance equal to its own length. This condition is true but is not the whole story.

Allow me to suggest that the second condition is that the time which the boy consumes in running forward and reaching the locomotive at B is equal to the time that the locomotive takes to go from 1 to 2, as marked in the figure, or advances through the distance x. The first of these conditions is expressed correctly in the formula given on page 389, the time being found by dividing the distance passed through by the speed of running, in each case, which gives

$$\frac{l}{v_1} = \frac{l + 2x}{v_2} \qquad (1)$$

In the second condition, the trip hauled at a speed of v_1 passes through a distance x, while the boy running at a speed of v_2 covers a distance $l + x$ in the same time, which gives

$$\frac{x}{v_1} = \frac{l + x}{v_2} \qquad (2)$$

Then, dividing equation 1 by equation 2 gives

$$\frac{l}{x} = \frac{l + 2x}{l + x}; \text{ and } 2x^2 = l^2$$

$$x = \frac{l}{\sqrt{2}} = \frac{200}{\sqrt{2}} = 141.4\ ft.$$

Now, since the boy runs a total distance $l + 2x$, he runs in all $200 + 2 \times 141.4 = 482.8$ ft.

From this solution can be given the arithmetical rule, by which to solve similar questions. It is as follows:

To the length of the trip add twice the quotient obtained by dividing the length of the trip by the square root of 2, and the result will be the distance traveled by the boy in delivering his message and returning to the rear car, in the time the trip advances a distance equal to its own length.

EDWARD HILLERY.

Matherville, Ill.

A number of letters have been received, drawing attention to the oversight in the solution to this question. It is quite evident that substituting the assumed values $l = 200$ ft., $v_1 = 8$ ft. per sec., and $v_2 = 14$ ft. per sec., in the equations 1 and 2, given by our correspondent, and which represent correctly the two conditions controlling the problem, will not give like values for x, the distance the locomotive advances while the boy is running forward. When these values are substituted in the first equation, $x = 75$ ft., while in the second equation, the same values give $x = 266$ ft., or a distance greater than the length of the trip, which is contrary to the statement of the question.

A little reflection shows that the problem is not susceptible of any simple arithmetical solution such as that first given on page 389; but must be worked out algebraically to conform to two conditions, which are as follows:

1. The first condition is that the trip advances through a distance equal to its own length l, running at a speed of v_1, in the same time that the boy covers a distance $l + 2x$, running at a speed v_2.

2. The second condition is that the trip advances a distance x, running at a speed v_1, in the same time that the boy covers a distance $l + x$, running at a speed v_2. equations 1 and 2 express these two conditions, respectively. Then, by transposition, equations 3 and 4 are derived from equations 1 and 2, each from each and we have

$$\frac{v_2}{v_1} = \frac{l + 2x}{l} \qquad (3)$$

$$\frac{v_2}{v_1} = \frac{l + x}{x} \qquad (4)$$

Equating the second members of equations 3 and 4 gives

$$\frac{l + 2x}{l} = \frac{l + x}{x}; \quad 1 + \frac{2x}{l} = \frac{l}{x} + 1; \quad \frac{2x}{l} = \frac{l}{x};$$

$$2x^2 = l^2; \ x = \frac{l}{\sqrt{2}} = 0.707l$$

The last equation shows that the distance x is a fixed decimal part of the length of the trip l, and is independent of the speed of the trip or that of the boy.

Finally, substituting this value of x in either of the two equations 3 and 4, giving the ratio of the speed of the boy to that of the trip, shows that this ratio, $v_2/v_1 = 2.414$, is fixed. Hence, in order that both conditions of the problem shall be fulfilled, the boy must run at a speed 2.414 times as great as the trip is running. In other words, assuming the trip is running at a speed of 8 ft. per sec., the speed of the boy is $2.414 \times 8 = 19.312$ ft. per sec.

EXAMINATION QUESTIONS

Indiana Firebosses' Examination, Vincennes, Jan. 17, 1918

(Answered by Request)

Ques.—(a) What is firedamp? (b) What is the lowest explosive point of firedamp? (c) What is the highest point of firedamp? (d) What is the maximum explosive point of firedamp?

Ans.—(a) Correctly speaking, the term "firedamp" should refer to any inflammable or explosive mixture of mine gas and air, although the term is commonly applied to a mixture of methane or marsh gas and air in inflammable or explosive proportions.

(b) The lower explosive limit of pure methane and air is reached when the proportion of gas to air is 1: 13, the firedamp then containing 7.14 per cent. of gas.

(c) The higher explosive limit of pure methane and air is reached when the proportion of gas to air is 1: 5, the firedamp then containing 16.67 per cent. of gas. The mixture still continues to be inflammable, though not explosive, until the proportion of gas to air becomes 1: 2.4, and the mixture then contains 29.5 per cent. of gas. With a larger percentage of gas, the mixture is no longer inflammable.

(d) The maximum explosive point of a firedamp mixture, consisting of pure methane and air, is reached when the proportion of gas to air is 1: 9.57, and the mixture then contains 9.46 per cent. of gas.

Ques.—What effect, if any, does mixing carbon dioxide with firedamp have?

Ans.—The mixing of carbon dioxide with firedamp renders it less explosive than before, carbon dioxide being an extinctive gas. Firedamp at its most explosive point is rendered inexplosive by the addition of one-seventh of its volume of carbon dioxide, assuming that the firedamp is pure methane and air.

Ques.—What effect, if any, does mixing carbon monoxide with firedamp have?

Ans.—The addition of carbon monoxide (CO) to firedamp has the effect to increase its explosive condition, since carbon monoxide is an inflammable gas. In other words, it widens the explosive range of the firedamp.

Ques.—What effect, if any, does bituminous coal dust suspended in the mine air have on an explosion of firedamp?

Ans.—The presence of fine bituminous coal dust suspended in the air, and acted on by the flame of an explosion, has the effect to greatly extend the explosion and increase its force. This is due to the inflammability of the carbon monoxide (CO) distilled from the dust by the heat and flame of the explosion. An otherwise local explosion of gas is thus frequently propagated throughout the mine when fine coal dust is present.

Ques.—(a) What is afterdamp? (b) What gases are found after an explosion of firedamp at its maximum explosive point?

Ans.—(a) The term "afterdamp" describes the variable mixture of extinctive gases that remain after an explosion of gas or dust in a mine. Although the composition of afterdamp is very variable, it consists chiefly of carbon dioxide and nitrogen, together with varying amounts of carbon monoxide and, at times, some unburned methane is present.

(b) The explosion of a firedamp mixture consisting of pure methane and air, at its maximum explosive point, produces carbon dioxide and water vapor. These gases are mixed with the nitrogen of the air remaining after the explosion.

Ques.—(a) What is a dangerous atmosphere? (b) How would you proceed to extinguish a mine fire at different stages of the fire?

Ans.—(a) A dangerous atmosphere is one that will expose workmen in the mine to danger, because of its inflammability, explosibility, or poisonous character. An atmosphere is also dangerous when it contains too small an amount of oxygen to support life and maintain a healthy condition of life.

(b) The means to be adopted for the extinction of a mine fire will depend on its location, the headway it has gained and other conditions. A gob fire, caused by the spontaneous ignition of fine coal and slack in the waste, can often be loaded out of the mine before it has gained much headway; but when such a fire has spread over a considerable area, it will often be necessary to seal off that portion of the mine workings, so as to prevent air from reaching the fire. The fire is thus permitted to smother itself.

A fire that has gained considerable headway must always be approached and fought from the intake side, in order to avoid the men being overcome by the gases produced by the fire. Before starting to fight a fire, under these conditions, all the men should be withdrawn from the mine, while steps are being taken to secure an adequate supply of water for fighting the fire. When it is evident that a live fire cannot be extinguished by the application of water, it must be sealed off by building air-tight stoppings at all entrances to that section of the mine or workings. If it is not possible to isolate a single section of the mine where the fire is located, the plan is often adopted of sealing off the mouth of the mine, for a period sufficient to extinguish the fire. As a last resort, recourse is had to flooding the mine so as to drown out the fire.

Attention has been called to a clearly evident error, in the calculation of the sectional area of the semicircular arch forming the roof of the airway, in the reply to the sixth question on page 390, *Coal Age*, Feb. 23. That portion of the answer should read, The area of a semicircle whose diameter is 9 ft. is $\frac{1}{2}$ $(0.7854 \times 9^2) = 31.8$ sq.ft.

COAL AND COKE NEWS

Harrisburg, Penn.

Stipulations were filed on Feb. 27 in the Dauphin County Court by the Attorney General and attorneys representing various anthracite coal companies in which it is agreed that the Locust Mountain Coal Co.'s suit to test the anthracite tax act of 1915 shall govern all the cases growing out of the act. The case is now in the Supreme Court.

A census by the police in every city and town in the state of all persons more than 50 years of age for the purpose of obtaining information for the granting of old-age pensions was proposed at a hearing of the State Commission for the consideration of Old-Age Pensions, recently appointed by Governor Brumbaugh. The census was suggested by James H. Maurer, chairman of the commission and president of the State Federation of Labor. It was also suggested that the labor unions take the census instead of the police, as then it would be more accurately and fully performed. Reports from poor directors of each county show the average cost of maintenance per capita is $2.80 a week. It was the consensus of opinion that the monthly pensions should be $25. The commission will report to the next Legislature.

With the state gaining revenues from the regular coal industry, the question has been raised as to the possibility of some returns being secured from the river coal industry. Attorneys and other persons familiar with state and municipal taxation are not wholly in accord on the question of title to the coal, or the right to tax. On the one hand it is held that by legislative enactment it might be possible for the state to impose a tax on the river coal industry, which at present is not being taxed. It is, of course, generally agreed that until some such law is actually enacted the industry probably cannot be made to produce any revenue to the state treasury.

As to a city or municipality's part of the taxation matter, it is asserted that possibly the only way to secure revenue from the industry would be to impose a wharfage tax or charge. River coal generally retails at from $1.25 to $1.75 a ton, the lower figure being the prevalent charge where there is not a long haul for delivery; but during the shortage of anthracite coal which has characterized the present winter, the cost of the river brand of coal leaped to prices above $2. The Capitol Building, the Harrisburg Light and Power Co. and quite a number of the local industries use river coal either entirely or in part.

The Susquehanna River is dotted with coal fleets in a number of places from Pittston to Harrisburg, a distance of 130 miles. The careful attention which has been bestowed in recent months upon culm banks, once thought to be worthless, has raised another question as to the ownership of the coal which is washed down the river from the mines and gives rise to the extensive river coal industry. Attorneys say as a matter of law it would probably be true that title to the coal would remain in the concerns from whose culm banks or mines it was washed down—provided it could be traced.

But tracing the identity of the particular particles of coal which happen to be washed downstream is quite another matter and, as can easily be seen, it is a pretty safe matter to gather it from the bed of the river without any mining concern from some distant point above where it was taken from the stream endeavoring to prove the coal to be its property.

There seems to be no question but that the title to the coal rests under existing conditions in the individual or firm who first takes it.

Odd features of the compensation law were brought out at a session of the State Board during the week. The most interesting one came from the anthracite region, when it was contended that a check-docking boss is not an employee of a coal company and that injuries sustained by a check-docking boss while lending a hand to workmen at the head of a shaft or slope do not make the company liable. Attorneys for the Lehigh & Wilkes-Barre Coal Co. argued against the decision of the referee in the appeal to the Board. The testimony showed that the check-docking boss at the Nottingham colliery had suffered a strain while assisting company hands in tipping a car of coal. The contention was raised by the company that the injuries did not result from this incident; and a second, and more unique point, was raised, when it was contended that the docking boss was not employed by the company. It was the contention of the company attorney that if assistance is given by a docking boss and injury results the company is not liable as the boss is employed by the men and occupies the same position as would a bystander who voluntarily renders assistance. The board reserved its decision.

The three companies controlling the canals that link Philadelphia with the anthracite mining regions have pledged their support in the movement which is to be sponsored by the Philadelphia Bourse, with a view of bringing about greater utilization of these waterways for coal-carrying purposes.

The Pennsylvania R. R. controls the Delaware and Raritan Canal, the Philadelphia & Reading Ry. operates the Schuylkill Canal and the Lehigh Coal & Navigation Co. controls the Lehigh Canal. It is the idea of the Bourse that if these waterways were used to their capacity for coal-carrying purposes, sufficient coal would be brought to Philadelphia during the summer to keep Philadelphia and other towns warm throughout next winter, and thus avert another famine.

PENNSYLVANIA

Pottsville — Notwithstanding numerous strikes during 1917, the Lehigh Coal & Navigation Co. increased its production 1,112,162 tons over that of the year 1916. The total production in 1917 was 4,579,571 tons.

Harrisburg—Dredges are again at work on the Susquehanna River, bringing up from the river bottom coal washed down from the anthracite fields. The "coal suckers" were laid up at the appearance of the first ice.

Pittston—Mines of the Eighth and Ninth inspection districts of Pennsylvania established new record productions for 1917, according to the reports of the inspectors, Robert Johnson and Edwin C. Curtis. The Eighth district produced 4,537,049 tons for 1917, an increase of 21 per cent., or 780,423 over the 1916 output. There was a reduction in fatalities, 168,000 tons being mined for every fatality in 1917, as compared with 124,000 per death in 1916. In the Eighth district, the output of 3,322,972 tons is 14 per cent., or 418,081 tons more than in 1916. In this district there was also a falling off in fatalities. In each district there was a slight increase in the number of employees despite the general exodus of mine workers for munition centers. The production in the Eighth district is considered a high record for an anthracite district.

North Pittston—As the result of a mine settling on Feb. 27 under the Lackawanna & Wyoming Valley R. R. bridge, traffic was blocked for several hours. The concrete walls that support the bridge and the tracks of the railroad were damaged. The bed of the tracks settled several feet and were rendered impassable. The settling is about 6 ft. deep and is due to a cave in the workings of the Heidelberg mine of the Lehigh Valley Coal Co.

Wilkes-Barre—Fire on Mar. 1 destroyed a large part of the machine repair shop of the Lehigh & Wilkes-Barre Coal Co. in the Empire yards and caused considerable damages. Although the loss amounts to thousands of dollars, a more serious aspect of the fire at this time is the fact that repairs are made at these shops for all collieries of the company in this vicinity.

Wilkes-Barre—On account of the vacancy caused by E. J. Newbaker, who left the Lehigh & Wilkes-Barre Coal Co. to become assistant general manager of the Berwind Coal Mining Co. in the bituminous fields, C. F. Huber, president of the Lehigh company, announces the following appointments to become effective on Mar. 4: Douglas Bunting, chief engineer, appointed general superintendent; A. H. Lewis, of Jeddo, chief engineer for the G. B. Markle Co., appointed mining engineer; H. G. Davies, formerly efficiency engineer for the Delaware, Lackawanna & Western Coal Department, appointed division superintendent of the Wilkes-Barre division; J. B. Tamblyn, district engineer, appointed division superintendent of Ashley division; R. G. Carpenter, district engineer, appointed division superintendent of Plymouth division; Walter Fahringer retains his position of division superintendent of the Honey Brook division, where the official organization will be maintained without change. The positions of chief engineer and district engineer are both abolished.

Stockton—The Lehigh Valley Coal Co. is planning to reopen the mines when labor and supply conditions become normal. The Hazleton Shaft colliery adjoins the workings at Stockton. Boreholes connect the Stockton flooded workings with the shaft and are controlled by valves. Whenever the water gets too high the valves are opened and the water is allowed to flow out of the Stockton mine through the boreholes into the shaft mine, where pumps remove it to the surface. More holes will be bored and the shaft pumphouse enlarged to cope with the water that will be removed from the old workings, which contains large quantities of unmined coal that was left by the Linderman and Skeer interests when they abandoned their lease of the mine in the early '90s.

Bituminous

Smithfield—Bad roads prevented the Prospect Coal Co. from supplying coal to its ovens by its motor-truck service. A tramroad is nearly built and the coal will be delivered by cars and a small locomotive.

Indiana—Job McCreight, who holds options on 1500 acres of coal in Washington township, southeast of the village of Willett, has disposed of his options to B. M. Clarke, of Punxsutawney, purchasing agent for the Rochester & Pittsburgh Coal and Iron Co. A spur will be built from the Ridge Branch to this new field by which to get the coal to market.

Surface of half-dozen farms in Cherry Run Valley have been optioned by a Rochester & Pittsburgh Coal and Iron Co. representative. A branch will be built from the Buffalo, Rochester & Pittsburgh R.R. tracks just south of Homer City up Cherry Run to a new coal town and tipple to be erected at that point.

Somerset—George H. Hay, of Milford township, recently sold his coal operation and 40 acres of mineral lands to W. D. Dillman, of Huntingdon County, for $10,000.

WEST VIRGINIA

Morgantown—Employees of Mine No. 1, of the Elkins Coal and Coke Co., at Richard, raised two flags and held an interesting program recently. The flags, one the Stars and Stripes, and the other a service flag with 12 stars, were raised on a 70-ft. pole. None of the men represented by the 12 stars was drafted, all volunteered.

Bluefield—The Hampton Roads Colliery Co., a new mining operation in the Pocahontas district which has recently been opened at Big Sandy, McDowell County, has started to ship coal. All sidings for the new operation have been installed and placed in service.

Huntington—The Main Island Creek mines, at Omar, Logan County, recently loaded 151 railroad cars of standard 60-ton capacity in one day. This is believed to be a new record, and shows what might be done in this field if the car supply were adequate.

The Long Fork Ry., a branch line of the Baltimore & Ohio, built on the left fork of Beaver Creek and extending to Weeksbury, opens up a rich coal deposit in the Big Sandy field. As soon as the railway begins to accept freight the Milquakee Coke and Gas Co. will start to load with steam shovel the 250,000 tons of high grade coal it has piled up close to the tracks.

Elm Grove—The Century Coal Co. has already started work on a new operation in this vicinity. The mine will be located on what is known as the Raymond farm directly across the creek from Elmwood. T. J. McNamee and A. C. Thomas, of St. Clairsville, Ohio, are interested. The staking out of grades for switches running from the Baltimore & Ohio R.R. to the mine entrance has already been attended to, and local parties were awarded contracts for hauling and grading.

Charlestor—With the completion of its tipple, the Northwestern Coal Co., which has large holdings at Horner, will be ready to begin mining coal. The Baltimore & Ohio R.R. will coal its engines at the tipple now nearing completion.

INDIANA

Fairmount—The Fairmount Mining Co. has filed a final certificate of dissolution with the Indiana secretary of state.

Sullivan—A small locomotive used in pulling cars of coal from a strip mine on the Frank Hale farm near this city jumped the track, plunged down the bank and was wrecked. The engineer, Edward Dailey, jumped as the engine left the rails and alighted in the water in the pit below. He was knocked unconscious and was almost drowned before he was rescued by mine workers. As the engine turned over in its fall, William Mills, a mine worker, jumped and fell, suffering a broken collar bone.

Bloomington—An old abandoned coal mine 10 miles southwest of Bloomington, which was worked some 35 years ago and which was reopened a month ago by George Timberlake and Richard Hall, has developed into a 42-in. vein. The coal is now being tested at Indiana University and the grade is expected to be much higher than the ordinary Indiana coal. There is an iron ore deposit near the coal mine which was successfully worked years ago, and Timberlake and Hall propose to reopen it.

ILLINOIS

Greenfield—The Greenfield Coal Co., which has been operated for several years by a group of local shareholders, has been leased to J. F. Dolan, of Springfield, for a period of one year. Dolan will pay a royalty of 20c. to the company on each ton mined. He has announced all coal will be sold cash at the mine, reversing a policy of wide credits allowed by the original company.

Carlinville—The Standard Oil Co. will sink four shafts in the vicinity of this city, according to Evan John, director of the Illinois State Department of Mines and Minerals. The company will use this coal for its plants at Wood River, Ill., Whiting, Ind., and Kansas City, Mo. Over 400 men are now employed in work preparatory to the sinking of the first shaft.

The Superior Coal Co.'s No. 3 mine here claims the distinction of being the greatest coal-producing mine in Illinois. Figures recently compiled show 1,158,796 tons of coal was mined at this operation during the 200 working days of 1917. The mine has a daily output of 4457 tons and employs 680 men.

The Standard Oil development is not the only one which is being promulgated in the Carlinville district at the present time. It is said that local interests expect to begin mine operations on a large scale, while a large railroad company is also considering entering this field. With the increased activity of the Standard Oil Co. in this territory the Chicago & Alton R. R. must enlarge its yards. The local Chicago & Alton yards have had new tracks installed to accommodate the Standard mines in Carlinville, but the main yards for the mines north of the city will be three miles north of the Carlinville station and will be located on the John C. Anderson land. The railroad company has purchased a tract from Mr. Anderson, upon which it will construct seven parallel tracks each ¾ mile in length.

Taylorville—Fire broke out recently in the third southwest section of Mine No. 8 at Tovey. The fire was brought under control the following day, but on account of the smoke in that section the men were not permitted to work in it for several days.

Mrs. Mary Ormsby, who is at present residing in California, has sold the coal rights on her farm of 328 acres just east of this city to the Peabody coal interests for $25 an acre, or a total of $8200. It is not known whether the Peabody interests intend to connect their field with this new mine or whether the purchase was made to break up the plan of another coal mine about to be launched and which included the farm which Mrs. Ormsby owned.

Belleville—It is reported that the St. Ellen Mining Co., of O'Fallon, was fined $100 by Justice Beineke recently for failing to properly equip the warehouse at the mine. The evidence was that the heating and the hot and cold water system were not according to the mining law.

John Downing, a shotfirer employed in the so-called "Nigger Hollow" Mine No. 2, had an unusual and dangerous experience when the lamp upon his cap became extinguished just as two charges of explosives were about to be discharged. Downing became confused after his light failed, and realizing that he was lost threw himself upon the ground face downward. He was painfully burned and also injured by flying particles of coal and debris. He was removed to a hospital where it is thought he will recover.

Springfield—Andrew Smaller, employed in Klondike Mine No. 5, was arrested by United States deputy marshals when it was reported he had told two other miners "he'd just as soon drop a fuse into that keg of powder and blow up the mine." He professed innocence of any intent of wrongdoing, but was held for investigation. He is a native of Austria and came to this country 24 years ago at the age of 19. He was naturalized in the County Court here 14 years ago.

Four kinds of negligence are alleged in the verdict of the coroner's jury into the deaths of four men in Mine A of the Citizens' Coal Co., on the morning of Feb. 23. The verdict was that the explosion was caused by a blownout shot, that the shot was improperly placed, that the shotfirer did not properly report the shots, that the mine was not sprinkled at proper intervals and that the shots were fired while employees were still in the mine. There was also testimony at the inquest that the ventilating fans were not stopped before the shots were fired. The regular shotfirers had placed three shots in one of the rooms and had not fired them because a car was off the track in the room. The night boss and six men replaced the car and the fuses were lighted under the direction of the night boss. The bodies of the men were found several hundred yards from the room where the explosion occurred.

Benton—J. E. Jones, ex-State Mine Inspector, 11th District, states that the annual coal report of Illinois shows that Franklin County produced 11,317,657 tons with 21 mines during 1917. This would make Franklin County rank first in the production of Illinois coal for last year, and not Williamson County, as mentioned in these columns on Feb. 23.

Danville—A new transformer has been placed in the Electric mines, near Missionfield, Ill., to replace one recently destroyed by fire. The burning of the transformer threw several hundred miners in mines Nos. 1, 2, 3 and 4 of the Hartshorn interests out of employment and curtailed production 24,000 tons.

Virden—Following are the details of how the four men were killed in the Royal Collieries mine here on the morning of Feb. 22, when 28 kegs of powder exploded on the 300-ft. level: The men had lowered the powder on the cage and loaded it on a mine car. An electric motor was attached to haul it into the entry which was being worked. The wheels of the motor skidded. This formed a short-circuit and set off the powder. On account of the stacks at the mine having been blown down a few days before, the men were working half shifts day and night and few were in the mine. The coroner's jury held the mine officials responsible in that the powder had been unlawfully let down into the mine and left standing on the switch track while the power was on, and it was recommended that the company be held liable. The explanation of the manner in which electricity reached the powder is that it entered the car through the axles and the drawbar and ignited the powder through the metallic kegs. G. G. Gordon, superintendent of the mine, says that when the powder was lowered at 2:30 a.m. it was put on the entry track out of the reach of electricity.

Gillespie—The Superior Coal Co. has discontinued its coal train between Benld, Ill., and the Sangamon River, owing to recent thaws which filled the reservoirs and which also assisted in operating the coal washer which had been shut down since last December.

KENTUCKY

Madisonville—The recently organized Grapevine Coal Co. announces that it is ready to commence loading cars at once, but that the output at the start would be small as most of the coal will come from the entries as they are driven.

Two coal companies have started a big boom at the mining town of Mannington, where 50 miners' houses are being erected. The Memphis Coal Co. is building a large commissary, while the Williams Coal Co. is planning operations on a large scale.

Hellier—It is reported that the huge plant and coal mines of the Allegheny Coke Co. have been sold to the Elkhorn Coal and Coke Co., in a deal involving an even million dollars. J. L. Morgan, superintendent of the Allegheny company's operations, has resigned to open mines of his own in the same vicinity.

Clay—The Ward Coal Co. has sold its mine here to the Boone & Boone Coal and Ice Co., of Louisville, Ky., the latter concern announcing that it would operate as the Fairmont Mining Co. The Ward company has been operated for several years by Luke Mitchell.

Providence—Edgar M. Young and James E. Morgan have purchased the coal mine and plant of S. K. Luton, located on the Illinois Central Ry. The new owners are planning to enlarge the capacity of the mine.

IDAHO

Boise—The Teton Valley Coal Co. has been sold to Seattle and Spokane investors, according to R. N. Bell, state mine inspector and one of the principal stockholders in the original company. The purchase price is given as $100,000. The property is the only commercial deposit of any size in the state and has a main shaft which is being driven to a depth of 500 ft. It is located near Driggs.

MONTANA

Bozeman—The Moxey Bros. at Storrs have uncovered a 10 ft. vein of coal which is believed to be the vein the Amalgamated Copper Co. abandoned after losing it several years ago. The coal is of excellent quality, a load of it having been burned by a local greenhouse with excellent results.

WASHINGTON

Bellingham—Anderson & Johnson and John C. Eden, the latter a prominent capitalist of Seattle, are opening a coal mine near here on Clayton Bay.

The Bellingham Coal and Coke Co., recently incorporated for $150,000 by F. W. Kittle, C. M. Skelton and F. I. Gater, has leased a recently discovered coal mine on the Samish road 1½ miles south of the city and development work has been started. The coal is said to be high-grade bituminous. Mr. Kittle was for years operator of the Issaquah coal mine in this state.

Cle Elum—The Independent Coal and Coke Co. has just completed the construction of an $8000 washhouse for the men of the local mine. The structure is said to be one of the finest in the state and has 34 shower baths.

Seattle—Dr. Bailey Willis, professor of geology of Leland Stanford Jr. University, of California, is in the state to continue work undertaken for the Carbon Hill Coal Mining Co. several years ago. For several days he has been making a study of the coal beds of King and Pierce Counties. "A very thorough investigation of the coal and iron resources of the Pacific Coast from Alaska to Mexico has been made," he states. "One of the objects has been to determine whether or not this main coast could become independent of the Eastern iron and steel manufacturers."

Spokane—Far-famed Alaska coal will undergo the severest commercial tests in Tacoma in a few days. A shipment of coke from the Alaska coal has been received, and will be tried out in the Puget Sound Iron and Steel works plant. The coke is from the coal shipped from the Chickaloon district in the Matanuska fields on the government railroad in Alaska to the Wilkeson Coal and Coke Co. for cooking in the company's big ovens at Wilkeson. This is said to be the first attempt to coke the coal on a scale sufficient to test its value for this purpose. The coking has been done by Supt. Joseph Lee of the Wilkeson Coal and Coke Co., and those who have seen the coke, and who can pass as judges, say it is a good grade of coke and should show satisfactory results from the tests. The Alaska coal fields were examined by the United States Government in 1912. The first steaming tests were made on the battleship "Maryland," and the coal proved to be 98 per cent. as efficient as the Pocahontas coal of West Virginia.

ALASKA

Cordova—The Katalla Anthracite Coal Co. has opened its property to such an extent that as soon as the railroad now building from Controller Bay to the mine

is completed it will ship at the rate of 200 tons of coal a day. The Government engineers have pronounced the coal the equal of Pennsylvania.

The Moose Creek line of the Alaskan Engineering Commission is now shipping coal at the rate of 50 tons a day.

Joseph Jandos and George Athans, of Anchorage, have driven a 50 ft. tunnel into their coal property a mile northwest of the crossing of the Little Susitna River, exposing a vein of coal 6 ft. thick.

John Lofstrom and Eser Wikholm, of Anchorage, are also proceeding with the development of their coal property near the Jandos and Athans mine and have shipped 20 tons of coal to the Anchorage market so far.

Foreign News

Paris, France—France mined 28,960,000 tons of coal in 1917, or 7,000,000 more than in 1915, an increase of 25 per cent. on 1916 and 45 per cent. on 1915. For the year imports declined to 18,470,000 tons, or 1,500,000 tons less than 1915.

Montreal, Can.—The International Coal and Coke Co., the mines of which are near Coleman, Alta., reports a profit of $84,565 for 1917, as against $48,250 for 1916. The balance at credit of profit and loss account is $86,583. This is regarded as a satisfactory showing in view of prolonged labor troubles.

Halifax, N. S.—A verdict has been rendered by the coroner's jury on the explosion at the Allan mine, Stellarton, N. S. The jury finds that the explosion occurred on the 1200-ft. level in one or two places. They recommend that a commission of mining experts be appointed to make a careful inquiry into the working of the Pictou County coal mines.

Sydney, N. S.—An agreement has been reached between the Dominion Coal Co. and the miners in its employ on the wage basis decided on at a conference some weeks ago in which Hon. T. W. Crothers, Minister of Labor, and Senator Robertson took part. The increase of wages granted will average about 17 per cent. and will increase the expenses of the company by nearly $1,000,000 per year. About 5000 men are affected.

Personals

Thomas L. Healy, of McRoberts, Ky., has accepted the position of superintendent of mines Nos. 1, 2 and 3 for the Main Island Creek Coal Co., at Omar, W. Va. Mr. Healy will be located at Micco.

J. Noble Snider has been appointed acting coal traffic manager of the New York Central R. R., in the absence of G. N. Snider, who has been assigned to the staff of the Fuel Administration at Washington.

W. P. Beveridge, of Beryl, W. Va., has resigned his position as mine superintendent of the Lower Potomac plant of the Davis Coal and Coke Co., to accept a similar position with a large operating company in Virginia.

Harry B. Christ, of Hazleton, Penn., chief engineer for the Dodson Coal Co. at the Beaver Brook mines, has resigned to become affiliated with the Lehigh Coal and Navigation Co. He will have headquarters at Lansford.

Merle I. Terwilliver, formerly of the mining engineer's department of the Lehigh Valley Coal Co. at Wilkes-Barre, has been appointed to the post of division engineer for the Mahanoy division of the company. He fills the post made vacant by the resignation of F. Nervain.

W. M. Chase has been appointed general superintendent of the Union Coal and Coke Co., Pittsburgh, Penn., to succeed Harry J. Meehan, now managing partner with Cosgrove & Co., Johnstown, Penn. Mr. Chase has been identified with the coal industry in central and western Pennsylvania during the past 20 years.

Garner Fletcher, who for several years has been manager of the Van Lear operations of the Consolidated Coal Co., has been promoted to the management of the company's larger operations at Jenkins, Ky. **E. R. Price,** who for several years was chief clerk at Van Lear, has been made manager at that point.

J. C. Messenger, of Beryl, W. Va., has been appointed mine superintendent of the Lower Potomac plant of the Davis Coal and Coke Co., to take the place of W. P. Beveridge, resigned, as mentioned elsewhere in these columns. Mr. Messenger is known as a progressive and efficient man, and one who is in every way qualified for his new position.

Paul T. Norton, Jr., former division engineer of the Somerset division of the United Coal Corporation, located at Boswell, Penn., who for the past three months has been in the Signal Department of the Government at Washington, D. C., has been transferred to the Officers' Aviation Training Camp at Fort Sill, Okla. Mr. Norton's home is in Columbus, Ohio.

R. Z. Virgin, who was recently mentioned in these columns as having accepted a chair in the College of Engineering of the West Virginia University, Morgantown, W. Va., was appointed instructor in Mining Extension, with headquarters at Elkins, W. Va. The head of the Department of Mining of the University is **A. C. Callen,** who on Nov. 1, 1917, succeeded Professor Zern.

Joseph Sinnotte, who for a number of years was mine foreman for the North East Coal Co., at Thealka, Ky., and later with the Consolidated Coal Co., at Van Lear, Ky., has been named as general manager of the Big Hollow Coal Co., of Pike County, with headquarters at Pikeville. Mr. Sinnotte has been prominent in the Sandy Valley operations for a number of years.

Obituary

J. D. Gibson, 74 years of age, a prominent coal operator of Kentucky, recently died at his home in Pineville. The funeral services were conducted by the Odd Fellows. Mr. Gibson is survived by two sons and two daughters.

John Woolcock, of Pottsville, Penn., a coal operator in the Schuylkill region, died on Mar. 2, aged 73 years. He was born in Ireland, but came to this country at an early age and engaged in coal mining on an extensive scale. After succeeding in the mining of anthracite he developed successfully soft-coal operations in West Virginia.

William Osborn, manager and part owner of the Osborn Machine Co., Dubois, Penn., manufacturers of overwind devices, soot cleaners and mine equipment, died at Dubois, Mar. 1, of pernicious anaemia, after a sickness lasting four years. He was born at Falls Creek, Sept. 15, 1855, and opened up his foundry and machine shops in 1900.

Thomas Sprague, one of the most prominent men of the Pennsylvania anthracite region, died suddenly at his winter home in Altamonte Springs, Fla., on Mar. 1, from heart failure. Mr. Sprague came from New England to Scranton in 1886 to develop the Mt. Pleasant and Sterrick Creek coal companies. When these operations were sold in 1900 Mr. Sprague formed a partnership with Walter L. Henwood in the diamond drill business. He was 73 years of age and is survived by his widow.

Industrial News

Wheeling, W. Va.—The Richland Coal Co. has purchased the towboat "D. A. Nisbet," of Evansville, Ind., and will ship by river. A costly tipple is now being built on the river near here.

Philadelphia, Penn.—The Philadelphia & Reading Coal and Iron Co. is installing a fleet of motor ambulances at all its collieries throughout the Mount Carmel region. The first of the ambulances has already arrived at the Locust Gap colliery. There will be 31 ambulances in the fleet.

Columbus, Ohio—With a view of securing adequate coal supply for next winter, the Columbus Railway, Power and Light Co. has purchased a mine in West Virginia, a stripping plant in the Hocking thin-vein district, several slack piles in the Hocking Valley, and is negotiating for a Hocking mine.

Columbus, Ohio—J. B. Dugan, chief inspector of the Ohio Utilities Commission, and other state officials are urging that general track connections be made between the Hocking Valley, Detroit, Toledo & Ironton and the Baltimore & Ohio in the Jackson field, with a view to securing three roads to serve every mine in that field.

Princeton, W. Va.—The Battleship Coal Co., recently incorporated with a capital of $150,000, is planning for the immediate development of 500 acres of coal lands to have a capacity of approximately 1200 tons daily. It is said that the company is considering the installation of a new 2300-volt central power plant and the construction of fifty miners' residences.

Charleston, W. Va.—The Consumers Smokeless Coal Co. has been issued a charter by the Secretary of State to develop 45,000 acres of coal lands on Gauley River, Fayette County. The company has an authorized capital stock of $1,400,000. Its headquarters will be in Charleston. Among those interested are former Attorney General Abraham A. Lilly and S. A. Moore, of Charleston. The company expects to break ground within the next 90 days.

Pittsburgh, Penn.—The Pittsburgh Coal Co.'s gross receipts last year amounted to $50,025,017, an increase of $20,649,219 over the preceding year. Of this expenses and taxes absorbed $31,555,468, according to the income account issued recently, and the net income after interest and depreciation charges had been met, was $14,076,853, a gain of $10,932,927. This was far and away the best profit the company ever had, the balance for dividends being equal to $20.66 a share of stock outstanding.

Huntington, W. Va.—At a meeting of representatives of Ohio River cities held here on Mar. 1, plans were perfected for the organization of a $300,000 corporation to build and operate a line of boats between Huntington and Cincinnati. The company will be known as the National Steamboat Co., and stock has been allotted to each city in proportion to its size and wealth. Four towboats, three passenger steamers and fifteen covered wooden barges will constitute the company's initial fleet.

Charleston, W. Va.—The State Council of Defense has appropriated $4000 to be used along with $20,000 donated by coal companies of the state for the purpose of having moving pictures made of the coal industry of West Virginia. The object is to have these pictures shown in various sections of the United States and foreign countries to show the conditions under which the coal is mined; the plants where the coal is handled; how it is transported by the railroads and what kind of homes and business houses are found in the mining communities, with the purpose of advertising the state's chief industry to the world.

Louisville, Ky.—According to reports from the eastern Kentucky field, in the Elkhorn district, the Louisville & Eastern and Louisville & Nashville lines will build at least six branches into as many new coal fields to be developed this summer. In several cases it is reported railroad building and development work has already started. One of the most important branch lines will be a six-mile section up Rockhouse Creek to Caudill's Branch, which will tap the operations of some six or seven new coal-operating concerns, including the Middle West Coal Co.'s mine. Adams & Sullivan, general construction engineers of Louisville, are building this branch.

Cleveland, Ohio—The Short Creek Coal Co., which has holdings of 7000 acres of coal lands in No. 8 fields, has been reorganized with the following officers: C. F. Branson, president; E. B. Thomas, vice president; R. Cunningham, treasurer; E. W. Long, secretary. The new directors are E. G. Tillotson, H. C. Robison, W. H. McFarland. The company now operates its Short Creek coal mine on the main line of the Wabash & Lake Erie and is planning for extensive developments of its land, on which the company has completed 7 miles of its own railroad. The Short Creek Coal Co.'s new mine, which is equipped to handle 4000 tons a day, will begin operations within the next 30 days.

New York, N. Y.—The Worthington Pump and Machinery Corporation, 115 Broadway, announces that the following appointments have been made, effective as of Mar. 1, 1918: James E. Sague, vice president, in charge of engineering and manufacturing; Leon P. Feustman, vice president, in charge of general commercial affairs, including contracts, prices, purchases, traffic, etc.; Frank H. Jones, vice president, in charge of sales; Edward T. Fishwick, general sales manager; Charles E. Wilson, assistant general sales manager; William Goodman, assistant to vice president; William Schwanhausser, chief engineer. The offices of the foregoing will be at 115 Broadway, New York. Neil C. Lamont has been appointed works manager, Laidlaw Works, with office at the works, Elmwood Place, Cincinnati, Ohio.

MARKET DEPARTMENT

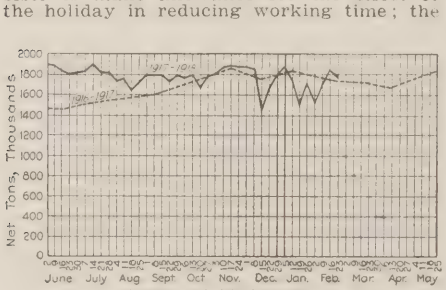
Weekly Review

General Easing Up of the Coal Situation—Car Supply Still Hampers Production—Anthracite Not So Scarce as Bituminous—Little Contracting for Next Year's Requirements

PREVAILING good weather has brought about a general easing up of the coal situation. The worst of the domestic distress is now over, and there is practically no suffering. New England, however, is still facing the problem of procuring an adequate coal supply—a problem that will not be solved till more ships are pressed into service. The shipping now available totals about 216,000 tons, as against the 351,000 tons considered necessary to meet the normal needs of this territory.

Though showing progressive improvement from week to week, the supply of cars to the mines is still not what it should be, and operators are unable to produce at maximum capacity. The bituminous mines in the central Pennsylvania district are the greatest sufferers from this lack of cars, the miners in that region working only part time. The loaded coal cars that figured in the recent rail congestion are now being returned from tidewater, and the near future should show a decided increase in the number of empties sent to the mines.

Deliveries of anthracite by rail continue to pick up, though river shipments are little better than the February average, and receipts at tidewater are about normal. There is an active demand for steam sizes, with no free coal to be had from the large operators. The Western markets are insistent in their plea for every pound of hard coal, as the Government has intimated that after Apr. 1 these markets will be asked to use bituminous coal from nearby regions.



Owing principally to the shortage of cars, the supply of bituminous coal continues to be unequal to the demand. True, there is a slight increase in production over previous weeks, but every ton is being quickly swallowed by a hungry market. Dealers are unable to accumulate reserve stocks as in former years, and it is hard to say when the shortage in soft coal will be overcome. Not until the mines get more cars will the situation change.

Much speculation exists regarding the many plans for zoning and distribution. The Government's new price schedule is also awaited anxiously by the operators; and as for the dealers, they are marking time and wondering what will be in store for them after Apr. 1, the Government having shown that it is actually in control of both the wholesale and retail branches of the business.

There is practically no contracting for the new year, which begins Apr. 1. Consumers, of course, are eager to provide for their next winter's requirements, but Government regulations are against contracts unless the operators are willing to sign up at the present Federal prices. Furthermore, another hindrance to the making of contracts is the fact that they are subject to cancellation if the authorities desire to confiscate the coal for Government purposes.

COAL PRODUCTION

A decrease of 510,000 tons as compared with the preceding week marked the total bituminous output during the week ended Feb. 23. While this decline in gross output amounted to 4.6 per cent. it is difficult to interpret the rate of production per working day because of the unequal observance of Friday, Feb. 22, as a holiday. In plotting the curve of average production per working day, Washington's Birthday has been counted as a full working day. Next week, when reports will have been received from individual operators, it will be possible to make allowance for the effect of the holiday in reducing working time; the

decline in production from the week of the 16th to that of the 23rd from them appear less marked. The total production of beehive coke is estimated at 568,000 net tons, an average of 95,000 tons per working day. Shipments of anthracite amounted to 36,612 cars, a decrease of 9.9 per cent. as compared with the preceding week. Contrary to the custom of the anthracite districts, an effort was made to operate the mines on Washington's Birthday, but the number of men reporting for work was small.

Continued mild weather has effected a material improvement in operating conditions in the beehive-coke industry. Sixty-seven of the principal operators in the Connellsville and adjacent districts of Pennsylvania reported a production of 253,855 net tons during the week of Feb. 23. The ratio of tonnage produced to capacity as rated by the railroads was 58.1 per cent., as compared with 53.2 per cent. during the preceding week. Indeed, the week's performance was the best since the week of Jan. 12. The same operators shipped 149,900 tons of coal.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Feb. 2	Feb. 9	Feb. 16	Feb. 23
Bituminous shipments, 121 roads	170,552	181,586	199,984*	189,562†
Anthracite shipments, 9 roads	34,482	32,011	40,661*	36,612†
Beehive coke shipments, 4 roads	9,655	10,470	11,357*	11,657†

*Revised from last report. † Subject to revision.

Atlantic Seaboard

BOSTON

New England still faces problem of getting enough ships. Outlook continues discouraging. Little change in local restrictions. A steamer cargo intended for gas companies through Massachusetts had to be diverted for Boston local distribution. Much interest in "next season." Anthracite rail deliveries improve, but water shipments continue only a little better than the February average.

Bituminous—Present activities of those interested in getting coal for New England are centered upon more ships. If about 115,000 tons more can be allotted, and the coal can be produced for loading, it is estimated that the industries here can be kept running and have enough for emergency needs in communities where the supply of anthracite fails. Aside from the importance of their output, in which the Government is vitally interested, there is a pronounced feeling that any enforced idleness in large mill centers like Lowell, Lawrence and Fall River would result in grave complications. While no manufacturer is being given more than a week's supply from the emergency receipts at the disposal of the fuel authorities, it is believed there will be no shutdowns for the present, unless calculations are upset.

Receipts have not appreciably increased during the past fortnight and most of the hopefulness one hears about is directly due to the less severe weather. Meanwhile, the plants and railroads where stocks were "ample" Jan. 1 are fast getting to the end of their tether. The number of distress cases will increase rather than otherwise as we near Apr. 1.

Large plants like the Bath Iron Works are working on very narrow margins and several of the pulp mills essential for newsprint paper are down to a fortnight's supply. The whole State of Maine, industrially, is in a very serious situation for lack of fuel. The Great Northern Paper Co., for instance, using 185,000 tons annually, is so far in the pulp wood country that it takes coal a long time to get there after ships are unloaded. To add to the complications, rehandling facilities at Portland are congested with other traffic, sulphur for paper mills and supplies for the Allies, and with quick discharge so vital an element in the supply of ships, it is feared that several cargoes relied upon for Maine points will not be delivered there.

The New York, New Haven & Hartford is now among the railroads showing anxiety over fuel supply. The Maine Central has more on hand than at any time since Jan. 1, due to ships being diverted from other consignments, but the Boston & Maine, the Central Vermont and the Boston & Albany are all dependent upon receipts almost from day to day. In order to give the Central Vermont an emergency supply the coal will have to be hauled over New Haven tracks from Providence to New

London because the ship available is too deep to berth at New London.

The matter of ships is being constantly kept before the Washington authorities, but other than two or three more "army boats" secured through the allied shipping control body at the request of the Quartermaster-General's department there are no important developments.

The Hampton Roads situation shows steady improvement. Over Saturday and Sunday, Feb. 23 and 24, 1305 cars were dumped. All of this was by no means for New England, but it shows that New England can rely upon better dispatch for the present, although there are signs of slackening again in the movement from the mines to tide.

All-rail deliveries have not increased in the same proportion, although reports are daily more encouraging. An effort is being made by the railroads to have an increasing tonnage flow to New York loading piers to be forwarded by boat to Bridgeport, New London, Providence, and even Boston, for distribution to inland points ordinarily reached all-rail. J. J. Storrow, New England Fuel Administrator, approves of this plan and looks to see it increase the volume of coal for New England. The supply of box barges is sufficient, it is said, and of course one of the great hindrances to shipment all-rail into New England is the long haul to which cars are subjected, with no return load.

The Boston retail situation is still acute. A steamer cargo with high volatile that had already been parceled out on paper to gas companies was diverted to a Boston retail wharf for distribution, largely to domestic users. There are a number of Boston retail dealers with only a few tons of bituminous on hand and no anthracite. Fuel cards are now a regular institution.

The trade is much concerned over contracts and prices for "next season." Everything seems to hang on decisions of the fuel administration, although doubtless there will be a great many cases where buyers will place themselves in the hands of their usual contractors, leaving details to be worked out as the season develops. No contracts are heard all-rail, although on water business that can be handled over wharves owned by interests that also control coastwise tonnage there is still some quiet canvassing.

Anthracite—The movement of domestic sizes by water both from New York and Philadelphia is only slightly better than the February average, even though there seems to be a general impression that conditions are a lot improved. Loading has made a better showing the past fortnight, although in ordinary times it would be considered very poor. The outlook seems still unsettled, although a meeting of the operators' committee this week is expected to forecast some line of policy that will be followed by the companies during the year beginning Apr. 1. The trade here is entirely at sea over what is to happen, except that coal will certainly be hard to get in sufficient quantities.

NEW YORK

Entire coal situation is improved. Demand has lessened, but supplies are low. Dealers are optimistic and expect that the rush is over. Retail interests take hand in anthracite steam-coal situation. Investigation may result in closing up of private power plants. Dealers in bunker coals warned.

Anthracite—Conditions are far from normal, but the coal situation in this market is much easier as regards the domestic sizes, due in most part to the temperature and improvement in transportation facilities. Everywhere one hears of a freer movement of coal and there is not that insistent demand that predominated the market for several weeks past. However, wholesale dealers and shippers complain of the lack of supplies at the loading docks. This they account for in part by the heavy deliveries made to retail dealers, which in itself keeps the stocks on hand down to the minimum.

So far as the retail interests are concerned they are optimistic of the future. Most of them have small tonnages in their yards, and with the demand remaining as it is now they expect soon to have full bins. The demand upon them has lessened owing to the weather conditions, which as usual regulates the New York market probably more than any other coal market in the country. With warm days consumption dwindles and the dealers soon begin to feel the effects.

The trade is anxiously awaiting information concerning the plan formulated for distributing anthracite this spring and summer. While it was originally intended, according to an announcement, that the East should be taken care of first, it is understood that other sections of the country, particularly the West and Northwest, have put in their claims before the Fuel Administration officials and the special committee of anthracite operators selected to arrange the plan.

The matter of dirty coal continues to command the attention of national and state fuel administrators. It is understood that inspectors attached to their offices have received explicit instructions regarding poor preparation and that shipments not coming within requirements will be rejected. Reports from the anthracite regions are that since the fuel administrators have begun an investigation of the preparation of coal the shipments have been of a much higher quality.

Regulation of the anthracite steam-coal prices is likely to be urged upon the Fuel Administration by the retail interests here. Much complaint has been heard of the conditions surrounding this phase of the market and there are murmurings that some individual operators are asking for their product higher prices than the companies and other individual operators are quoting. There continues to be shortage of these coals, and as about everything coming here is already under contract the buyer looking for free coal finds it difficult to pick up a cargo.

No advices have been received so far with regard to the usual spring reduction of 50c. It is safe to say, however, that whether or not there will be a discount consumers will place their orders early.

The inquiry into the coal situation being conducted by the Board of Aldermen has developed testimony to the effect that the cellar peddler system ought to be controlled, if not entirely abandoned, and that a central plant where the poor could go and get their fuel would be better. The control of the peddler and cellar dealer was urged before the committee conducting the investigation by County Fuel Administrator Reeve Schley and by Harry T. Peters, who is chairman of the State Fuel Conservation Committee. It was also suggested that a good plan would be the establishment of a central heating plant for the distribution of heat and electricity.

There was a hearing before the Public Service Commission on Monday of this week with a view to looking into the advisability of closing down all private electric plants, thereby conserving the fuel supply. There was considerable opposition to the promulgation of the proposed order.

There were shipped for export from the Port of New York during January of this year 490 tons of anthracite as compared with 7934 tons exported in January of last year.

Current quotations, per gross tons, f.o.b. Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buckwheat	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—The situation is somewhat easier, but there is practically no free coal to be picked up in the New York harbor. Jobbers continue to anxiously await the official word from Washington which they believe will put them out of business. While it has been stated from what appears to be authoritative sources that Dr. Garfield intends to sign the order, there were rumors early this week that the final order would not be promulgated at this time. However, there was a much stronger belief that the order will be put into force on Apr. 1 as originally announced, notwithstanding the many protests.

The attention of the members of the Wholesale Coal Trade Association of this city has been directed to the complaints made of inferior coal furnished for bunkering purposes, both in New York and Philadelphia, and urging upon them the imperative necessity of furnishing only the best qualities of coal. It is recommended that coal be supplied only from the following pools: South Amboy, No. 9 and No. 10; Port Reading, No. 9, No. 10, No. 22 and No. 23; St. George, No. 22 and No. 23; Port Liberty, No. 9 and No. 23.

Operators in the Central Pennsylvania fields whose coal is wanted by the United States Shipping Board for bunker and export, and those whose coal is subject to priority orders, are receiving a better supply of cars than others. There is said to be practically no distribution of coal for commercial purposes, the car supply for that purpose averaging between 10 and 15 per cent. Conditions along the Baltimore & Ohio are about the same, but along the New York Central car supply is much better.

It is likely that there will be little done toward closing contracts for the new coal year beginning Apr. 1. Consumers are anxious to provide for their requirements for the next year, but Government regulations are against contracts unless the operators are willing to sign up at the Government prices; and then the stipulations are subject to cancellation if the authorities desire to confiscate the coal for Government purposes.

The bunkering situation shows much improvement. There are comparatively few ships in the harbor and none of these is being detained because of the failure to secure coal. There is no spot coal here and contract coal is not moving freely, although most contract holders are obtaining enough to keep their plants in operation.

PHILADELPHIA

Anthracite retailers catch up with orders. Commission rules against stocking now, but modifies later. Shipments near normal. Hope 50% discount will be passed. New card delivery system. Coal inspections grow more drastic. Bituminous shows slight improvement. Situation still serious, with car supply the factor. Brokerage discussion continues.

Anthracite—Dealers are marking time and wondering what is in store for them after Apr. 1. They have been forced to realize that the retail as well as the wholesale branch of the business is now practically under Governmental control. This was again impressed upon them when the Chairman of the Federal Fuel Administration for Philadelphia on Feb. 27 issued a circular letter to all local dealers instructing them not to attempt to stock cellars, but to deliver coal for immediate use only.

In the same letter they were reminded that the whole system of coal distribution for the year beginning Apr. 1, 1918, will be regulated by the Government prior to that date and that the local fuel administration will not recognize or allow delivery of orders accepted prior to that date. This letter proved most disconcerting to the trade and immediately there was a storm of protest. After several representative dealers had carefully explained all the facts to Mr. Lewis they were given permission to use their own judgment and to commence delivering gradually, but were advised not to complete any large orders.

Receipts from shipping companies have assumed almost a normal aspect and are running from 12,000 to 14,000 tons of domestic sizes daily. Egg coal continues to accumulate to a limited extent in dealers' yards and stove displays just the least tendency to drag. The real demand, as is usual at this time of the year, is for chestnut and pea. With this falling off in demand for certain sizes has come a certain uneasiness among the individual shippers as to whether they can still maintain their prices at 75c. above the company shippers right up to the end of the month, when new prices are expected to be announced. Usually at this time the independents are compelled to quietly shade prices to move their entire output. The dealers are placed in a peculiar position, for they are anxious to buy their coal as cheaply as possible and naturally would cancel their high-priced orders, but when they consider that next winter they will need all the coal they possibly can get regardless of price, they hesitate to cut off any independent shipments.

Every one remains hopeful that the usual 50c. reduction will not be put into effect this year. The local fuel administration has been quoted as being opposed also to the 75c. differential allowed the smaller operators, but it is a noticeable fact that as a whole the retail dealers oppose any concerted action on their part as objecting to it. At a recent meeting of the dealers it was apparent that none was keen to request the authorities to equalize the prices.

Despite the greatly augmented shipments recently, numerous retailers who have been interviewed are practically unanimous in their determination to procure all the coal they can this month regardless of price. The possibility of a 50c. reduction will not deter them from buying all the coal they can store. At present quite a number of the smaller yards are carrying full stocks of certain sizes and requests to suspend shipments are growing more common. Of course, this will quickly cease when spring deliveries commence. These cancellations are not bothering the larger shippers for

outside markets continue extremely anxious for every pound of coal, especially Western points, which have been threatened by the Government with curtailment after Apr. 1, with the understanding that they must use bituminous coal from nearby regions.

At the suggestion of the local fuel administration a new system covering the retail deliveries of coal is to become operative with the first of next month. It is to be based upon information to be developed by a card questionnaire radically different from the one now in use. Complete data concerning household coal consumption will thus be obtained. The Coal Exchange, the local retail organization, will be delegated to keep the new cards and assume the responsibility for operating the bureau. In order to meet the expenses of the bureau a tax of 2c. a ton will be levied against the retail dealer on every ton delivered. The card will contain blanks to be filled with all details as to tonnage and sizes formerly used; whether hot-air, hot-water or steam-heating system is used. Every time coal is delivered the dealer will be required to make a report and each delivery will be tabulated. In this way a check will be had on every consumer; and it is hoped hoarding will be prevented and a stop put to the practice of "shopping" from dealer to dealer and leaving an order with all. It is also planned to make a survey of the city's industrial plants to determine how many are using domestic sizes and to what extent steam sizes or soft coal may be substituted. A great saving of family coal is expected from this investigation.

The dealers are greatly encouraged with the prospect of receiving more of Philadelphia's most popular size—pea coal—during the coming year. It has been learned that shippers who have contracts on this size expiring Mar. 31 will not renew them, but will reserve the coal for domestic use. The contracts were all with industrial plants and the fuel administration will not consent to their renewal.

Coal inspection by the Fuel Administration representatives continues. Dealers who delivered coal of inferior preparation to homes are being compelled to refund money or send an extra supply to their customers, gratis. This was done in seventeen cases in one day at the direction of the State Fuel Administration. Following this the dealers are refusing to receive poorly prepared coal from the shippers, and one dealer reported that because he had done this further shipments had been cut off. The fuel officials warned the shippers that this was a violation of the law and made themselves liable to prosecution under the Lever Act. In order to offset this phase as much as possible the State Administration has increased the number of inspectors at the breakers in the region.

Late in the week it was learned that in distributing coal to the trade during the coming year the tonnage shipped to the various dealers from April, 1916, to March, 1917, will be made the basis on which all calculations will be made for the coming fuel year.

Steam sizes continue in very active demand, with no free coal to be had from the large operators, and with the individuals making sales of the few cars of this kind they may have at the prices that have practically prevailed all winter, with $4.15 being the highest price asked for buckwheat and very little to be had at this figure.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—The supply continues unequal to the demand. It cannot be overlooked, of course, that weather conditions have been a wonderful help, but whatever increased production there has been has been quickly absorbed by a market long since bare. Yet while it is intimated that there has been a slight increase in production this output is far from what could be accomplished if the car supply were adequate. The greatest shortage continues to be in the Central Pennsylvania district, although there has been a considerable improvement over a month ago. From the Fairmont district and other southern fields entering this market the report of car supply is somewhat better, but far below what it should be. Taken in all its aspects the soft-coal situation continues to be extremely serious.

There seems now to be no particular objection to the new Government price, except only when it is considered in question with the brokerage problem. As is well known, practically all companies mining coal and who at the same time operate a sales department had quite a little tonnage for the brokers, which tonnage they were willing to continue, even though they could have marketed it all direct under present conditions. The brokers are making a hard fight and the outcome of their efforts is awaited with much interest.

There continues to be two prices for coal in this market, as so far there has been no change in the prices of coal from the southern fields. Some authorities consulted feel that a smaller allowance than the 60c. granted in Central Pennsylvania may be allowed there, but others, basing their opinion on the fact of less difficult mining conditions, believe that there will be no change in the immediate future.

BALTIMORE

The coal trade wonders how consumers are to take advice to lay in coal. Warmer weather aids movement, but many bins are entirely empty.

Bituminous—The milder weather has caused a let-up in the rush of domestic consumers for bituminous coal to take the place of anthracite. Many who tried soft coal in stoves and grates that were unsuited for burning that product have had more or less woeful experiences with soot-ridden homes and injured stoves, and are back to a "hard coal or nothing" basis in their demands. This lightened domestic demand and the fact that public service corporations and city emergency departments have been a little better supplied this week, has led to some diversion of bituminous to those industries hardest hit by fuel shortage. A number of firms, however, are still traveling on the narrow edge of supply and some are claiming that they are not able to get out full production because of lack of coal.

Anthracite—Supplies to arrive here are still vastly short of needs. The trade is wondering how the public is to take the advice of the Government and purchase coal for next winter. There is not a chance to get enough coal for even immediate needs, much less for storing. There may be relief under a new Government distribution plan after Apr. 1, but there is not a coal man here but would venture the prediction that next winter will be entered with consumers vastly short of needs.

Lake Markets

PITTSBURGH

Broader market. Jobbers are making sales. Supplies good in Youngstown district and fair in immediate Pittsburgh district. Uncertainty regarding new prices.

The most trustworthy evidence of the greatly improved relation between supply and requirements now obtained is found in the fact that some coal jobbers are now transacting a very fair amount of business. In the great majority of cases they are operating under a brokerage paid by the consumer, the producer receiving the full fixed maximum price; but in an occasional instance a brokerage is now being paid by producers, out of the set price.

The steel mills in the Youngstown district are now well supplied with coal, except that an interest here and there might be disposed to purchase a limited tonnage of high-grade gas coal. The immediate Pittsburgh district is fairly well supplied, but this condition is due chiefly to the resumption of river coal movement since the ice ran out. Rail deliveries to Pittsburgh are only moderately improved.

The trade has been unable to form any definite opinion as to what sort of price revision will occur Apr. 1 pursuant to the recent announcement of the Fuel Administration that there would be a revision by that date. The specific statement was that the allowance of a brokerage to be paid by the buyer, over and above the set price, would be discontinued, the brokerage in future to be paid by the producer, out of the set price, and that there would be an increase in the set price to cover selling expense. That would mean raising the present set price of $2.45 for mine-run in the Pittsburgh district by all or part of the 15c. brokerage now allowed.

Nothing definite and practical has thus far been announced as to putting in operation the proposed general zoning system for distributing coal. There is a regular trading market, although rather a narrow one, now in existence, and of course at the set prices: Slack, $2.20; mine-run, $2.45; screened, $2.70; per net ton at mine, Pittsburgh district, with 15c. extra permitted to be charged in the case of sales made by brokers.

BUFFALO

Situation still perplexing. Coal more plentiful, but not well distributed. Anthracite demand not so keen, on account of the mild weather.

Bituminous—No change for the better is to be seen, for the mines still refuse to sell at the Government price if they can avoid it. The operators and the jobbers have a way of establishing offices in Canada and shipping a big percentage of their coal there, where the price is higher. This cuts down the amount to be had in the border towns, like Buffalo, and makes it hard to get coal enough to use. Everybody is dissatisfied; and the complaint against the regulations or practices without much regulation, is as great as it ever was.

Coal is still standing in quantity at railroad junction points and the rules have cut out the wagon production to a great extent and increased nothing, so that the situation can hardly be called promising. Mild weather and nothing else has averted a big disaster, as the local trade looks at it.

It is not easy to quote prices, especially as the bulk of the coal still goes on contract figures, but thick-vein Pittsburgh coal still is quotable on the basis of $4.25 on cars here for lump and thin vein at $4.45½, Pittsburgh rail rate, for mine-run. So little attention is paid to these prices that jobbers hardly know how to quote them.

Anthracite—The situation does not change much, but the warm weather has so reduced the demand that the mines have been able to get along by cutting down the amount shipped this way. The local fuel authorities are now finding that most of the coal can be trusted to the retailers for distribution, though the disposition to hoard is still common. But for that there would not have been much shortage. There has been little or no suffering here in that line.

The lake trade, and especially the fixing of next season's terms and prices, is a source of much discussion in the anthracite trade now, but it is all uncertainty. There is a surplus of bituminous on the upper lake docks and the anthracite supply is supposed to be good there also, but the coal is all in the hands of consumers and the amount is not easy to determine. Nothing will be loaded for the lakes right away. The local consumers would complain of such tying up of fuel.

DETROIT

Transportation conditions improve with continuance of favorable weather. Fuel administration restrictions are partially relaxed.

Bituminous—Moderate temperatures continuing through the week have contributed materially in placing the transportation situation on a better basis, facilitating the clearing away of freight in congested districts along the coal carrying roads south and southeast of Toledo and releasing shipments of coal that have been delayed long in transit. This has the effect of increasing temporarily the quantity of coal coming into Detroit. Jobbers and wholesalers, however, are directing attention to the probable diminution of supply, within a week or 10 days, which is likely to result from shortening of car supply at the mines, while cars now being unloaded or awaiting unloading are being taken back for loading.

The present supply in the Detroit market, though of more satisfactory volume than for many weeks past, merely makes provision for day-to-day requirements of steam plants. Little or no opportunity has been afforded yet for stocking up and free coal on tracks is still conspicuously absent.

Weather conditions, besides effecting an improvement in transportation and supply, have brought relief from the pressing demands of domestic consumers, thus increasing the proportion of coal available for industrial consumption. The improvement in the general situation has been so marked that the Michigan fuel administration has revoked the nine-hour limit on business establishments and most of the drastic restrictions designed to save coal.

Anthracite—There has been a slight improvement in quantity of anthracite coming into Detroit. The supply still falls short of normal requirements. Warning has been issued to retail dealers by the Michigan fuel administration to guard against selling to individual consumers a larger amount of anthracite than is necessary for reasonable requirements to Apr. 1. The fact that the Federal Fuel Administration on the same date issued a recommendation that coal users at once make provision for future needs is an interesting coincidence.

COLUMBUS

Better supply of coal arriving in the local market and the stringency is now passed. Steam business is attracting considerable attention.

The coal trade in Ohio has been rather active during the past week, both in domestic and steam lines.

Pocahontas coal is exceedingly scarce and only a small amount of West Virginia splints are coming into the local market. The trade is depending largely on Hocking, both thin and thick vein, and on Pomeroy grades. Some Jackson is arriving, but it is not being used as extensively as formerly.

The steam business is active to the extreme. Manufacturing plants which were compelled to suspend operations for some time owing to lack of fuel are now being operated. Schools and public institutions are fully supplied. Some steam users have been able to lay in surplus stocks to act as insurance. Public utilities are especially active in stocking-up as they do not want to be caught short-handed again.

Lake trade is being considered both by shippers and dockmen. Few lake contracts have been made as yet, but all producers have received many inquiries. The disposition appears to be to let the matter of price rest with the Government. Vessel men are casting around for all available tonnage, as indications point to a rather active lake season, right from the start.

Production in Ohio fields has again shown an increase over previous weeks. This is especially true of the Hocking Valley, where the car supply has been excellent. Pomeroy Bend is credited with about 80 per cent. production while Massillon and Crooksville had about 75 per cent. In eastern Ohio the car supply is still lax and the output is estimated at 65 to 70 per cent. of normal.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.70	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

The situation continues to improve, aided by mild weather and a better car supply. Some coal has also arrived by river. Contract inquiry is already in evidence.

With a continuation of comparatively mild weather, and a much better car supply reported from most districts serving this section, the coal situation is rapidly improving, although as long as severe weather is a possibility coal men and the fuel authorities emphasize the fact that there might be a renewal of the recent shortage. Dealers are accumulating stocks, however, warned by the situation in which they were placed during the winter months, and will probably not again be found unable to supply their trade. Industrial consumers are again receiving coal more or less regularly on their contracts; and, on the whole, the situation is more nearly normal than it has been for several months. There is every reason to believe that there will be no cessation in the active demand for fuel, however, as the public and all classes of consumers had a drastic lesson during the winter, and buying for spring and summer delivery, for next winter's use, is certain to be on an unprecedented scale, especially as the authorities at Washington are now urging that consumers buy during the summer, instead of asking them to hold off as was the case last summer and fall. Jobbers remain somewhat disturbed over the intimation that Washington may cut off their profits, but it is believed that some adjustment of this threatened difficulty will be made.

LOUISVILLE

Prevailing good weather throughout the district has resulted in much lighter consumption. Dealers are carrying fair stocks, and are able to supply all demands. Western Kentucky production good. Eastern Kentucky showing improvement. Traffic conditions generally better and car supply larger.

Due to a better car supply, the eastern Kentucky mines in some localities have been able to operate three to four days a week, whereas two to three days has been the average for the greater part of the winter. A number of coal developments are being started, and indications are that many new companies will shortly start operation.

In the western Kentucky district the labor and car supply situation has shown considerable improvement, and a fair tonnage is moving from that district. While several developments are under consideration there is no great amount of development activity in progress in the western section at the present time, it appearing as if most of the coal-land development in the state is now in the eastern section—in Perry and Letcher Counties—or in the Elkhorn district.

Retail dealers of Louisville are now enabled to make prompt deliveries on all grades of Kentucky coal, and are delivering orders placed before noon on the same day, if requested. Labor to unload and store coal is being obtained in fair quantities. The general domestic demand is fair for this season of the year, but as usual is for small quantities of from one-half to two tons for the most part.

Captain Shaw, of the Pittsburgh Coal Co., Louisville office, reports that there is practically no movement of coal tows down the Ohio this season, due to the fact that there is no coal to be had from the Allegheny district for southern or western delivery, as such coal is going into the Pittsburgh and other districts. There is an excellent boating stage on the Ohio, and plenty of boats, barges and tugs, as well as other equipment, but there is no coal to move by river at this time. Generally there is a heavy movement in February and March on high water. There may be some movement during the latter part of the month, however.

BIRMINGHAM

Tension in domestic channels has entirely disappeared and one-ton restriction has been removed. Steam situation unchanged, demand continuing strong. Slight gain in production over last week. Transportation facilities reported good.

All possibility of any further acute shortage developing in the domestic market this season having been abated, the fuel board at its last session removed the one-ton limit of sales to householders and is urging that consumers provide themselves during the spring and summer months with reasonable tonnage to carry them through next winter. The latest inventory from yards shows that stocks are gradually increasing and receipts of lump coal are improving. The demand upon the mines is good, but not so insistent as heretofore.

There is no easing up in the inquiries for steam coal and every ton that can be mined is being judiciously distributed. There seems to be no relief in sight for the tension that exists in the steam market, it being impossible under existing conditions to bring the output of the mines up to capacity production; and the supply is inadequate to meet all demands.

Coke

CONNELLSVILLE

Some price advances in other districts. Improvement in car supply is slow. More promise. New system proposed for allotting cars promises better quality of coke.

The Fuel Administration has raised the set prices 75c. and $1 a ton in the case of certain West Virginia districts, above the general level of $6 for furnace and $7 for foundry, while selected foundry coke made with washed coal from the lower bench of coal of the Upper Freeport seam, in Indiana County, Pennsylvania, is set at $8.50 if the ash is under 10 per cent. and the sulphur under 9 per cent., the price being $8 if either of these analysis limits is exceeded.

Car supplies have been improving slowly indeed, and while there is a progressive increase in shipments from week to week the gain in coke shipments in the past three or four weeks has been at the rate of not much more than 5000 tons a week, the shipments still being about 75,000 tons a week under the estimated requirements of the blast furnaces tributary to the region.

Pittsburgh & Lake Erie cars have been in practically full supply, but as they are not permitted to go off the road the number of customers is limited and occasionally it is not easy to find buyers for all the coke thus loaded. Consumers on other lines are still short of coke. The blast furnaces have been running fairly well in the past two or three weeks, at 75 per cent. or more of capacity, but were able to reach this rate only by reason of the considerable amount of coke that has accumulated along the lines and was moved forward to destination when the weather broke.

The market is rather narrow, but there are some transactions. The set prices govern: Furnace, $6; foundry, 72-hour selected, $7; crushed, over 1-in., $7.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 23 at 264,849 tons, an increase of 24,077 tons, and shipments at 297,578 tons, an increase of 12,219 tons.

Buffalo—The demand for all sorts of by-product coke for fuel is as great as ever and it promises to continue. The effort to turn out this in quantity is stimulated to the limit, though the price does not appear to have been crowded up much by the situation. No complaint comes from the iron furnaces, though they do not appear to have any understanding as to what the prices will be when the contracts run out. Many coal consumers appear to be glad that they are allowed by contract to pay more than the regulation price, as they stand a better chance of getting the coal; and it may happen that the big coke consumers will find some way still of keeping close to the ovens, as they have done right along.

Middle Western

GENERAL REVIEW

Conditions greatly improved. Car supply better. Movement of both loaded and empty cars more regular and uniform.

The past week has seen a vast change for the better in the Middle Western section. Weather conditions did not disturb transportation to any noticeable degree. During the week 2 in. of snow fell in the northern districts, but throughout central and southern Illinois the weather has been mild, thereby permitting mines that had cars to load maximum tonnage. Conditions at the large terminals, which for three months have been congested with coal, are better and the movement of both loaded and empty cars is easier and more regular. The last three days of February showed that production had reached normal again. However, production for the month is far below the corresponding month in 1917.

No contracts are being closed for the coming season. Jobbers do not know where their next season's supply is to come from, and producers are not anxious to contract, preferring to allow matters to drift for a while until they clear up the orders they have on file. Then, too, the matter of zoning has delayed the making of connections for next year.

Dr. Garfield's order eliminating the jobber's commission, after Apr. 1, still arouses much debate. The 15c. per ton allowed jobbers under the present working arrangement gives them sufficient margin to continue business. They contend that if this 15c. is eliminated and the demand continues to be as urgent as it has been for several months, there is little likelihood that they will be able to make connections with producers that have a sales organization of their own. The jobber who now has connection with a mine that has no sales organization is considered fortunate.

CHICAGO

Chicago trade easy, although there is a market for any grade of coal offered. Weather conditions favorable.

The coal trade is breathing a sigh of relief because milder weather and the ability to get a sufficient tonnage of coal to care for orders. Although most of the coal coming to this market is bituminous from the East, all classes of users are more than satisfied to be able to get high-grade southern Illinois coal. The domestic trade has eased off considerably during the week just passed, but industries are ready and anxious to replenish their depleted stocks, many of which were confiscated during January and February for the relief of distress. The volume of coal reaching this market from the extreme southern part of Illinois was never greater than now. Williamson, Franklin and Saline Counties are large shippers to this market. Eastern bituminous coal is still in demand, although there is some improvement in movement. Still the demand far exceeds the supply, and the uncertainty of the tonnage that will be available from the East continues to have the effect of helping Indiana and Illinois coal into apartment houses that heretofore would not consider storing Western coal. The anthracite market is irregular. Some dealers are getting more, others less than last year, although there is an improvement in the movement from the mine.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La-Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Extra delivery charge because of winter conditions abolished. Wisconsin's urgency call for additional supplies of soft coal to receive favorable response.

A practical reduction of 75c. per ton on all coal was made on Mar. 1, when the local fuel administration abolished the extra charge of that amount ordered on Jan. 17 to make up for increased cost of delivery because of snow and ice conditions. Otherwise rates remain undisturbed. About 10,000 tons of fire-damaged Pocahontas mine-run has been thrown upon the market by one dock company at $7.75 per ton.

Wisconsin's urgency call for about 40,000 tons of soft coal to supplement present stocks sufficiently to make them last until the opening of lake navigation about the middle of April will receive favorable consideration, according to advices received from Washington by State Fuel Administrator W. N. Fitzgerald. No bituminous coal is being received at present, as the preferred list in Illinois is absorbing all the coal mined in that state. Anthracite is also being withheld from the West because of the needs of Eastern coast communities.

There is a disposition on the part of consumers to put in new supplies of coal at once, and the fuel administration office is the center of inquiries in this regard. All are advised to wait until lake receipts are resumed. Meanwhile a system of supply regulation to guard against "hogging" is being perfected. In the rural districts all signs point to a revival of wood burning to an extent which will have an appreciable effect upon coal consumption next winter.

Springlike weather continues to act as a sedative in coal circles and there is a refreshing relaxation from the tension of winter's tribulations.

ST. LOUIS

An unusual situation accounted for by weather conditions altogether. Steam unusually quiet, and nothing doing in domestic lines. Railroads showing slight improvement. Little Eastern coal and no Arkansas. Condition satisfactory to the consumer.

Continued mild weather has brought about a condition in the local market that is commencing to worry the producer. Louisville & Nashville still has an embargo in effect that prevents coal from going to Chicago and many other points where it is needed, with the result that the local market is glutted.

The Louisville & Nashville seems to pay no attention to the rules that govern the railroads, and it is time that something drastic is done to make an example of some of these roads that are openly violating unwritten laws that have a tendency to ease the fuel situation in sections where it is still somewhat acute.

The Illinois Central furnishes about two day's supply of cars for the mines on its lines and its service is entirely unsatisfactory to everyone concerned. The other roads are doing fairly well, both with equipment and service.

There is some slight improvement in the equipment furnished on most roads and conditions show slight improvement, but not what should be expected. It is openly commented on here by some coal men that the roads seem to be falling down, and without any just cause, unless it might be that it is in an effort to get the public discouraged with the Government supervision of the rail lines; but the fact remains that investigations fail to find any valid reasons for some of the delays and inconveniences caused by the carriers in this section.

In the Carterville district the working time has improved and equipment is somewhat better. The tonnage from this field still continues to go to Chicago and the North, and the railroads still draw heavily, so that there is no excess tonnage offered in this market from this field.

The same condition exists to a great extent in the DuQuoin field. The situation is much easier in the Mt. Olive field, and there has been an abundance of this coal on the open market in the past few days. The retail trade in St. Louis is stocked up heavily with this grade and the producers are finding markets farther away from home.

In the Standard field there seems to be a surplus in a general way in domestic coal and some sizes of steam. During the past week several operators have had some strenuous work in order to dispose of their tonnage, and it is shortly expected that the railroads will be able to buy coal under the market price from operators who would rather not cut the commercial price.

Washington intimates that St. Louis will get no Pennsylvania anthracite this year, and what can be gathered from the Arkansas operators would indicate that they will not have enough tonnage to ship any to this market. There is some early buying on the part of domestic consumers, but this is light as yet.

The prevailing market is, per net ton f.o.b. mine:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80

Williamson & Franklin Co. rate is 87½c.; other fields, 72½c.

I. C. C. Decisions

The Commission, Division 2, in conference on Feb. 16, 1918, considered the following inquiries concerning demurrage charges and storage charges assessed by common carriers on the fuelless days designated in the order of the Fuel Administrator dated Jan. 17, 1918:

1. May the fuelless days designated by the Fuel Administrator be considered legal holidays as that term is used in the demurrage code?

2. Should demurrage charges be collected on a shipment such as asphalt which arrived at destination on Jan. 18 and which because of its consistency could not be unloaded without first being heated and which was not heated because of the shipper's understanding of the Fuel Administrator's order?

3. Should demurrage charges be collected on cars containing freight which could not be loaded or unloaded without the use of a derrick operated by power derived from fuel?

4. Should demurrage charges be collected on shipments to a large industrial concern which could not load or unload them without certain inter-plant switching which could not be performed without power derived from fuel?

5. Should storage charges be assessed on less-than-carload freight which was not removed because an industry completely ceased operation on the fuelless days as the result of its understanding of the Fuel Administrator's order and of the instructions of the local fuel administrator?

Held, as to the first question, that the fuelless days designated by the Fuel Administrator may not be considered legal holidays as that term is used in the demurrage code.

Held, as to the second and third questions, that a particular shipper's understanding of the Fuel Administrator's order is not conclusive, as different shippers may construe the order differently; and that in cases where power or heat derived from fuel is necessary and customary for loading or unloading property, cars arriving and set for loading or unloading on Jan. 18 should be treated exactly as though set for loading or unloading on Jan. 23. In other words, in the circumstances of these cases, no demurrage charge should be assessed.

Held, as to the fourth question, that demurrage charges should be collected on shipments to industrial concerns which failed to load or unload cars because it is alleged that they were prevented by the Fuel Administrator's order from using locomotives for inter-plant switching. The Commission does not consider that there was any prohibition upon the plant locomotives from using power where necessary for loading or unloading any more than there was a prohibition against the use of locomotives for general railroad business.

Held, as to the fifth question, that storage charges should be assessed on less-than-carload freight not moved because the industry ceased operation on the fuelless days as the result of its interpretation of the Fuel Administrator's order, or the instructions of the local Fuel Administrator.

General Statistics

CHESAPEAKE & OHIO

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for the month of December, 1917, and twelve months ending Dec. 31, 1917:

COAL

To	December 1917	December 1916	Twelve Months 1917	Twelve Months 1916
Tidewater (bituminous)	365,703	470,367	5,396,288	5,367,468
East (bituminous)	327,818	287,627	3,022,336	2,716,772
West (bituminous)	1,157,690	1,049,591	15,540,865	16,157,778
Company's fuel (bituminous)	183,203	203,025	2,292,363	2,308,884
From connections (bituminous)	135,123	173,898	1,756,287	2,489,365
Total (bituminous)	2,169,537	2,184,508	28,008,139	29,040,267
Anthracite	4,373	1,553	13,652	16,579
Total coal movement	2,173,910	2,186,061	28,021,791	29,056,846

COKE

PITTSBURGH			
Bessemer iron*	37.25	37.25	24.95
Basic iron*	33.95	33.95	20.95

*These prices include the freight charge from the valley to the Pittsburgh district. †Delivered Tidewater, New York.

STRUCTURAL MATERIAL—The following are the base prices, f.o.b. mill, Pittsburgh, together with the quotations per 100 lb. from warehouses at the places named:

	Mill, Pittsburgh	New York, Mar. 5, 1918	New York, 1 Year Ago	St. Louis	Chicago
Beams, 3 to 15 in.	$3.00	$4.195	$3.25	$4.27	$4.20
Channels, 3 to 15 in.	3.00	4.195	3.25	4.27	4.20
Angles, 3 to 6 in., ¼ in. thick	3.00	4.195	3.25	4.27	4.20
Tees, 3 in. and larger	3.05	4.245	3.40	4.27	4.25
Plates	3.225	4.45	5.15	4.52	4.45

BAR IRON—Prices in cents per pound at cities named are as follows:

	Pittsburgh	St. Louis	Denver	Birmingham
Mar. 5, 1918	3.50	4.17	4.05	4.38

NAILS—Prices per keg from warehouse in cities named:

	Mill Pittsburgh	St. Louis	Denver	Chicago	Birmingham	San Francisco	Dallas
Wire	$2.70	$4.30	$4.85	$4.25	$4.25	$4.60	$4.50
Cut	2.70	5.25	....	4.40	....	6.15	....

TRACK SUPPLIES—The following prices are base per 100 lb. f.o.b. Pittsburgh for carload lots, together with the warehouse prices at the places named:

	Pittsburgh, Mar. 5, 1918	Pittsburgh, One Year Ago	Cincinnati	Chicago	St. Louis	San Francisco	Birmingham	Denver
Standard railroad spikes ⅝-in. and larger	$3.90	$2.65	$6.00	$5.00	$5.30	$6.25	$5.30	$5.00
Track bolts	4.90	3.25	8.90	6.25	Premium	7.45	6.75	6.00
Standard section angle bars	3.25	2.00	....	4.50	Premium	4.65	....	....

COLD DRAWN STEEL SHAFTING—From warehouse to consumers requiring fair-sized lots, the following discounts hold:

Cincinnati	Cleveland	Chicago	St. Louis	Denver	Birmingham
17½%	List	+10%	+10%	+35%	+20%

HORSE AND MULE SHOES—Warehouse prices per 100 lb. in cities named:

	Mill Pittsburgh	Cincinnati	Chicago	St. Louis	Denver	Birmingham
Straight	$5.25	$6.30	$6.50	$6.25	$7.50	$6.25
Assorted	5.40	6.30	6.50–7.00	6.40	7.75	6.85

CAST-IRON PIPE—The following are prices per net ton for carload lots:

	New York, Mar. 5, 1918	New York, 1 Month Ago	New York, One Year Ago	Chicago	St. Louis	San Francisco	Dallas
4 in.	$58.35	$58.35	$44.50	$57.55	$57.00	$65.00	$61.00
6 in. and over	55.35	55.35	41.50	54.55	54.00	62.00	58.00

Gas pipe and 16-ft. lengths are $1 per ton extra.

STEEL RAILS—The following quotations are per ton f.o.b. Pittsburgh and Chicago for carload or larger lots. For less than carload lots 5c. per 100 lb. is charged extra:

	Pittsburgh, Mar. 5, 1918	Pittsburgh, One Year Ago	Chicago, Mar. 5, 1918	Chicago, One Year Ago
Standard bessemer rails	$60–65	$38.00	$60–65	$38.00
Standard openhearth rails	63–65	40.00	63–65	40.00
Light rails, 8 to 10 lb.	*3.135 (100 lb.)	52.00	*3.135 (100 lb.)	47.00
Light rails, 12 to 14 lb.	*3.09 (100 lb.)	52.00	*3.09 (100 lb.)	46.00
Light rails, 25 to 45 lb.	*3.00 (100 lb.)	50.00	*3.00 (100 lb.)	44.00

OLD MATERIAL—Prices per net ton in Chicago and St. Louis (including delivery to buyer's works and freight transfer charges):

	Chicago, Mar. 5, 1918	Chicago, One Month Ago	St. Louis, Mar. 5, 1918	St. Louis, One Month Ago
No. 1 railroad wrought	$32.80	$31.25	$30.75	$30.50
Stove plate	27.80	21.50	20.50	20.50
No. 1 machinery cast	27.80	26.00	26.00	26.00
Machine shop turnings	17.80	17.00	17.50	17.50
Cast borings	17.80	16.50	17.00	17.00
Railroad malleable cast	32.80	26.80	26.00	26.00

COAL BIT STEEL—Warehouse price per pound is as follows:

New York	Cincinnati	Birmingham	St. Louis	Denver
$0.12	$0.16½	$0.16	$0.13	$0.17

DRILL STEEL—Warehouse price per pound:

	New York	St. Louis	Birmingham
Solid	14c.	14c.	15c.
Hollow	24c.	25c.	....

PIPE—The following discounts are for carload lots f.o.b. Pittsburgh; basing card of Nov. 6, 1917, for steel pipe and for iron pipe:

BUTT WELD

Steel, Inches	Black	Galvanized	Iron, Inches	Black	Galvanized
⅛, ¼ and ⅜	44%	17%	¾ to 1½	33%	17%
½	48%	33½%			
¾ to 3	51%	37½%			

LAP WELD

2	44%	31½%	2	26%	12%
2½ to 6	47%	34½%	2½ to 4	28%	15%
			4½ to 6	28%	15%

BUTT WELD, EXTRA STRONG PLAIN ENDS

⅛, ¼ and ⅜	40%	22½%	¾ to 1½	33%	18%
½	45%	36½%			
¾ to 1½	49%	36½%			

LAP WELD, EXTRA STRONG PLAIN ENDS

2	42%	30½%	2	27%	14%
2½ to 4	45%	33½%	2¼ to 4	29%	17%
4½ to 6	44%	32½%	4½ to 6	28%	16%

From warehouses at the places named the following discounts hold for steel pipe:

	Black, New York	Black, Chicago	Black, St. Louis
¾ to 3 in. butt welded	38%	42.8%	40.1%
3½ to 6 in. lap welded	18%	38.8%	36.1%

Cold punched hexagon	1.00	.50	.75	3.00	1.00	3.00

Semifinished nuts sell at the following discounts from list price:

	Mar. 5, 1918	One Year Ago
New York	40%	50—10%
Cleveland	60%	60%
Chicago	50%	65%
St. Louis	50—10%	.....

MACHINE BOLTS—Warehouse discounts in the following cities:

	New York	Cleveland	Chicago	St. Louis
⅜ by 4 in. and smaller	30%	50%	40—10%	40%
Larger and longer up to 1 in. by 30 in.	15%	40%	30—5%	35—5%

WASHERS—From warehouses at the places named the following amount is deducted from list price:

For wrought-iron washers:

New York..$1.00 Cleveland..$2.00 Chicago..$3.00 St. Louis..$3.00

For cast-iron washers the base price per 100 lb. is as follows:

New York..$5.00 Cleveland..$4.50 Chicago..$3.50 St. Louis..$2.75

RIVETS—The following quotations are allowed for fair-sized orders from warehouse:

	New York	Cleveland	Chicago
Steel ⅞ and smaller	30%	35%	40%*
Tinned	30%	35%	40%*

*For less than keg lots the discount is 35%.

Button heads, ¾, ⅞, 1 in. diameter by 2 in. to 5 in., sell as follows per 100 lb.:

New York ..... $7.00 Cleveland ..... $5.85 Chicago $5.50

Coneheads, same sizes:

New York ..... $7.10 Cleveland ..... $5.95 Chicago $5.60

MISCELLANEOUS

GREASES—Prices are as follows in the following cities in cents per pound for barrel lots:

	Cincinnati	Chicago	St. Louis	Birmingham	Denver
Cup	7	5¼	6.1	7½	10
Fiber or sponge	8	6	6.4	7½	15
Transmission	7	6	6.4	7½	15
Axle	4½	4	3.3	...	5
Gear	4½	4½	6.5	7½	6
Car journal	22 (gal.)	3½	4.6	7½	6

BABBITT METAL—Warehouse prices in cents per pound:

	New York		Cleveland		Chicago	
	1918 Mar. 5	Year Ago One	1918 Mar. 5	Year Ago One	1918 Mar. 5	Year Ago One
Best grade	90.00	60.00	93.00	53.75	90.00	55.00
Commercial	50.00	35.00	22.00	17.75	30.00	28.00

HOSE—Following are prices of various classes of hose:

Fire

	50-Ft. Lengths
Underwriters' 2½-in.	75c. per ft.
Common, 2½-in.	40%

Air

	First Grade	Second Grade	Third Grade
¾-in. per ft.	$0.55	$0.30	$0.25

Steam—Discounts from list

First grade... 30% Second grade... 30-5% Third grade... 40-10%

LEATHER BELTING—Present discounts from list in cities named:

	Medium Grade	Heavy Grade
St. Louis	45%	40%
Denver	40%	40%
Birmingham	35%	40%
Chicago	30—10%	40—5%
Cincinnati	40—10%	40%

RAWHIDE LACING—40% off list.

PACKING—Prices per pound:

Rubber and duck for low-pressure steam	$0.90
Asbestos for high-pressure steam	1.65
Duck and rubber for piston packing	1.00
Flax, regular	.90
Flax, waterproofed	1.10
Compressed asbestos sheet	1.00
Wire insertion asbestos sheet	1.20
Rubber sheet	.60
Rubber sheet, wire insertion	.90
Rubber sheet, duck insertion	.50
Rubber sheet, cloth insertion	.25
Asbestos packing, twisted or braided, and graphited, for valve stems and stuffing boxes	1.10
Asbestos wick, ½- and 1-lb. balls	.65 to .70

WIRE ROPE—Discounts from list price on regular grades of bright and galvanized are as follows:

	New York and St. Louis
Galvanized iron rigging	+ 20%
Galvanized cast steel rigging	List
Bright plain rigging	30%
Bright cast steel	17½%
Bright iron and iron tiller	5%

MANILA ROPE—For rope smaller than ⅝-in. the price is ½ to 2c extra; while for quantities amounting to less than 600 ft. there is an extra charge of 1c. The number of feet per pound for the various sizes is as follows: ⅝-in., 8 ft.; ¾-in., 6; ⅞-in., 4½; 1 in., 3½; 1⅛-in., 2 ft. 10 in.; 1¼-in., 2 ft. 4 in. Following is the price per pound for ⅝-in. and larger, in 1200-ft. coils:

Boston	$0.35½	Kansas City	$0.33½
New York	.34	Los Angeles	.33½
Chicago	.32½	Seattle	.33½
Denver	.33½	St. Louis	.33
Birmingham	.37	Cincinnati	.33

PIPE AND BOILER COVERING—Below are discounts and part of standard lists:

PIPE COVERING

Pipe Size	Standard List Per Lin.Ft.
1-in.	$0.27
2-in.	.36
6-in.	.80
4-in.	.60
3-in.	.45
8-in.	1.10
10-in.	1.30

BLOCKS AND SHEETS

Thickness	Price per Sq.Ft.
½-in.	$0.27
1 -in.	.30
1½-in.	.45
2 -in.	.60
2½-in.	.75
3 -in.	.90
3½-in.	1.05

85% magnesia high pressure ..... 15% off

For low-pressure heating and return lines..... 4-ply.... 58% off; 3-ply.... 60% off; 2-ply.... 62% off

LINSEED OIL—These prices are per gallon:

	New York		Cleveland		Chicago	
	Mar. 5, 1918	One Year Ago	Mar. 5, 1918	One Year Ago	Mar. 5, 1918	1 Year Ago
Raw per barrel	$1.39	$0.99	$1.40	$1.00	$1.41	$0.98
5-gal. cans	1.49	1.09	1.50	1.10	1.51	1.08

WHITE AND RED LEAD in 500-lb. lots sell as follows in cents per pound:

	Red				White	
	Mar. 5, 1918		1 Year Ago		Mar. 5, 1918	1 Yr. Ago
	Dry	In Oil	Dry	In Oil	Dry and In Oil	Dry and In Oil
25- and 50-lb. kegs	11.50	11.00	10.50	11.00	10.50	10.50
12½-lb. keg	11.75	11.25	10.75	11.25	10.75	10.75
100-lb. keg	11.25	11.50	11.00	11.50	11.00	11.00
1- to 5-lb. cans	13.25	13.00	12.50	12.50	13.00	12.50

CALCIUM CARBIDE—Price f.o.b. cars at warehouse points in Eastern States is $102.50 per ton for Union miners' lamp carbide, and $97.50 per ton for Cameo miners' lamp carbide. Union sells in 25-lb. cans for $1.46 per can.

COMMON BRICK—The prices per 1000 in cargo or carload lots are as follows:

Cincinnati	$13.50	Birmingham	15.00
St. Louis, salmon	8.00	Denver	$8.50

FUEL OIL—Price variable, depending upon stock. New York quotations not available owing to this fact. In Chicago and St. Louis the following prices are quoted:

	Chicago	St. Louis
Domestic light, 22-26 Baumé	5c.	none
Mexican heavy, 12-14 Baumé	7c.	7 1/10c.

PREPARED ROOFINGS—Standard grade rubbered surface, complete with nails and cement, costs per square as follows in New York and Chicago:

	1-Ply		2-Ply		3-Ply	
	c.l.	c.cl.	c.l.	l.cl.	c.l.	l.cl.
No. 1 grade	$1.15	$1.40	$1.45	$1.60	$1.75	$1.90
No. 2 grade	1.10	1.25	1.25	1.40	1.50	1.65

Asbestos asphalt-saturated felt (14 lb. per square) costs $6.50 per 100 lb.

Slate-surfaced roofing (red and green) in rolls of 108 sq.ft. costs $1.85 per roll in carload lots and $2.10 for smaller quantities.

Shingles, red and green slate finish, cost $4.75 per square in carloads, $5 in smaller quantities, in Philadelphia.

ROOFING MATERIALS—Prices per ton f.o.b. New York or Chicago:

	Carload Lots	Less Than Carload Lots
Tar felt (14 lb. per square of 100 sq.ft.)	$61.00	$62.00
Tar pitch (in 400-lb. bbl.)	15.00	16.50
Asphalt pitch (in barrels)	29.00	30.50
Asphalt felt	60.00	62.00

STEEL SHEET PILING—The following price is base per 100 lb. f.o.b. Pittsburgh, with a comparison of a month and a year ago:

Jan. 30, 1918	One Month Ago	One Year Ago
$4.50 to $5.00	$4.50 to $5.00	$2.60 to $2.70

Chicago	21.5	New York	19.5
Cincinnati	18.5	Philadelphia	18.5
Cleveland	13.5	St. Louis	27.0
Denver	79.0	St. Paul	35.5
Kansas City	47.0	Pacific Coast (all rail)	90.0

COAL AGE

Vol. 13 NEW YORK, MARCH 16, 1918 No. 11

THE MARCH OF JUSTICE

THERE is such a thing as the March of Justice, and it vitally concerns every mining man. A few years ago we were not so much interested in it, for then we did not realize what an important part the coal industry was to play in a world war.

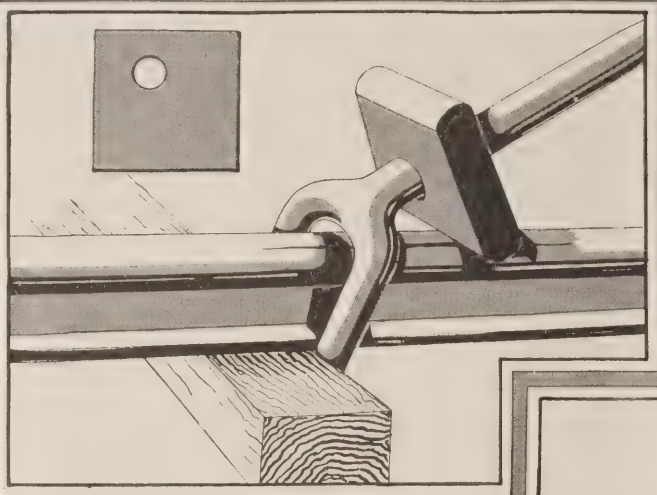
Only a short time ago we had no thought that our best efforts would be required to mine coal to send ships to France loaded with our sons and the products of our toil, for the purpose of preserving justice on earth. Individualism has passed. What happens in the far ends of the earth today is our business, whereas formerly we were quite unconcerned.

We know now that the great triumvirate that will save human freedom is—the miner, the soldier and the ship-builder. If one of these three fail, all other efforts will be useless. The German attempt to enslave Russia has removed the last hope that there is any way out but to conquer by force of blood and iron.

A NATION'S vanity tells it what is honor—a nation's conscience what is justice. Justice, therefore, does not exist in a land where pride has supplanted conscience. The great aim of the mighty march of the coal-mining business is to rid the world of a menace, the like of which was never known before.

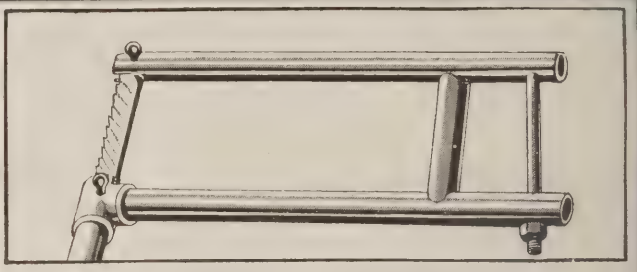
The progress of justice has been painfully slow because individuals and companies have refused to believe they could be mired in the holes they dug themselves. Its progress has also been retarded by self-interest. Few men but have at some time stood pat for personal profit, to the exclusion of all other considerations.

MANY employers and employees can recall a series of strikes that lasted just as long as one or the other of the parties was too hard-headed. That was obstructing the march of justice—and the families concerned, the community and the nation all suffered. Many men in their business relations are like the Southern sheriff who got up a crap game among the negroes in order to arrest enough prisoners to make a profit from his business of boarding the inmates of the county jail. Others of us are like Plowden, the lawyer, who gave an opinion to a client concerning an offense, but on learning that he himself was the wrongdoer said: "The case is altered." All such impede the march of justice.



When a virtue is exercised unseen and unsung, it wears its greatest crown. That is why the coal miner in the dark and grime of his underground world has an unmatched opportunity to show character and patriotism. Here he can load clean coal and strike a fatal blow to the Hun, or he can send up slate and render an irreparable injustice to his own countrymen fighting for freedom in France.

IT IS impossible to judge a tree by its bark, a horse by its harness, or wine by the barrel that contains it. The present day of distress and sacrifice is the one time in history to go deep in testing the worth of men and things before judgment is passed. Mine operators must be patient and slow to criticise the men who have been empowered to regulate the industry. It is certain that any mistakes made will be unintentional. Correction will surely follow a persistent presentation of the truth.



And the fuel administrators—they have the least enviable jobs of all. Nothing is more difficult than the task of catching and chastising the guilty, without also unjustly punishing those who are worthy and decent. A present case in point is the problem of the jobber. Some members of this selling fraternity have done wrong, but there are a lot of decent jobbers whose honesty and patriotism rank second to none, and who have built up businesses legitimately and in absolute conformity with the letter of the law. These men only sell three-eighths of the total coal mined. A slight increase in the ton price of our total output would exceed the commission now paid jobbers for the small part of the total production they handle.

GENERALLY there are several different ways to do the same thing. We must be careful today to see that each new plan we put into effect is better than the old system it supplants. That must be the cardinal aim of the Fuel Administration, the coal operator and the coal miner. Furthermore, let us not forget that **"every man loves justice at another man's expense; nobody cares for it at his own."**

The Mineral Spring Breaker

By DEVER C. ASHMEAD
Tarrytown, N. Y.

SYNOPSIS — *Description of grounds and construction of building. Wet treatment of coal from egg to pea sizes in jigs. Operation of an interesting barney plane.*

EXCELLENT in design, construction and management, the Mineral Spring breaker of the Lehigh Valley Coal Co., at Wilkes-Barre, Penn., is a credit to the city from an architectural point of view, instead of being an eyesore, as is the case with a number of other breakers in the anthracite region. The grounds of the colliery are fenced in with about 3½ miles of board fencing, painted red, the entire fence being surmounted by barbed wire.

The ground immediately surrounding the breaker and the main plant has been laid out as a park and is always kept in fine condition, favorably comparing in this respect with many city parks. The old slate dumps have been terraced and covered with a layer of good soil to a depth of one foot in which grass seed has been sown; and a well-kept lawn greets the visitor as he enters the main gate (see Fig. 1).

For the main walks concrete has been used, while the minor pathways are of cinders, the borders along the walks being correctly trimmed. On each side of the walk, and extending from the main gate to the top of the hill, is a line of shade trees. These trees do not appear in any of the illustrations to this article, as they were only planted last fall. Flower beds are laid out, adding considerably to the beauty of the grounds. A glimpse of the flower beds may be obtained in Figs. 3, 4 and 5.

In Fig. 6, which is a general view of the plant, it will be observed that the grounds about the main shafts and buildings are covered with cinders. The entire place is kept scrupulously clean, not so much as a scrap of paper being visible. No broken cars or parts of machinery are in sight, the company officials evidently being firm believers in "a place for everything and everything in its place."

The men at the plant are responsible for the appearance of the grounds, the company furnishing the neces-

sary materials and tools and the employees are paid for the time they give to the work. That this arrangement has resulted to the satisfaction of all is evidenced by the fact that the efficiency flag which the company presents yearly to the colliery with the best-kept plant has been won four years in succession by the Mineral Spring plant.

The breaker is of steel construction and is roofed and sided with galvanized corrugated sheet iron and steel sash with ribbed glass. The glass area amounts to about 75 per cent. of the total sides of the structure, affording plenty of light. The building is heated by exhaust steam to a temperature of 60 degrees with an exterior temperature of 0 degrees F. and is a comfortable place in which to work. It is also vital to the successful operation of the breaker, which has all wet preparation. If there were no heat the water would freeze during cold weather.

Figs. 1 and 2 afford two excellent views of the breaker

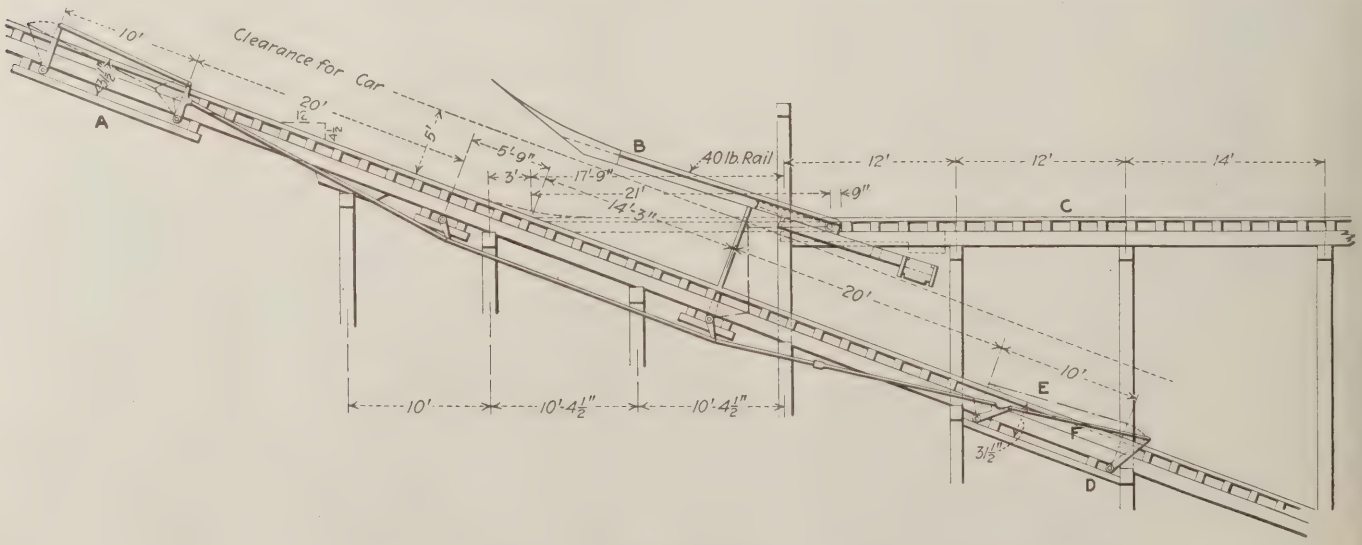

FIG. 10. DIAGRAM ILLUSTRATING OPERATION OF BRIDGE ON BARNEY PLANE

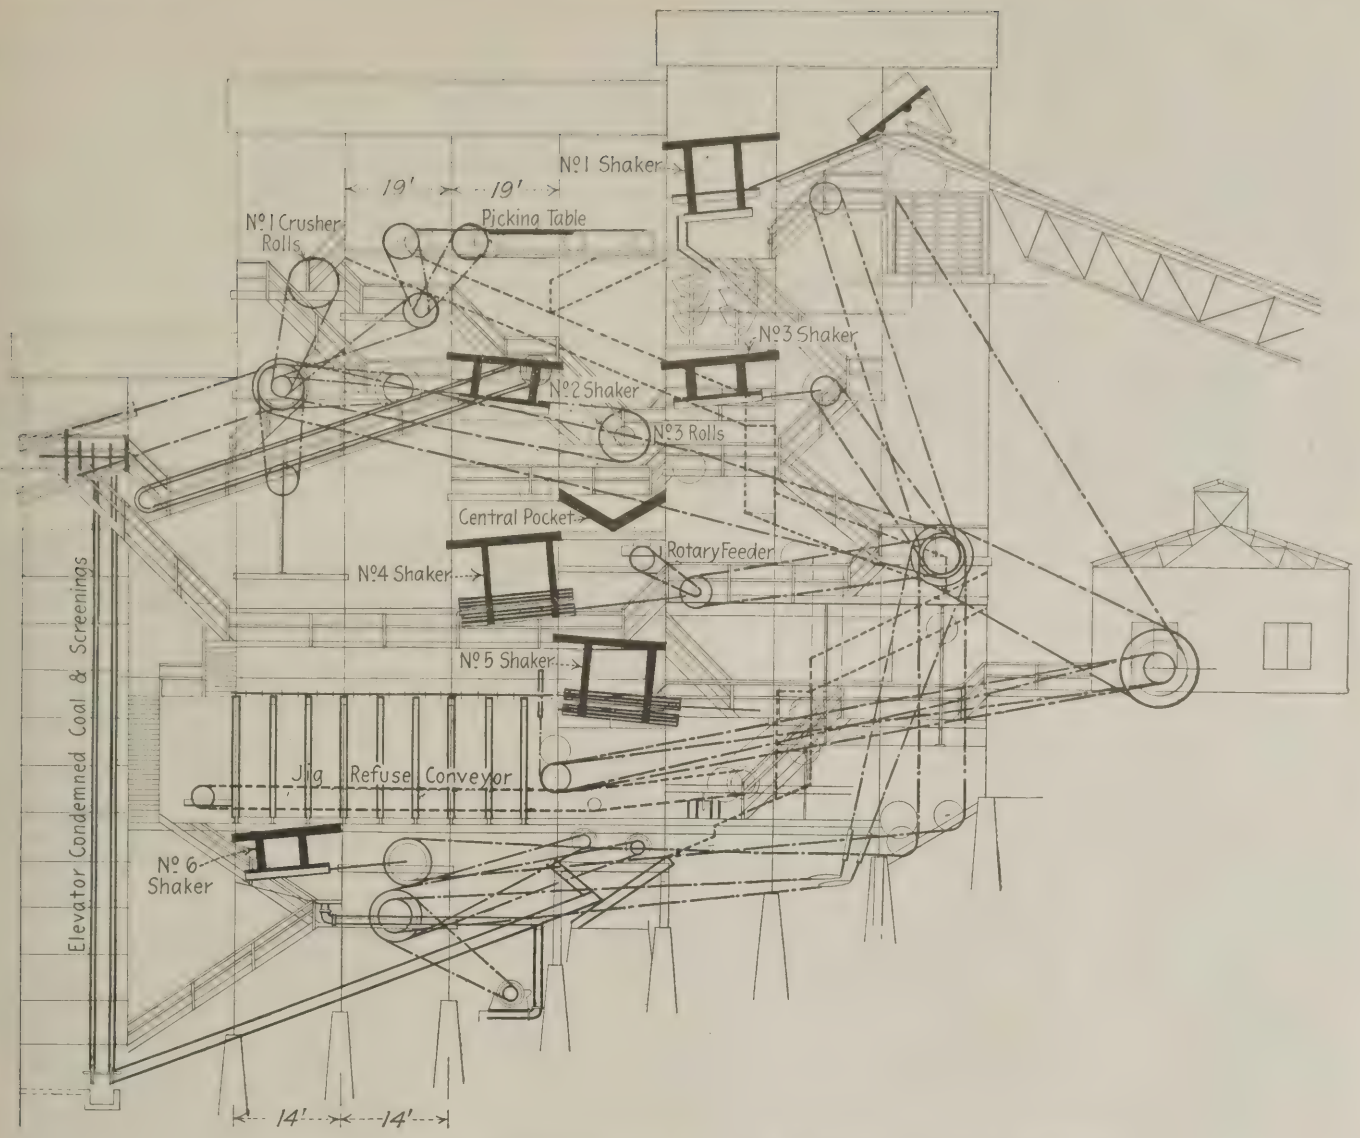

FIG. 11. ANOTHER CROSS-SECTION OF THE MINERAL SPRING BREAKER

and illustrate in particular the large area of glass surface. Fig. 3 shows the front end of the breaker and the housing over the loading track machinery.

The coal treated in the breaker is brought from the shaft shown at the extreme left of Fig. 6, and from a slope just off the edge of Fig. 6 on the right (not illustrated). The production from both shaft and slope is approximately 1400 tons a day. The shaft is about 400 ft. and the slope 600 ft. distant from the breaker. In a short time additional coal will be hauled by locomotive from a tunnel about 3 miles from the breaker. When this is done the maximum capacity of the breaker—1600 tons a day—will be reached. The shaft shown in the center of Fig. 6 is the manshaft. The mine cars from the hoisting shaft and the slope are run by gravity to the foot of the barney plane, which is illustrated in Fig. 2.

The control of these cars is excellent. No brakes are employed, nor is it necessary to use sprags, as there are two car retarders on each track which are controlled by a man at the foot of the plane.

When a loaded car is released from the last car retarder it runs to the foot of the barney plane and over the barney pit. The engineer in charge of the barney

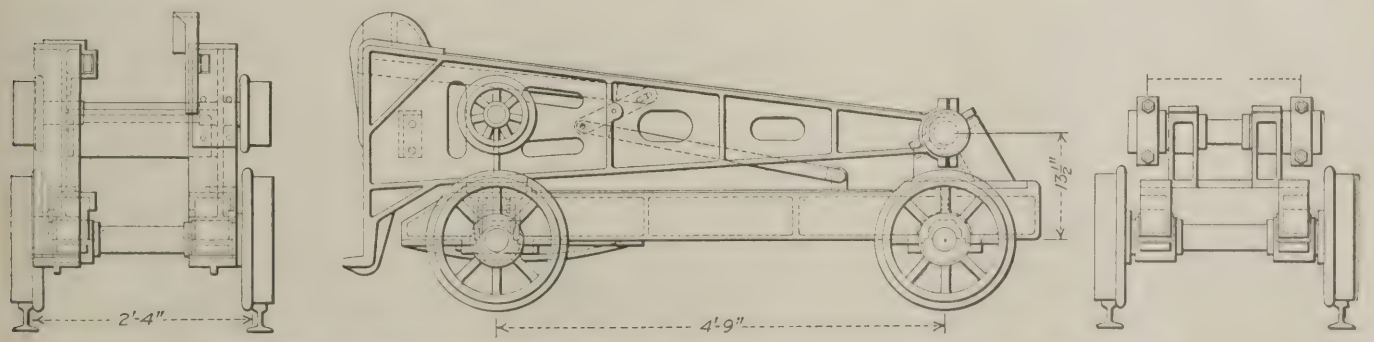

FIG. 12. DIAGRAM ILLUSTRATING CONSTRUCTION OF BARNEY USED AT PLANT

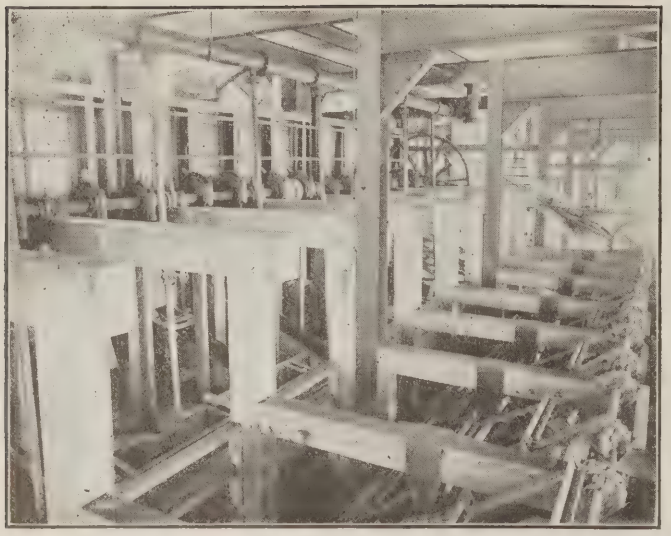

FIG. 13. JIGS FOR TREATING THE COAL

engine starts the barney (Fig. 12) and the upper part, which acts on a hinge, lifts, due to arrangement of the track in the pit. The upper part of the barney

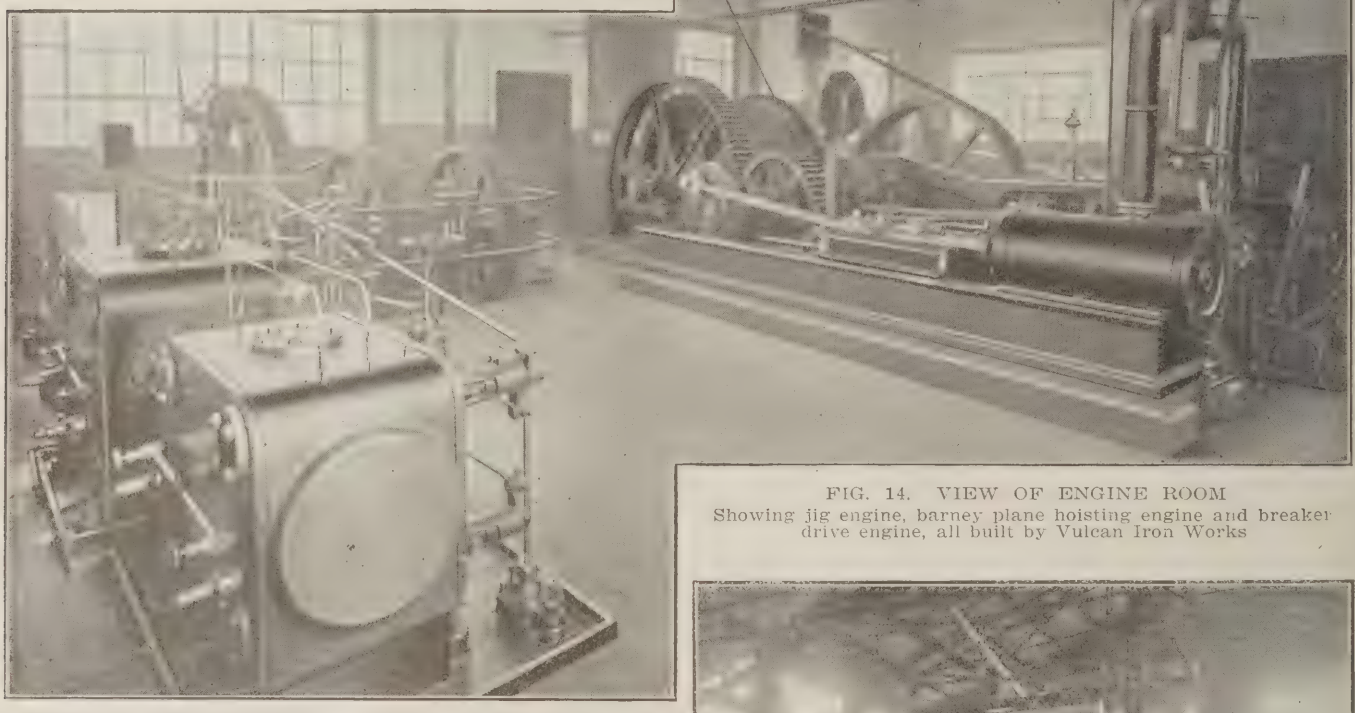

FIG. 14. VIEW OF ENGINE ROOM
Showing jig engine, barney plane hoisting engine and breaker drive engine, all built by Vulcan Iron Works

catches the end of the mine car and pushes it up the plane. As soon as the barney comes out of the pit, the track on which the lower wheels rest rises until the hinge is closed.

On reaching the point shown at *A* in Fig. 10, the car engages a trip and the bridge *B* lowers. The mine car goes to the top of the plane, where it is automatically dumped, as shown in Fig. 11. Returning to the bridge *B*, Fig. 10, the car runs over the bridge onto the empty track *C*, the barney passing between the tracks of the bridge and returning to the barney pit. Before reaching this pit, however, the barney engages with the trip at *D*, which is then in the position *E*, and troughs it to the position *F*. This opens the bridge at *B* to allow the next loaded car to pass up the plane.

From the mine car the coal passes to the No. 1 shaker, which has two decks. The coal that leaves the mine car is thoroughly wet. The lump coal passes over the top deck of the No. 1 shaker, which has a 6-in. perforated screen, and also over the lump picking tables and the larger pieces of rock are thrown out. Then the lump goes to the No. 1 rolls, where it is crushed. The coal which passes over the second deck of the No. 1 shaker goes to picking tables on the top floor and from this it is mixed with the coal from the No. 1 rolls. All this coal goes to the No. 2 shaker, which has one deck, and all coal larger than egg passes over the shaker and goes to No. 3 rolls, where it is broken to egg and smaller. The top floor of the breaker is shown in Fig. 15.

Coal passing through the second deck of the No. 1 shaker goes to chutes which carry it to the No. 3 shaker, where, if desired, the egg can be run through the No. 3 rolls; or else all the coal passes to the central pocket, as does also the coal from the No. 3 rolls.

FIG. 15. HEAD SHAKERS AND PICKING BANDS

From the central pocket the coal is fed by rotary feeders to the No. 4 shaker, which is a four-deck affair. The egg coal is taken off the top deck and sent to the jig storage pockets by means of chutes. The coal from the second deck is stove, from the third deck nut, from the fourth pea, all of which goes to their proper jig-storage pockets by means of chutes. The central coal pocket and the shakers with their chutes are very well shown in Fig. 16.

From the jig pockets the coal is fed to the jigs and the refuse separated, the pure coal going to the main storage pockets. The main jig floor of the breaker is shown in Fig. 16. This illustration also shows the jig refuse conveyor. Fig. 13 is a view of the jigs from shaker goes to the elevator for screening, being conveyed back to the central coal pocket for re-treatment.

All the rock collected from the picking tables on the top floor of the breaker goes by means of chutes to a crusher, and from here, together with the slate from the jig refuse conveyor, it passes to two pulverizers, where it is pulverized and then sent down into the mine for filling.

The arrangement of the loading pockets is different from that in most breakers, as the pockets are arranged at right angles to the railroad track rather than parallel to it. The coal from these pockets is discharged onto a belt conveyor which is 36 in. wide and 145 ft. centers. The discharge end of this belt conveyor is arranged so

FIG. 16. INTERIOR VIEW OF BREAKER, SHOWING JIGS AND JIG REFUSE CONVEYORS

above. These jigs are of the Lehigh Valley Coal Co.'s plunger type.

The coal that passes through the lower deck of the No. 4 shaker goes to the No. 5 shaker, which can be seen in Fig. 16. This shaker has three decks, separating buckwheat, rice and barley coal, each of which goes direct to its respective storage pocket. The rice and the barley coal can also be sent to the boiler house by means of a drag conveyor, which can be discerned in Fig. 6 between the breaker and the boiler house.

The slush from the jigs and what passes through the No. 5 shaker is run over a No. 6 shaker. The silt goes to the mines and what passes over the No. 6 that it can be raised or lowered to discharge at the proper height into the railroad cars. One lever opens gates for the same kind of coal on each side of the conveyor, there being seven levers in all. The Lehigh Valley Coal Co. has installed an Ottumwa box car loader, which enables the loading of box cars when other types of equipment cannot be obtained.

If any of the coal already loaded into railroad cars is condemned as not being up to standard, it is dumped into a pocket and carried to the foot of an elevator by means of a conveyor, the elevator taking the coal up to the central coal pocket for re-treatment.

The breaker engine house is a separate building in

the rear of the breaker and under the barney plane. This is shown in Fig. 2 and also in the cross-section, Fig. 11. The engine house contains a Vulcan 16 x 30-in. duplex hoisting engine, which operates the barney plane. A Vulcan 11 x 16 x 24-in. tandem compound engine drives the jig machinery. A Vulcan 17 x 26 x 30-in. breaker cross-compound engine drives the breaker machinery. The jig engine has a double rope belt, while the engine that drives the breaker machinery has a 24-in. belt. Fig. 14 is a view of the interior of the engine house.

Only 27 men are employed around the breaker, making an average of 60 tons of coal a day per man employed, or 80 tons of coal a day per man employed inside the breaker. The men employed and their positions are as follows: One on the barney plane; one man in the engine house; one man tends to the dumping of mine cars at the top; two men are on the picking table floor; one man tends to the elevators; one man looks after the shakers; one man is the breaker oiler; eight men tend to the jigs under a jig boss; two men pick all the slate from the egg coal after it leaves the jigs; one man tends to the breaker machinery and there is one slusher; one man operates all the loading machinery, including box-car loader; five men are on the outside to handle the railroad cars.

Smokeless Boiler Furnaces

The Bureau of Mines, Department of the Interior, after several years of experiments in fuel combustion in a special furnace, makes the announcement that from the results it is possible to design a furnace with considerably more assurance as to its capabilities than has heretofore been possible.

Starting with the analysis of the coal to be used and the rate at which it is to be burned, the furnace dimensions in feet and inches can be designed with a reasonable assurance of obtaining a desired degree of completeness of combustion.

The bureau has just made a report on this subject, Bulletin 135, "Combustion of Coal and Design of Furnaces," by Henry Kreisinger, C. E. Augustine and F. K. Ovitz. The publication marks a period in work approved in 1906 by a National Advisory Board appointed by the President to advise the Government concerning fuels. The bureau proposed to conduct such experiments as would make it possible to design fuel-burning furnaces on a rational basis rather than by the cut-and-try methods of the past.

The process carried on in the combustion space is influenced by many factors, the most important of which are the volume and shape of the combustion space; the kind of coal used, especially the character and amount of volatile matter it contains; the rate of firing; the quantity of air supplied over the fuel bed; the rate of mixing the air with the combustible rising from the fuel bed; the rate of heating the coal; and the temperature in the combustion space.

The qualitative effects on the rate and completeness of combustion of many of these factors have been known for a long time; but the quantitative data, presented in definite units of seconds, pounds, feet or percentages, have been lacking. To obtain such definite information a study of combustion in the space beyond the fuel bed was undertaken, and the results of extensive tests are given in this bulletin. About 100 elaborate tests were conducted in a special furnace using three kinds of coal—Pocahontas, Pittsburgh and Illinois—and at rates of combustion covering the full range found in practice. These are believed to be the most extensive tests of the kind ever undertaken.

While the bulletin is especially for those interested in the design or reconstruction of fuel-burning furnaces, it contains much of interest to the general engineer interested in fuel problems. Some of the statements sure to arrest the attention of the interested engineer are as follows:

The size of the combustion space required appears to be directly proportional to the percentage of oxygen in the moisture-free and ash-free coal.

The percentage of excess air that gives the best results varies with the size of the furnace and the kind of fuel. This fact explains why in one plant the highest efficiency may be obtained with 14 per cent. of CO_2 in the gases, and in another plant with only 10 per cent. of CO_2.

There is a definite relation for each coal between the excess air supply and the percentage of CO_2 in the furnace gases.

Soot is formed at the surface of the fuel bed by heating the hydrocarbons in absence of air. It is not formed by the hydrocarbon gases striking the cooling surfaces of the boiler. As a matter of fact only a small trace of the hydrocarbon gases ever reaches the surface of the boiler. Hydrocarbons that do so are prevented from decomposition by the cooling effect of the contact. The cooling surfaces do not cause the formation of soot; they merely collect soot and prevent its combustion.

It seems that most mechanical stokers are smokeless not because they burn the smoke, but because they burn the coal in such a way that little soot or smoke is produced. Hand-fired furnaces are smoky because soot is produced in or near the fuel bed, and can not be burned in the limited combustion space of the furnace.

Copies of this publication may be obtained free of charge by addressing the Director of the Bureau of Mines, Washington, D. C.

Bud's Boss

By Charles L. Fay

Sociological Superintendent, Davis Coal and Coke Co., Cumberland, Md.

I like a boss who is bigger than me,
With a head made fer thinkin' an' eyes that can see.
I want him jest common, but with that somethin' there
That tells you he's bigger an' right on th' square.

I want a boss who knows how to say "No!"
Th' sort of a man that makes everything go,
Th' side-steppin' boss, who allus gives in,
Jest gets me nowhere—he's weak as his grin.

I want a boss who can show where I'm wrong,
An' point out my failin's so I can get strong.
Why should his salary be big as it be,
If he cannot show plainly he's bigger than me?

I want a boss that I can respect;
A man on his job, who will never neglect
To tell me my faults or give praise when I win it;
That kind of a boss gets my best every minute.

I'm climbin' life's ladder th' best that I can,
With th' patience an' pluck of a red-blooded man;
An' d'you know, sir, to me 'twill be a big loss
When I can't make a teacher out of my boss.

Cement Gun in Mining Work—I*

By GEORGE S. RICE
Chief mining engineer, Bureau of Mines, Pittsburgh, Penn.

SYNOPSIS—*A partial history of the early use of concrete and cement grout in mines and of the introduction of the cement gun. Its use in the experimental mine. A description of the gun and its manner of operation and an account of the results obtained in tests of the gunite.*

THE use underground of hydraulic cement, and the scope of its uses increased almost as rapidly as in surface construction. One of the early underground applications was for the filling of the cavities behind the linings of tunnels, this being accomplished by pumping cement grout into the open spaces. In France in later years the "cementation process" of impregnating broken water-bearing ground by forcing in cement under high pressure was successfully employed, revolutionizing the method of shaft sinking through water-bearing chalks and marls in the north of France and Belgium. The employment of concrete for making massive linings of shafts and tunnels in place of timber framing and brick arching has been very extensive. The development of thinner, reinforced lining came into use later. In 1906 I waterproofed the air shaft of a mine in central Illinois by placing a thin but reinforced concrete lining, rectangular in section, inside a wood cribbing. The shaft passed through water-bearing ground.

About 1907 one of the large colliery companies of northern France, Mines de Béthune, began, in a new colliery, the use of a light, reinforced-concrete lining for all its cross-strata tunnels. When I visited this colliery in 1908, two miles of this lining had been constructed. It was only 5 or 6 in. thick, and the mixture was lean. Moreover the reinforcement was so very light that the cement work seemed to be hardly more than self-supporting and probably bore little of the weight of the encompassing strata. In other words, it apparently served merely to protect the strata from weathering.

The lining served its purpose satisfactorily as I found out when I again inspected it three years later (1911), by which time more lining had been built. On the other hand timbered tunnels in the same formation had given much trouble. This demonstration convinced me that the important factor was to protect the strata from the action of the air. The cost of the lining in the Béthune mine was relatively low under the conditions then prevailing in France, only $5 per lineal yard, which figure would have to be doubled if an estimate were to be made of the cost of such lining in this country, even prior to the war. The general method of lining seems an admirable one, although the first cost was considerable, but, in the long run, it should be economical because it eliminates the cost of timbering and of cleaning up of falls of roof inseparable from the maintenance of a roadway and it also serves as a protection for the men against injury from roof and rib falls.

Concluding that the protection of the natural roof and ribs against weathering, a process for which oxidation is principally responsible, was probably the important factor in preventing subsequent falls, I studied the problem carefully in the hope of determining what sort of inexpensive coating might be applied to a shale roof to prevent its coming in contact with the air currents with the hope of thereby saving expensive work later on and furthermore of lessening accidents from falls.

In many mines, when the mine entries are first driven, the top or bony coal roof seems admirable. It appears as if it would stand forever; but in a year or even less the weathering action begins, falls occur and timbering and retimbering follow. Finally you find the roof has dropped until the entry is twice as high as it was originally, and more or less filled with timber. When this condition has to be met it involves a great annual expense for the maintenance of the roads, and should a fire start there is plenty of fuel to feed it. Also the timbers provide places for the lodgment of the dangerous coal dust which floats in the air. In this manner timbering increases the explosion hazard.

In 1910, when I saw the cement gun exhibited at the convention of the National Association of Cement Users, held in New York, I thought that here was an apparatus that would furnish the agency I sought for the placing of a more or less impervious coating on the mine walls. I made reference to its availability for that purpose in an address on concrete in mining (which appeared in the transactions of the 7th convention in 1911). After showing how much safer was a smooth, concrete lining as compared with timbering, I made the following statement which appears to be as true now as then:

"The apparatus for applying cement mortar by means of compressed air, commonly known as the 'Cement Gun,' offers great possibilities for the lining of passageways, etc., with cement. By protecting from weathering the roof and walls of a passageway with a thin coating of cement, it is possible that the heavy expense of timbering in many cases may be avoided. The machine also offers possibilities of use in the fireproofing of timber and board stoppings and in the erection of firewalls in places difficult of access, since the material can be pumped for a considerable distance."

For many years grout has been pumped into cavities behind tunnel and shaft linings. However, G. L. Prentiss, in a paper given at the meeting of the cement users above referred to, on the "Use of Compressed Air in Handling Mortars and Concrete," stated that compressed air was first used for the transporting agent in placing concrete and mortar in France, for the repairing of tunnels on the Paris-Lyons-Mediterranean Ry., France. This was in 1906. The linings of

*Paper read before the Coal Mining Institute of America at its Pittsburgh, Penn., meeting, Dec. 6, 1917, and entitled "Weatherproofing Mine Roof and Walls and Making Tight Stoppings with Cement Gun."

the tunnels were leaking and the arches were thereby becoming weakened. The engineers attacked the problem by using a machine consisting of a charging hopper connected with a pressure tank, into which air was forced by a compressor at a pressure of 40 to 50 lb. per sq.in. The tank was first charged with a grout composed of cement, sand and water, and after the pressure had been put on the material was forced out through a line of flexible hose to a discharge nozzle, which was applied to holes drilled through the arch of the tunnel. It is stated the results from an engineering standpoint were satisfactory, but the machine gave trouble, as it and the hose became clogged with grout, and the process was therefore tedious and expensive.

Various other attempts were made to use compressed air for blowing cement or concrete mixtures through pipes, and according to Mr. Prentiss, J. W. Buzzell and W. H. Larkin, in 1909, undertook work in this country as 1910. The method was used for applying stucco and cement-sand mixtures, thus it was used for coating a frame building with stucco. Brick walls and fences were by this means covered with stucco or cement. He also instanced its use in the construction of the General Cement Products Co.'s buildings; the coating of structural steel, with and without the addition of reinforcing wire mesh; the fireproofing of the interior of wood-lined buildings; the building up of sections of cement pipe from a wire-mesh skeleton; the use for tree surgery; and the very important application of lining the iron syphons in the water supply system of New York. These syphons were 11 ft. 3 in. in diameter, and the total length to be treated was nearly 14 000 feet.

In that same 1910 meeting there was some talk of using the cement gun in mines, but it was with the idea of pumping concrete or cement into an excavation and filling it solid. In this manner it was suggested that a

FIG. 1. THE MACHINE BEHIND THE GUN

FIG. 2. THE MAN BEHIND THE GUN

of that nature. They found that they could force a mixed concrete through a 4-in. pipe a distance of 400 ft. with a pressure of 40 to 50 lb. per sq.in., a higher pressure than this not being found advantageous.

The predecessor of the cement gun appears to be the long-used spraying device employed for the painting and whitewashing of rough work, like railroad freight cars. Here the paint or whitewash is ejected from a nozzle by means of compressed air. Nevertheless, this method like those previously described used the compressed air to transport the grouting, concrete, or whitewash in liquid mixture, whereas the cement gun operates on a different principle; namely, to transport the cement and sand dry, wetting it only at the nozzle. It is not, of course, possible to employ crushed stone in the mixture, which must be composed of cement and sand only.

As the cement gun is a patented machine, I feel it is necessary to explain that I have never had any financial interest in it, and that I am concerned in it only as a means of obtaining a certain practical result in the mines.

Mr. Prentiss described in the paper, to which I have just referred, a variety of applications of compressed air to the placing of cement mixtures, some as early deposit of cement mortar might be placed which would later serve as a pillar. Men not familiar with mining thought that as concrete was so much stronger in compression than coal, no coal pillars would be required, if much smaller concrete pillars were substituted. Manifestly with the ordinary roof or floor the concrete blocks would be pushed into the roof or floor before the full strength of the concrete was developed, or else the roof spanning the excavated area would fail. So far as known, this futile project was never tried.

After seeing the demonstration of the gun in the exhibition of 1910, and the way the cement coating, sometimes termed "gunite," would stick to steel and stone, I concluded that here was a machine which offered a means of applying a thin cement coating to the roof and ribs of an entry or tunnel before weathering took place.

When the experimental mine of the United States Bureau of Mines, located near Bruceton, Penn., had been fully developed for its purposes, a cement gun was loaned in 1914 to the bureau by the Cement Gun Co., for trial applications. The manufacturers at that time, not having turned their attention to its mining possibilities, could not be induced to lend the gun without considerable negotiation. It was found, after ex-

perience had been gained in handling the gun, that a cement-sand covering, varying from a thin coating to one several inches thick, as desired, could be placed without difficulty on the coal ribs. It would even stick to the "draw slate" or clay band. Moreover, a thin to a ¾-in. coating could be made to stick to the roof without the use of wire mesh.

It was also found to be of great advantage in making stoppings practically air-tight. In October, 1914, when the American Institute of Mining Engineers met at Pittsburgh, an exhibit was given at the mine of the use of the cement gun for these purposes. The cement-sand lining has been extended in the mine entries from time to time until now nearly 1000 lin.ft. of entry has been thus lined, the roof coating being from ¼ to ¾ in. thick and the rib covering from 1 to 2 in. thick.

These coatings have been found very successful in the prevention of weathering on the sides and roof. It is true that from time to time repairs have had to be made on the roof coating, but this, in part at least, seems to have been due to the effect of the violent explosions produced in our experiments, of which over three hundred have been conducted. After many of these the coating would shell off the roof in patches, particularly where a void had developed behind the coating. These voids, or spaces, are caused by the concrete shell pulling away from the main roof where it is shaly, taking some scale with it. The concussion or rush of the explosive blast later knocks off the shell.

Gunite Withstood All Except Explosions

In offsets, where the work is protected from the explosions, the coating has rarely come off. As a result of these experiments it was thought that if the coating was well put on, particularly when the roof was fresh and sound, it would stick tight for a long period under ordinary mine conditions. Since the conditions at the experimental mine were abnormal, the failures in patches of the roof cannot be considered to condemn the system and there has been no trouble whatsoever from the coating on the ribs and draw-slate. This is most important, as those who have operated in the Pittsburgh beds well know. Usually disintegration which leads to falls in the roof come about through draw-slate over the coal softening, thereby widening the roof span. Then the roof falls and the widening and cutting back goes on, making the timbering more and more expensive.

These tests at the experimental mine were brought to the attention of leading mining men, and this caused some of them to try experiments of their own. Trial of the method was made slowly at first, but the representatives of the bureau constantly urged further experiments as the change seemed to promise increased safety as a result of better lighting, the reduction of falls and the danger of coal dust explosion propagation. Now the development is proceeding more rapidly.

Fortunately the cement gun can be used for other purposes than to prevent the weathering of the mine roof. For example, it can be used in the fireproofing of wooden stoppings, the sealing off tightly of fires, something which much appealed to the metal mining companies, operating large bodies of rich sulphide ores which are prone to spontaneous combustion in stopes. The cement gun is also most useful wherever iron or steel beams or posts are employed underground or in shafts as it prevents the metal from rusting.

An excellent description of the cement gun was presented by Carl Weber in a paper before the Western Society of Engineers of Mar. 9, 1914. It described the gun as it appeared in earlier stages of its development. A good description also appeared in *Engineering* (London) for June, 1916. These articles show the remarkably wide adaptability of the cement gun to other uses than those already mentioned, such as the repairing of concrete walls in subways, the rehabilitation of retaining walls, the lining of reservoirs, the repairing of street-car tunnels and the lining of coal bunkers.

The cement gun (see outline drawing) consists of two hoppers, an upper and a lower one, the upper one being the receiving hopper for the mixture of sand and cement. This mixture is made on the ground and shoveled into the hopper in a dry state. The receiver has a cone stopper in the top and one for the discharge of material from the bottom, thus the feeding material is "air locked" into the lower hopper which is

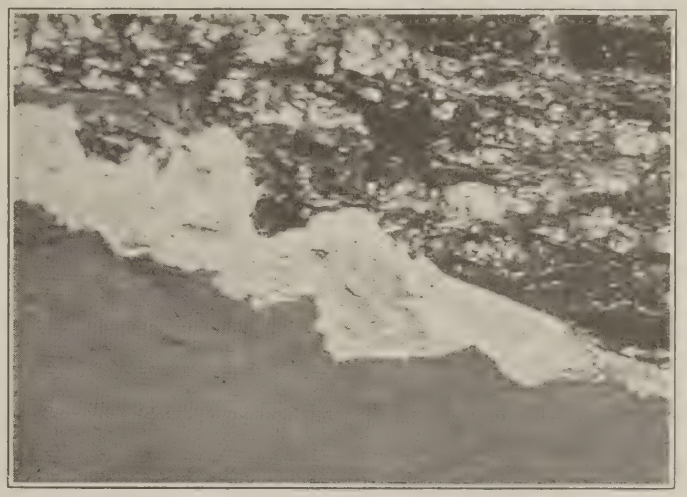

FIG. 3. SHOWING THE GUNITE PICKED DOWN
The gunite adheres closely to the coal surface

under air pressure of from 20 to 50 lb. In the bottom of this hopper there is a feeding wheel, which is turned mechanically. As it revolves, it delivers the right quantity of cement material opposite the outlet. Here the pressure of the air in the lower hopper forces the measured material out. As the dry mixture is forced into the flexible hose, additional air is injected and this aids in carrying the material onward to the nozzle. The hose may be of considerable length—50 or 100 ft. or even more. At the end of the discharge tube there is a nozzle where water is supplied at a pressure about 20 lb. per sq.in. higher than the pressure of the air. This is delivered in such a manner that it immediately mixes with the sand and cement. The nozzle is handled like a water hose and pointed approximately at right angles to the wall or surface to be covered. The sand is mixed with the cement in proportion of 3 to 1, but about 20 to 25 per cent. of the sand, after impinging on the wall, drops to the floor so that the coating put on is about 2½ to 1. The surplus sand can be shoveled up and used again. It is surprisingly clean.

The wheel is turned by a worm which is driven by a small air motor. The compressed air and the water under pressure are usually furnished by the mine plant,

but if the mine is not equipped it would be necessary to have a portable compressor and also a pump with a supply of water for the operation of the cement gun.

A cross section of the machine is shown in Figs. 4, 5 and 6. *A* and *B* are cone valves operated by control lever *C* and *D*. *E* is the air-supply valve. The air-supply hose is connected at *F*. *G* is the supply cock for the air motor; *H*, an air pipe, controlled by cock *A*. The main air-supply pipe to the lower main hopper is controlled by the cock *K*. *L* is discharge tube of the machine and it is shown in Fig. 5 at *M*.

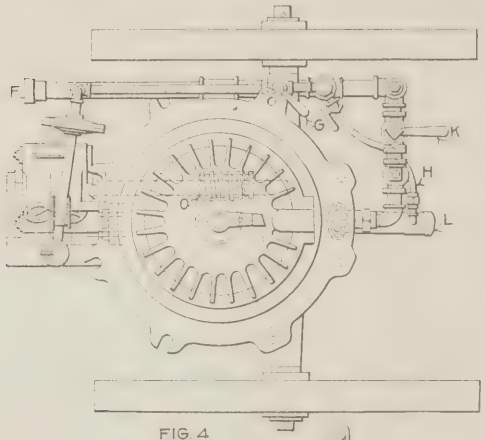

FIG. 4

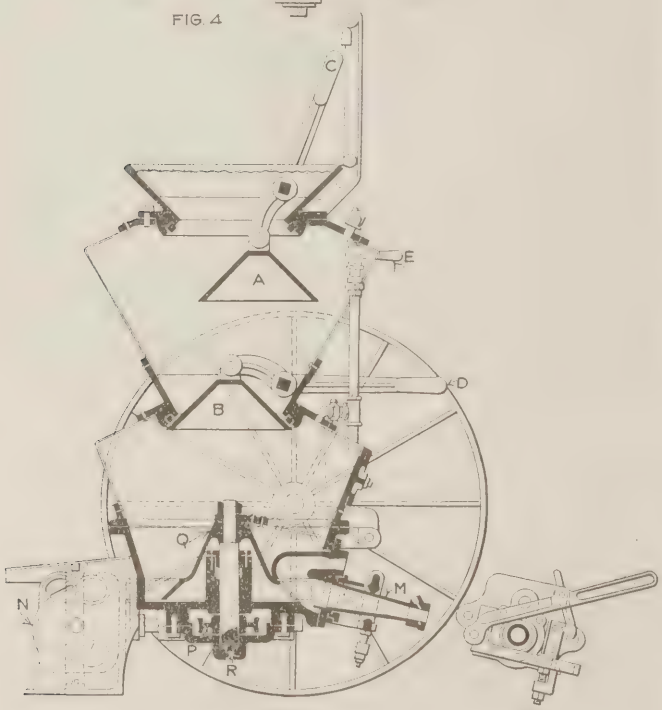

FIG. 5 FIG. 6

FIGS. 4, 5 AND 6. SECTIONAL PLAN, SECTIONAL ELEVATION AND DETAIL OF PINCHING LEVER

The tube is flexible and may be throttled by the pinching action of a lever shown in the small detail drawing, Fig. 6. *N* is the air motor and *O*, a worm, driving through gear *P*, the feed wheel *Q*. *R* is the footstep of the vertical shaft of the rotating wheel. It is to be noted that the discharge tube *L* is of rubber and the hose is rubber lined, there being no metal exposed to the sand blast except a little at the nozzle.

According to Mr. Weber, the sand-cement material leaves the nozzle with a velocity of about 300 ft. per second. In striking a hard surface the sand rebounds and falls down, only the neat cement adhering until a coat is formed thick enough to hold the sand. Then the rebound lessens and the coat is built up until the desired thickness has been obtained. The tightness by which the sand-cement coating is placed by this method is of great value. A report was made by Westinghouse, Church, Kerr & Co., testing engineers, which was quoted at length in the paper just referred to. It bears testimony to the quality of the cement-sand coating produced by the cement gun. Their conclusions were:

In all of the tests made the products of the cement gun were shown to be superior to good hand-made products of the same kind. The degree of superiority varied between wide limits.

In tensile strength the gun work excelled hand work in every case by amounts ranging from 20 to 260 per cent.

In compressive strength the excellence of the gun work was even more marked, ranging from 20 to 720 per cent. better than hand work.

In the matter of surface permeability the gun work absorbed from 7-10 down to 1-20 as much water per hour, per unit of area as the similar hand-made surfaces.

As regards absorption of water, the hand-made mortars took up from 1.4 to 5.3 times as much as the gun-made mortars.

The percentage of voids of the gun-made product ranged from 52 to 75 per cent. of that in the hand-made product.

The adhesion of the gun-applied mortars was on an average of 27 per cent. better than that of the hand work.

I will not attempt to take up at length the many uses other than those already cited, for which the method may be employed, except to quote from Mr. Weber's paper that a large reinforced-concrete power house with a chimney 150 ft. high was coated with a thin gunite coating, the chimney receiving the same coating as that used on the building, thus providing a uniform finish for the entire structure. There was no difficulty experienced in shooting up the sand-cement mixture through the hose to the nozzle in working on the high chimney, with the gun standing on the ground level.

The foregoing description refers to a specific machine. There are other machines which are said to accomplish similar results, one called the "Concrete Atomizer." These machines use a different principle, forcing out a wet or liquid mixture with steam or compressed air. A concrete atomizer was employed, in 1914, on the Delaware, Lackawanna, & Western R.R., in the repair of honey-combed and cracked concrete piers, girders, beams and slabs. No doubt there are other workable machines, but I have only had experience with the cement gun. It is presumable that there be a great variety of forms which might meet the needs of the mining industry, but the essential requirement for that service is the delivery of the mixture under considerable pressure through a nozzle with a flexible hose which may be over 100 ft. long if desired.

(To be continued)

BLIND LUCK

IT may be true that some men are fated to reach enviable positions in life. There are those who will tell you that if the stars were scattered about the heavens in some mystic, lucky way when you were born you're bound to get there—regardless. It may be true. But you can be sure that the chap who thumbs his nose at horoscopes and pitches in to carve a niche for himself way up on top is going to beat your "lucky" fellow who waits for his dreams to come true. The Annual Success Number of "Coal Age" will contain a number of articles about men who are carving niches in the coal-mining world. Perhaps you, too, know of someone whose story should be told—of some man who has left his impress on the coal-mining industry of your district by successful methods, successful management, or the successful adaptation of machinery. If so, tell us the story of the man or his methods, and send us the article by Mar. 25, accompanied by the necessary photographs or drawings.

Mining Engineers Consider Industrial Relations—III

By R. DAWSON HALL
Associate Editor, "Coal Age"

SYNOPSIS—*The American Institute of Mining Engineers discusses the losses sustained by employer and employee from the preventible sickness of the latter. Addresses are made on the abnormal workman and on the percentage of accidents resulting from human fallibility, the greenhorn and the chance-taker.*

As has been said it was the session on employment problems which attracted the most general and most favorable consideration. The session held the day before had been dominated by no less a person than Hudson Maxim—whose fame would probably not be enhanced even by saying that he is a member of the Naval Consulting Board, for the members of that Board are all more distinguished in themselves than even in their association.

Nevertheless, Hudson Maxim did not seem to create the interest that was aroused by Dr. Thomas Darlington, formerly commissioner of health of New York City and now secretary of the welfare committee of the American Iron and Steel Institute and consulting surgeon to the American International Shipbuilding Corporation. The remarks of Dr. Darlington in briefing his paper were eloquent and forcible.

In fact, cold type taken from the paper itself can hardly convey any idea of the strength of his presentation. Moreover, he added extensively to the material presented in the paper to cover some matters in industrial hygiene which do not look well in print. After saying that compulsory health insurance may introduce an interest in the employees' health such as compensation laws have already introduced in regard to safety, he adds in his paper:

Gain To Industry in Steady, Healthy Workman

"Illness in industry already has an effect on operating costs that is far from being generally realized. When a man is absent from his work because of illness it is usually necessary to have someone else take his place.

"The substitute, as a rule, is a less efficient workman; he makes a smaller output for the day's wages, he spoils more raw material, he requires more supervision from the foreman, who is thus distracted from more important work. Moreover, procuring and sending the substitute to the work needed involves a cost and usually a delay in the operations.

"When labor is abundant, it is customary to maintain a working force that is at times larger than is actually necessary, in order to avoid interruption of operations when men fail to report for work at the usual time. It is evident that this adds to cost, and now that labor is generally so scarce that industry is unable to maintain a reserve supply this cost is represented by loss of efficiency in plant operation.

"The illness of the workman is not, therefore, a matter which concerns himself only, but is a source of direct loss to his employer. The cost of health supervision is relatively not large, as is shown by a comparison of the cost of health supervision in 99 industrial establishments, employing altogether 495,544 men, made recently by M. W. Alexander, for the Conference Board of Physicians in Industrial Practice.

"The figures vary rather widely, since some plants reported only the medical cost, while the majority included the cost of clerical assistants and even of janitor and scrubwomen. The average cost per man per year for the half million employees was $2.50, or about ¾c. per day. Two of the companies not only give medical and surgical attention to injured employees, but furnish all the medical attention required for the families of workmen, as well as for the men themselves. In the case of an iron- and coal-mining company employing 11,000 men, the cost of giving all the medical attention required for the men and their families amounted to $11.82 per man per year or less than 4c. per man per day."

Conflict of Human Needs with Economic Law

The remarks of Dr. Darlington bear forcibly on a subject that we will all have to consider more definitely in the future than in the past—the opportunity and ability of the workingman for steady employment. The workman needs pay enough to compensate him for the time in which he has to be idle. The need for such pay is quite obvious, but it is equally obvious that, as his pay is derived from production, he cannot be paid for his idle hours. The workman will eternally wrangle from the point of view of his needs; the employer will equally tenaciously argue from the law of nature that the ration of the world in the average is the quotient of persons producing into product produced.

The argument brings us nowhere. The need of the workman is insatiable, and the economic law which the employer advances is likewise inexorable. The immovable mass has met the infinite force. But in a degree we can sidestep the whole matter. When we do away with the idle days by promoting good health and industrial continuity we increase product and so meet the workman's needs. It is true, however, that eventually—yes, in less than a generation—the needs of the workmen will grow till they equate themselves to the earnings and then a new source of betterment must be sought. That source we must find in greater industrial efficiency during the working period which is the outcome of machinery and industrial education.

Dr. Darlington is a warm advocate of the garden as a corrective of many of our social ills. In this connection he says:

"Of distinct economic value has been the encouragement given by employers to those living in industrial or mining villages by fencing in plots for gardens, assisting

when necessary in plowing and fertilization, and stimulating the employees and encouraging them in thrift and industry by offering prizes for the gardens. These gardens reduce the cost of living—some yielding vegetables enough for the family and also a surplus for sale—and they promote health by bringing members of the family into the fresh air and sunshine.

"They mean cleaner yards and better care of drainage and waste, thus preventing odors and the breeding of flies and mosquitoes. They provide a greater variety of food, and this is good for many workmen eat too much meat, and an excess of flesh diet is not conducive to the best work, growth or health. They tend to the abolition or the confining of domestic animals. They promote morality, keep the owner from the saloon and advance his own self-respect. They help to make homes and have a refining influence on the family."

After brief remarks from Dr. L. A. Shoudy, the paper was supplemented by a talk by Dr. E. E. Southard who spoke on the "Psychopathic Employee." Dr. Southard directs a psychopathic institute in Boston, and he has made a careful study of persons who are on the borderland of insanity. He was able, therefore, to discuss most interestingly the abnormal mentality of moody and simple-minded employees.

In the afternoon he presented a resolution that met with ready response calling on the board of directors of the institute to appoint a committee to study with a similar committee of the National Committee on Hygiene, if such should be appointed, the problems of employment in relation to mental disease and deficiency, said committee to report as a joint committee to the two organizations a year from date.

Part of Human Fallibility in Mine Accident

The first paper of the session was, however, that of Herbert M. Wilson, the point most insisted on being that the "human element" in accidents is the leading cause of their occurrence. Unfortunately there is no denying that fact. It was realizing it which held back compensation so many years and that made the courts construe the laws as they did as regards contributory negligence. It is for this cause largely that we tend to keep down compensation to a percentage rate of earnings.

Still it is to be questioned whether 40 per cent. of all accidents occur under conditions which could not have been avoided had the employer used every possible safeguard. Some concerns like the United States Coal and Coke Co. may be able to prove the blame for 40 per cent. or even two-thirds of the accidents is on the human element, but it is hard to believe that at the general run of plants of the 40 per cent. of accidents attributed to the human element not one of them is attributable in part, not perhaps to contributory negligence of the employer, but to the lack of his contributory defense against the accident. Mr. Wilson remarked:

"In connection with the inspection of mines for the fixing of merit-premium rates for insurance under workmen's compensation, it has been the practice of the Associated Companies to allow 60 per cent. of the credits for the safeguarding of the physical hazards of the mine and 40 per cent. for the human element. By 'human element' is meant that inherent tendency of the industrial worker to be careless, negligent or disobedient, in respect to his own safety, and after that also of his fellow workman. This is a tendency not only of the laborer or of the skilled miner, but of all human beings, working or traveling anywhere.

"This element of mine safety, sometimes called the moral hazard, has been admirably shown by statistics compiled from the records of the Department of Mines of the Union of South Africa to be due in about equal measure to the carelessness of the miner and to that of the operator. These statistics show that about one-half of the fatalities in mines are due to the so-called hazard of the industry, or what is sometimes called the dangers inherent to work or misadventure.

Operator and Miner Almost Equally To Blame

"Of 2497 fatalities investigated, including over 200,000 employees, for a period of over 2½ years, it was found that 17.5 per cent. were due to faulty plant or material, fault of foreman, or of management—in short were due to the operator; 17.1 per cent. to disobedience of orders, carelessness or ignorance of injured persons; and 5.9 per cent. through fault of others, including fellow workmen.

"The fault of the operator is evidenced by failure to give proper warning, failure to inspect, failure to furnish proper equipment, and neglecting to comply with the recommendations of the inspector. That education and training of the mine operator as well as of the mine worker is essential to any material improvement in the safety of mining is beyond question, and the system of schedule-rating insurance premiums under workmen's compensation which has been adopted by the Associated Companies takes cognizance of this to the fullest possible extent.

"While The Associated Companies has accepted 40 per cent. as a reasonable measure of the proportion of accidents due to the human element, a careful study of accident causes in the last two years for over 2000 mines has convinced me that the human element is responsible for a much larger percentage of accidents. J. S. Herbert, Superintendent of the Safety Department of the Cambria Steel Co., says that the statistics of that company convince him that 93 per cent. of its accidents have had no relation to mechanical defects, and that 73 per cent. of their injuries are chargeable to the man himself or one of several causes, usually carelessness, indifference, or recklessness."

Accidents To Greenhorns and Chance-Takers

Of course the usual discussion followed as to the relative proneness of the greenhorn and the hardened chance-taker of years of experience to get injured and killed. The problem is so far quite far from solution. But the experiences of some companies have been tabulated, and in a few years they will cover a sufficient length of time and a sufficient number of instances to make their publication advisable. B. F. Tillson, E. E. Bach and C. W. Goodale were among those entering into this discussion.

Few companies ask their men on employment how long their experience has been and, if they did, the answers they might get would be far from truthful. Every man would try to show that his experience would qualify him as a competent miner. But figures are needed badly so that the operator can order his safety work accordingly.

(To be concluded)

Importance of Proper Robbing Methods

By J. T. MORRIS
Superintendent, E. E. White Coal Co., Stotesbury, W. Va.

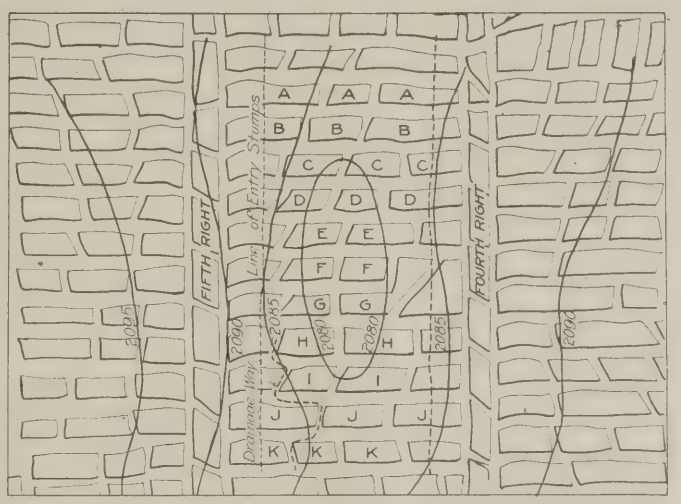
SYNOPSIS — *The advantages of systematic mining in the first stage are appreciated by all operating companies, and systematic mining in the second stage should be observed by all. Mining methods today are nearing the goal to a 100 per cent. recovery, and the robbing of pillars, or second mining, should receive the earnest attention of all mine foremen, assistant foremen, pillar bosses and contractors.*

THIS article is not a criticism on any method of robbing, nor on the inefficiency of persons connected with the direct production of coal from the working places, but is more or less in the nature of advice to the latter—and to some men "higher up" who are held responsible for the operating company's "goods in stock," which is coal.

To the average foreman, the term "pillars" usually implies a few cars of coal coming from a certain section or sections of a mine that require little attention on his part. The sooner these are loaded out the better, he considers; and when the fall comes his inefficiency is hid forever. How many tons of coal has gone to waste in a stump here and a stump there!

But this is not the view that should be taken of pillars. These should receive more of the foreman's attention than any other part of his work, for statistics show that practically three-fifths of all accidents in normal mining comes from falls of roof, slate and coal. We have more falls on the pillars than elsewhere. In addition large feeders are liberated by these falls in pillar work in a gaseous seam, and more material is lost in robbing than in first mining.

Question of Pillars One of Importance



Granting that the foregoing statements are true, it is readily seen that the pillars should receive the chief attention of officials, as I have shown that there is greater loss of life, property and coal than in first mining.

In the Beckley seam being mined by the E. E. White Coal Co., at Glen White and Stotesbury, W. Va., there is a large overburden over the Raleigh sandstone that lies immediately over the coal and ranges from 30 to 85 ft. It therefore is necessary to extract the pillars with rapidity in order to prevent squeezing, on account of the sandstone being thick and not subject to breaking readily in the area away from the crop where no surface seams are existent.

There have been several squeezes in some of the near-by operations, where the coal was either extracted too slowly or some pillars became "wrapt up" and prevented a fall or the proper characteristic upheaval of the bottom, which would have allowed a greater portion of the pressure exerted on the coal to cease, owing to the fact that at a reasonably safe distance from the working faces of the pillars the top and bottom converge.

With excellent top conditions, therefore, and with full knowledge of its nature from previous mining and experience, we have thrown or cast aside the long-practiced "pocket-and-stump" method. This is a system that lends itself admirably to friable and ordinary slate top where breaks are short and a fall can be started at will, and is the only practice pursued in the Pocahontas field, as far as the writer can recall. Instead of this discarded method we have adopted a "slabbing" system, which enables us to concentrate our haulage. This means less timbering and less track and motor expense, and leads to a higher efficiency per loader.

We have one section now "coming back" that is averaging 20 to 25 tons per loader, and we are only

ROBBING METHODS OF E. E. WHITE COAL COMPANY
Robbing starts on pillars marked A, on heavy bottom lines. When these are out, robbing starts on pillars marked B, and so on to pillars C, D, E, F, etc., leaving the entry stumps on both sides until later

using ten men; whereas under the "pocket-and-stump" method we would be using 15 to 20 loaders with an average loading of 10 to 12 tons by working in single places.

In addition to slabbing these pillars, taking out an average of one cut daily on the ordinary pillar 80 ft. in length, with three men, we start in the lowest point (see accompanying sketch) to extract the coal. This enables us to leave our water behind (which is contrary to the regular established system of pillar extraction) by starting at a given point and formulating a robbing line approximately 30 deg. off the course of the heading.

This is a radical change from some of the present methods of mining and robbing, both advancing and retreating, and substantiates only too well that every mine and every seam has its own peculiar and particular characteristics. It also shows that its chief supporting factor lies in the ability of the men in charge to adopt a system suitable to their conditions, one that will win the maximum amount of coal by the most economical method.

The Beckley seam is irregular, and it has an underlying seam that is regular as to thickness and general

dip, which is just the opposite in the upper split. The strata between the upper and lower split range from nothing (where both seams merge into one) to 65 and 70 feet.

When the coal in the upper seam (which runs from 4 to 13 ft. and is of an absolutely clean variety) is not extracted quickly enough in second mining, a downward pressure is exerted by the roof. This causes the bottom to heave or buckle up, and it becomes necessary to take out the pillar at once so as to avoid the height that is too low for equipment and the taking of bottom.

In many cases we have no falls whatever, and we are mining now on two slabs, one 360 ft. long, the other 250 ft. long, the machine that cuts the coal going up. When the end of the slab is reached the bits are reversed, and after the coal is cleaned out the machine cuts its way back again. In these instances the track is slewed to the face as it advances, and at a safe distance back from the face the roof and bottom are together, and no fall has occurred.

No shooting is necessary in this coal, owing to the pressure of the roof, which is just enough to break a cut up, as is often the case in our straight workings, or first mining. These long slabs, or longwall in a mild form, are experiments on our part and so far have worked out as planned; but the success of any method of mining depends on the attention it receives from the men in charge.

Pricing F.o.b. Mine with Freight Allowed

By J. Crow Taylor
Louisville, Ky.

The embargoes of last spring and the priority orders of the present winter have served to turn attention to the idea of selling coal f.o.b. mine and furnishing the freight figures to destination showing just what it will cost delivered.

Some time ago I heard a mine representative and salesman who covered quite a large territory complain bitterly about the difficulties he had encountered in his efforts to serve the needs of customers. The customers were short of coal and some of the coal he had sold them had been held up by embargoes. This had necessitated his rebilling and disposing of it elsewhere after it had been put in transit. And all he got for his trouble was accusation from some of his customers of manipulation and crooked dealing.

The customers were inclined to view the matter in the light of profiteering. They believed that he had diverted cars intended for them, or else withheld shipment of their order simply because he had been offered better prices by someone else. They accused him of simply making embargoes an excuse. In fact there was so much of this that he said he had almost determined to make all his sales f.o.b. cars at the mine so that when cars were loaded at the mines and offered to the railroads for any given customer, that would settle the producer's responsibility and the customer himself could fight out the complications arising from the railroads confiscating cars or failing to make deliveries because of the embargoes, priority orders and other interference.

This one individual case might be taken to represent more an expression of personal feeling because of temporary disagreeable circumstances, but there have been many such cases in the past. Numerous instances have been found where mine operators have sought to free themselves from the burden of wrangling about shipments in transit by selling their product f.o.b. the mines and simply figuring out for the customer what the total cost will be delivered at a given destination, guaranteeing the rate of freight, but not the time of delivery further than their own delivery or tender of delivery to the railroads at the mouth of the mine. This tendency has been particularly noticeable in connection with making contracts. Just to what extent this new policy will prevail will probably depend upon the conditions of car supply and the ability of the railroads generally to handle the needs of the country in the way of coal transportation.

It is practically a reversing of the usual selling plan, for heretofore most sales managers and jobbers have builded their business largely upon selling coal delivered to the customers at a specified price. Usually the customer is more interested in knowing exactly what his cost will be on coal delivered than he is in figuring out freight rates from various points to determine just where and how he might better himself a fraction. It has been the lot of the sales manager and the wholesaler to unravel the complexities of freight-rate combinations and profit thereby, because he who is well posted in traffic matters can often figure out a profitable saving in freight while at the same time satisfying both the mine operator with his positive price at the mine and the consumer with his positive price delivered.

This figuring of freights is a form of service that the jobber has argued is worth something, and as a consequence he has made a specialty of this kind of work. To reverse the plan of selling and make prices f.o.b. mine with the freight rate guaranteed would seemingly result in eliminating all chances of the jobber profiting from such service.

With a return to normal conditions so that freight will move smoothly and the majority of people will be plentifully supplied with coal, there will be found a natural appeal in the idea of resuming the present practice of making delivered prices to the consumer and handling the freight rate problem as a part of the selling proposition. On the other hand, with a continued shortage, and when as now wrangling and charges of unfairness are piling up, there is a natural disposition on the part of sales managers to favor the idea of selling at an f.o.b. mine price and shifting the burden of freight misunderstandings to the railroads and the consumers.

Perhaps nothing is more illustrative of the goading they have been subjected to and the trying times that sales managers have been going through in the coal industry than the present tendency toward favoring f.o.b. mine prices.

Approximately Fifty Million car stops are made in the United States each day. The "skip-stop" schedule would eliminate one-third of these. The elimination of six billion stops a year, together with the regulation of car heating, will bring a fuel saving of not less than 1,500,000 tons of coal a year, which will meet the fuel needs of 300,000 average families.

Modern Coal Stripping in Ohio

By W. E. HOLLOWAY
Cleveland, Ohio

ONE of the latest Ohio coal properties to be worked by means of the stripping process lies in the Smithfield district of Jefferson County. This is the property of the Superior Coal Co., of Wheeling, W. Va. E. T. Hitchman, a man of long and varied experience in the operation of coal mines, is president and general manager.

The first carload of coal was shipped from this operation on Dec. 1, 1917, just seven months after the placing of the contract for the loading facilities. The property consists of 2500 acres and it was necessary to construct one-half mile of railroad siding in order to develop it.

The coal is known as Ohio No. 8. It is a high quality of steam coal and on this particular property runs about 5 ft. 3 in. in thickness. Careful consideration was given to the arrangement of the railroad sidings and the method of working the coal and preparing it for mar-

TWO VIEWS OF THE TIPPLE AND THE LOADING AND STRIPPING SHOVELS IN ACTION

ket. Three sidings were accordingly built, arranged around the property at the outcrop. This insured quick production and a minimum of expense for loading facilities.

The average cover overlying the coal bed is 21 ft. This is removed by means of two Bucyrus No. 225-B, steam shovels equipped with 6-cu.yd. dippers and 80-ft. booms. The boilers of these machines are 250-hp. capacity and the shovels are among the largest used in stripping work, each weighing 420 tons.

Bucyrus shovels are also used for digging and loading the coal. These are of the caterpillar type, No. 35-B, equipped with 1½-cu.yd. dippers. One stripping and one digging shovel work in from either side of the property toward the center. This greatly reduces the time of handling the coal from the shovels to the tipple, for no shifting of shovel trains is necessary.

Four Vulcan saddle tank locomotives handle side dump cars of 5-cu.yd. capacity each. These cars are placed in trips of 10, and while one train is being loaded the other is at the tipple being unloaded. From here the trip passes through the tipple and around to the second shovel. By this method of train manipulation the company is prepared to load 1800 to 2000 tons per day.

At the tipple the coal is deposited in a 50-ton receiving bin from which it is delivered to a crusher or bypassed direct to a conveyor where picking is done. This conveyor delivers to a bin over the railroad siding. This bin is employed to facilitate the moving or changing of railroad cars without stopping the operation of loading.

The crusher and conveyor are driven from a 150-hp. horizontal steam engine, boilers for which are located in the rear of the tipple.

The water-supply for this operation is obtained from a dam located on the property, impounding 3,000,000 gal. of water. This is pumped into two receiving tanks of 47,000 gal. capacity each, from which it is distributed to the shovels, tipple and locomotives.

The entire operation was planned with a view to reducing to a minimum the operating expense and the amount of machinery necessary for producing and loading coal. It was designed by and erected under the supervision of the Willis E. Holloway Co., of Cleveland, Ohio, working in conjunction with Mr. Hitchman.

Use of Electricity in Saving Coal

The accompanying illustration shows a 270-ton Baldwin-Westinghouse electric locomotive hauling a 3250-ton train of loaded steel coal cars up the Elkhorn Grade electrification of the Norfolk & Western Railway.

Previous to the electrification it required three of the biggest modern Mallet locomotives equipped with mechanical stokers to haul a train of this tonnage up the Elkhorn Grade at a speed of 7 miles an hour. Now two electric locomotives haul it up the same grade at 14 miles per hour, or double the speed formerly obtained by steam locomotives. As a matter of fact, in cold weather it was frequently necessary to reduce the tonnage of the train considerably in order to permit the steam machines to get it up the grade.

With electric propulsion, the same coal traffic can therefore be handled with about one-third the former number of locomotives and half the number of engine and train crews. Such economies in rolling stock and labor are particularly effective at this time in lessening the traffic congestion and hastening the movement of coal to eastern points. Of equal interest is the statement recently made by the Commissioner of Agriculture of the State of Montana in regard to the use of electric power by the Chicago, Milwaukee & St. Paul R.R., which is now obtaining 160,000 kw. of electric energy from the hydraulic plant of the Montana Power Co. The saving in fuel effected by this use of water power instead of coal has been highly gratifying to the state officials.

The commissioner states: "To give an idea of the value of the power which is being generated by these

BALDWIN-WESTINGHOUSE ELECTRIC LOCOMOTIVE HAULING TRAIN OF LOADED COAL CARS

plants it may be stated that to produce 160,000 kw. from coal would require the yearly consumption of 2,500,000 tons. This, at the average price of $4 which would apply at the points where the power is used, would amount to $10,000,000. When it is considered that the value of this coal is, by means of water power, being saved each year for future generations, and that during the next 10 years this saving will in all probability be increased seven or eight times, it is not difficult to understand that true conservation consists in encouraging the rapid development of water power, which unless developed and utilized becomes lost for all time."

It has been estimated that the national shortage of coal last year amounted to 50 million tons. The saving therefore by this one company alone of 2,500,000 tons of Montana coal amounts to 5 per cent. of the total shortage in the country last year.

Oh, No! He Was No Coal Man

Recently an operator of the Clearfield region of Pennsylvania went to Washington to complain that official requisitions had been made upon his mines for about 1,000,000 tons more than they were capable of producing. After being passed along by nine different officials, the operator finally reached the sanctum of a dynamic young man who admitted responsibility for the requisitions.

"Are you a coal man?" the operator inquired.

"Oh, no," replied the fuel administration official. "I was an automobile salesman before I got this appointment."—*N. Y. Tribune.*

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The miners in the anthracite region are many of them disgruntled at the recent increase in the dues payable to the union. A meeting to discuss the matter was declared "disloyal and traitorous" by President James Matthews, of the 9th district, at Pottsville. The manifest need for the change in dues does not seem to appeal to the dissentients, but it could easily be proved were they minded to accept proof.

The Reliance colliery of the Philadelphia & Reading Coal and Iron Co. struck on Mar. 8 because the officials of the company refused to add two men on each shift of firemen. Even foremen and clerks were compelled to man the boilers though it is usual for the union to provide men to do this work when mines are on strike, even when the union regards the strike as justifiable, for the mines must be kept free of water and gas or they will be shut down almost indefinitely. Seven hundred men were laid idle by this strike at the Reliance colliery.

CENTRAL PENNSYLVANIANS WANT WAGE INCREASE

Central Pennsylvania mine workers are seeking an increase in wage to absorb the new increase in price conceded by the Fuel Administration. The miners want a 20c. a ton advance, and the day workers want another $1 per day, the boys to receive, however, only 55c. The concession was given to the mine operators to make the prices gibe with the costs of operation, but ignoring that fact the mine workers want an equivalent rise in the price of their labor. The mine workers have demanded a joint convention with the operators of the district.

It was reported at the recent biennial convention in western Pennsylvania that 76 new locals have been established in the district, and that 52 more coal companies are now making contracts with union labor.

In Ohio the miners in the 8-A seam are talking strike quite menacingly. As noted last week in this department the men believe that a revision of the scale should be made in recognition of the thinness of the measure in which they have to work. The Cambridge district miners are interesting themselves in seeing that they get a fair apportionment of railroad cars. When certain of the mines could not run by reason of high water the mines were rated as having received their full apportionment of cars. When the floods receded the mine workers were idle because cars were not supplied. On Mar. 7 a delegation of Cambridge district mine workers called on Governor Coxe to protest against this treatment and he ordered James B. Dugan, chief inspector of the public utilities commission, to take up the complaint with the railroad officials whom Dugan claims are violating agreements.

HITCHMAN MEN JOIN UNION OF THEIR OWN WILL

The Hitchman Coal and Coke Co., in West Virginia, it will be remembered, enjoined the United Mine Workers not to interfere with its operations by unionizing its employees. On Mar. 4 the International President, Frank J. Hayes, and nine other officials filed briefs declaring that if the tonnage of the Hitchman Coal and Coke Co.'s mines was reduced it was not due to labor troubles and that if any of the men employed by the company joined the union they did it of their own volition and not because of any encouragement on the part of the union. They presented 22 affidavits to this effect.

In Preston County, West Virginia, the miners are demanding a reduction in the price of blasting powder. At the mine of the Kingwood Coal Co., although the company does not handle powder, the mine committee has served notice on it that if it did not provide powder for $2.10 a keg the mine workers would strike. Other companies have received similar demands but they have been couched in milder form.

In the Georges Creek field of Maryland the miners are also asking increased wages.

The biennial conference of western Kentucky, held at Louisville, was addressed on Apr. 6 by the Rev. Dr. Richard Wilkinson, who spoke on the necessity for coöperation with the nation in its war policies. On the following day the delegates pledged their loyalty and promised not to strike during the war. Should the union, however, continue in its determination to use the war as a means to extend its affiliations in the western Kentucky field, as has been ordered by the international conference and already foreshadowed by union action, it is hard to say what may happen in western Kentucky.

MINERS REFUSE TO WORK WITH ENEMY ALIENS

Some mine workers at Greenwood, Ark., composing local No. 1842, have addressed a resolution to Newton D. Baker, the Secretary of War, protesting against the employment of enemy aliens in the mines, seeing they are being discharged from the army, and urging that mining work with its hazards to the employees is made more hazardous by the presence of men who are unfriendly to the native mine workers and may "by the slightest negligence or by malicious conduct" jeopardize the lives of their coworkers. They also protest against the employment of enemy aliens because they "take the place in the mines of our boys who go to the front." On the whole, however, no one can note that enemy aliens have been doing, in the coal mines, the acts anticipated of them. Moreover, a man might be quite a loyal worker behind the lines and yet could not be depended upon to strike down those of his own race in the battle line.

A somewhat similar condition exists near Lansford in the Pennsylvania anthracite region at mines of the Lehigh Coal and Navigation Co. Twenty-one Austrians were drafted into the national army prior to the declaration of war with Austria-Hungary. When war was declared with that country they were discharged and they returned to the mines. The other miners refused to work with them. One of the men is said to have made slighting reference to the United States uniform. Two others tried to persuade men of Austrian parentage from joining the United States army or the Slovak-Bohemian army. These men have been arrested. The 21 Austrians have been discharged and the strike is now at an end.

MICHIGAN MINES SETTLE DOWN TO STEADY WORK

In Michigan, it is said, that President Crutchfield's desire to turn the Albion strike into a state-wide suspension was due to union politics. Robert Gaffney, of Bay City, with the other international officials has been in favor of ending the strike. Crutchfield is to be retired from the presidency, and he desires to get Gaffney's berth as international board member, whereas Gaffney is a candidate for reëlection. On Mar. 6 W. K. Prudden, State Fuel Administrator, tried to solve the difficulties in a joint conference of mine operators and union men held at Lansing, Mich. He seems to have been entirely successful and the Albion men went back to work Mar. 8 with an increase in wage of 30c. a ton, the rate being now $1.30.

The only question remaining to be settled is whether the increase shall be dated back to Nov. 1, the date of the Washington agreement. This matter will be left to Dr. Garfield for settlement. There is still a discussion at Saginaw where a 10c.-per-ton increase is demanded. The Albion operators have, since Jan. 1, been willing to increase the rate 15c., but on Mar. 6 they gave the increase demanded.

It appears that the referendum regarding a strike in Michigan mines was quite favorable to that action, Crutchfield declaring on the date of the conference that 4 or 5 men favored it in their votes to every one who opposed it. Only the settlement at Albion relieved the situation. It now appears that Crutchfield will be safely elected as international board member.

The Colorado split is becoming wider. The United Mine Workers refused to accept a delegate to the biennial conference because he was a delegate also to the Independent Union of Miners of America. The delegates declared also that they would not attend a meeting to be addressed by British labor officials because John R. Lawson, the president of the Independent Union of Miners of America, was scheduled as chairman. The new union claims 3000 of the 5000 union members in the fifteenth district, whereas the United Mine Workers claims that the United Mine Workers of America has nearly 8000 members.

In Nova Scotia the agreement of the Dominion Coal Co. with its miners was duly ratified about Mar. 1. The terms of the agreement appeared in our issue of Feb. 23. The men get an increase of about 17 per cent. or a trifle less than a million dollars a year. About 5000 men work at the mines of the Dominion Steel Corporation, and all participate in the new scale.

The strike in Drumheller, Alberta, narrowed down ultimately to a strike at the Rosedale mine. On Feb. 27 W. H. Armstrong, director of coal operations, demanded that the day wages and working conditions set forth in the agreement in force at other mines in the Drumheller district be observed. According to J. F. Moodie, the general manager, this meant a reduction in wages of from a few cents to 75c. a day. The men went back to work, however, but on Mar. 4 they struck again. Yet on Mar. 7 it is recorded that they were working.

Central Pennsylvania Asks More Pay

The biennial convention in central Pennsylvania came shortly after the decision of the United States Fuel Administration to increase the price of coal from that district 60c. so as to make the production of coal profitable to all the operations in that district that are conducted with reasonable efficiency. The mine workers who got an increase when the 45c. increase in prices was made—and in fact that increase in price was granted so the wage increase could be safely conceded—believe they should have a like increase to accord with the new price.

If the advance should be granted the aims of the Fuel Administration would be circumvented. The concerns which from low coal, higher freight rates, difficulties in operation and inadequacies of equipment cannot produce the cheaper coal would be forced out of business as they threatened to be when the price for run-of-mine was $2.45 instead of $3.05. Only the concerns with favorable conditions would be able to pay an increased wage and go on working.

It was not so when there were large contracts at more than Government prices to sweeten the dose which the Administration had ordered the industry to swallow. More and more it becomes true that only Government prices are obtained, and if these are kept to the lowest operable basis the mortality among coal concerns will be high. Apparently Dr. Garfield has decided that it will be higher than is desirable. The increase he made was to avoid that mortality, but if the miners get the increase, the end of many coal operations will be a matter of a few weeks.

It begins to appear that there is but one decision possible with the Fuel Administration. It is already setting prices; it must also inevitably prepare itself to set wages. The right to regulate one is just as clear as the right to regulate the other.

The central Pennsylvania convention met in Dubois, Penn., on Feb. 27 with delegates clamoring that the coal miner who got an increase of two-ninths of the 45c. advance should receive two-ninths of the 60c. advance, or roughly 13⅓c. Presumably the rest would go to the other mine workers as in the 45c. advance.

The whole uneasiness in the district arose from the higher rate paid per ton to the miners in the Broad Top and Osceola districts, so for this reason the unrest mainly concerned itself with miners' wages and not with the day wages of the other mine workers.

On Feb. 28, when local 64, of Holsopple, presented a resolution for the nationalization of coal mines, it was unanimously approved by the assembled delegates. They also declared in favor of "clean coal" with equal unanimity, but the resolution on the subject was returned to the committee for alterations which would take cognizance of the fact that the obligation to produce clean coal rested equally on miners and operators. Some of the miners declared that the operators were mainly to blame for the loading of bony coal. According to the delegates the operators were loading out bony material that had been left lying in piles for years and ordering the miners at the coal face to load bony coal with the clean.

Do Not Like Unions or Increased Wages

The Indiana County doctors came in for much criticism. They had done two extremely wicked things. They had, to begin with, formed a new union or association, and they had increased their fees. Now men who form a union and increase their pay are demonstrably "profiteers." The mine workers sought to get some authority in the selection of mine doctors. This is almost sure to come sooner or later. The men so selected may in some cases not be the best of men, for good professional men are little disposed to have their services hang on the issue of a vote, but today there are cases in which the selection of the doctor by the mine management is not wise and not altogether uninfluenced by pelf.

The mine workers ask also for better "company houses" with water service and more defense against the cold. The rent, however, is already inadequate. House ownership around the mines is now too often a debit, not a credit. So long as rents remain at their present low level improvement cannot be granted without adding a loss on the houses to the cost of the coal.

Broad Top Differential Made All the Trouble

The Broad Top differential was a big source of dispute. The Central Pennsylvania district as a whole when the contract was modified by the Washington agreement asked for a 33⅓ per cent. increase and obtained a 25 per cent. increase, the allowance of all the other districts. The Broad Top field held out and got 10c. more a ton for the mining of coal, as is stated in our issue of Dec. 15, 1917. This 10c. was to continue till Apr. 1 and then was to be removed. But, as might have been expected, the Broad Top men do not want to suffer the reduction in price to which they agreed in their contract. Despite much urging, the delegates refused to do anything for the Broad Top miners. The Clearfield County district—using the word in its narrowest interpretation to include the district around Osceola, Houtzdale and Madera, where the Independent Operators' Agreement of Clearfield and Center Counties is in force—has the same rate as the Broad Top district. Apparently this arrangement is unlimited as to time, and it is generally understood that it is to be operative till the war ends.

The policy committee ultimately brought in a resolution asking for an increase of 20c. per ton and $1 per day for all day hands except trappers and boys under 18 years of age. These employees are to get an increase of 55c. per day. Of course the Broad Top and Osceola-Houtzdale-Madera miners who have the larger wage are to get smaller increases so that their advantage will be removed.

Though there was some opposition to increased international dues it did not have any strength. It was decided eventually to raise the dues 26c. per month which will make the miner's dues $2.28 and the day man's dues $2.26 per month.

When the vote for the next convention city was counted it was found that Johnstown had 87 votes, DuBois, 70; Indiana, 10; Philipsburg, 14; Kittanning, 1; and Barnesboro, 0. All but Johnstown and DuBois were cast out and a second vote gave Johnstown 99 votes and DuBois 89, there being 8 more votes cast in this final ballot.

EDITORIALS

Nonessential Industries Should Not Expand

THE action of Congress in refusing to give the authorities power to curb the issuing of new securities for the expansion and initiation of nonessential industries is much to be deplored. We may well have consideration for the workmen and capitalists who have invested their abilities—mental and financial—in industry and feel that it would disturb the nation unduly and with little advantage to ruthlessly put them out of business and on to the street.

But clearly we have a duty to keep persons from entering into new businesses during the war wherever we feel that the business is not of any advantage in the prosecution of the war—our supreme duty. Stores, theaters and hotels are being erected where there is really no need for them. To add to these industries is to add to the number of those institutions which may ultimately have to be curbed.

When the automobile industries catering to the pleasure seekers are voluntarily restricting production 30 per cent., no new automobile factories should be erected and no new companies be formed. Action should have been taken long ago. The public will be happy if it can retain a few of its luxuries during the war. It will certainly be ill advised if it tries to add to them.

The Governor Closes His Eyes and Dreams

IN early days we used to delight in dreaming that we had money in scads, and that we had no difficulties except to bestow it where poetic justice and our generous instincts would dictate. Sometimes we got that wealth from the sea water, where there is an unbelievably large stock of gold more hopelessly watered than any stock on the New York Curb.

But why not dream? M. G. Brumbaugh, of Harrisburg, and W. S. Tompkins, of Wilkes-Barre, admit that they do it. They have been dreaming of how they would take the methane out of the air of the mines and sell it for burning under boilers and, with that money, Mr. Brumbaugh, who is governor of Pennsylvania, would pension the mine workers.

The pension prescription reminds one of the old recipe for the making of hare soup which began with the words: "First catch your hare." Before the big-hearted governor schemes pensions let him find out how diluted methane can be concentrated. At present it seems that the fixation of nitrogen is far nearer profitable accomplishment. Yet there is more nitrogen in air than methane in the mine atmosphere, and the air of the woods and the fields is without ownership; whereas there might be more question as to the air sucked or forced, out of the mines and enriched by the gaseous emanations of the minerals below.

However, if it pleases Messrs. Brumbaugh and Tompkins to dream such miracles of science and scheme how they may be utilized, why should we object? Like the man who was hectored by his puny wife we may say, "It pleases she and doesn't hurt I." Why take offense so long as Mr. Brumbaugh does not ask the industry to store enriched mine air till such a time as he finds a way to turn it to a commercial use.

Concrete Industrial Homes

A DOLLARS AND CENTS proposition generally secures the attention of business men everywhere. Often this feature is not antagonistic to the treatment of industrial problems along humanitarian lines, as evidenced by recent improvements in the housing of employees at large plants in various industries. This is notably true in coal mining.

Suitable house accommodations attract and hold the better class of labor. Then there are great numbers of employees at the mines who are not Americanized, their living conditions often are not conducive either to efficiency or morality. Good citizenship does not seem to have appeared at all as a factor in the lives of many of our foreign-born laborers. They may live far from their work in crowded quarters—bachelor colonies existing according to their traditional standards of living.

It has been aptly expressed by one who has made a close study of such problems: "To remedy these conditions—to bring the workers closer to their work, to house them comfortably and economically, and under such an arrangement as to minimize the tendency toward over-crowding; to induce to more nearly normal, a more American recreational expansion of the individual; to inculcate a sense of appreciation of the better things in home and community life—with no less ambitious an idea the problem was undertaken by a steel company in Youngstown, Ohio."

Considering the housing problem from a technical standpoint, concrete offers a building material of exceptional advantages. A number of methods have been worked out which have been successfully used. Those will probably survive as fittest which follow ordinary contract methods—those which do not use excessively heavy, unwieldy or complicated forms in construction.

Meeting the objection of excessive standardization in similarity of design—whole rows of houses exactly alike—specialists have developed methods which give a pleasing effect by varying the style of houses. Different colors of cement stain also relieve monotony. Eliminating severe lines of straight streets and substituting curved ones makes a pleasing change. But isolated groups of houses around open courts, is a scheme tabooed by one of the larger anthracite companies. Preliminary to erecting extensive accommodations for its men, it gave the matter considerable thought. The sentiment among the employees favored the old close formation of mining villages with easy access to shopping and amusement centers.

The consensus of opinion of those who have lived in

both frame and concrete houses favors the latter type of construction. One thing stands out forcefully, and that is the solidity and tightness of the concrete house in low temperatures during high winds. If this point required a practical demonstration, the conditions of the winter of 1917-18 should have provided it conclusively. Evenness of room temperature in both summer and winter adds much to the comfort of those living in dwellings of cement construction.

At one time concrete houses were damp under certain conditions. But this objectionable feature has been removed on a better understanding of the contributing causes. Dampness on the interior surfaces of concrete walls may be due: First, to poor concrete, which is so porous as to permit the moisture to strike through from the outside. Second, cracks, from various causes, through which moisture penetrates to the inside. Third, lack of continuous air space for insulation in the wall, or lack of proper ventilation so that moisture in the air inside the house condenses on the walls. Continuous air space is readily provided by furring, lath and plaster at nominal cost.

Considerable literature on cement and concrete construction has been distributed through the medium of technical and trade journals, pamphlets and circulars of manufacturers and associations and practical works by various authorities. This building material lends itself to a great variety of applications. There is little excuse today for anyone to plead ignorance of its value and many uses.

Paying for Services Rendered

THE many schemes for regenerating the world after the war all seem to take it for granted that natural law will be suspended and economic law repealed. But just as most of us regarded the world with some misgivings before this war, so after it is over we expect to find it hampered by the laws of nature and the imperfections of mankind.

Last week reference was made editorially to the inadvisability of making a uniform price for coal winter and summer, thus causing idleness in the summer when work is unhampered and causing excessive activity in winter when every kind of difficulty interposes. A proposal of the British labor party, just as much to be criticized, is that coal should be sold at one price regardless of the distance over which it has to be transported and regardless of the difficulty of transportation.

In a country larger than Great Britain perhaps it would not have occurred to the labor leaders to ask for a perfect uniformity of price regardless of all geographical and transportation considerations. But the principle is the same whether a country be large or small.

The manifesto of the Labor Party in regard to this matter is as follows:

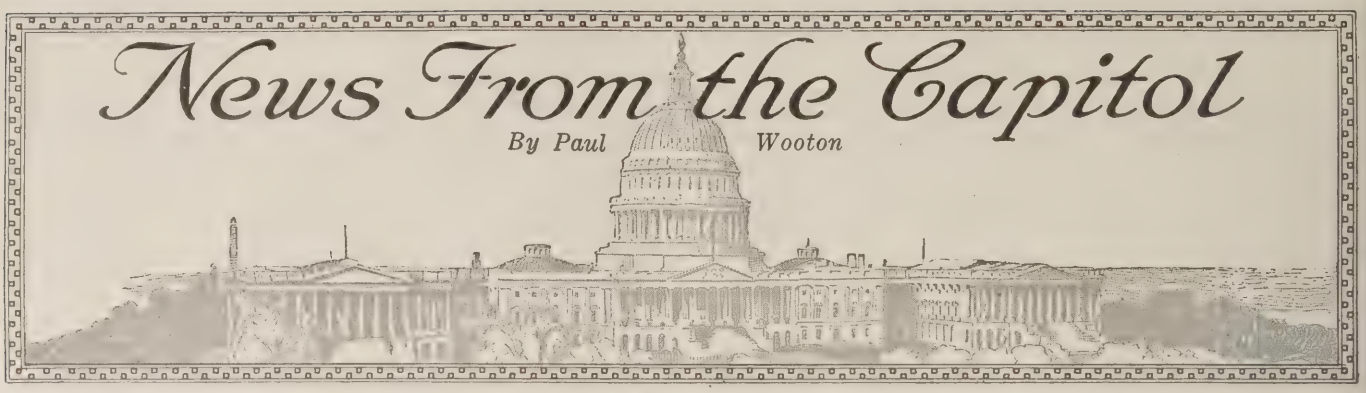
"There is no reason why . . . the consumer [of coal] should be made to pay more in one town than in another. What the labor party would aim at is for household coal of standard quality, a fixed and uniform price for the whole kingdom, payable by rich and poor alike, as unalterable as the penny postage stamp."

Under this arrangement the mine worker would be deprived of the privilege of buying coal below cost as he insists on doing today in America. He would have to pay as much for it as if he lived say 500 miles from the mines instead of within hailing distance.

If this unalterable charge for extremely variable services is to be extended to coal for industrial purposes no plant will try to establish itself, and no person will build, with any regard for accessibility. The problem of delivery is left to the Government which also must deliver coal of a standard quality—a thing obviously not possible of accomplishment.

The fact that the burden of transportation for long distances has hitherto been thrown, in the main, not on the transporter but on the consumer has tended to make the consumer move toward the source of supply. It has prevented big iron mills being erected in Kansas and beet-sugar mills from being built in New Mexico.

But granted a rate independent of distance and all the plants of the country will be erected to satisfy passing whims. Let us suppose that at a certain location there is a good foundation for a blast furnace making erection easy. The iron ore is found 1000 miles away; the coke must come some 800 miles; the nearest limestone is 400 miles distant; there is no water readily available; the market is across some half-dozen state lines. What do all these things matter when the world is run rigidly on a uniform-delivered cost basis and the Government does the hauling? The foundation for the mill or the idiosyncracy of the mill operator is the only consideration.



Everything will be done without regard to zones as soon as our zones are removed. Some economic feature must replace the zonal law. But the labor leaders of Great Britain would have us forget after the war the lessons taught by the necessities of the conflict, and among these lessons is the necessity for reducing needless transportation.

There is too much transportation now. Some states seem devoted to the manufacture of raw, or at least crude materials; others devote themselves to finished articles. The raw material even now often travels to the East to be refined, then to the West to be made into merchantable products and then back to the East for actual merchandizing.

The only safe and reasonable cure for this shifting back and forth is a fair and proportionate charge for transportation. If a man will persist in living or in operating where transportation is uneconomical the high prices for everything will be the best way of convincing him that his action is contrary to public interest and his private profit.

If, however, domestic fuel alone is made uniform in price the damage will not be as great. But the principle seems best which leaves the heavy burden of transportation on the man who elects to make that transportation burdensome.

Probably the labor leaders who penned the manifesto will see this point as clearly as anyone. They declare in their statement that "no labor party can hope to maintain its position unless its proposals are, in fact, the outcome of the best political science of its time." From this declaration more hope can be drawn than would be possible had they declared, with many labor men, that all economic and political law is to the labor movement but a source of stumbling and offense.

Regulations Governing Retail Distribution

In an effort to secure the broadest and the most equitable distribution during the coming coal year, the Fuel Administrator has prepared an extended list of regulations governing retail distribution. With their promulgation, he has announced that anthracite prices will be subject to an average reduction of 30c. a ton, effective from Apr. 1 to Sept. 1, rather than continuing the plan of the sliding scale of reductions. The retail regulations, in full, are as follows:

Every consumer should be urged on or before Apr. 1, 1918, to place with his regular dealer his order for his reasonable normal requirements for the year ending Mar. 31, 1919. Such orders must be made in writing and must state substantially the information called for in Regulation 3 hereinafter set forth. When such orders have been entered, the dealers shall proceed to make deliveries thereon, until each consumer, willing to accept the same, has received two-thirds of his normal annual requirements, provided that orders of six tons or under may be filled in full. When all consumers, who are willing to accept it, have received two-thirds of their normal annual requirements, the dealers may proceed to fill the balance of such orders up to normal annual requirements of each consumer. (The provision for two-thirds delivery should apply only to anthracite. With respect to bituminous for domestic use, the dealer may proceed to deliver the consumer's normal annual requirements.) If a consumer already has a quantity on hand, he shall receive only such additional amount as shall make up his normal annual requirements.

New consumers who are unable to have their orders accepted by a dealer should apply to the local fuel administrator, who should see that their requirements receive attention from the proper dealer. Carload or barge-load lots shall not be delivered to a single domestic consumer or to a group of consumers except with the permission of the local fuel administrator. Dealers shall file with the local fuel administrator on the first of each month a statement containing the names and addresses of consumers to whom deliveries have been made during the previous month and the quantity delivered to each.

The following regulations have been established by the United States Fuel Administrator:

1. Until further notice no domestic consumer of coal or coke shall purchase, receive or otherwise take possession of more coal or coke than is required for his actual and necessary requirements prior to Mar. 31, 1919. If such consumer already has a quantity on hand he shall receive only such additional amount as shall make up his actual and necessary requirements prior to that date.

2. No person, firm, association or corporation, whether acting alone or in conjunction with others, shall, directly or indirectly, provide any domestic consumer of coal or coke with more coal or coke before Mar. 31, 1919, than is necessary, with the amount already on hand, to meet the actual and necessary requirements of such consumer prior to that date.

3. On and after Apr. 1, 1918, no person, firm, association or corporation shall sell or deliver coal to a domestic consumer who does not first furnish to the person selling or delivering such coal a statement which the consumer declares in writing to be true, and which specifies (1) the amount of coal the consumer has on hand, (2) the amount of coal he has on order and the name of the person from whom ordered, (3) the amount of coal used by him in the 12 months ending Mar. 31, 1918, and (4) the amount of coal needed to meet his actual and necessary requirements prior to Mar. 31, 1919; provided, however, that this regulation may be modified by any state fuel administrator within his own state under such circumstances and conditions as he may deem proper.

4. On and after Apr. 1, 1918, and until further notice, no retail dealer shall, unless authorized by the state fuel administrator, deliver or cause to be delivered to any domestic consumer more than two-thirds of his normal annual requirements of anthracite coal until each domestic consumer who has placed his order with said dealer and is willing to receive delivery of the same has received two-thirds of his normal annual requirements for the year ending Mar. 31, 1919; provided, however, that orders of six tons or less may be filled in full.

Any dealer or consumer who violates the foregoing regulations will be subject to the penalties prescribed by the Lever Act. Such further regulations will be issued as may be necessary to enforce the essential features of the foregoing plan.

To Insist on Clean Coal

An order expected to insure the cleaning of coal to prewar standards was issued by the Fuel Administrator last week. If a shipment of coal is found to contain an unfair amount of noncombustible matter, the operator may re-prepare the shipment or it may be delivered to the consignee with the understanding that 50c. a ton may be deducted from the authorized price. The intent of the order is stated to be to reinstate the cleaning of coal at the working face and to reinstate the employment of slate pickers. The order in its entirety is as follows:

Section I. Authority is hereby given to the district representatives of the United States Fuel Administration to appoint a sufficient number of inspectors in their respective districts to carry out the terms and provisions of this order, and to assign to each of said inspectors a particular territory.

Section II. It shall be the duty of each of said inspectors:

1. To cover his territory at as frequent intervals as may be consistent with thorough inspection; the inspectors shall be qualified by knowledge and experience of the particular district or districts in which the inspection is to be per-

formed, and shall familiarize themselves with the conditions under which the coal is produced and prepared, so as to enable them to effectually carry out the terms and provisions of this regulation, the intent being to reinstate the cleaning of coal at the working faces of the mines; to reinstate employment of slate pickers with a view of bringing the ash contents of coal back to approximately the standard of normal times. Furthermore, where the coal in any part of the mine is found to be naturally of such character as to be unfit for market, judging from the usual standard of the district, the district representative may order the mining suspended in said part or parts of a mine until or unless proper cleaning methods be adopted; provided, however, that the workings shall not be so suspended where the nature of the mining to be done is necessary to preserve the mine from damage, or where a cessation of work endangers life or may result in serious risk of flooding, of explosions or of squeezing.

2. To report daily to the district representatives of the Fuel Administration mines inspected, the condition of the coal as loaded; methods being employed to prepare and clean the product, whether or not the product being shipped to market is, in his judgment, a well-prepared and merchantable product. All reports of inspections shall be made in quadruplicate, one to be forwarded by mail to the Fuel Administration, Department of Inspection, at Washington, D. C.; one to the district representative; one to the operator; and one to be retained by the inspector for his personal files.

Section III. Inspectors are authorized to condemn at the mines any coal loaded in railroad cars which, in their judgment, is not properly prepared; and any inspector finding unmerchantable coal shall immediately notify the district representative and the operator by wire or in person or in person and in writing, giving the car numbers and initials of any and all cars so rejected and stating the facts on which such action was based. A copy of such notice shall be immediately mailed to the United States Fuel Administration, Department of Inspection, and to the district representative. If the district representative approves the inspection report, he shall so notify the operator at once; in which case, unless the operator unloads and reprepares the rejected coal, the consignee shall be permitted to deduct 50c. per ton from the authorized price for the grade of coal with which the car is loaded; provided, however, the consignee after examining the coal may at his option pay and the operator may receive the full authorized price. Each invoice covering the sale of condemned coal shall bear the following notation, "This reduced price is fixed by the United States Fuel Administration as a penalty for improper preparation." The operator shall thereupon immediately report to the United States Fuel Administration, Department of Inspection, at Washington; and to the district representative the disposition made by him of said car or cars of coal, and shall accompany his reports with a copy of the invoice.

The district representative, where repeated violation of this regulation has taken place or in flagrant cases, shall require a special written report from the operator, which report shall be transmitted by said district representative to Washington with his conclusions thereon, all of which is subject to review by the Fuel Administrator.

This order or regulation shall not operate to change the terms, conditions or validity of existing contracts, but new contracts shall be made subject to this order.

While the order with regard to clean coal has been contemplated for some time, it was hurried by reports from fuel administration inspectors who found that considerable quantities of anthracite were being marketed which did not come up to the standard. It resulted in the condemnation of 1600 tons of coal in Pennsylvania markets. William Potter, the fuel administrator for Pennsylvania, has had the matter of cleaning coal before the anthracite operators for several weeks. In a report to the fuel administration, Mr. Potter says:

"Large shippers of anthracite, after indorsing the standard of preparation adopted by the fuel administration, are keeping their word and now are sending properly sized and prepared coal to all markets. Some of the small operators have been giving trouble, but the unloading of the cars, which contain the coal condemned because it did not measure up to the requirements, is believed to have effectually ended the practice."

Weekly Production Statistics

Continued fair weather and a better car supply permitted the production of 11,055,000 tons of bituminous coal during the week ended Mar. 2. Beehive coke production during the same week was 621,000 tons, a marked increase over the week preceding. This is the largest production since early in December. Anthracite shipments also increased and for the week ended Mar. 2 totaled 39,875 cars. Byproduct coke production for the week under review was 407,982 tons.

Production of bituminous coal during the week ended Feb. 23 was at the rate of 68.2 per cent. of full-time capacity. Nearly 23 per cent. of the loss was charged to unfilled car orders. The foregoing figures are those of C. E. Lesher, the geologist in charge of coal statistics for the United States Geological Survey. The percentage of operators in each field who make weekly returns to the Survey is so great as to make the weekly estimates approximate closely the actual figures, which are not available until later.

Some New Price Regulations

Rapid progress is being made at the Fuel Administration in the general review of coal prices. This work is to be completed before Apr. 1. New prices for Iowa coal are as follows: Marion, Boone and Appanoose fields: Run-of-mine, $2.75; prepared sizes, $3.10; slack and screenings, $2. This price is a decided reduction from the former prices, which were: Run-of-mine, $3.15; prepared sizes, $3.40; slack or screenings, $2.90. Ninety per cent. of the coal produced in the fields mentioned is prepared sizes. Prices in the Des Moines and Albia fields remain unchanged. A 40c. increase has been allowed to all mines in Wayne County, West Virginia. The new price, which does not include the allowance made to those operators who are parties to the Washington wage agreement, are as follows: Run-of-mine, $2.40; prepared sizes, $2.65; slack or screenings, $2.15.

After prolonged negotiation, which was not unaccompanied by friction, new prices have been fixed for Colorado coals as follows: Domestic coal, domestic field, run-of-mine, $2.25; prepared sizes, $3.50; slack or screenings, $1.25. Steam coal, Trinidad district, run-of-mine, $2.35; prepared sizes, $3.25; slack or screenings, $1.65. Lignite, run-of-mine, $2.25; prepared sizes, $3.25; slack or screenings, $1. Summer reductions in the price of prepared sizes on domestic and steam coal provide for the following deductions: Domestic coal, Apr. 1, 70c.; May 1, 50c.; June 1, 35c.; Aug. 1, 15c. Steam coal (Trinidad district), Apr. 1, 40c.; May 1, 30c.; June 1, 20c.; July 1, 20c. Former prices in Colorado were: Run-of-mine, bituminous domestic, $3; prepared sizes, $4; slack or screenings, $1.50.

Uniform prices have been prescribed for Montana, Wyoming and Utah, as follows: Run-of-mine, $2.65; prepared sizes, $3.30; slack or screenings, $1.50. This schedule meets the complaint of the Utah operators that they were not receiving enough for their prepared sizes in addition to straightening out minor inequalities.

No Leniency to Future Violators of Fuel Administration's Orders

Great leniency has characterized the action of the Fuel Administration, until recently, toward violators of its orders, it is pointed out by H. D. Nims, Dr. Garfield's assistant, whose duties include the direction of the administration's legal department. For obvious reasons, it has been deemed best not to be too severe during the early stages of fuel control. It is believed now, however, that ample time has passed to enable all concerned to be conversant with the general procedure and in future the teeth in the Lever act will be much more in evidence. This change of policy is undertaken more with the desire to back up those who are heartily carrying out the orders of the Fuel Administrator than it is to punish the small percentage of offenders.

Criminal prosecutions have been instituted in 83 cases to date. Most of these are against the "little fellows," a number of them in the Kentucky mountains. Some complaints have been lodged against the more prominent offenders. These cases are under active investigation and if found to be justified, every effort will be made to see that the severe punishments provided for in the Lever act are brought upon those guilty.

To date the Fuel Administration has received 424 complaints alleging violation of its orders. This number excludes violation of the "closing down" order. It is expected that the number of complaints will increase to some extent when it becomes known that active prosecutions are under way.

Coal Priority List Suspended in Many States East of Mississippi River

All states east of the Mississippi River, with the exception of Pennsylvania, Maryland, West Virginia, Ohio and the eastern part of Kentucky, have been released from the Fuel Administrator's order providing for priority in distribution. The reason for this action is explained by the Fuel Administrator as follows:

"Improved transportation conditions and other helpful factors have contributed to a material improvement in the coal situation in the territory where the coal priority list has been suspended. It was deemed to be no longer necessary because the flow of coal into those states is sufficient to meet normal needs.

"Continuance of the order for a longer period would have resulted in the accumulation of reserve stocks of coal for the consumers benefited by priority. In the states where the regulation will continue to operate, the car shortage has not been entirely overcome."

BITUMINOUS COAL PRODUCTION in January of the present year was at the lowest rate since September, 1916. The United States Geological Survey blames the slump entirely on railroad congestion. The January output was 42,727,000 tons.

Coal and Coke Exports in January

Exports of bituminous coal in January were 647,681 tons. Exports during the corresponding month of 1917 were 1,071,124 tons. Anthracite exports during January of 1918 and 1917 were 239,549 tons and 295,396 tons, respectively. Exports were distributed in part as follows:

	1917 Tons	1918 Tons
Italy	71,773	4,505
Canada	584,241	455,377
Cuba	110,476	76,938
Argentina	50,207	11,579
Brazil	53,127	None

Coke exports in January were 84,741 tons, a slight increase over those of January, 1917.

In Charge of Zone Licenses

A. M. MacLeod, of Boston, Mass., was selected by the Fuel Administration on Mar. 13 to take charge of zone licenses. Under the new zoning plan, all coal which passes from a producing district into a consuming district other than its own must move under a license granted by the Fuel Administration through Mr. MacLeod.

Legal Department

DEFICIENCY OF COAL IN PLACE UNDER LEASE—LOSS OF RENEWAL OPTION—The English and many of the American decisions hold that when in a mining lease the parties contract with reference to a mineral known to exist, but the quantity is unknown, and incapable of certain ascertainment, and the lessee agrees to mine and bring forth a minimum quantity annually, or at other intervals, and to pay a minimum royalty therefor whether mined or not, the contract amounts to a sale of the mineral in the land, and that the lessee is bound to pay the minimum price, whether mined or not, and whether it exists or not. But when the contract relates to mineral supposed but not known to exist, and the covenant of the lessee is to mine a minimum amount and pay a minimum royalty at stated intervals, his obligation is to diligently prosecute the work of development, and to produce the minimum quantity of minerals if it exists, and not whether it exists or not. A lease—granting to the lessee for ten years a particular tract of land and a specific vein of coal known to exist, with mining rights, together with plant and improvements, fixtures, etc., with covenants of good title and quiet and peaceable possession, but without warranty of acreage or quantity of coal, and with agreement by the lessee to pay a specified price per ton for coal mined, he guaranteeing a minimum royalty of at least $31,000, $5000 payable at the execution of the lease and the remainder in annual installments—constituted a sale of the coal in place upon condition that it be removed within the term of the lease. And after expiration of the lease and making of such payments, the lessee is not entitled to recover on account of a shortage of coal in place, preventing production of enough coal to cover the minimum royalties paid, in the absence of proof of mutual mistake or of fraud or misrepresentations on the part of the lessor. And ordinarily recovery on the ground of fraud or mistake will be barred five years after the date of the lease, under the laws of Pennsylvania. Under a clause in a coal mining lease giving the lessee an option to extend or renew the lease for the purpose only of mining and removing coal from adjacent lands, right to the extension or renewal is lost by failure to give notice of exercise of the option before expiration of the original lease term. (West Virginia Supreme Court of Appeals, National Coal Co. vs. Overholt, 94 Southeastern Reporter, 735.)

DISCUSSION BY READERS

The Fuel Situation

Letter No. 2—I was much interested in two editorials that appeared in *Coal Age*, Feb. 23, pp. 382 and 383, regarding the securing of good, clean coal. Most of what has been written on this subject, however, is in the nature of complaint in respect to the inferior quality of the coal that is now being shipped from many of our mines. In but few instances has an effective remedy been suggested by means of which the trouble may be overcome.

One suggestion made was to the effect that the proper way to secure good coal would be to have the railroad cars inspected at their destination before being unloaded; and the statement was added that, occasionally, such an inspection might be made at the mine by competent men appointed for such purpose. It was suggested further that where a shipment of coal was found to fall below the standard set, the operator should be warned, for the first offense. For the second offense, the car was to be shipped back to be cleaned at the mine; while, for a third offense, it was stated that a fine of $5000 might be imposed on the operator found guilty. It was even urged that the mine should then be taken over by the Government if it is inefficiently managed.

Two Principal Sources of Impure Coal

To the uninformed, this proposition would seem to appeal favorably, but not so to the man who knows the real source of the trouble. There are two responsible sources for the shipment of impure coal to market. These are: (1) Dishonest miners who wilfully load slate and rock with their coal, in order to increase their daily tonnage and enable them to draw a larger amount on payday; and (2) small mines that have no means of properly cleaning the coal or that are compelled to work thin seams of inferior quality.

Before the present scarcity of labor in mines, an effective docking system was in use at all the larger operations, which prevented dishonest miners from sending out slate, rock and bony coal. At the present time most operators are afraid to enforce the docking system, because of the danger of losing their men, who will quit and go where the operator is not so particular.

Allow me to suggest that competent inspectors should be sent to the mines to inspect the coal sent to the surface by the miners, and that these inspectors should be authorized to impose a heavy fine on all miners found guilty of loading impure coal and rock, after being suitably warned against the practice. It seems to me that this would place the blame where it belongs and would be an effectual method of overcoming the trouble.

I have already referred to the small mines, most of which are run by farmers who are taking advantage of the present high price of coal. In most cases, the coal shipped from these mines is not fit for market, being high in ash and sulphur and mined too close to the outcrop. Being unfamiliar with proper methods of mining, the men employed in these mines use dynamite to take the place of bone and muscle, blowing the coal to pieces and shattering the roof so that it is practically impossible to load clean coal from such mines.

The situation calls for some drastic remedy. I have seen cars pass through on the railroad, loaded with what was shipped for coal, and do not hesitate to say that I would not use the stuff they contained, for making a wagon road. There was mixed with the coal much mud and soft shale that already showed the disintegrating effects of the weather. In my opinion, these smaller mines, guilty of making such shipments, should be closed down and any good miners found in them should be sent to other mines where the quality of the coal is satisfactory and it is possible to mine the coal without mixing with it bone and slate.

Ohiopyle, Penn. General Foreman

Storage-Battery Locomotives

Letter No. 1—Since the publication of a number of articles in *Coal Age*, some time since, regarding the peculiar adaptation of the type of locomotive known as the "storage-battery type," little has been heard in regard to the performance of these machines in the mines. In the hope of learning the results that have attended their use, let me ask that those who have operated such machines submit their opinions through *Coal Age*.

During the past two years, I understand that great progress has been made in developing this particular type of mine locomotive, which has now passed the experimental stage and fully earned its right to stay in the mine. We all remember the struggle experienced in the attempt, a few years ago, to introduce electrical machinery in mine haulage. There were many obstacles to be overcome, to say nothing of prejudices that had to be set aside; but, today, the most uptodate mines in the country are electrically equipped.

The Storage-Battery Locomotive Speedily Coming into Its Own

The attempted introduction of a storage-battery locomotive, in mine haulage, likewise, has had its difficulties and prejudices to overcome; and, to the close observer, it is remarkable how rapidly this type of locomotive has come into popular favor, since it was first brought to the attention of coal operators.

While some of the manufacturers of old-line mining machines and equipment have not given this branch of the service the attention it deserves, it has not been because they have failed to recognize its growing importance. Such has been the demand for mining equipment that manufacturers have been overrun with business in their standard lines, and have not had the time to devote to making the changes required in the building of new types of machinery.

On the other hand, some of the newer companies have devoted their entire attention and energies to the building of storage-battery locomotives. One in particular, has specialized on this class of equipment, with the result that it is shipping one locomotive a day and is unable to catch up with its orders for these machines.

To the observer who has watched its progress, the conviction is firm that this type of locomotive will soon replace all other methods of gathering coal in mines. This opinion is based on the fact that the storage-battery machine works independently, which enables it to go to the face of any room or heading, or enter any place where track is laid.

Much credit is due to the zeal and effective work of the battery companies who have set themselves to the development of a long-life battery that would be suitable for mine service. One company now furnishes a battery for which they claim a life of five or ten years, which is an important factor in the reduction of cost of maintenance. From the start, the question of a suitable battery has been the main consideration.

Operators Want Facts Showing Performance

My experience, in recently passing through the mining districts of West Virginia and Kentucky, proves to me that operators are greatly interested in getting the facts relating to the performance of storage-battery machines. They freely admit the advantage of such a machine for haulage purposes, especially for the work of gathering coal at the face. On every hand, I hear the statement that in a short time this locomotive will be found in every mine.

Since no trolley wire or rail bonding is required for its operation, the storage-battery machine has proved very popular in the development of a new mine, as a small generating unit only is required, in such cases, for charging the batteries. In the later development of the mine, the storage-battery machine can be used in the gathering service, and a larger machine installed for the main-line work.

Another instance where storage-battery locomotives have proved of advantage is where alternating current is being used in the mine, for operating coal-cutting machines. A small unit can then be installed for charging the battery, since 6 or 7½ kw. is an ample charge for a 5- or 6-ton locomotive, as this eliminates the necessity of installing a high-priced substation. The flexibility of the storage-battery machine makes it adapted to conditions where other equipment could not be used. From the standpoints of safety and economy, this type of locomotive is superior to the old trolley type.

Pittsburgh, Penn. ENGINEER.

Mine Cars

Letter No. 2—Referring to the interesting letter of L. B. Paul, *Coal Age*, Feb. 16, p. 346, I want to endorse what he has said about its being practicable to use roller-bearing cars in the same mine and at the same time with plain-bearing equipment. Of course, it is willingly admitted that the most satisfactory results can only be obtained when the entire mine is equipped with roller-bearing cars; but there are many things to be considered before an entire change of equipment can be advocated.

If the mine is one that is about to start operation, it is an easy matter then to install either plain-bearing or roller-bearing equipment as the desire and ability of the operator may determine. But, consider for a moment a mine in full operation and using, say 300 cars, equipped with plain bearings. In my opinion, no difficulty should be experienced in changing the type of bearing on 50 of these cars, which would require a comparatively small outlay.

Comparative Tests Show Superiority

After changing the bearings on these cars, they should be operated, as far as practicable, on the same trip or section with plain-bearing cars, so that comparative notes can be made in regard to the force or power required to move each type of cars. Such a comparison will enable the operator to determine whether or not it will pay to make the same change in the balance of his equipment. But, in every case, the decision cannot fail to be in favor of the roller-bearing equipment; and orders will be quickly given to change the balance of the car bearings, a few at a time. By the end of the year, probably, the entire rolling stock will be equipped with roller bearings.

This method of proceeding has been in use in a large number of operations in the bituminous field of Pennsylvania, where plain bearings are rapidly giving place to roller bearings for car wheels. To my personal knowledge, none of these operations have been inconvenienced at all while making the change.

Effect of Mixed Equipment

Mixing the two types of equipment on the same haul does not, in any way, hold up the production of the mine. On the contrary, it has been found that the daily output has been much increased. As Mr. Paul says, the miners soon discover the easy-running cars.

At the present time, when every operation is confronted, not only with a shortage of labor, but with the necessity of paying a higher price for mining and other work, it behooves the management to study carefully every feature that promises to reduce operating costs and increase the efficiency of the men in the mine. This practice is occupying the mind and thought of every successful operator in the anthracite and bituminous regions and its importance is growing every day.

Pittsburgh, Penn. J. M. KELLY.

Letter No. 3—I was interested, in the reading of L. B. Paul's letter on Mine Cars, *Coal Age*, Feb. 16, p. 346, to note that he takes issue with H. M. Crankshaw, who claimed in a previous article, Jan. 26, p. 191, that "It does not pay to mix roller-bearing cars with other rolling stock." If I am not mistaken, Mr. Paul's experience has been obtained in the anthracite fields, but the practice is the same in the bituminous fields throughout the country.

The question of underground haulage is an important factor in the production of coal. Inefficient equipment has a paralyzing effect on the mine's production, and operators generally are giving this question favorable attention. Knowing the great advantage derived from the use of roller bearings on mine cars, manufacturers of this class of equipment, by advertising and other

means, have not failed to impress coal operators with its importance.

Tests of flexible-roller bearings, which is the type most widely used in mines, have shown that by the use of such bearings the power consumption is very materially reduced. It is also claimed that the expense for lubrication is greatly lessened. Similar claims have been made by the manufacturers of other types of bearings, however; and the only way the operator can determine for himself the superiority of either type is by actual comparison under the same conditions.

In order that this may be done, the roller-bearing and plain-bearing cars must both be in operation, under the same conditions. In other words, the equipment must be mixed for a time at least, until it can be determined which type of bearing will give the best service in that mine. No operator will care to change his entire equipment without having first made such a comparative test.

Storage-Battery Locomotives and Roller-Bearing Cars

In connection with the growing tendency of operators to install storage-battery locomotives, on the gathering haul in mines, it is worthy of note that the use of plain-bearing cars will often cause a heavy discharge from the battery, owing to the large increase of track resistance. Where such heavy discharges are liable to occur, it may become necessary to recharge the locomotive before the close of the shift, which would mean much annoyance and delay.

Speaking of the saving of power, it must be remembered that the greatest saving is effected on a level track. The saving accomplished at a time when hauling a loaded trip of cars up a considerable grade is small in comparison with the gain on a level track, for the reason that the grade resistance has increased so much as to overshadow the smaller gain resulting from the use of roller bearings, which therefore represents a much smaller percentage of saving on a grade, than when the cars are hauled on a level track. However, it is easy to show a considerable power saving when hauling on grades up to 5 and 6 per cent., with roller-bearing cars.

Comparative Cost of Lubrication

Speaking of the saving in expense for lubrication, it is necessary to make the same comparative tests, in order to determine the superiority of roller bearings, in this respect also. For example, mine-car oil or, as it is better known, "black strap," runs 50 gal. per bbl., and costs, at this time, about 15c. per gal. Grease for roller bearing mine cars weighs 400 lb. per bbl. and costs approximately 10c. per pound.

The average plain-bearing wheel will consume about one pint of black strap in the performance of the same work, where the average roller-bearing wheel will consume about one pound of grease. Since there are 400 pts. in 50 gal., a barrel of black strap will lubricate as many cars as a barrel of grease weighing 400 pounds.

The advantage in respect to lubrication, however, is due to the fact that plain-bearing cars that have been in service for a year or so require lubrication every day, or at least four times a week, or 208 times in a year. At a cost of 8c. per car, for each oiling, this would mean a total yearly cost of $16.64 per car.

Comparing this with the lubrication of roller-bearing cars, regardless of whether they have been in service six months or six years, such a car will not require to be lubricated oftener than once in three months, or four times a year, and some cars have run for a longer interval without causing trouble. The cost for lubricating a car of this type is 40c., making a total of $1.60 per car per year. Allow me to state, in this connection, that a roller bearing never needs the full amount of grease to fill the reservoir, after the first greasing.

Again, the oiling of plain-bearing cars requires the services of an oil boy, each day the mine is running; and, under present conditions, his pay is $3 per day. If the mine works 300 days in a year, the labor charge for this work is $900, in that time. In the lubrication of roller-bearing cars, this labor is only required when the cars are being oiled or once in three months. Results show that, at the average mine, 12 days of labor, per year, is required to grease the cars, making a total labor cost, for this work, $36 per year.

A study of these figures is sufficient to convince anyone that the use of roller-bearing mine cars effects a great saving in the cost of operation. Foremen know that miners are prone to insist upon receiving some consideration when they are given cars that push as hard when empty as others do when loaded.

The claim that the mixing of these two types of bearings in the equipment of a mine causes any inconvenience is not founded on fact; but the difference, whatever it may be, serves to argue in favor of roller bearings.

Operators who have made the change from plain bearings to roller bearings, after being convinced by a test of the latter, for a few months, have found that the entire change can be made, in some mines, in a few months, while in others it may take a couple of years, depending on the size of the operation and the financial condition of the company.

Experience.

Johnstown, Penn.

Wagon Mines vs. Patriotism

Letter No. 5—I was much interested in reading the last letter of Thomas Hogarth on this snbject, *Coal Age*, Jan. 19, p. 158. Judging from his remarks, I would consider Mr. Hogarth to be a broad-minded man of long experience in coal mining and possessed of democratic views. At the same time I must admit that he regards the subject from a different angle and reaches a different conclusion from my own.

In many localities the small wagon mine is a blessing to the country and should be encouraged. The product of these mines is generally consumed in the neighboring locality with the result that freight charges and profits of the middleman are eliminated, and the farmer and local consumer pay less for their fuel supply.

In the operation of these small mines it occasionally happens that the output exceeds the demand, and the operator finds that he can ship one or two flats if permitted to load them on the railroad switch. In justice to him let me say it is my opinion that the railroads should supply the flats for that purpose. It is true that the loading of a car, here, may take a little longer time than would be required at a larger mine, but the teams and men employed to haul the coal from the mine to the track would mostly be idle if not thus

engaged. Supplying the flats needed at such mines will keep them running and enable them to supply the local trade, which will lift that burden from the railroad. It must be admitted that the time lost in unloading a car is probably as great as or greater than that which would be lost in loading the same for shipment.

Someone has suggested that all miners should be located where they could do their best work in digging coal. In reply to this remark, however, let me say that the small mines offer a greater advantage in this respect than the larger mines where the miner is often subjected to much delay due to causes beyond his control. The wage scale paid at the small mine is generally the same as that at a larger mine, and the miner is able to produce as much or more coal in the former as in the latter.

Recently I had an opportunity to compare the tonnage, per man per day, in pick and machine mines. I found that the machine loaders averaged from 7 to 8 tons per man per day in a 5½-ft. seam, while pick miners averaged about 8 tons per man per day in a seam varying from 4 to 6 ft. in thickness. This difference is explained partly by the fact that all good and experienced miners in time work their way into pick mines, leaving men of generally less experience in the machine mines. Moreover, it frequently happens that, in machine mining, the miner finds his coal has not been cut and is obliged to go home for that day.

In addition to what I have mentioned there are numerous causes of delay in a large mine equipped with mechanical haulage. The workings are more extended, which increases the opportunity for delay, owing to falls on the roads, breakage of machinery, or the mine being thrown idle as a result of the careless act of one of the men. Delays from these causes are of far less frequency in a small mine employing but a few men.

R. J. PICKETT.

Shelburn, Ind.

Influence of Ash Content of Coal

Letter No. 1—The interesting article, by Frank G. Philo, relating to the influence of the ash content of coal on its fuel value, published in *Coal Age*, Mar. 2, p. 415, calls to mind some investigations we made of the same nature.

As the article dealt with anthracite coal and our investigations considered bituminous coals exclusively, it may prove of interest to compare the results of the two findings. We undertook to ascertain the exact relationship between the ash content and the value of the coal under our conditions of operation. The relationship discovered is believed to hold closely in the average plant.

Most contracts for coal purchased upon the basis of its heating value are predicated upon the hypothesis that the value of the coal closely approximates the value indicated by the calorimeter. Practically all of such contracts seem to recognize that the ash content influences this value and they penalize an excess of ash. No contract under the writer's attention has attempted to penalize the ash content on any other than an empirical basis, and the article referred to is the first seen that has attempted the solution of the problem.

Our starting point was the proven fact, as stated in a bulletin of the coal-testing plant of the Government, that a coal with an ash content as high as 40 per cent. was worthless as it was difficult, if not impossible, to keep it ignited in an ordinary furnace. We have had no such coals, but have had them approximating 30 per cent., and the results lead us to assume the correctness of the Government report.

Coal apparently follows a straight line characteristic, as regards its value in the calorimeter on a basis of its ash content, assuming the same character of coal, and a nearly straight line though at a different angle, as regards its usable value in the furnace. This last curve drops a little as the ash content nears 30 per cent., beginning to drop at about 20 per cent., and presumably this increases in curvature toward the point of zero value. These results seem similar to those for anthracite coal in the previously mentioned article.

The Personal Equation of the Fireman

Since the personal equation of the fireman greatly affects the results obtained from the same coal on two successive days or different parts of the same day, it is difficult to keep all of the factors the same in a combustion test and the results are approximate at best.

It is also remarkable to note the closeness of the formula we have been using to evaluate our coal to the results obtained by Mr. Philo. Because the curve begins to drop rather rapidly between 20 and 30 per cent. ash and in practice we use coals having an ash content of 15 per cent. or less, we have settled upon 1½ per cent. depreciation in the coal value for each 1 per cent. of ash content; we reject as worthless for our uses any coal above 15 per cent. Were we closer to the coal fields, with consequent lower rate on coal freight, it would probably pay us to consider coals with higher ash content, but under our conditions we cannot afford to pay freight on the ash.

In practice, then, in estimating the probable value of coal, we use the formula:

$$\textit{Value of coal} = \frac{C + F + U}{\textit{B.t.u.} - (\textit{B.t.u.} \times 1\tfrac{1}{2}\ \textit{ash per cent.})}$$

where

C = Cost of coal at mine per ton;
F = Freight rate per ton;
U = Unloading cost per ton;
B.t.u. = Heat value by calorimeter per ton.

Considering the fireman and the inability to keep our conditions exactly constant, this formula gives us results as nearly correct as we can determine. In other words, the errors caused by its use are well within the errors of observation and measuring instruments.

Selma, Ala. FUEL ENGINEER

Opening New Mines

Letter No. 1—After reading the interesting article of A. C. Watts, entitled "Coal Mining in Utah, During 1917," *Coal Age*, Jan. 26, p. 174, I am led to question the remarks made by Mr. Watts on page 177.

In speaking of the effect that the opening of new mines will have on the coal industry of the state, it appears to me that the gist of his remarks convey the idea that such undertakings should be discouraged owing to two essential reasons: (1) The present limitation of transportation facilities. (2) The shortage of

skilled labor in mines. There can be no doubt but that these two conditions prevail generally throughout the country, at the present time. The question, however, of how far these conditions should be permitted to curtail development work in coal mining is open to argument.

A company known as the Iron County Coal Co., owning property located near Cedar City, in Iron County, Utah, has just commenced the installation of a two-mile gravity tram, for the purpose of transporting the coal mined in their new opening to nearby towns, lying off the main line, in the southwest section of the state. Coal is now brought to these towns from mines several hundred miles farther away than the coal property at Cedar City.

Discussion Is Invited

Viewed from either an economic or a patriotic standpoint, I would like to hear the opinions of *Coal Age* readers, in regard to the suggestion that such new developments should be discouraged. In other words, is there any ground for condemning the undertaking of the Iron County Coal Co., in opening a new mine at Cedar City to supply a particular market that has heretofore obtained its coal from a distance of several hundred miles?

In Iron County, where the new mine is to be started, the coal measures outcrop at an elevation of 2000 ft. above the town, the coal seam itself lying practically flat. Under these conditions, no large expenditure for development work of the nature of shafts or slopes will be required, and little mining equipment will be needed in the operation of the mine. The greatest expenditure is the installation of the two-mile gravity tram connecting the drift opening with the towns further down the valley where the coal is to be delivered. To my mind, there is every reason why such an undertaking should be heartily encouraged and I see no reason to the contrary.

To supply the towns in question with the coal that they require will take a fewer number of railroad cars than when it is necessary to transport the same amount of coal a greater distance, inasmuch as the coal would then be a longer time in transit. The proposed gravity tramway will greatly relieve the transportation on the main roads and those tracks can be utilized wholly for carrying coal to other districts.

There is an abundance of labor in the local field mentioned that will be available in the new undertaking, and there will be no need of calling workmen from other mines where they are employed. Taking these things into consideration, it appears to me that it is not only good business economy, but good patriotism as well, to encourage the investment of capital in the opening up of such local properties, and I shall be glad to hear from others on this question. J. L. Donahue.

Salt Lake City, Utah.

Surveying and Mapping

Letter No. 4—After reading the several letters that have appeared in *Coal Age*, on the subject of surveying and mapping, it seems to me that an engineer's familiarity with one or another method of numbering survey stations will determine which system he will adopt. While one will prefer to number all survey stations in the mine, starting from zero at the foot of the shaft or slope, another will prefer to number each pair of cross-entries or section of the mine separately, starting from zero at the mouth of each pair of entries.

Having had considerable experience with both of these methods of numbering, it is my belief that each possesses its particular advantages. First, it must be clearly understood that the stations referred to are generally taken to mean transit points and not the hundred-foot points spoken of in connection with taking grade levels.

The consecutive numbering system certainly possesses the advantage that a newcomer can locate a given station with greater certainty and find the same in the notes more quickly, than where each pair of entries has its own set of numbers. However, I fail to see that there is any uncertainty in establishing the correct location of a given station when it is known on which entry the station occurs. It is rare, indeed, that one or more of the members of a surveying party is not familiar with the mine and can lead the way to the entries in question. In regard to grades, the level pluses shown on the map will clearly indicate the desired distances and enable the grade to be ascertained.

Need To Establish Reliable Reference Points

In this connection allow me to mention an important point that has not as yet received attention. This is the need of establishing permanent survey points at or near the mine opening, to which reference can be made later as the need may require. It has been my experience that this has generally been neglected by engineers when making the original survey of the mine. The need of such reference points close to the mouth of the mine is often not realized until it is found that the original stakes of the surface survey have been destroyed, and it is necessary to run lines from distant points on the surface to connect with what points can be found in the mine.

In one instance that I recall it became necessary to reëstablish connection on the surface 15 years after the original survey had been made. In that case three weeks was consumed in making the connection. This could have been accomplished in a short time had good reference points been maintained at the mine entrance. We were fortunate, however, in making the connction when we did, since shortly after this was done the original stakes were destroyed. I recall two similar cases, in one of which two weeks' time was consumed and in the other three weeks, in making connection between the points in the mine and the original stakes on the surface.

Let me suggest that the reference points near the mine entrance should be three in number and form a triangle, being about 300 ft. apart. I have found that old car-axles make good stations or monuments for this purpose. A collar should be shrunk on one end, while the other end of the axle is pointed to permit of its being driven in the ground. After driving such a monument in place, a center hole should be drilled in the end of the axle to indicate the exact point or station. The head of the monument should then be thickly covered with white lead to preserve it from injury.

Piney Fork, Ohio. F. C. Sanner.

INQUIRIES OF GENERAL INTEREST

Regulator Calculation

Awhile ago an examination question was answered in *Coal Age* [Vol 9, p. 771], and it seemed to me that the result obtained was incorrect. The question read as follows:

Ques.—A mine has 50,000 cu.ft. of air, under a 2-in. water gage, passing in two equal splits 6 x 10 ft. in section and 10,000 ft. long. It is proposed to divide this air so that only 15,000 cu.ft. will be allowed to the one split. State how this can be accomplished and the size of the opening required.

Kindly explain in what way the following solution is wrong: Since the quantity of air passing in one of these splits is to be reduced to 15,000 cu.ft. per min., the rubbing surface being $10{,}000 \times 2(6 + 10) = 320{,}000$ sq.ft. and the sectional area $6 \times 10 = 60$ sq.ft., the water gage due to the friction of the air in that split is found thus:

$$w.g. = \frac{ksq^2}{5.2a^3} = \frac{0.00000002 \times 320{,}000 \cdot 15{,}000^2}{5.2 \times 60^3} = 1.28\ in.$$

Then, subtracting this result from the original water gage gives for the water gage due to the regulator, $2 - 1.28 = 0.72$ in. This would give, for the area of opening in the regulator

$$A = \frac{0.0004q}{\sqrt{w.g.}} = \frac{0.0004 \cdot 15{,}000}{\sqrt{0.72}} = say\ 7\ sq.ft.$$

The answer given by *Coal Age* to this question is 4.68 sq.ft. Please explain where my trouble lies.

Fernie, B. C., Canada. JOHN BELL.

The solution given by this correspondent ignores the fact that the placing of the regulator in one of the splits, for the purpose of reducing the quantity of air passing in that split to 15,000 cu.ft., has the effect to increase the water gage in the main airway and reduce the total quantity of air in circulation.

As explained in the answer given to this question on page 771, and to which reference has been made. it is necessary to assume that the power on the air remains unchanged. This being the case, the unit pressure or the pressure per square foot of sectional area will vary inversely as the quantity of air in circulation. That is to say, as the pressure or water gage is increased by the placing of the regulator, the quantity of air circulated by a constant power will be decreased in the same proportion.

In the solution given, it was found by trial that when the quantity of air passing in the regulator split was reduced to 15,000 cu.ft. per min., the total quantity of air passing in the main airway was reduced from 50,000 to 42,200 cu.ft. per min.

The increase in water gage must be calculated from the increased quantity of air passing in the open split, which is $42{,}200 - 15{,}000 = 27{,}200$ cu.ft. per min. Then, since the water gage in the open split varies with the square of the quantity of air in circulation, the increase in water gage is in the ratio $(27{,}200/25{,}000)^2 = 1.088^2 = 1.18+$, and the increased water gage is therefore $2 \times 1.18 = 2.36$ in.

In order to calculate the water gage due to the regulator, it is necessary to ascertain how much the original water gage of 2 in. is lowered when the air traveling in that split is reduced from 25,000 to 15,000 cu.ft. per min. Since the water gage varies with the square of the quantity of air passing, the natural water gage, or the gage due to friction, in the regulator split, is $2(15/25)^2 = 2(3/5)^2 = 2 \times 9/25 = 0.72$ in. The water gage due to the regulator is, therefore, $2.36 - 0.72 = 1.64$ in., and the area of the opening in the regulator, as calculated on page 771, is 4.68 sq.ft.

It will be observed that the size and length of the airways, given in this question, do not enter the solution. The question states that a water gage of 2 in. was required to pass 50,000 cu.ft. of air per min. in the two equal splits. As a matter of fact, assuming the usual coefficient of friction, $k = 0.00000002$, the water gage required to pass 50,000 cu.ft. of air per min. in the two splits given in this question would be

$$w.g. = \frac{0.00000002 \times 640{,}000 \times 50{,}000^2}{5.2(2 \times 60)^3} = 3.56\ in.$$

This shows that if the given quantity of air was circulated in the two splits mentioned, under a water gage of 2 in., the coefficient of friction used was probably the old Fairley coefficient, $k = 0.00000001$. This, however, does not affect the solution of the question, which is as given on page 771.

Accumulation of Mine Gases

Kindly explain the reason for the accumulation of gases in mines, and state why these gases do not diffuse rapidly into the air, as we are taught they do, in all mining textbooks. T. W. MOLANEY.

Avella, Penn.

The reason for the accumulation of gas at the working face and in cavities and other void places in mines is that they are generated, or issue from the strata, more rapidly than they diffuse into the air. The diffusion of gases varies inversely as the square roots of their densities; and, as the density of the layer of gas in contact with the air closely approximates the density of the air itself, it follows that diffusion at the point of contact is very slow.

In order that diffusion shall continue to be rapid, it is necessary that fresh surfaces of contact between the gas and the air shall be constantly maintained, which requires that the air and gas shall be kept in motion. For this reason, diffusion takes place more rapidly in a place where a good air current is moving. On the other hand, diffusion is very slow in a poorly ventilated place.

EXAMINATION QUESTIONS

Indiana Firebosses' Examination, Vincennes, Jan. 17, 1918

(Answered by Request)

Ques.—(a) What is a safety lamp? (b) Describe the essential features on which a safety lamp is based.

Ans.—(a) A safety lamp is one in which the lamp flame is inclosed in a chimney of wire gauze or a glass cylinder surmounted by a wire-gauze chimney. It is so arranged that no air can enter the combustion chamber of the lamp or pass out through the chimney, except by passing through the mesh of the wire gauze, which must be arranged to protect all openings admitting air to the lamp.

The gas-charged air surrounding the lamp enters the combustion chamber and the gas is permitted to burn within the lamp chimney, but the flame is prevented from passing out of the chimney, by the cooling effect exerted by the wire gauze with which the burning gas must come in contact in its outward passage.

(b) The essential features of a properly constructed safety lamp are its simplicity of construction and good workmanship, by which all parts are made to fit tightly together, and these should so depend on each other that the lamp cannot be put together with any part omitted. All openings to the lamp must be protected by wire gauze, of standard mesh, containing 784 openings to the square inch.

For testing purposes, the lamp should be sensitive to gas; the air should enter at a point below the flame and pass out through the upper part of the chimney. A good working lamp must give a good light; the gauze chimney must be protected by a bonnet; the lamp should be simple in construction and capable of withstanding rough usage, besides being light and portable. A working lamp should be protected by a lock fastening that will show any attempt to tamper with the same.

Ques.—Supposing there are 20 men working in rooms off the 3- and 4-E off the main north and, in making an examination as fireboss, in the morning, you found a large accumulation of gas in rooms Nos. 2, 3 and 4, off the 4-E, the same being the intake; how would you proceed to remove the gas and what precautions would you take to prevent an accident?

Ans.—The gas being found, in this case, near the mouth of the intake of this section of the mine, all the men should be notified and withdrawn from this pair of entries, before any attempt is made to dislodge the gas. Having withdrawn the men from this section, proceed to increase the circulation of air in these two headings, as far as practicable.

If it is possible to short-circuit the air at any point between the mouth and the head of these entries by setting open a door, let this be done. At the same time, hang a piece of canvas on the intake airway, just inby from the point where the air current is short-circuited and passes into the return. This will prevent the gas from being carried to the face of the heading, by conducting it directly into the return airway.

Now, beginning at No. 2 room on the 4-N, hang a canvas just inby of the mouth of this room, to deflect the air current into the room. Use safety lamps only, and watch these carefully to observe the progress being made in the removal of the gas, which should pass out through rooms Nos. 3 and 4. When the gas is cleared from No. 2 room, move the canvas on the entry to a point just inby of the mouth of No. 3 room, thereby forcing the air up Nos. 2 and 3 rooms.

If no gas was found in room No. 5, and those following, a canvas should be hung in the inby breakthrough connecting rooms 4 and 5 near the face. In this manner, continue to drive the gas from the three rooms where it was found accumulated and allow it to pass out on the headings without permitting it to enter the rooms, as far as this is practicable and possible. In the performance of this work, only competent men should be employed, and all entrances to the return air current should be properly guarded to prevent anyone from entering the return current.

Ques.—How would you render first aid to a person suffering from an electric shock?

Ans.—It is important, first, to see that the person is not in contact with the live wire that has produced the shock. If it is found that he is still in contact with the wire he must be removed from it as speedily as possible and in a manner that will not affect the rescuer.

Send for a doctor at once. Then proceed to apply the Schaefer method of resuscitation, by turning the victim over so that he will lie on his stomach. Rest his forehead on a coat that has been folded up to form a pillow, or on one of his arms and turn the face slightly to one side so that the ground will not obstruct his breathing. See that the mouth is clear of any obstruction and that the tongue is pulled forward so that it does not impede the passage of air through the throat.

No time should be lost, but, as far as practicable, the patient should be given the advantage of the best air available. Now, kneel astraddle of the man's thigh in a position facing his head and resting both hands on his loins with the fingers spread over the lower ribs, swing forward, thereby throwing the weight of the body gradually and without violence upon the patient. Again, swing back and repeat this to-and-fro movement at the rate of about twelve or fifteen times a minute, imitating the action of breathing. Continue this for the space of two hours or more, or until a doctor has pronounced the man dead.

Ques.—How would you render first-aid to a person overcome by mine gases?

Ans.—Remove the person at once to fresh air. Loosen the clothing about the chest and abdomen and sprinkle cold water on the face and chest. Then give artificial respiration in the manner just described.

Coal and Coke News

What Happened in February

Feb. 1—Explosion at Mine No. 21 of Peabody Coal Co., Stonington, Ill., kills three men. General committee of anthracite operators formed to regulate anthracite industry.

Feb. 2—Dr. Garfield announces that he may do away with workless Mondays.

Feb. 4—Anthracite committee formed Feb. 1 makes report.—In Drumheller field, Alberta, Canada, 2000 men go on strike to enforce closed shop.—Dominion Coal Co. makes an agreement with its men.

Feb. 5—Meeting of state fuel administrators of the East and Michigan at which question of closing down on Mondays is considered with Federal Fuel Administrator.—Order in Council passed by Canadian cabinet suspending operation of all manufacturing plants in Canada Feb. 9-11, closing country clubs during February and March and theaters on Mondays from Feb. 18 to Mar. 25.—J. E. Roderick, chief of Pennsylvania Department of Mines, dies.

Feb. 6—A. C. Campbell and Tudor Williams, fuel administrators in Luzerne and Lackawanna Counties, order the operators in the anthracite region to prepare their coal, as in former days, with breakers and washeries.

Feb. 7—Senator Overman introduces a bill providing that the President may coördinate and consolidate executive bureaus, agencies and offices, this power to continue for one year after the war.—Prices are increased 40c. per ton for run-of-mine, prepared sizes and slack at the mines in Maryland and in Mineral, Grant and Tucker Counties and a part of Preston County, West Virginia. The same increase is conceded in the Kenova and Thacker fields in Mingo County, the extreme southern part of Wayne County, the extreme northeastern part of McDowell County, West Virginia, and the extreme northern part of Buchanan County, Virginia. All these rates may be increased 45c. per ton more if the terms of the Washington agreement have been complied with. The rates before the Washington agreement was accepted were: Run-of-mine, $2, prepared sizes, $2.25; slack, $1.75.—Fuel Administrator declares that the "heatless" Mondays must continue a little longer.—Secretary McAdoo offers a half billion dollars worth of Treasury certificates for purchase and says that the offer will be repeated every two weeks.—Members of the mine cave committee of the Civic Bureau of the Scranton Board of Trade meet with railroad presidents and heads of coal companies in New York City.—Strike at Broadwell colliery of the Lehigh Valley Coal Co., at Moosic.

Feb. 8—War Department refuses request of Fuel Administration to exempt mine workers.—Price of Pennsylvania crude oil set at $4 a barrel, an advance of 25c. Change has apparently the approval of the Fuel Administration. Corning set at $2.85. Cabell at $2.77, Somerset at $2.60 Ragland at $1.25, advances of 5c. per barrel.—Fuel Administrator lifts Monday closing order from North Carolina, Tennessee, South Carolina, Georgia, Florida, Alabama, Mississippi and Louisiana and gives power to state fuel administrators to withhold coal as well as to divert it.—Dr. H. A. Garfield, United States Fuel Administrator, refuses to Alabama the increase of 45c. per ton in the price of coal granted in other regions.

Feb. 11—L. A. Snead, in charge of appointment and distribution, is appointed assistant to the United States Fuel Administrator with duties similar to those in the office he vacates.

Feb. 12—Chairman William J. Harris, of the Federal Trade Commission, resigns.—Tipple No. 5 of the Jackson Hill Coal and Coke Co. is burned in a fire believed to be incendiary.

Feb. 13—Explosion of gas at a Lehigh Coal and Navigation colliery injures four men.—Fuel Administration announces that as the coal situation has improved the fuel restrictions on Mondays will hereafter be removed.

Feb. 14—Fuel Administrators of New England declare that under powers delegated to them by the National Fuel Administrator next Monday will continue as a holiday in New England except perhaps in New Hampshire. (New Hampshire was later included.)—Big strike commences in the Alabama field at mines of Tennessee Coal, Iron and Railroad Co., and on Feb. 15 extends to Republic Iron and Steel Company.

Feb. 15—The President orders that licenses be obtained for all imports and exports to foreign countries.—Judge Strauss, of Luzerne County, Pennsylvania, reverses decision of Workmen's Compensation Board of that state declaring that the negligent act of an employee does not defeat his right of compensation.—Fuel Administration order, under which smithing coal is put at the same price as prepared sizes of bituminous coal, goes into effect.

Feb. 17—Ten members of the National Board of Labor named. Two more will be chosen by National Industrial Conference Board and the American Federation of Labor.

Feb. 18—Coke prices revised by Fuel Administration in certain coke districts of Georgia, Alabama, West Virginia and Oklahoma.—Fuel Administration orders that prices shall be the same for the same kind of coal whether sold by operator or jobber.

Feb. 18-21—New York meeting of American Institute of Mining Engineers.

Feb. 19—President Wilson writes to W. G. McAdoo, Director of Railroads and Secretary of the Treasury, in reply to his letter of Feb. 18, authorizing him to urge on state officials that it is their duty to obtain increased rates for public service wherever public-utility corporations are suffering from the increased labor, fuel and equipment charges.

Feb. 20—Texas and Montana notify the Fuel Administration that they will take care of their own fuel needs during the war. Anthracite is barred entirely in Montana.—The Fuel Administration classifies coal consumers into four groups with priority in coal delivery in accordance with their importance. Group 1 includes households, ships, railroads, public utilities and public institutions; Group 2, necessary war industries; Group 3, necessary peace industries, and Group 4, the so-called makers of luxuries.—Frank J. Hayes, president United Mine Workers of America, orders mine workers in Alabama to go back to work.

Feb. 21—Fuel Administration fixes price of diverted coal. It is to be either the Government price or the contract price at the option of the owner of the coal thus diverted at the time of diversion.

Feb. 22—By an explosion of 28 cases of powder at the Royal colliery at Virden 4 men were killed.

Feb. 23—Fuel Administrators of Maine, Rhode Island, New Hampshire, Vermont, Connecticut and Massachusetts have decided to suspend "heatless Monday" under the United States Fuel Administration order of Jan. 17.—A. W. Calloway, of the Davis Coal and Coke Co. and the Terminal Railroad Coal Co., is appointed Director of Bituminous Coal Distribution.—E. R. Stettinius made one of the Assistant Secretaries of War.—Four shotfirers are killed in an explosion at the mines of the Citizens Coal Co., at Springfield.

Feb. 26—The Fuel Administration demands greater coal conservation.—Bernard Baruch made chairman of the War Industries Board.—Senator Reed attacks the Fuel Administration in the Senate.

Feb. 27—Frank P. Walsh chosen by American Federation of Labor to serve on the National Board of Labor.—Prices of coal produced on Tug River, West Virginia, west of Welch to Panther, including branches except Newhall, Berwind, Canebreak and Hartwell: Run-of-mine, $2.40, prepared sizes, $2.65, slack, $2.15, an increase of 40c. per ton. The "Upper Clinch" prices in Virginia are raised 50c. per ton and are 10c. higher than those above quoted. All are subject to a further 45c. increase where Washington agreement is accepted.—Independent Union of Miners of America organized.

Feb. 28—Fuel Administration orders that where cannel and bituminous coal is mixed the Government price for bituminous shall govern.

Correction—Instead of 87 lives being lost in the Stellarton explosion as stated in "What Happened in January," published Feb. 9, the correct number ultimately proved to be 86.

Harrisburg, Penn.

Judge McCarrell, of the Dauphin County court, on Mar. 8 ruled that under existing state laws it is not a crime to sell coal by short weight, provided the scales used are tested and corrected. Lawyers declare the ruling amounts to a conclusion that giving short weight is in error and that persons seeking redress under state statutes must go through the civil and not criminal courts. Judge McCarrell's ruling is that the weights and measures act contains no penalty for short weighing in any sale, but merely for use of fraudulent scales. The Dauphin judge's decision will be carried immediately to the upper courts for a final ruling.

The State Compensation Board has declined to rule that Jerry Willis, of Altoona, a claimant against the Altoona Coal and Coke Co., sustained a total loss of a hand when he had only part of a hand to lose. Willis was injured 30 years ago and lost four fingers at the knuckle joint and his thumb at his first joint, but developed much dexterity with what remained and worked as a carpenter and in other occupations. Last year as a result of an accident the remainder of his thumb and the palm of his injured hand were amputated. The Board has modified the award made so that it will terminate when Willis "shall have acquired an earning capacity."

Four coal companies operating in Clearfield County on Mar. 7 charged in a complaint filed with the Public Service Commission that the Pittsburgh & Susquehanna R.R. had allowed its line to get into such a state of disrepair that operation was attended by accidents and that money secured under promises of repair had not been expended for maintenance. It was also charged that when a bonus was refused operations were interrupted. The commission will inaugurate an inquiry at once as the coal companies declare they are dependent on the road for transportation.

The first indictments for alleged profiteering in the eastern district of Pennsylvania were returned by the Federal Grand Jury on Mar. 9. They charge the Orr Coal Mining Co., of Clarksburg, W. Va., and James M. Orr, president of the company, with asking prices in excess of those fixed by President Wilson. The Government alleges that the company billed bituminous coal to consumers in this state at the prices fixed by the Federal regulations, but under secret arrangement with certain customers an additional sum of 73c. to $1 a ton was collected by Charles T. Schectman, the Philadelphia representative. The technical charge against the company is asking higher prices than those fixed by the regulation, and against Orr of conspiracy to ask higher prices.

The method used, it is said, was to have an understanding with manufacturing plants that the receipted bills would disclose only the regulation price and that the excess could be paid in cash. Four companies in Philadelphia and vicinity paid heavy excesses, according to the indictment.

These companies, a Government official said, consented to pay the excess because of the necessity of having fuel to keep their plants in operation. The trial of Orr and the mining company has been tentatively fixed for Mar. 25.

The miners' examining boards for Luzerne County held monthly examinations of applicants for miners' certificates at the courthouse on Mar. 8-9 and questioned over 100 applicants of various nationalities who sought the right to mine coal. Seventy certificates were granted and the others were rejected on failure to answer questions satisfactorily. The examination

boards are making no distinction as to nationality, natives of Austria being accepted if their appearance and answers are satisfactory. At first when natives of Austria were classed as alien enemies the boards requested a decision from the court whether to grant these men certificates and were told to use their own judgment. Men are needed in the mines, and a man who is eager to work and aid this country in the production of coal is not considered an enemy.

Both the increase in anthracite output and fewer fatalities are shown in report, issued recently, by mine inspectors for the third, fifth, sixth and seventh anthracite districts in Lackawanna County, Pennsylvania, which produced 13,532,786 tons of coal, a big increase over 1916 despite the fewer number of mine-workers.

There were 85 fatal accidents in these four districts, or one fatality for every 159,186 tons produced. Of this number 72 occurred inside the mines and 13 outside. In the same districts there were 211 non-fatal accidents, the fatalities being saved by the safety devices installed in and about the mines by the operators at a constantly growing expense.

Inspector S. J. Phillips, of the fifth district, highly praised the work being done to safeguard mine workers at the Greenwood colliery of the Hudson Coal Co. An organization, known as the Safety Institute has been perfected, and numbers all of this colliery's employees. The operators are at work organizing all their working forces and will shortly issue a new set of safety rules for the benefit of all mine workers in the anthracite region.

Inspector T. J. Williams, of the eleventh anthracite district, in his 1917 report shows that there were mined 3,559,980 tons of coal by the eight collieries under his jurisdiction with 33 fatal accidents distributed among the 19 mines, and of these only one was nongaseous. There were 10,000 tons of coal produced by electrical machines. The fatalities were 28 inside the mines and 5 outside. In his district there were 127,141 tons of anthracite produced per fatal accident.

PENNSYLVANIA

Anthracite

Lavelle—To provide for a large reservoir to be used for washing coal at its new colliery, the Laurel Hill Coal Co. purchased the George W. Turner farm. This farm of 149 acres contains large springs, streams from which will be turned into a big dam. Lack of adequate water-supply necessitated the purchase of the farm.

Hazleton—Members of the educational committee of Hazleton Mining Institute have decided to award diplomas to students completing the course of study in the night schools of the institute. State Mine Inspector John J. Stickler was elected head of the educational committee to fill a vacancy caused by the departure of Arthur H. Lewis to Wilkes-Barre.

The Pennsylvania R R. closed a deal for the purchase of the coal yards of Claude L. Wilde, within a square of its freight station, for extensive enlargement of its facilities here as soon as the war is over. The consideration was $35,000.

The Lehigh & Wilkes-Barre Coal Co. is making efforts to get control of the long abandoned mines at Silver Brook which were formerly operated by J. S. Wentz & Co. The workings are flooded but are said to still contain great quantities of anthracite, estimated by some experts at 3,000,000 tons.

Shamokin—Justices of the peace throughout Northumberland County report a 75 per cent. falling off in criminal cases in connection with their work. Full time at the collieries, strict observance of the coal corporations' rules against drunkenness and war conditions in general have had a wonderful effect on the morale of the coal region.

Mahanoy City—Special officers for the Susquehanna Collieries Co. have arrested 14 boys and young men charged with setting fire to a mountain of young trees owned by the coal company and upon which thousands of dollars in timbers had been destroyed. They were heavily fined.

Johnstown—The Hannan Coal Co., capitalized at $10,000, is opening a new coal mine on the Horner and Wilson properties, in Ferndale, and expects to begin shipments within a few days. Dr. C. E. Hannan, of this city, is president; Henry Dasbaugh, of Pittsburgh, secretary-treasurer; R. G. Hannan, mining engineer, and F. F. Osborn, sales manager.

Bituminous

Dubois—The John E. Laing Coal Co. of this city, operating several mines at Weedville on the Buffalo & Susquehanna R.R., has sold its operations to James Archibold, of Weedville, Penn.

The Chief of the Department of Mines, Seward E. Button, has placed the Fourth Bituminous district under the jurisdiction of Inspector Joseph Knapper, of Philipsburg, of the Eighth District, until a successor to the late Elias Phillips is appointed.

The Stewart Coal Co., of Knoxdale, Penn., has taken over upward of 1000 acres of Redstone coal lands in Lewis County, West Virginia, about one mile from Weston, the county seat, a town of about 5000 population. The siding and tipple are built and coal is being shipped. Contemplated extensions to the existing plant will cost about $50,000. Power will be furnished by the Monongah Traction and Power Co., and the boilers now in use will be done away with. A. L. Bouton, former city engineer of Dubois, will superintend the plant.

Punxsutawney—John McKleavy & Co. have sold their mines at Florence, Penn., to a new company composed of Punxsutawney men. A new mine was recently opened in the upper seam of coal and is developed to a capacity of about 100 tons per day.

Savan—A pocket of 6-ft. coal has been opened up here by W. H. Bicknell, and the operator is loading the production over the tipple of his Big Two mine. It has caused considerable excitement as this vein was heretofore unknown.

Pittsburgh—More than 100 of the leading mining men of western Pennsylvania, members of the various district examining boards, met at the Seventh Avenue Hotel on Mar. 8. The dates set for the mine foremen and firebosses' examinations this year are Apr. 9, 10, 11 and 12. The following men were selected to act as a committee to draft questions, answers and other minor details: P. J. Walsh, Nicholas Evans, mine inspectors; R. H. Kay, James Porter, superintendents, the operators' board representatives; John McKillip, J. O. Van Riper, miners' representatives. The alternates chosen are John I. Pratt, mine inspector; Thomas Easton, superintendent, and John Walters, miner.

Macdonaldton — Extensive improvements will be made in the present equipment of the Brothers Valley Coal Co. The capacity of the present mines will be materially increased and a new shaft opening will be made on another part of the property. The new mine will be electrically operated, and is to be modern in every respect. H. B. Reed, of New York City, is president of the company and Charles M. Means, of Pittsburgh, is consulting engineer.

Uniontown—Referee J. G. Carroll has set Friday, Apr. 12, at 10 o'clock as the time for a hearing at which lien creditors of the J. V. Thompson estate may participate prior to the proposed sale of Greene County coal lands to the H. C Frick Coke Co. The meeting will be held in Mr. Carroll's office in the Cooper-Lackey building.

A deed recorded here last week shows the transfer of 130 acres of coal land in Franklin and Perry townships, Fayette County, from Ferdinand Guth to the Coke City Coal Co., of Connellsville. The consideration is given as $11,000.

Brownsville—J. H. Price, of South Brownsville, has purchased the mine of the Ross Coal Co. near Merrittstown, and will operate it in the future under the name of the Price Coal Co. The new owner purchased the coal, the mining rights and the new coal tipple recently erected. Mr. Price will fill the contracts made by the old company.

Greensburg—The Westmoreland Coal Co. has sold to the Irwin Gas Coal Co. seven seams of coal in Franklin Township for $237,601.80.

Pottsville—The Laurel Coal Co., composed of capitalists from Wilkes-Barre, are building a large breaker at Mowry.

Connellsville—The Jim Run Coal Co. has closed a deal for 163 acres of coal land in Stewart township, Fayette County, from Charles P. Newell and others for a consideration of $30,000. A. C. Stickel is president of the Jim Run Company.

West Virginia

CHARLESTON

Increases in several of the districts of the state having been granted by the fuel administration, operators at the central counties and northern counties, most of whom are affiliated with the Central West Virginia Coal Operators Association, have been requested to take their cost sheets to Washington in order that the application for an increase in price for the coal from the mines in the Fairmont-Clarksburg field may be considered. The Central Association has named a committee to go to Washington. Figures forwarded to Washington show that production in the central West Virginia coal fields fell off more than 1,285,000 tons in the five weeks from Jan 13 to Feb. 16, most of the decrease resulting from car shortage.

Coal operators on the Monongahela R.R. and on the Morgantown & Wheeling R.R. are facing a serious crisis, according to their opinion, unless an agreement can be reached at a meeting of committees representing the coal operators and Government railroad officials to be held in Washington at an early date. Officials of both the New York Central lines and the Pennsylvania System who jointly operate the Monongahela, it is alleged by the operators, have openly declared themselves opposed to supplying cars to the mines on the two railroads already referred to. If the sources of car supply—the Pennsylvania and the New York Central—are cut off every mine in the vicinity of Morgantown will be closed. The coal operators are to be represented by E. H. Gilbert, of Preston County, and Samuel D. Brady, for Monongalia, at the coming conference with Government railroad officials.

No cars are owned either by the Monongahela R.R. or the Morgantown & Wheeling R.R., and consequently those two roads are dependent upon the two systems which control them for a supply of cars.

While the movement of coal freight has materially improved in this state in the last three weeks, operators still voice the opinion that the tonnage moved is far below both the producing capacity of West Virginia mines and market demands. Consequently West Virginia mines, even with a return to conditions somewhat approaching normal, are not producing their maximum output.

In coal-mining circles it is felt that the fact that the fuel administration is seeking the coöperation of recognized experts in the mining industry will enable the administration to remedy existing conditions and will have beneficial results.

Cleveland capitalists and Virginian Ry. officials were in conference in Wyoming County last week with a view to determining the feasibility of building a branch line of the Virginian to tap the property of the Wyoming Pocahontas Coal Co. To reach the large tract owned by the Wyoming company it would be necessary to build about 10 miles of railroad, involving heavy construction work and the boring of a tunnel nearly a half mile in length. The branch, if built, would connect with the main line of the Virginian at Maben.

The Lick Fork Coal Co., located about 2 miles from Bishop on the Virginian Ry., will begin to load coal by Mar. 15. This colliery was recently purchased by P. C. Thomas, Alexander McNabb and F. S. Monahan, the latter having been placed in charge of operation. The company is said to have a 7½ ft. seam of clean coal. Up-to-date mining machinery has been installed.

The Hillcrest Coal Co. is opening a wagon mine just outside of Charleston at the eastern edge of the city. The development will be made in the Lewisburg seam. T. M. Boogs, of Charleston, is at the head of the enterprise.

The Davis Creek Coal and Land Co., which is headed by J. H. Snyder, of Charleston, has secured its right of way and is now shipping coal from its new mine back of Spring Hill.

Williamson—The Coalburg Coal Co., of Wilsondale, of which Judge F. H. Evans is president, has recently opened a fine plant on its property and is now ready to ship coal.

Clarksburg—According to a deed filed for record in the office of the county clerk, the Pitcairn Coal Co. has sold to the Harry B. Coal and Coke Co. the Pittsburgh vein of coal underlying 443 acres of land and three tracts of land in fee simple aggregating 164.57 acres in Clark district. The consideration was $200,000.

Pike—Work of sinking the new slope for a coal mine on the property of the Cleveland Coal and Dock Co., at Roney's Point, is rapidly nearing an end.

ALABAMA

Birmingham—According to a statement of W. E. Matthews, president of the state board of convict inspectors, convicts employed in the mines of the Sloss-Sheffield Steel and Iron Co., Bessemer Coal, Iron and Land Co. and Montevallo Mining Co. earned more than $50,000 during 1918 for coal mined in excess of their tasks. At Aldrich, an operation of the Montevallo

Mining Co., the convicts produced 20,691 tons extra and thus contributed their "bit" toward relieving the acute shortage of domestic coal.

Construction work has been begun on the new steel and concrete coal washery and screening plant of the Republic Iron and Steel Co., at Sayreton, near North Birmingham, Ala., and will be pushed to completion as rapidly as possible.

INDIANA

Vincennes—The Royal Coal Mines, backed largely by Vincennes capital, has obtained the option on 15,000 acres of coal land in Gibson and Pike Counties. The company is headed by Henry F. Allen, a coal operator formerly of Evansville. Marlein R. Moser is vice president; Charles A. Bainum, president of the Knox Bank and Trust Co., treasurer; W. M. Wilmore, general manager of the Hartman Manufacturing Co., and John L. Klemeyer, president of the Knox County Lumber Co., are trustees. One shaft is being sunk at Oakland City.

Sullivan—Henry A. Butler, of Cass, near this city, after 30 years in the coal business, has sold his interests in the Syndicate Coal Co. operating in Sullivan County, to Roy Price and John McLin, of Dugger.

ILLINOIS

Springfield—Examinations which were to have been conducted in Saline and Williamson Counties by the State Mining Board have been postponed as a result of epidemics of smallpox. The two counties were omitted from the itinerary of the board on recommendation of Dr. St. Clair Drake, of the state department of health. The board at this time is holding sessions in the southern part of the state.

Deciding that a train of the Alton & Chicago R.R. operated between Springfield and the Devereux mine is a "special" and not engaged in regular service, Commissioner Dempcy, of the State Public Utilities Commission, has overruled a petition of miners employed at the Peabody mine asking for an order to have this train stopped daily for their accommodation. The train is run under contract with the Devereux Co. The Peabody miners explained the train passed within a short distance of their shaft where 200 men were waiting to ride, but that the crew refused to stop. Company officials declared the seating capacity of the train now is taxed to the limit and that to overload the cars would tend to make travel dangerous. Lack of equipment precludes making up another train or of adding any cars to the one now in operation.

Subdistricts will be reorganized by the Illinois miners' union. A few years ago there were subdistricts in the state, but the plan has since been abandoned. Each subdistrict will contain about 15,000 miners and will have a president, secretary and other officers. The committee in charge of the reorganization is composed of George L. Mercer, Peoria; Hugh Watles, Herrin; Edward Dobbins, Belleville; Benjamin First, Gillespie; and William Hutton, of DuQuoin.

Bush—The new mine here recently opened by the Western Coal and Mining Co. is being rapidly developed for the production of fuel coal for the Missouri Pacific R.R.

Belleville—A coal miner from Shiloh recently bought $1000 worth of Thrift Stamps during a Four Minute Man Campaign here. Another coal miner bought $166.50 worth.

O'Fallon—On Mar. 7 three loaded coal cars pulled by a switch engine on a branch of the Baltimore & Ohio feeding the International Coal Co.'s Taylor mine went through a 75 ft. bridge, injuring two brakemen. The accident will tie up the Taylor mine two or three weeks, meaning a layoff of about 325 men.

Danville—The mine at Batestown has been sold by John Mauck to Terre Haute parties.

Carlinville—The Chicago & Alton Railroad Co. has given the name "Cowan" to the new station established 2 miles north of this city where the Standard Oil Co. is developing new mines. The station was named in honor of an official of the Standard Oil Co. who is in charge of construction work. Cowan will become an important coal-shipping station when the mines are opened.

New Baden—The New Baden mine of the Southern Coal, Coke and Colliery Co. has been opened, having been closed since Nov. 21, 1917, when a cave-in stopped all operation. The opening of the mine was a peculiarly difficult task as the mine caved in repeatedly and the work had to be done over patiently. Finally, 12 x 12-in. oak beams were used and a permanent shaft was opened. The mine will employ 650 men.

Ziegler—The Bell-Zoller colliery at Ziegler has been reopened. It has been closed since last December, when three miners died from a gas explosion. Inspectors sealed the mine after the explosion in hopes of getting control of a fire which raged for several weeks in the mine. Director Evan John, of the Illinois Department of Mines and Minerals, and State Mine Inspector Thompson approved the opening of the mine. They have not, however, authorized the opening of the New North mine at Christopher, Ill., where 18 miners were killed several months ago. There was also considerable property damage which must be repaired before the mine is opened. The shaft has been sealed for some time.

OHIO

Coalton—A large amount of development work in this section is projected and much of it is being carried forward at this time. When the new mines that have been planned are completed the output will be increased fully 25 per cent. if not more. Thompson & Son, of Radcliff, are opening a drift mine in No. 4 seam on the Hocking Valley Ry. near Radcliff. The company controls a large acreage at that place. It will be electrically equipped.

The Kinwood Coal Co. of Columbus, has started work on a drift mine located near Oreton in No. 4 vein. This is also located on the Hocking Valley Railway.

The Shafer Coal Co., of Logan, is another of the concerns to start work on a slope mine in No. 4 seam in Vinton County, J. J. Reittemeyer is superintendent.

The Wellston Rich Run Coal Co., of Wellston, is opening a shaft mine in No. 2 seam which is designated for gas coal. A hoist is to be built.

The Standard Colliery Co., Jackson, of which E. L. Stephenson is superintendent, is opening a mine in No. 2 seam in the Jackson district. It will be exclusively pick mining.

St. Clairsville—The coal company recently formed by Oliver Monaco, Louis Costanzo and other residents of this vicinity will mine the coal owned by ex-Congressman W. B. Francis at Robyville, near Adena, on the local branch of the W. & L. E. The company's tipple is half completed. The plant will cost $60,000. The company is one of the few that will mine on a royalty basis.

Steubenville—It is reported that the City of Cleveland is seeking coal lands in Jefferson and Belmont Counties. It is expected that about $3,000,000 will be expended on coal properties. The Cleveland administration plans to purchase large coal tracts and to erect a large power plant. S. A. Williams, representing the Cleveland administration, is in this vicinity, looking over available property.

KENTUCKY

Lexington—The Frick interests recently announced a program for the expenditure of $9,000,000 in the development of 30,000 acres of coal land for the Louisville & Nashville R.R. A modern Kentucky town is to be built in South Harlan County, giving employment to thousands.

Whitesburg—Ohio people, including M. C. Justice, W. K. Elliott and others, have organized the Eastern Kentucky Coal and Land Co. in Pike County, with $100,000 capital, after acquiring 800 acres of coal lands for development. Work is to be started at once.

Madisonville—The power house of the Shamrock Coal Co., near Providence, owned by the St. Bernard Coal Co., of Earlington, was dynamited recently and the concrete building practically ruined.

COLORADO

Denver—Twelve mines in the bituminous coal fields in Colorado, having a total production of 2500 tons daily, ceased operations to-day as a result of the fuel administration's order reducing the price of coal, according to reports made to the Colorado division of the fuel administration. As many more mines, reports received by the State Administrator said, will shut down Apr. 1. More than 500 miners are idle and the number may reach 1000 within a week, it was reported. A 50c. reduction in the price of Colorado coal at the mines went into effect on Mar. 11 and a further cut of 70c. has been ordered, effective Apr. 1.

Foreign News

Edmonton, Alta., Can.—A railway line to tap the immense anthracite coal fields held by Patrick Burns, a packing magnate of Calgary, in the foothills of the Rocky Mountains southwest of Calgary, has been made possible by a bill passed in the house to incorporate the Calgary & Southwestern Ry. It is reported that this line will be started at once in order to bring the coal into the Calgary market next winter, if possible.

Montreal, Can.—Profits of the Intercolonial Coal Co. for the year ending Dec. 31 last totaled $183,419 compared with $122,734, an increase of $60,685, or 49.4 per cent. Deductions amounted to $83,427, leaving a surplus for the year of $9992, which, added to the previous surplus, made the profit and loss total $179,089. Charles Ferngie, the president, stated that the total quantity of coal raised was 170,700 tons, compared with 143,748 in 1916, an increase of 35,952 tons. Outputs were at times, however, adversely affected owing to shortage of labor. Current assets totalled $301,868, compared with current liabilities of $42,098, leaving the net working capital $259,770, compared with $164,307 a year ago.

Personals

Harry Irvine has been appointed manager of the Carter Coal Co., Charleston, W. Va.

Frank B. Stewart, of Cincinnati, Ohio, for some time treasurer and general manager of the Winifrede Coal Co., operating in Kanawha County, has been made president of that company.

Irene Stahl, formerly private secretary to A. W. Calloway, president of the Davis Coal and Coke Co., has been promoted to assistant secretary of the Davis Coal and Coke Co. and allied interests.

J. E. North resigned as mine foreman of Fulton Run shaft of the Jefferson and Clearfield Coal and Iron Co. to accept a similar position with the Allegheny River Mining Co. at Pine Furnace, Penn.

George Love, formerly mine foreman for the Jefferson and Clearfield Coal and Iron Co. at Ernest, Penn., has accepted a similar position with the Cowanshannock Coal and Coke Co. at Yatesboro, Penn.

J. E. Sullivan, of Jermyn, Penn., and for the past 10 years a special agent for the Pennsylvania Coal Co., has been made chief clerk to E. J. Mulvihill, assistant to the president. Mr. Sullivan will have headquarters at the main offices in Dunmore, and will be in direct charge of about 50 clerks.

Obituary

Capt. James Miller Hustead, aged 91, one of western Pennsylvania's biggest coal and coke operators, died at Clearwater, Fla., recently.

David Murphy, of Dawson, N. M., a member of the New Mexico mine inspection crew, was killed on Mar. 6 in the Government coal mine at Carthage, N. M., when he removed his oxygen helmet while making an inspection of the mine with four other members of the crew, according to State Inspector Risbon. He was carried to the mouth of the mine where effort to revive him proved unsuccessful.

Publications Received

Twenty-sixth Annual Report of the Ontario Bureau of Mines, 1917. Vol. XXVI. Printed by order of the Legislative Assembly of Ontario. Illustrated, 6½ x 9¾ in.

"The Determination of Moisture in Coke." By A. C. Fieldner and W. A. Selvig. Department of the Interior, Bureau of Mines. Technical paper 148. Unillustrated, 12 pp., 6 x 9 in.

Combustion of Coal and Design of Furnaces. By Henry Kreisinger, C. E. Augustine and F. K. Ovitz. Department of the Interior, Bureau of Mines. Bulletin 135. Illustrated, 137 pp., 6 x 9 in.

Combustion of Coal and Design of Furnaces. By Henry Kreisinger, C. E. Augustine and F. K. Ovitz. Department of the Interior, Bureau of Mines. Bulletin 135. Illustrated, 137 pp., 6 x 9 in.

Occupational Hazards at Blast-Furnace Plants and Accident Prevention. Based on Records of Accidents at Blast Furnaces in Pennsylvania in 1915. By Frederick H. Willcox. Department of the Interior,

Bureau of Mines. Bulletin 140. Illustrated. 147 pp., 6 x 9 in.

Coal: The Resource and Its Full Utilization. By Chester G. Gilbert and Joseph E. Pogue, of the Division of Mineral Technology, United States National Museum. Smithsonian Institution, United States National Museum. Bulletin 102, Part 4. Unillustrated, 26 pp., 6¼ x 9¾ in.

Catalogs Received

Graphite Mine Car Lubricants. United States Graphite Co., Saginaw, Mich. Booklet. Pp. 16; 3½ x 6 in.; illustrated.

"What the Erie Is Doing" is the title of a new bulletin issued by the Ball Engine Co., Erie, Penn., which shows how the Erie steam shovel is employed on various kinds of work.

Anniversary Advertising Portfolio of 85% Magnesia. Magnesia Association of America, 702 Bulletin Building, Philadelphia, Penn. Illustrated, 32 pp., 10¾ x 13¾ in. The book is a large and impressive assemblage of all the educational publicity regarding the association's insulation which has been appearing in the technical press. It is a series of careful presentations of the nature and applications of 85% Magnesia for covering steam pipes and boilers.

Safety Auto-lock Switches, Krantz Mfg. Co., Inc., of Brooklyn, N. Y. Special publication No. 1585-A. These switches are designed for use on circuits wherever the ordinary knife switch may be applied. They are especially designed for safety, it being absolutely impossible to touch the live parts regardless of the position of the switch or of the door. Switches are particularly adapted for use in steel mills, factories, mines and other similar locations where men are employed who have no practical knowledge of electricity.

Hopper Car Door Operating Mechanism. J. M. Rohlfing, assignor to American Car and Foundry Co., New York, 1,256,165. Feb. 12, 1918. Filed Apr. 10, 1917. Serial No. 160,952.

Industrial News

Philadelphia, Penn.—The Jonathan Coal Mining Co. has been incorporated with a capital of $100,000. The incorporators are F. R. Hansell, of Philadelphia, J. Vernon Pimm and S. C. Seymour, of Camden, N. J.

Findlay, Ohio — The Virginia Fuel Co. has been incorporated with a capital of $10,000 to deal in fuel. The incorporators are A. E. Kerns, Chester Pendleton, George W. Corbin, T. C. Schwartzbeck, Gladys E. Yoxthimer.

Buffalo, N. Y.—The Border Coal Co. has been incorporated with a capital of $10,000 to engage in the coal and wood business. The incorporators are B. M. Lempenau, M. L. Heinis of Buffalo, and M. C. Bartholomew, of West Falls.

Philadelphia, Penn.—Nearly 99½ per cent. of the coal coming into this city is clean coal, says the Pennsylvania Fuel Administration, according to a statement issued recently by the General Committee of Anthracite Operators.

San Diego, Calif.—Material for the construction of a concrete coaling platform at the naval coaling depot at La Playa is being assembled. The platform will replace the present wooden decking on which coal is stored. It will be built by day labor.

St. Clairsville, Ohio—The Century Coal Co. has been incorporated with a capital of $60,000. The incorporators are John C. Nichols, David H. Thomas, John H. Anderson, Thomas J. McNamee, Bert W. Hopkins, J. H. Boroff, S. E. Boroff and J. A. Williamson.

Muskogee, Okla.—Headquarters for District 21, United Mine Workers of America, which includes the states of Texas, Arkansas and Oklahoma, was moved on Feb. 28 from McAlester, Okla., to Muskogee. The office had been maintained at McAlester since the organization of the district in 1908.

Bayonne, N. J.—A large portion of the trestle of the Lehigh & Wilkes-Barre Coal Co., at the Port Johnson docks here, was destroyed Sunday of this week. Shipments will be taken care of at the Elizabeth docks. It is believed that a couple of months will be required to rebuild the trestle.

Washington, D. C.—All shipments of coal from the Pocahontas district of West Virginia except that for byproduct use were ordered shipped to tidewater points for bunker and other purposes by the fuel administration on Mar. 10. The orders included all coal standing on mine sidings and continued in effect until the night of Mar. 12.

St. Louis, Mo.—Wood-chopping "bees" marking the inauguration of a movement to conserve coal have been started in St. Louis County. Parties are formed under the guidance of experienced wood choppers and the cords are stored away for next winter's supply. Many districts have pledged themselves to use no more coal until the end of the war.

Denver, Colo.—The Colorado Fuel and Iron Co. reports for the six months ended Dec. 31, 1917, a surplus of $1,647,117 after all expenses and charges have been deducted. Dividends paid on the preferred stock totaled $8000 and on the common stock $513,438, leaving a balance of $1,053,679 carried to the profit and loss account. Profit and loss surplus, as of Dec. 31, 1917, was $7,689,875.

Cincinnati, Ohio—Plans have been completed for a conference in Cincinnati on Mar. 20 of representatives of Ohio Valley cities interested in the improvement of the river for transportation purposes, the Ohio Valley Improvement Association having the matter in charge. Specific plans for improvements in the way of terminal facilities and connections with railroads will be discussed.

St. Louis, Mo.—The Walter A. Zelnicker Supply Co. has recently secured the services of G. W. Bichlmeir, who prior to his association with the Zelnicker company was connected with the supply departments of the Missouri Pacific and Kansas City Southern Railway companies, as well as having been secretary-treasurer of the W. L. Sullivan Machinery Co. Mr. Bichlmeir is connected with the Zelnicker machinery department.

Tacoma, Wash.—Suit for the foreclosure of the property of the American Coal Co.'s mines and improvements near here has been filed in the Superior Court by W. V. Rinehart, Jr., trustee for the Seattle Trust Co. Bonds of the company amounting to $1,500,000 were indorsed by the Seattle Trust Co. Interest since Mar. 1, 1912, when the mortgage was executed has not been paid and amounts to approximately $500,000 more.

Columbus, Ohio—On behalf of a delegation of coal miners from Guernsey County, Governor James M. Cox took steps to see that the district is furnished railway cars on the basis desired by the delegation. The miners say that there are two months in the year, in the spring, when the mines are flooded and they cannot work, and that they wish their cars so distributed as to time that they may get 100 per cent. car supply in times when they can work.

St. Louis, Mo.—Information has been received here that Attorney-General McAllister is preparing to file suits under the anti-trust law against members of the Fifth and Ninth Illinois Districts Association and the Fifth and Ninth Districts Coal Bureau, based on information obtained by him in an inquiry last November and December. McAllister, when questioned, said that he would not act hastily and that he was not prepared to say what his ultimate plan of procedure would be.

Columbus, Ohio.—The announcement is made by Secretary B. F. Nigh, of the Michigan-Ohio-Indiana Coal Association, that the annual convention of the organization will be held in Cincinnati, the exact time to be fixed later. It is believed that the date will be the last week in April. Last year because of unusual war conditions the annual meeting was called off. This year the meeting will be of a strictly business nature and practically all entertainment features will be eliminated.

Springfield, Ill.—A suit has been filed against the Chicago-Williamsburg Coal Co. restraining it and its officials from disposing of its "company stock," requiring the company to display its records and asking that a receiver be appointed for the company. E. H. Buckley filed the suit, alleging that he paid certain debts of the company with agreements that he was to receive 768 shares of stock. He also asks that the stock due him be ordered delivered by the company on order of the court.

Washington, D. C.—Government reports give details of an important addition to the world's coal supply. The new source of supply is guaranteed by the building of a new Peruvian railroad which will run to the eastern slope of the Andes. The coal fields, which are 25,000 ft. above sea level, are estimated to contain about 50,000,000 tons. The coal is said to be of excellent quality. The new railroad will cost about $1,500,000 and will be financed by the Italian bank at Lima. The contract is not let, but the grading probably will start within the next three or four months.

St. Louis, Mo.—Edward F. Goltra, president of the Mississippi Valley Iron Co., who is planning a barge line to the northern fields for shipments of coal and iron ore, has entered a denial to charges of Congressman James A. Frear, of Wisconsin, that he received anything "free" from the Government in the experimental barge trips made under his supervision. Two Government boats, used in making the experiments, Goltra said, were paid for in full. The barge line, which now is nearing reality, is designed to transport iron ore from the northwest ranges to St. Louis and to ship coal from the southern Illinois fields for return cargoes.

Wheeling, W. Va.—The annual meeting of the Ohio Coal Strippers' Association was held in Wheeling on Mar. 7, the principal pieces of business transacted being the admission of West Virginia and Pennsylvania stripping operators, and the change of the name of the organization to the Tristate Strippers' Association. The following officers were elected: President, W. J. Sampson, Youngstown, Ohio; vice president, George A. Blackford, Wheeling, W. Va.; secretary, B. A. Elkins, Cleveland; treasurer, Douglas Vaas, Wheeling; directors, the officers and Everett Ferguson, Steubenville, Ohio; J. A. Swanberg, Danville, Ill., and E. A. P. Roy, Cleveland. The organization now has a membership of 35 operators, representing an investment of $60,000,000. Resolutions were adopted pledging full support to the Government in the conduct of the war. A meeting will be held in Pittsburgh on Apr. 7.

St. Louis, Mo.—A protest has begun to take form against the plan to supply St. Louis and the eastern district of Missouri from the Fifth and Ninth Illinois districts, to the exclusion of the normal supply of high grade coal from Franklin and Williamson Counties, which it is intended to divert to Chicago. While the plan would assure St. Louis of a supply of fuel, it would be practically all of the inferior grade which comes from the Fifth and Ninth districts. There is a disposition on the part of consumers to insist that part of the high grade coal from southern Illinois be sent to St. Louis, particularly as St. Louis is nearer to the southern Illinois field than Chicago and shipments from that field to Chicago will have to go around St. Louis. P. H. Greenlaw, Secretary of the Fifth and Ninth Districts Bureau, has been recommended by operators of those districts as Government Distributor for St. Louis and the Eastern district of Missouri.

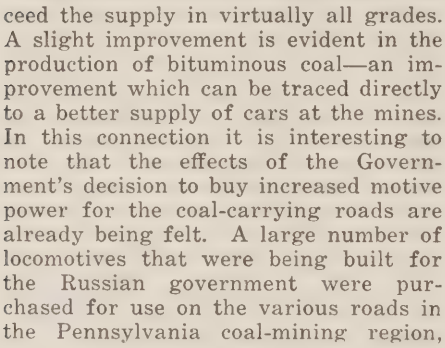
Weekly Review

Coal Year Drawing to a Close—Improvement in Output of Bituminous Due to Better Car Supply—Anthracite Still Short—No Contracting as Yet

THE most eventful year in the history of the coal industry is drawing to a close. Operators, jobbers, dealers and the consuming public are relaxing from the tension of a nerve-wracking winter and turning hopefully toward Washington, whence is soon to come the word that will dispel the clouds of uncertainty that now envelop the Government's plans for prices, zoning, car supply, diversion of shipments and so forth.



The demand for coal continues to exceed the supply in virtually all grades. A slight improvement is evident in the production of bituminous coal—an improvement which can be traced directly to a better supply of cars at the mines. In this connection it is interesting to note that the effects of the Government's decision to buy increased motive power for the coal-carrying roads are already being felt. A large number of locomotives that were being built for the Russian government were purchased for use on the various roads in the Pennsylvania coal-mining region, and many of them are now in service. It can safely be asserted that with this increase in motive power and a better supply of cars the bituminous mines will soon be producing enough soft coal to meet the country's needs.

As regards anthracite coal, however, the situation is not so favorable. The production of hard coal has about reached its zenith, and it is doubtful if the 77,000,000 tons mined in 1917 will be approximated this year, much less bettered. It has been figured out that the total population of the anthracite-burning area, which includes New England, the Middle Atlantic states and the District of Columbia, is 32,877,609. Therefore, if only 25,000,000 of this total be taken as a basis, it would mean that there would be three tons to every consumer. When it is also considered that this does not include the Government's coal supply, nor the constantly increasing number of war industries that use hard coal, it can be understood readily why anthracite will continue to be scarce for some time.

Indications point to a heavy contract demand after Apr. 1, which is the beginning of a new year in the coal trade. Consumers have still uppermost in their minds the memory of the past winter's sufferings, and they are determined not to fall short again if they can help it. The trade is fixing no prices in contracts, however, the general attitude being that as the Government's prices must necessarily prevail, subject to such future action as the Fuel Administration may see fit to take in the matter of distribution, there is nothing to be gained by a fixing of contract prices. Agreements are being made which simply state that a certain number of tons of a certain kind of coal will be furnished, subject to existing and future Government regulations, and to whatever other contingencies may arise to affect either the price or the supply. The fact that consumers are readily accepting contracts under such extremely indefinite conditions is an indication of the anxiety to secure a fuel supply.

COAL PRODUCTION

Except for time lost in occasional observances of Washington's Birthday as a holiday, the continued fair weather has permitted three consecutive weeks of normal operation with bituminous production well above 1,800,000 tons per day. Preliminary estimates place the output (including lignite and coal made into coke) at 11,055,000 tons during the week ended Mar. 2. The average production per working day was 1,843,000 tons, as compared with an average of 1,777,000 tons for the past year and 1,753,000 tons in February, 1917. The total production of beehive coke is estimated on the basis of railroad shipments at 621,000 net tons, an average per working day of 104,000 tons. The output was the largest recorded since early in December and reflects the improved car supply at the ovens. Anthracite shipments amounted to 39,875 cars.

Steady improvement in operating conditions at byproduct coke plants was reported during the week of Mar. 2. For all plants reporting the ratio of tonnage produced to maximum capacity rose from 77 to 79.9 per cent. The improvement was effected by a reduction in loss due to lack of coal, the tonnage lost for that cause amounted to 14.4 per cent. of maximum capacity. Only one plant reported labor trouble, and its loss on that account was small. Alabama and New Jersey were the only states in which production declined appreciably. An increase in losses due to no coal caused the ratio of tonnage produced to full-time capacity in the former state to drop from 84.3 to 74.4 per cent. Conditions in Massachusetts and Minnesota underwent no change. In all other states, particularly in the Middle West, operating conditions improved. Illinois, which had suffered severely from shortage of byproduct coke reported a production of 84.2 per cent. of capacity. The output in Indiana though still restricted by inadequate transportation, continued to increase. Production in Maryland was 97.8 per cent. of capacity.

TABLE II. CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended:			
	Feb. 9	Feb. 16	Feb. 23	Mar. 2
Bituminous shipments, 121 roads	181,586	189,984	189,691*	196,563†
Anthracite shipments, 9 roads	32,011	40,661	36,612*	39,875†
Beehive coke shipments, 4 roads	10,470	11,357	11,634*	12,753†

* Revised from last report. † Subject to revision.

Atlantic Seaboard

BOSTON

Somewhat less anxiety over current needs. Most of local restrictions removed Mar. 6, and normal hours resumed. Much eagerness to know season program, although no adequate plan has yet been put forth. Washington interested in New England coal statistics. Meanwhile a large tonnage of "Storrow coal" diverted to keep railroads in operation. Army colliers slow in arriving. Textile manufacturers hold conference to support jobbers as performing a necessary function. Emergency supplies doled out to industrials, a few days' supply at a time. All-rail movement fair. Heavy weather again interferes with boats. Dispatch not so good at Hampton Roads. "Storrow" coal beginning to move also by barges from New York piers. Anthracite loading beginning to be less irregular.

Bituminous—The storm of Mar. 10 was a vigorous reminder that winter conditions have not entirely passed. Receipts again show a falling off and demands upon fuel authorities to keep plants running are as insistent as ever. The railroads are still worrying along on an extremely close-hauled basis, and hardly a collier reaches Mystic Wharf, Boston, without a portion of the cargo being requisitioned by the Boston & Maine. All the industrials, too, are working on small coal reserves, but all will admit less apprehension over the near future. Under present conditions distribution is bound to be uneven. The question whether a consumer gets deliveries in contracts depends upon whether his source of supply has a car supply over and above the various "priorities." The buyer who either has no contracts or is unable to get coal in the open market has to make himself heard by the Fuel Administration and there, if possible, he is given a supply, limited usually to a few days. The departments at Washington are still actively supporting the demands made by plants manufacturing Government material, and there is now a detail of officers with Mr. Storrow's office to recommend to the distributors an order of preference in which manufacturers should be served, the classification being roughly according to prior need of output.

Beginning Mar. 6 the regulations governing retail stores, office buildings, etc., the past six weeks were lifted, except for the Federal order requiring two lightless nights per week. The result is a heavier draft upon retail stocks of coal and to such extent that the dealers have been seriously

embarrassed more than once the past week. Efforts to make up the Boston deficiency all-rail are not productive, and it is evident that all distributors must to a greater extent exert themselves at Hampton Roads and elsewhere to get coal loaded. It is observed that large industrials, like paper mills, power plants, etc., are getting coal in somewhat increased volume, chiefly because they are using every means at their command to get barges and steamers to the piers to connect with coal arranged for at the mines. In other words, those who try energetically to help themselves, as in the old days of competition, are likely this year to get better service.

No material change has so far been made in the all-rail order of Jan. 3, covering emergency shipments to the New England Fuel Administration. About 90 cars are now the daily yield instead of the 500 that are so often referred to, and of these about 80 per cent. are going to the railroads for engine supply. Only on one day, and that in January, did actual shipments amount to 60 per cent. on this order.

Only two of the "army colliers" sent here through the Quartermaster-General's office have so far reached Boston. The cargoes were distributed to textile and other plants engaged on war orders. The other ships have not loaded as yet, so the measure of relief to New England industrials through this channel is so far not very great.

Deliveries from emergency supplies at the disposal of the fuel authorities continue to be made on a hand-to-mouth basis, a week's supply usually being the most that a plant of any size can secure from any one cargo. Occasionally this is modified in cases where large consumers are in sections by themselves, as, for instance, the Great Northern Paper Co. at Millinocket, Maine, using more than 150,000 tons. A steamer is assigned for that particular plant and continues until some other arrangement has to be made.

All-rail movement keeps up in fair shape, although every few days there is more or less congestion. It is plain, however, that one or two of the gateways could handle more coal if it were sent to them. Increased shipments over the New York piers for Bridgeport, New Haven and New London are helping out the situation at Harlem River and therefore in the southeastern corner of Connecticut. There have been several cases where plants have actually shut down and there are many more where there would have been shutdowns if the New Haven R.R. had not come to the rescue from its engine supply.

Loading dispatch at Hampton Roads has slackened enough so that two or three days is the best that cargo ships can rely upon. Movement from the mines shows improvement the last few days and when dumping is more regular it is likely that coal will flow to the piers in better volume. Unfavorable weather has interfered with the arrival of boats and there have been days the past week when the public would have been alarmed had it been generally known how little coal was available for the absolutely necessary needs. Of one cargo of "Storrow" coal this week, 17,500 tons in all, nearly half had to be turned over to the Boston & Maine R.R. to keep the Boston terminal in operation.

There is now a fairly steady volume of coal coming forward along the Sound for Mr. Storrow's account, thereby relieving a great many emergency needs inland from Providence and other points. There seems a good supply of box barges for this trade, and in these days of locomotive shortage it should help a lot.

Anthracite—Movement all-rail shows a very material improvement over corresponding days in February, although the number of cars passing the gateways increases only gradually from day to day. Aside from interruptions because of weather the loading of barges at Philadelphia and New York is less intermittent and a better volume of tidewater coal is now looked for. There are many rumors of new methods of distribution the coming season but they are hard to verify. Another week will doubtless see announcements of much importance.

NEW YORK

The announcement from Washington regarding reduction in prices is pleasing to the trade. Retailers arranging for proper distribution of coal. While demand is not so heavy coal remains scarce. Steam coal situation unchanged. Bituminous situation slightly improved due to better car supply. Miners want more work. No inclination on part of producers to make contracts.

Anthracite—The announcement from Washington that mine prices for the domestic sizes will be reduced 30c. per ton during the four months beginning Apr. 1 has gone a great way toward placing the anthracite situation on a firmer basis. Although the flat reduction came as a surprise to most coal men, the change from the old form of discount seems most welcome as everybody realizes the consumer will look upon it with more favor. It will also mean considerable in the way of business to the retail dealer.

Dealers are not waiting for the new prices to go into effect before placing orders for their summer coal. Demand, so far as the wholesale offices are concerned, continues strong, but mild weather conditions have caused a lessening in consumption which has resulted in a let-up on retail dealers and enabled them to put some coal into their yard bins. Dealers in The Bronx, according to the announcement of the Fuel Administration officials, on one day during the past week had more coal on hand than on any day since the early part of the winter.

Supplies at the docks are not heavy, although production is at top-notch. Middlemen dependent entirely upon free coals are not able to find many stray lots.

Cleaner coal is one of the matters of vital interest to the trade. Many complaints continue to be heard but tradesmen say the coal is coming forward in better shape. The operators have assured the public that they are outspoken for clean coal. Inspectors of the Fuel Administration are in the coal regions watching shipments and dirty coal is immediately returned to the shipper.

Harry T. Peters, chairman of the State Conservation Committee, has submitted to A. H. Wiggin, State Fuel Administrator, a report on the fuel needs of New York State and its coal supply for next winter. The report recommends that public service corporations, public utilities and hospitals should put in a sufficient supply of coal to take care of their normal winter needs, that county fuel administrators should investigate conditions in their respective localities and report to the state fuel administrator as to their storage facilities, and that plans should be made so as to facilitate and secure the proper distribution of the necessary quantities of coal.

There has been no change in the steam-coal situation. Buckwheat and rice are practically out of the spot coal market, while barley and culm are difficult to get. Nothing has been heard from Washington regarding the prospects of Government price fixing for these sizes. As the time approaches for the renewal or the making of new contracts for the small anthracite coals there is much conjecture as to what course operators and wholesale dealers will take.

Current quotations, per gross tons, f.o.b. Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buckwheat	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—There has been an improvement in the bituminous situation at this harbor, but the demand is so heavy that supplies on hand at the docks do not show an increase. Everybody appears to want coal and as a result the buyer who wants in excess of his contract has a slim chance of picking up free coal.

Reports from the mines are more encouraging than for some time past. Car supply is better, the mines along the Pennsylvania receiving about 25 per cent. of their requirements, while the other roads are doing as well if not better.

Production continues to improve and the Fuel Administration officials are hopeful that the tonnage figures will show the amount necessary to meet the nation's needs.

Consumers without contracts are having a hand-to-mouth existence so far as coal is concerned. Contract coal is none too plentiful, and as practically all of the coal shipped is going on contract or priority orders there is very little left for the spot buyer.

Demand is heavy from all sections of the East, shippers here receiving many inquiries from New England, Canada and the northern part of the state.

It is not likely that many contracts will be closed between now and April 1, the beginning of the coal year, although buyers are showing unusual activity in their efforts to protect themselves. Operators on the other hand are not displaying any great desire to tie up their output, but it is the belief that any consumer having a contract now will be taken care of in the matter of distribution after the expiration of his contract.

PHILADELPHIA

Anthracite spring prices create stir. Order silent on individual differential and broker's commission. Retail trade quiet. Larger dealers anxious to store at present prices. Gross retail margin unchanged. Interest as to contract prices. Bituminous conditions improve, but demand still extraordinary. Rail conditions improve. Increased motive power promised. No contract business.

Anthracite—The feature of the week has been the announcement of the new spring prices by the National Fuel Administration. The plan of making a flat reduction of 30c. a ton on domestic sizes to remain effective from Apr. 1 to Sept. 1 seems to meet with the approval of most interests. According to this the prices beginning Apr. 1 will be as follows:

	Line	Tide		Line	Tide
Egg	$4.50	$5.70	Chestnut	$4.85	$6.10
Stove	4.75	6.05	Pea	3.45	4.35

Unless a change shall be made by the Fuel Administration it will be seen from the new order that the winter prices for next year, beginning with Sept. 1, will be the same as have been in effect during the winter just passing.

For a week past there has been much confusion in the local market, as the state fuel administration had given out the information that the regular 50c. discount, with the 10c. decrease each month, was to be put into effect on Apr. 1. Evidently there was a mix-up somewhere, for the switch to a flat discount of 30c. came with a suddenness that startled.

Due to the publication in the local papers that a price reduction was imminent, together with the mild weather, the retail trade has been extremely quiescent. Probably no better illustration of this was the advertisement of a large local retailer announcing to his regular customers that he was in position to fill orders on all sizes for current consumption, giving the retail prices. This is the first publicity used by any retailer for many months. Business continues quite brisk on chestnut and pea, but many requests to hold the larger sizes are being received by the shippers, especially from dealers who supply the smaller homes.

While the retail business is somewhat inactive, or at least having lost much of its vigor of previous weeks, the stocks on hand continue to be quite small; but some of the large buyers, with more courage than their smaller competitors, are anxious to increase theirs. They claim that despite the announced reduction of 30c. beginning with Apr. 1 they will be willing to pocket this loss on any coal they store now, in order that they may be in position to do business as soon as the rush comes. The wiser ones realize they have nothing on which to base a belief that they will receive substantial shipments immediately after the first of the month. There are a few who admit that if the $2.50 gross margin which they now enjoy is not disturbed they can easily afford to assume this 30c. if only to keep their equipment going. Another thing which inclines them to the belief that there will be no great rush of coal to this market, at least not in excess of last year, is the statement of several operating authorities that they believe the maximum production of anthracite coal has now been reached and that it will be many years, if ever, before the production of the past year will be approximated.

In regard to the margin of gross profit to be allowed the dealers after Apr. 1, nothing definite has been announced and the trade remains on the anxious bench, for it was intimated when the margin was increased it was only because of more difficult delivery conditions during the winter. Chairman Lewis has promised a decision in the matter before Apr. 1.

With the definite announcement of a reduction in prices throughout the summer the dealers began to receive quite a large number of orders, but the rush does not seem to be nearly so large as usual, on account of the reduction being equalized for the entire summer. For this reason some dealers fear that they will be swamped with orders during August, the last month of the cheap coal. However, the coal authorities intend to keep urging consumers

to order at once and in addition the dealers will more than likely solicit orders themselves with the understanding that delivery is to be made before Sept. 1.

Early in the week the records showed but 39,000 tons of coal in stock in the various retail yards. This is estimated as being only 3 per cent. of what the Fuel Administration hopes to see stored in the cellars before fall, by which time it wants to see 1,140,000 tons tucked away.

We learn that much time and thought is being given by the various shippers as to the distribution during the coming coal year. All figures are naturally based on purchases of the past two years. In the latest order issued by the National authorities this matter of anthracite distribution has been placed in the hands of two local men, W. J. Richards, president of the Philadelphia & Reading Coal and Iron Co., and S. D. Warriner, president of the Lehigh Coal and Navigation Co., in addition to J. B. Dickson, of New York. If the public at large is to carry out the desires of the authorities, the coming spring and summer will see more coal delivered to homes than during any similar season in the history of the trade.

While many of the local retailers, with the exception of the larger ones referred to, are inclined to hold orders at this time, this causes no concern with the operating companies, for they are making heavy shipments to the West, while New England also continues to receive attention. The movement to outside markets has been of such volume as to reduce receipts here to about 8000 tons daily.

The local authorities continue to wage the campaign against dirty coal and this week condemned several shipments that had been dumped in the yards of retailers. The local committee also has sent details of its system of inspection to the administrations in the other states receiving anthracite, which method has been approved by the National Fuel Administration.

With the new spring prices in effect much interest is taken in what the new contract prices on steam coals will be. While fewer contracts than usual were closed last year by all the companies, yet there are certain sizes, particularly rice and barley, that the companies are anxious to have assigned in this way. Of course, the steam prices are not controlled by the Government, but it has always been the practice to advance or decrease these prices in sympathy with the domestic coals and inasmuch as the basic prices of domestic coals have not been increased it may be that the steam contracts will remain unchanged.

The prices for the month of March per gross ton of 2240 lb. for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—There continues to be improvement in the situation, due principally to the almost ideal weather conditions, which have assisted the rail movement to a notable degree. This is not to be taken that conditions are normal, for such is not the case, as the shortage is still serious. Numerous plants continue to operate on restricted time and many of the essential industries are still compelled to depend upon the fuel administration to confiscate a considerable tonnage. There continues to be considerable rail congestion and this is particularly true west of Altoona, although eastward from there to this city the improvement has been quite pronounced. The movement of fuel from the southern fields via the Baltimore & Ohio R.R. is also on the mend.

The trade is quite gratified at the decision made by the Government to expend vast sums in the purchase of increased motive power for all the coal roads. If anything the greatest need of the industry has at all times been for more locomotives and the prompt repair of the large number that have been disabled.

Due to the very much unsettled conditions in the trade relating to the Government's control, practically no contract business is being done. As it now stands most interests take the stand that there is no particular advantage to be gained by entering into an agreement. On the part of the consumer, though, he feels that if he can negotiate a contract he will feel some assurance of getting a fairly regular supply. As it now stands he is compelled to plead with his old shippers to keep him supplied, but in the case where the operator is having his production deflected by priority orders the old customers are left out in the cold. This is a condition that the operators themselves are chafing under, as we know of several companies who for the past several months on account of priority orders have not had more than a dozen cars of coal for customers of long standing.

BALTIMORE

Bituminous supply easier, but still apportioned to hard-pressed industries. Little anthracite arriving. Trade looks toward changes coming in April.

Bituminous—Ideal weather conditions for the railroads in this section have speeded up movement. While many mines are still complaining that they have not all the cars they could use by any means, there is no doubt that a great quantity of fuel is now awheel and that even easier conditions are assured for a time. Reports of coal between this point and the mines show that hundreds of cars are on sidings, in addition to those now moving. The coal coming here was readily absorbed, however, and there is still no spot market. As a matter of fact the urgent demand from certain factories is such that the Fuel Administrator is practically directing the distribution of all coal coming here to jobbers.

Anthracite—The trade, of course, generally discussed the 30c. reduction plan for domestic anthracite, and it is for the most part looked on as equitable. The idea of requiring consumers to file requests showing tonnage used, on hand, etc., was also generally approved. These were two of the recommendations of the national coal merchants group while in session here recently. Receipts of anthracite continue light as compared with demand. The approach of spring has lightened the call, as most of those without coal in their cellars have made up their minds to do without until the 30c. reduction plan is inaugurated in April. Even under careful handling of summer distribution the trade is skeptical of ability to furnish consumers with anything like full supply before the advent of next fall and winter.

Lake Markets

PITTSBURGH

Coal contracting awaits new prices. Some reservations made. New inspection system discussed. Car supplies increasing. Large consumers supplied with coal.

Making of coal contracts for the period beginning Apr. 1 naturally awaits the announcement of the Fuel Administration's plans. Never before has the contracting been so long delayed, but it is doubtful if there will be the usual volume of contracting when prices are set, as both producers and consumers are disposed to go slow. Informal understandings have been reached between producers and consumers in many cases that shipments are to continue as formerly, subject to the ruling Government price.

The expectation is still entertained in some quarters that if any considerable advance is made over the present set prices, based on $2.45 for mine-run, there will be times when the open market for free coal will be below the Government limit. That, after all, would only repeat the condition that has often obtained in spring and summer of prompt prices being below the contract level.

Local operators are much interested to see how the inspection system of the Fuel Administration will work out. Undoubtedly the district representatives of the Fuel Administration can find many men willing, or even anxious, to act as inspectors, but it is pointed out that the test of the inspector's ability is not clearly defined. All the operators express themselves as favorable to the elimination of slate and other refuse matter as a material to be carried by the railroads under the guise of "coal," as its elimination would increase the real capacity of the railroads; but none of the operators is willing individually to plead guilty to the charge of shipping 9 per cent. waste matter with his coal. The fact that inspection is at least a possibility may have a good moral influence at the mines.

Car supplies increased slightly last week, while this week opened with very good promise. There is little scarcity of coal in the immediate Pittsburgh district, and practically none at all in the Youngstown district, the large consumers in both districts being in fairly comfortable position as to coal. The steel mills are not running full, however, on account of difficulty in shipping their product, and are therefore not consuming altogether normal tonnages of coal. Jobbers are still doing business, when opportunity offers, on the commission basis, but are doubtful what position the trade will accord them when the commission comes off Apr. 1, as an extra to be charged the ultimate buyer. The market remains quotable at the former set prices: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. extra permitted to be charged by brokers.

BUFFALO

Some car improvement. Bituminous in usual heavy demand. Anthracite not yet meeting wants of consumers. Interest in reports of price reduction.

Bituminous—The situation improves slowly, chiefly on account of the better movement of cars. If this improvement keeps up complaints will soon be over. Some jobbers are able to report good blocks of cars now and then, but not regularly.

There are predictions on the part of some shippers that the cars which have been frozen in all over the country will soon begin to move with a rush, in which case the coal supply will increase fast. It will be hard to get too much of this sort of thing, though, and if it does not go on very far the coal shortage will continue. The winter has apparently gone, so that the need of coal is less.

The uncertainty in the trade continues. Nobody knows what to look for next, and orders from Washington to report this or that phase of the trade are as numerous as ever. Oddly enough, the new zoning order does not make its appearance here, and the taking over of the railroads has not produced any visible change in the running of the roads. Shippers are puzzled.

It is anything but an easy matter to fix prices on bituminous coal, as the various rail rates and orders are complicating. Generally Buffalo pays $4.60½ for mine-run (thin-veined at the Pittsburgh rail rate) with 5 and 15c. less at the Bessemer and Allegheny Valley rates. The thick-vein prices are $4.35 for three-quarter, $4.15 for mine-run and $3.90 for slack at the Pittsburgh rate, all per net ton, f.o.b. Buffalo.

Anthracite—The supply is not good. It seems that the shippers overdid the reduction of weather shipment which was instituted to meet the arrival of mild weather. No distress is possible now, but the supply in consumers' cellars is not increasing to any extent. At the same time many consumers are returning to the exclusive use of natural gas, which relieves the shippers to a great extent.

Shipping agents say that they have no coal to load for lake shipment and do not see how they are going to have any till the local demand is satisfied. Canadian retail dealers are still demanding coal as usual, on the plea that it is entirely lacking in many homes; but the shipments are such that this condition of things will slowly disappear.

DETROIT

Return of wintry temperature stimulates domestic demand. Receipts of bituminous maintain fair volume.

Bituminous—While in a general way the Detroit market presents an easier aspect because shipments are being maintained in fair volume, there is still no excess of supply arriving. The fact that weather conditions through the first week of March were characterized by springlike temperature permitted a considerable reduction in household consumption, thus increasing the supply of coal available for the use of steam plants.

Atmospheric conditions, however, have undergone a conspicuous change, and snow, blustering wind and low temperature have brought a revival of demand from household consumers, many of whom had allowed their supplies to dwindle away during the warmer weather. Records of the Detroit-Toledo railroads' operating committee indicate that shipments of bituminous coal coming into Detroit in the week ending Mar. 9 averaged slightly above 700 cars daily.

Apparently little attempt has yet been made by retail dealers or industrial concerns to begin stocking up reserves for later needs. It is said, in fact, that the quantity of coal coming into the city just about meets present requirements. Some of the jobbers are advising customers to get a reserve as large as possible during the present month, explaining that with the resumption of navigation on the lakes early in April the opportunity for stocking up will likely be much less favorable,

as cars now used in moving coal here may then be required in carrying it from mines to lake loading docks.

Uncertainty as to what prices may be put in effect after Apr. 1 is a deterrent factor as far as the retail dealers are concerned, as also is a statement credited to the Michigan fuel administrator that after Apr. 1, the maximum permissible margin ought to be not more than $2 a ton.

Anthracite—Receipts of anthracite rather fall short of requirements. Practically all the stock now arriving is needed for immediate distribution to household consumers, and retailers are seemingly finding no opportunity to create reserve piles in their yards. With little or no coke available and not much smokeless bituminous in the market, the greater proportion of household users are endeavoring to get anthracite.

COLUMBUS

A much more easier feeling is shown in the coal trade in Ohio. Stocking by domestic users is not as active as might be expected although a considerable tonnage is being laid up for next winter.

The coal trade in Ohio shows a much more normal aspect in every way. With the passing of the low temperatures and the wonderful improvement in transportation facilities the coal situation is much easier and coal men generally now have time to cast around and predict the future of the trade. Steam business is still active, although stocking for that purpose is not frenzied. The opinion appears to prevail that there will be sufficient fuel in this section to take care of current needs for some time to come.

The domestic trade is still active as a large sprinkling of users are taking heed of advice and are stocking for the coming winter. Others are holding off in the belief that they will be able to get Pocahontas and other fancy grades later. There is a marked scarcity of the fancy grades on the local market, due largely to talk of instituting the zoning plan of distribution. But so many complaints have been received against the zoning plan that it is now the belief that Federal authorities will allow the domestic trade at least to develop along normal lines. Dealers are stocking up to a certain extent in anticipation of a better demand prior to the opening of the lake trade. Some of the most farsighted dealers are trying to get as much coal in their yards as possible, as it is believed an advance in price may be made. Wagons which have been used for coal delivery during the emergency of the winter are not now required. On the whole the domestic trade is practically normal as far as supply and demand goes.

The steam business is probably the most active department of the trade at this time. Steam consumers, especially those using the largest tonnage are stocking up as fast as possible and many have accumulated quite a surplus. Manufacturing plants are now completely supplied with fuel. The same is true of public utilities and all interurban lines. Curtailment of service upon the advice of the state fuel administration is still in vogue by public utilities. Some of the larger users are casting around for contracts as the time for contracting is now approaching. But contracts will not be nearly as numerous as in previous years. Railroads are still taking a large tonnage as their freight movement is still large.

The production in all Ohio districts has been gradually increased under the influence of a better car supply. The Hocking Valley is now almost up to capacity and the same is true of the Pomeroy Bend field. Massillon and Crooksville are producing about 75 to 80 per cent. of normal and quite a good increase is reported from eastern Ohio.

Prices of short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.70	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

Demand continues to exceed supply in virtually all lines. Little spot coal available. Contract inquiry is heavy.

The continuation of moderate weather has to some extent caused a diminution of demand, especially from domestic consumers; but the total volume of demand is still much in excess of the available supply, as traffic conditions remain bad, and the car supply is far from up to normal. Virtually all of the coal shipped is being delivered under old contracts, leaving the spot market bare of offerings, or very nearly so. What coal is available is moving at the prices fixed by the Government and is eagerly snapped up. Prospects are for the heaviest contract demand ever witnessed, as all consumers have fresh in their minds the scarcity of the past few months and are determined not to be caught short of coal again if they can help it. The trade will fix no prices in contracts, however, the general position being that as Government prices must necessarily prevail, subject to such subsequent action as the Federal authorities may see fit to take in the matter of prices, car supply, diversion of shipments and so forth there is no use in attempting to fix contract figures. The agreement will simply be to furnish a certain amount of a certain kind of coal, subject to existing and future Government regulations and to whatever other contingencies may arise to affect either price or the supply itself. The fact that consumers will readily accept contracts under such extremely indefinite conditions is a sufficient indication of the general anxiety to secure some guarantee of a fuel supply.

BIRMINGHAM

Domestic demand experiences a slowing up; steam market strong. Production better than last period though curtailed by irregular work and local strikes.

There has been a noticeable slacking up in the domestic demand during the past week, though inquiries continue fairly good. The easing up is due, presumably, to the anticipated new schedule of prices to be announced by the Fuel Administration, effective Apr. 1. It is learned that such schedules will carry some changes in the classification of mines, but further than this it is not known that there will be any revision in prices. It is stated that the mines in the Blue Creek district will be placed on the big seam basis, and other classification adjustments made.

Inquiries for steam coal show no diminution, and some mines producing the soft Cahaba domestic coal, which does not stock so well, have temporarily thrown their output on the steam market to help relieve the stress.

The output of coal in the Alabama field, while showing considerable improvement over a week ago, especially at the mines where differences existed with union labor, and where outputs are nearly normal again, is far below what it should be. Production at the mines of the commercial operators is reported as badly crippled by irregular work and labor shortage. A strike at the Piper mines of the Ivy Leaf and Piper Coal Co. closed that colliery down three days the past week and cut the production 50 per cent. or more.

An ample car supply is being furnished all mines in the district, no complaint being heard on this score.

Coke

CONNELLSVILLE

Much better car supply this week but poor distribution as to consuming points, and competitive market possible in coke loaded in some cars. Labor supply regarded adequate for heavier shipments.

The opening of this week saw the largest car supply in the Connellsville region since last October, also the largest increase from one week to the next that has occurred for a long time. The improvement, assuming it to be lasting, is attributable partly to better movement of empties back from furnaces to ovens, the movement of loaded cars having greatly improved several weeks ago, and partly to the addition to the service of a number of cars released in the east by the clearing of the congestion there.

The Monongahela R.R., which is the governing factor, had an 80 per cent. car supply Monday of this week, with a promise of a 70 per cent. supply for Tuesday. Last week the average was only 43 per cent. while with such a start this week promises about 60 per cent. for an average. The increased car supply this week will help the coke operators more than the blast furnaces, for the reason that the supply of Peoria & Lake Erie cars is much better than that of Pennsylvania cars, and the former reach only a limited number of furnaces. Coke operators will have an opportunity to move a little of the coke they have been accumulating the past few weeks. This may make a wide open market for coke in Peoria & Lake Erie cars, while coke loaded in Pennsylvania and Baltimore & Ohio cars may continue scarce. Market transactions of late have been confined almost entirely to Peoria & Lake Erie deliveries.

While there may be some difficulty in getting out full working forces this week to take care of the large increase in car supply, operators have no fear but that in the long run they will be able to produce and load all the coke the furnaces require, if only they are given the cars regularly.

Nothing specific has been heard as to progress in the movement to reform car distribution and make it in relation to the capacity of the individual coke works instead of, as for a long time past, in relation to the number of ovens in blast.

The market on the whole continues quiet, with only occasional sales of small lots. So far as known all transactions are at the set prices: Furnace, $6; foundry, 72-hour selected, $7; crushed, over 1-in., $7.30, per net ton at ovens. So far as known no contracts expire this month, but the major portion of contracts now in operation will run out June 30.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Mar. 2 at 285,828 tons, an increase of 29,979 tons, and shipments at 297,234 tons, a decrease of 344 tons.

Buffalo—With the slight stir in bituminous coal the coke trade seems to take up all their time, so that nobody is able to report new business in coke. It remains undecided whether the consumers are going to be able to make their own deals with the ovens direct, as they did last year, and whether the price can be made without reference to the Government rules, as has been the case in general for the present contracting year. The supply to the furnaces remains adequate.

Birmingham—There is little change to be reported in the coke market. Inquiry is stiff and Government figures rule in the business booked. Both foundry and furnace coke supply is far short of requirements. Production is not up to capacity by any means, trouble in coal-mining circles causing a corresponding slump in the output. The problem of securing an adequate supply of furnace coke is becoming a serious problem with the iron-makers, and temporary banking of furnaces has been reported.

Middle Western

GENERAL REVIEW

Trade is delaying buying, waiting for the Government to announce some definite program.

All branches of the coal trade are fully cognizant of the fact that there are to be some changes in the program and have been patiently waiting for an announcement from Washington to outline a policy for the coming year. The trade is awaiting the Government's zoning policy before closing for next year's requirements with any jobber or producer. The fact that some trade papers have suggested there might be a reduction of prices for the early buyers is having its influence regardless of the disastrous results of such a policy last year.

The immediate coal situation is much relieved. The demand for domestic coal naturally slumps with the advance of warm weather. The dealer welcomes a let up in order that he may sum up his accomplishments for the past season and collect outstanding accounts, which have in some instances been neglected, because of the constant attention that was necessary to supply the trade with enough fuel to keep it warm. Many dealers say that a summary of their last year's business indicated a smaller percentage of outstanding accounts at this time than for any similar period for years. Transportation conditions are much improved as to movement. However, cars are still scarce and mines have not worked on an average to exceed 68 per cent. during the past week. The Chicago & Eastern Illinois, Burlington, Illinois Central and Missouri Pacific have all failed to provide sufficient cars to keep local mines in operation.

The receipts of steam coal have reached almost normal, and little or no trouble is expected in the need of western bituminous coal for the immediate future. Few contracts will be made until the Garfield policy is announced. Eastern bituminous and

hard coal is still scarce in the Middle West, dealers reporting that they are unable to buy hard coal for early delivery. This seems to be more than true with the dealers that have had no long-time connection with some firm that handles hard coal.

CHICAGO

Demand for steam good and market brisk. Domestic trade buying only the best grades.

There is still a market here for any grade that comes in. However, the lower grades are finding a market only with the steam user, and the better prepared high grade Illinois and Indiana coal is demanded by the domestic trade. Some few contracts have been closed, but with connections that have been intimate for years; in fact everyone seems to prefer to delay contract negotiations until some definite assurance is had that arrangements made will meet with the approval of the Federal Fuel Administration.

The receipts of eastern coal in this market are by no means normal, though much improved; in fact, more coal from the East is arriving than at any time since November, 1917.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La-Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Chestnut anthracite sold out in city and state. Plenty of egg and buckwheat, and also of coke. Plans made to check coal hoarding.

The announcement by the Federal Fuel Administration that anthracite coal would be cut 30c. per ton between Apr. 1 and Sept. 1 has served to check immediate buying to some extent, but it is expected that the advent of April will witness a rush on the part of householders to stock up their bins. At present there is an ample supply of egg and buckwheat anthracite, but chestnut is not to be had. The same is true at points in the interior of the state. Coke is easily obtainable. There is some uneasiness over a report that there will be no chestnut the coming season. State Fuel Administrator W. N. Fitzgerald has given notice that any attempts to hoard coal beyond estimated needs will meet with severe treatment.

W. H. Groverman, of Minneapolis, will supervise coal docks on Lake Superior and the west shore of Lake Michigan the coming season, but his authority does not affect that of the state fuel administration's.

ST. LOUIS

Spring weather has taken all the life out of the local market. Railroad conditions have helped it some, but in a general way the market is loaded with coal and the demand exceedingly light, with no outside coals coming in. Steam demand easy. Car service bad and movement slow.

The local condition is now worrying the shipper more than it is the consumer. During the past two weeks everybody has filled up to storage capacity with both steam and domestic coal, with the result that the demand is practically nothing.

There seems to be an effort on the part of some of the large buyers to hold off buying right now in an effort to break the market. The latter part of the week there were rumors that the prices had been cut under the $2.65 price in some instances, but this could not be confirmed. The situation, however, is a bad one, for several of the mines have had coal left over unbilled. The L. & N. R.R. still has an embargo on Chicago and that has filled the local market with the output of the mines on that road. The ferry of the Illinois Southern R.R. at St. Genevieve went out of commission last week, shutting off the gateway to southeast Missouri and the Lead Belt, with the result that an additional tonnage was thrown in here.

The Illinois Central, however, has been running about two to three days a week with a scant supply of cars, and the same condition is to some extent true of the M. & O. and L. & N. The Iron Mountain R.R. is perhaps as bad, if not worse. The movement on most of these roads is exceedingly poor. For the first time in many months the Terminal situation is practically normal, and cars locally are beginning to move in somewhat reasonable time.

In the Carterville field working conditions are improved, but not as they should be, on account of the poor car supply afforded by the Iron Mountain and Illinois Central. The Chicago & East Illinois has somewhat better service and the Burlington is doing remarkably well. The greater portion of this coal is still going for railroad purposes, and the Government orders have let up some, but no coal to speak of from this field is coming into St. Louis. In the DuQuoin field conditions are somewhat similar.

The Mt. Olive district has a tendency to be a little bit long on domestic sizes, and especially is this so when loaded in equipment restricted to St. Louis. All equipment that can move to the north and west is billed out that way, and a fairly good market is found north and west; but this is diminishing fast under the heavy tonnage supplied.

The Standard field is about ready to break on the price. The Chicago market shut off shipments of Standard coal and that has practically shut everything in here locally.

The country buying has not been as good as it was a year ago, and in a general way the condition is not satisfactory to the shipper. There is no indication that any cold weather will be severe enough to bring about any great change, and the only thing that can be expected to bring any relief will be the fact that the public will generally begin the storage of coal in April. This will have a greater effect in the way of moving tonnage than two weeks of real severe weather at this particular time.

There have been no shipments of anthracite, with the exception of from 12 to 15 cars, and no smokeless and but a small tonnage of Arkansas. The local coke situation is somewhat easier and some yards have a small supply.

During the past couple of weeks there have been some contracts made by operators for a maximum and minimum tonnage of either lump, egg or nut, as the operator may choose, and in the event that he cannot get it, mine-run at the Government price prevailing at time of shipment, with a stipulation to the effect that if there is any increase it shall be added. The contract is just a mere form of protection for the buyer, he having the assurance that he will have some regular source of supply.

The local market is per net ton f.o.b. mine:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80
3x6-in. egg	2.65@2.80	2.65@2.80	2.65@2.80
2x3-in. nut	2.65@2.80	2.65@2.80	2.65@2.80
No. 2 nut	2.65@2.80	.....	.....
No. 3 nut	2.65@2.80	.....	.....
No. 4 nut	2.65@2.80	.....	.....
No. 5 nut	2.15@2.30	.....	.....
2-in. scrgs	2.15@2.30	2.15@2.30	2.15@2.30
2-in. lump	.....	.....	2.65@2.80
3-in. lump	.....	2.65@2.80	.....
Steam egg	2.65@2.80	2.65@2.80	2.65@2.80
Mine-run	2.40@2.55	2.40@2.55	2.40@2.55
Washed:			
No. 1	$2.65@2.80	$2.65@2.80	.....
No. 2	2.65@2.80	2.65@2.80	.....
No. 3	2.65@2.80	2.65@2.80	.....
No. 4	2.65@2.80	2.65@2.80	.....
No. 5	2.15@2.30	2.15@2.50	.....

Williamson & Franklin Co. rate is 87½c. Other fields 72½c.

SEATTLE

Washington coal to be reclassified with maximum price fixed for every grade and preparation. Some prices to be lowered, others raised.

The coals of Washington will be completely reclassified and maximum prices fixed for every grade and preparation of coal produced by the mines if recommendations forwarded to Washington by David Whitcomb, state fuel administrator, are accepted by the national fuel administrator. The recommendations are based upon the report of the mine price board, which spent six weeks in formulating the new classification and new prices. The exact prices will not be given out until a decision in the matter is made by the national head of the Fuel Administration, but it is known that some radical changes in prices, some increased and some decreased, have been asked. The figures are based on an accurate tabulation and knowledge of mining costs in the various fields of the state. Sizes and the composition of mixtures have been taken into consideration so that all classes of coal will have a definite price hereafter.

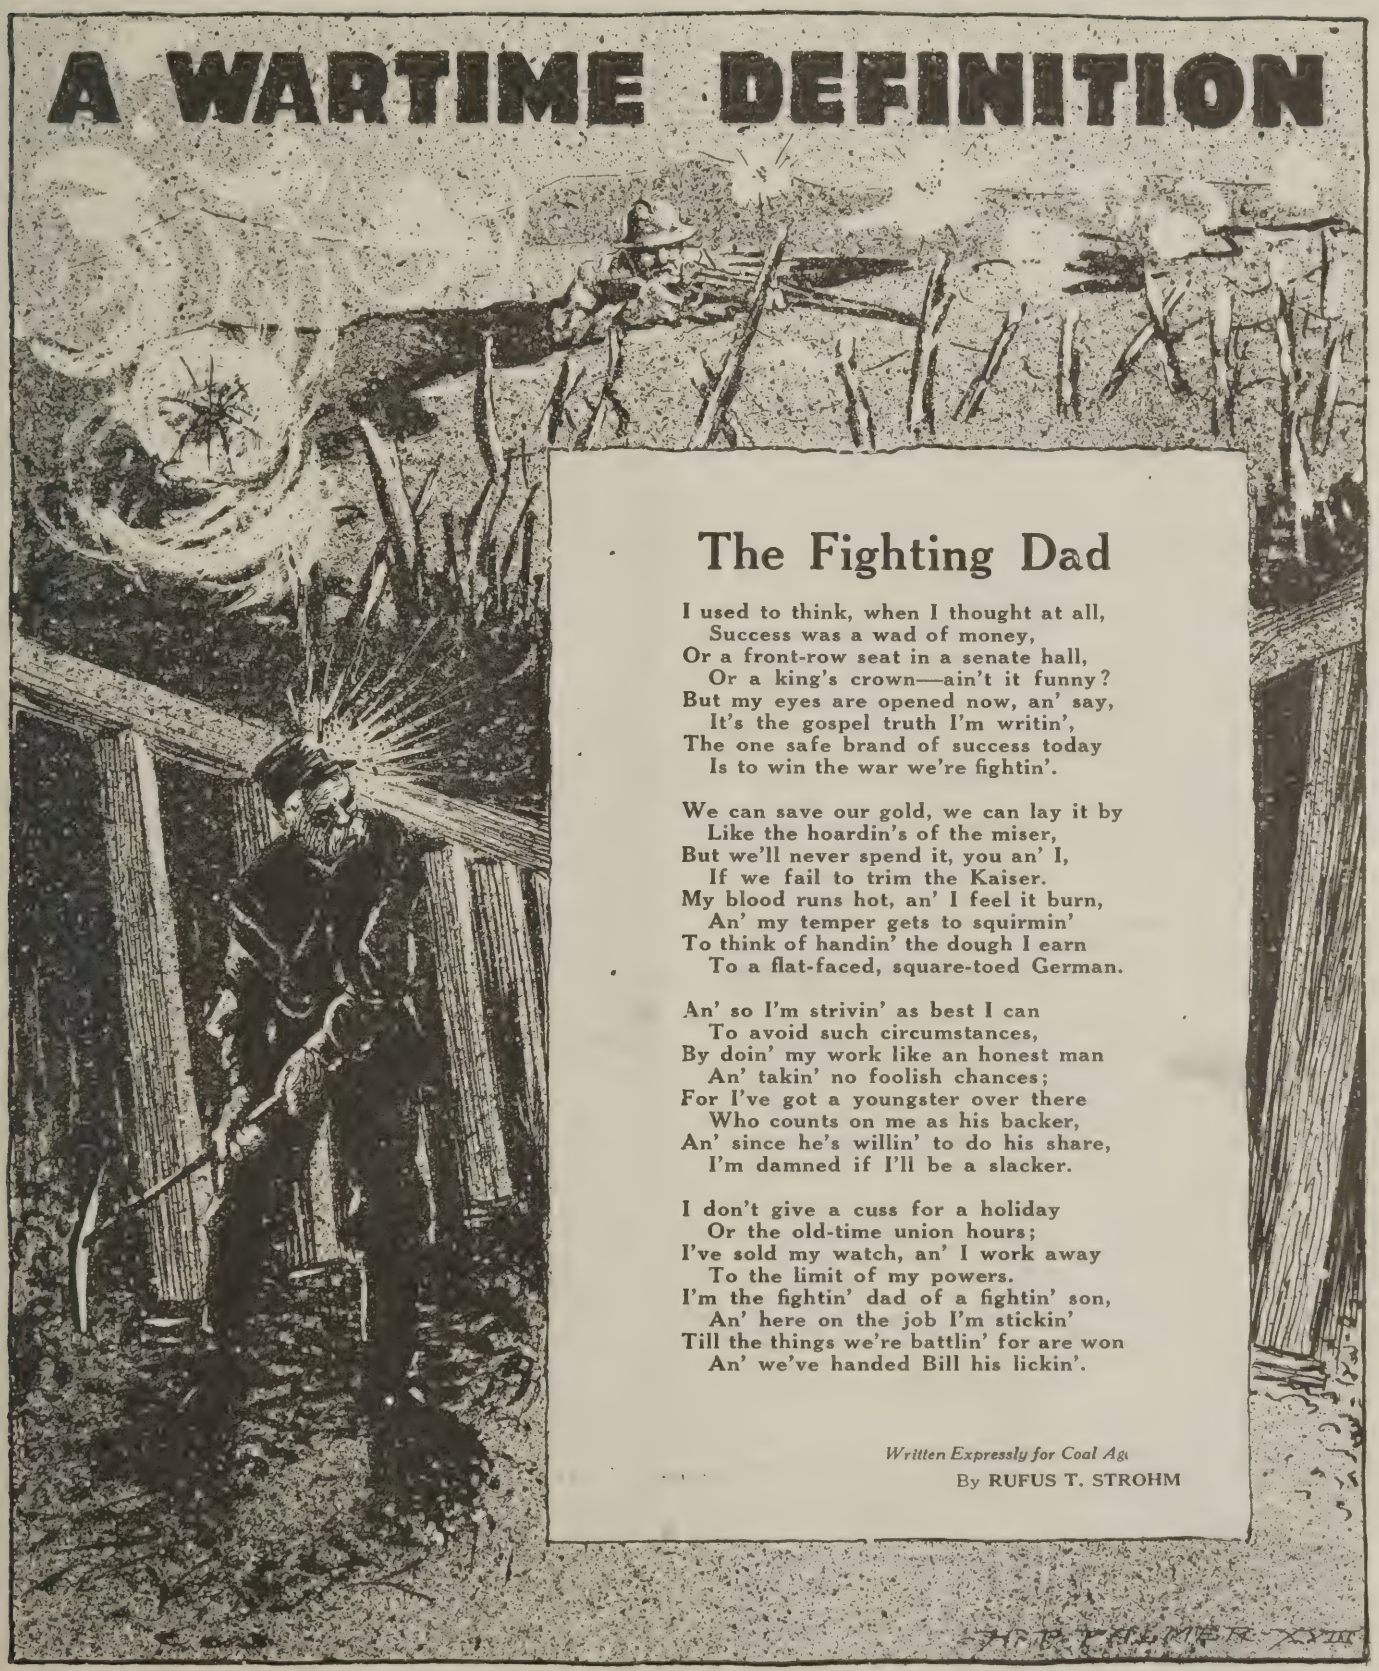
General Statistics

BALTIMORE & OHIO

The following is statement of the coal and coke tonnage moved over the Baltimore & Ohio system and affiliated lines during the month of December, 1917, as compared with the corresponding month of the previous year:

	Tons, 1917	Tons, 1916
Coal	2,911,244	2,749,964
Coke	231,032	309,791
Total	3,142,276	3,059,755

ANTHRACITE SHIPMENTS FOR FEBRUARY, 1918



The shipments by carrier companies in February, 1917, and 1918, and for the coal year to date, were as follows:

	February, 1918	February, 1917	Coal Year, 1917–1918	Coal Year, 1916–1917
P. & R. R. W	1,107,982	966,725	13,459,445	11,541,178
L. V. R.R.	1,042,784	909,704	12,865,850	10,934,270
C. R. R. of N. J	638,557	536,023	7,598,756	6,485,736
D. L. & W. R.R	997,550	901,098	11,372,936	9,776,614

COAL AGE

Volume 13 NEW YORK, MARCH 23, 1918 Number 12

The Fighting Dad

I used to think, when I thought at all,
Success was a wad of money,
Or a front-row seat in a senate hall,
Or a king's crown—ain't it funny?
But my eyes are opened now, an' say,
It's the gospel truth I'm writin',
The one safe brand of success today
Is to win the war we're fightin'.

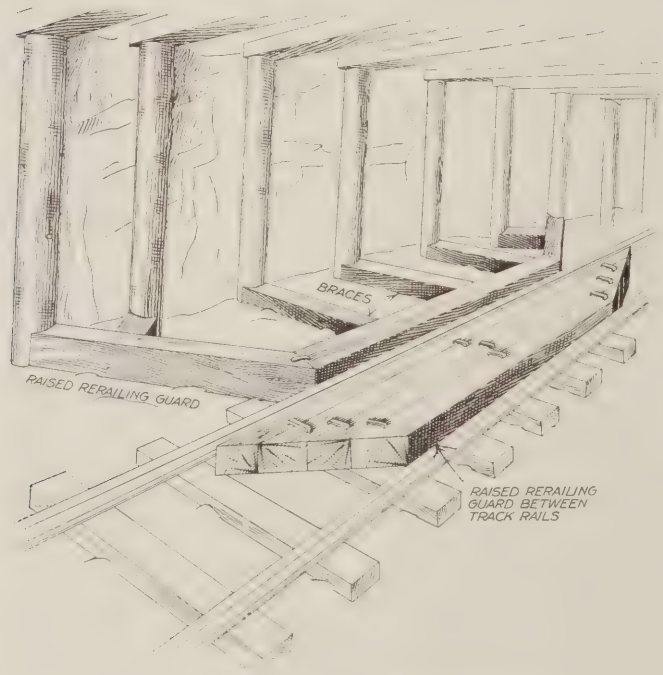
We can save our gold, we can lay it by
Like the hoardin's of the miser,
But we'll never spend it, you an' I,
If we fail to trim the Kaiser.
My blood runs hot, an' I feel it burn,
An' my temper gets to squirmin'
To think of handin' the dough I earn
To a flat-faced, square-toed German.

An' so I'm strivin' as best I can
To avoid such circumstances,
By doin' my work like an honest man
An' takin' no foolish chances;
For I've got a youngster over there
Who counts on me as his backer,
An' since he's willin' to do his share,
I'm damned if I'll be a slacker.

I don't give a cuss for a holiday
Or the old-time union hours;
I've sold my watch, an' I work away
To the limit of my powers.
I'm the fightin' dad of a fightin' son,
An' here on the job I'm stickin'
Till the things we're battlin' for are won
An' we've handed Bill his lickin'.

Written Expressly for Coal Age

By RUFUS T. STROHM



IDEAS AND SUGGESTIONS

A Simple Rerail

BY RALPH W. MAYER
Roslyn, Wash.

The Roslyn Fuel Co. uses a simple device for replacing derailed cars upon the track automatically. It is placed at the top of the slope just below the knuckle. Cars which are on the rails pass without touching it, but those which have become derailed are promptly replaced upon the rails. Heavy planking is spiked close against the outside of the rail, the top surface of the planking being as high as or a trifle higher than the top of the rail. A piece of 6 x 8-in. timber is spiked on top of this planking, parallel to the rail. This timber is placed just far enough from the rail so that the tread of the car wheel will clear it when the car is on the track. This timber should be 10 or 15 ft. long.

From both ends of this timber other timbers of the same size are placed at a long sloping angle to the rib of the incline, or entry. The side of these timbers next to the rail should be shod with iron to prevent the derailed cars from chewing into the wood, and to slide the cars over onto the rails easily. Braces are placed from these timbers extending back to the rib, or to

DEVICE TO REPLACE DERAILED CARS

the legs of the timber sets. The car wheels striking the long slanting timbers which are placed at an angle with the rail are crowded over to the rail and up onto it, the long timber parallel to the rail holding the wheel upon the rail.

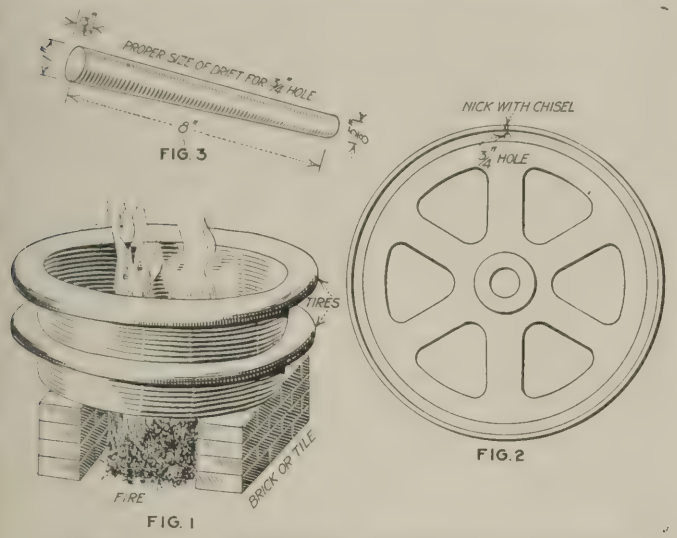
Between the two track rails planking is spiked. The top surface of this planking is even with the top of the rails. Room for the flange of the car wheel is left next to the rail. Other timbers are spiked on top of this planking, just high enough to clear the axles of the cars. The under planking extends beyond the ends of the top timbers about 6 ft. The top timbers are laid tight up one against the other or skin to skin. Their ends are cut on a long slant, so that those next to one rail are about 10 or 12 ft. longer than those next to the opposite rail.

The long side of this rerailing guard between the tracks, should be placed next to the rail which has the outside rerailing guard. The ends of the timbers between the rails should be iron shod the same as the outside guards. These timbers catch the inside wheels of the derailed car and crowd them over onto the rail, while the guard outside the rails crowd the outside car wheels in a similar manner. The length of the inside and outside guards should be such that the car wheels strike the outside guard first and slightly before the wheels touch the guard between the rail.

Retiring Mine Locomotive Trucks

BY JACK L. BALL
Amsterdam, Ohio

The life of the tires on mine locomotive trucks varies. Sometimes it is necessary to replace such tires after four months' service; then again, they may last for a year or two, depending greatly on the actual working conditions, length of haul and to a considerable extent on the motorman. Occasionally we find men who use sand when it is not at all necessary, and sand is injurious to both tire and rail; others sometimes grind away just to see the sparks fly. Poor contact causes arcing, which shortens the life of a tire. The purpose of this article, however, is not to discuss why tires wear out, but to give a few suggestions to those who may have to retire a set of trucks.



Assume that the locomotive to be retired is outside of the mine; then, by using a few bricks, you can build a support like that shown in Fig. 1. Place the tires one on top of another and build a good fire. If you have four tires it is better to build two fires, as a more even heat can be secured by placing two rather than four tires over each fire.

With a ratchet or some other kind of portable drill bore a ¾-in. hole entirely through the center of the tire to be removed. This hole should be drilled over a spoke if possible (see Fig. 2). Then take a cold chisel and nick the tire deeply, directly over the drilled hole. Insert the drift (see Fig. 3); then with the aid of a sledge little trouble will be experienced in loosening the tire. The sledgeman should stand to one side of the drift when sledging, as the drift may fly out with sufficient force to break an arm or a leg.

It is a good plan to drill all the holes and then remove the tires, or if a helper is employed the work may be arranged to any agreeable advantage. By the

time all the old tires are removed the new ones should be hot enough to shrink in place.

New tires should not be heated to any degree of color. An easy test is to throw a little water on them, and if they are hot enough the water is instantly converted into steam; in other words, the water will "sizzle." It should be borne in mind that a tire which is too hot is liable to warp out of round. It is sometimes im-

FIGS. 1 TO 3. RETIRING LOCOMOTIVE TRUCKS

possible to get a tight fit on account of the tires having expanded too much; again, unless care is exercised during the shrinking process, tires are liable to burst through undue contractional strains.

When the tires are at about the right temperature put one in place. A bucket of water and some waste or old rags should be close by. Wet the waste or rags, and apply them to the tire until it is comfortably warm to the hand. This cooling should be done gradually. Do not use a stream of water from a hose, as this sometimes causes a great deal of trouble.

Where an oxyacetylene torch is available the tire can be cut away more quickly than by the drill and drift method. In using a torch, however, one thing should be borne in mind—the channel should be cut evenly all the way across. When the cut is deep enough the tire will break away, owing to the strain caused by the shrinkage.

The Mining Camp Pest

By Observer

Rosemont, W. Va.

For creating dissension, disturbance and general misunderstanding, the mining-camp gossip belongs in the same class with the I. W. W. and the German propagandist. One woman of this sort can cause more trouble and do more to impede the smooth running of a mining plant than would seem humanly possible. And every community seems to have at least one of these pests. If she is a miner's wife, that is bad enough; but if she happens to be an official's wife, no matter how subordinate his position, the situation is doubly serious. Husbands, most generally, have a habit of listening, at least with one ear, to what their wives say. And if a man is narrow enough to give credit to everything he hears, he makes a perfect medium for his gossiping wife's activities.

Often one woman spreads dissatisfaction among her neighbors by repeating conversations, purely fictitious or with a slight degree of truth, which conversations were supposed to have taken place between a superintendent, mine foreman or some other company official and her husband and, usually, containing some criticism of some employee, whose ears it finally reaches; or that improvements are to be made to the house which she occupies and to no other house; or her "man" is to have the best working place; or some other apparently idle, but nevertheless dissension-provoking gossip.

The worst feature of this evil is that there is nothing one can put one's finger on. A man cannot be discharged simply because his wife gossips. Yet if he possesses a wife or family with a fertile imagination, coupled with a malicious and agile tongue, he may as well say farewell to his hopes of a better job.

Though there is a fixed price for wheat, coal and other things, there seems to be no restrictions of any kind on a woman's tongue; and the damage that it often does is incalculable.

Safe Loads for Beams of T-Rails

By Sheldon Smillie

Indiana, Penn.

Owing to their availability at all times, old and new T-rails are being constantly used around mines as beams or reinforcing for concrete.

The accompanying table giving the safe load for various spans was calculated for the convenience of mine superintendents and foremen. It is based on new rail of the American Society of Civil Engineers standard sections for the weights given. It gives the net safe load uniformly distributed over the entire span, the weight of the beam itself being deducted from the figures. Allowance must of course be made for old rail based on its condition and length of service. Rail deteriorates rapidly when used for electric haulage and halving the safe load for rails having had much service would not be too great an allowance. If the load is concentrated at or near the center of the span the figures in the table should be reduced one-half.

In reinforcing concrete slabs or roofs it is safest to consider the steel as carrying all the load and the weight of the concrete as well, since the concrete itself is valueless in tension. A crack on the under side might throw the upper side counted on for compression into tension, thus causing failure.

Economy of Electricity Over Steam for Colliery Power Purposes*

By R. E. HOBART
Mechanical Superintendent, Lehigh Coal and Navigation Co., Lansford, Penn.

THE development of the Hauto power plant and the claims made by various engineers that electricity was more economical than steam for power purposes in and about the mines, led the Lehigh Coal and Navigation Co., in 1911, to conduct a test to ascertain the consumption of power used by a large steam hoisting engine. The question being one on which no reliable information could be found, and the opinion of various engineers differing to such an extent, it was decided that a test under actual operating conditions was necessary. This was arranged for at one of the collieries. The engine selected was a 30 x 60-in. piston-valve engine of modern type, and comparatively new.

The boiler plant from which the hoist received its power was about 600 ft. from the engine, the latter being fed by a 10-in. steam line insulated with magnesia pipe covering. Two batteries of the boiler plant, aggregating 1200 hp., were cut off and fed into a separate steam line leading direct to the hoist engine. Steam auxiliaries, consisting of feed-water pump and blowers, were fed by the boilers in test, and their consumption charged against the hoist. A barrel weighing device was installed, as it was felt that this would be the most accurate way of determining the consumption of water. The fuel, No. 3 buckwheat, was carefully weighed, and every precaution was taken to make the test accurate in every particular.

Test Was Run for One Week

The test was run for one week, or a total of 168 hours. A record was kept of the number of trips hoisted or lowered, and continuous indicator cards were taken. One particular set of cards was taken with the hoist operating balanced, and also with the hoist operating with no counterweight other than the empty cage, the coal in the car being weighed. This speed of the hoist was taken by means of a graphic recording instrument which registered the number of revolutions every 5 sec. From this record, speed-time curves were plotted.

The test was divided into two periods: working time and idle time. The hoist did not operate between the hours of 5:30 p.m. and 6:30 a.m., nor from 3:30 p.m. Saturday until 6:30 a.m. Monday morning. The actual working time, therefore, was 64 hours, and the idle time 104 hours for the week. The total weight of coal used in idle time was 108,075 lb., while the coal used in working time was 119,950 lb. From these figures, the amount of coal consumed per hour to cover standby losses would be $108{,}075 \div 104 = 1038$ lb. of coal per hour.

During the week, 1705 cars of coal were hoisted from a depth of 581 ft. A tabulation of test results is shown in Table I.

*Presented at the February, 1918, meeting of the American Institute of Mining Engineers, New York City.

From these results, it will be noticed that to the 104 idle hours, representing the period when the hoist was not operating, must be added the idle time occurring between hoists during the operating period, which makes a total of 156.2 hours, the actual hoisting time being only 11.82 hours in the week. From these surprising results, the Lehigh Coal and Navigation Co. felt that it would be advisable to use electric power at the new operation to be developed at No. 11 shaft.

It is a well-known fact, in the anthracite region, that the working time of a coal hoist is only from 8 to 9 hours in a day, the night hoist being intermittent. At the time the test was made very few electric hoists of this capacity were in operation, and most of the larger ones had either the Ward Leonard or Ilgner system of control, the only large induction hoists being in South Africa. Various hoist engineers were consulted on the different types of hoists using alternating current. Propositions were submitted on the Ward Leonard and Ilgner systems, as well as on the induction-motor type. All these hoists have their good and bad features. The Ward Leonard system consists of a motor-generator set in which an alternating-current motor is directly connected to a direct-current generator, which generator furnishes power to a direct-current hoist motor. The Ilgner system also consists of a motor-generator set, which drives a direct-current hoist motor, the generator being separately excited. By means of a flywheel and slip regulator, the load peak on the power system is practically eliminated. The other type of hoist is driven with an induction motor, with a polar-wound rotor to permit of the addition of external resistance to the rotor direct.

The lift at No. 11 shaft was 266 ft., and the desired number of cars to be hoisted per hour was 120. This short lift and the number of cars per hour would mean numerous peaks, which from the brief description given of the different systems might make it appear that the Ilgner system would have been the better one to use. However, when it was considered that the working day at that time consisted of 9 hours, with occasional hoisting during the remaining 15 hours of the day, and with

TABLE I. TABULATION OF RESULTS, HOISTING BY STEAM

Depth of shaft, ft.	581
Weight of coal per car, lb.	8,960
Coal used during 104 idle hours, lb.	108,075
Coal per hour idle, lb.	1,038
Trips during week.	1,705
Actual time used in hoisting, sec., $1{,}705 \times 25$	42,625
Actual hours hoisting $42{,}625 \div (60 \times 60)$	11.82
Seconds during week.	604,800
Seconds idle during week.	562,175
Idle hours.	156.2
Coal used during idle time, lb., $156.2 \times 1{,}038$	162,135
Coal used during hoisting, lb., $228{,}025 - 162{,}135$	65,890
Coal used per trip, lb., $65{,}890 \div 1{,}705$	38.6
Horsepower-hours per trip, $\frac{581 \times 8{,}960}{33{,}000 \times 60}$	2.63
Coal per horsepower-hour, lb., $\frac{38.6}{2.63}$	14.70

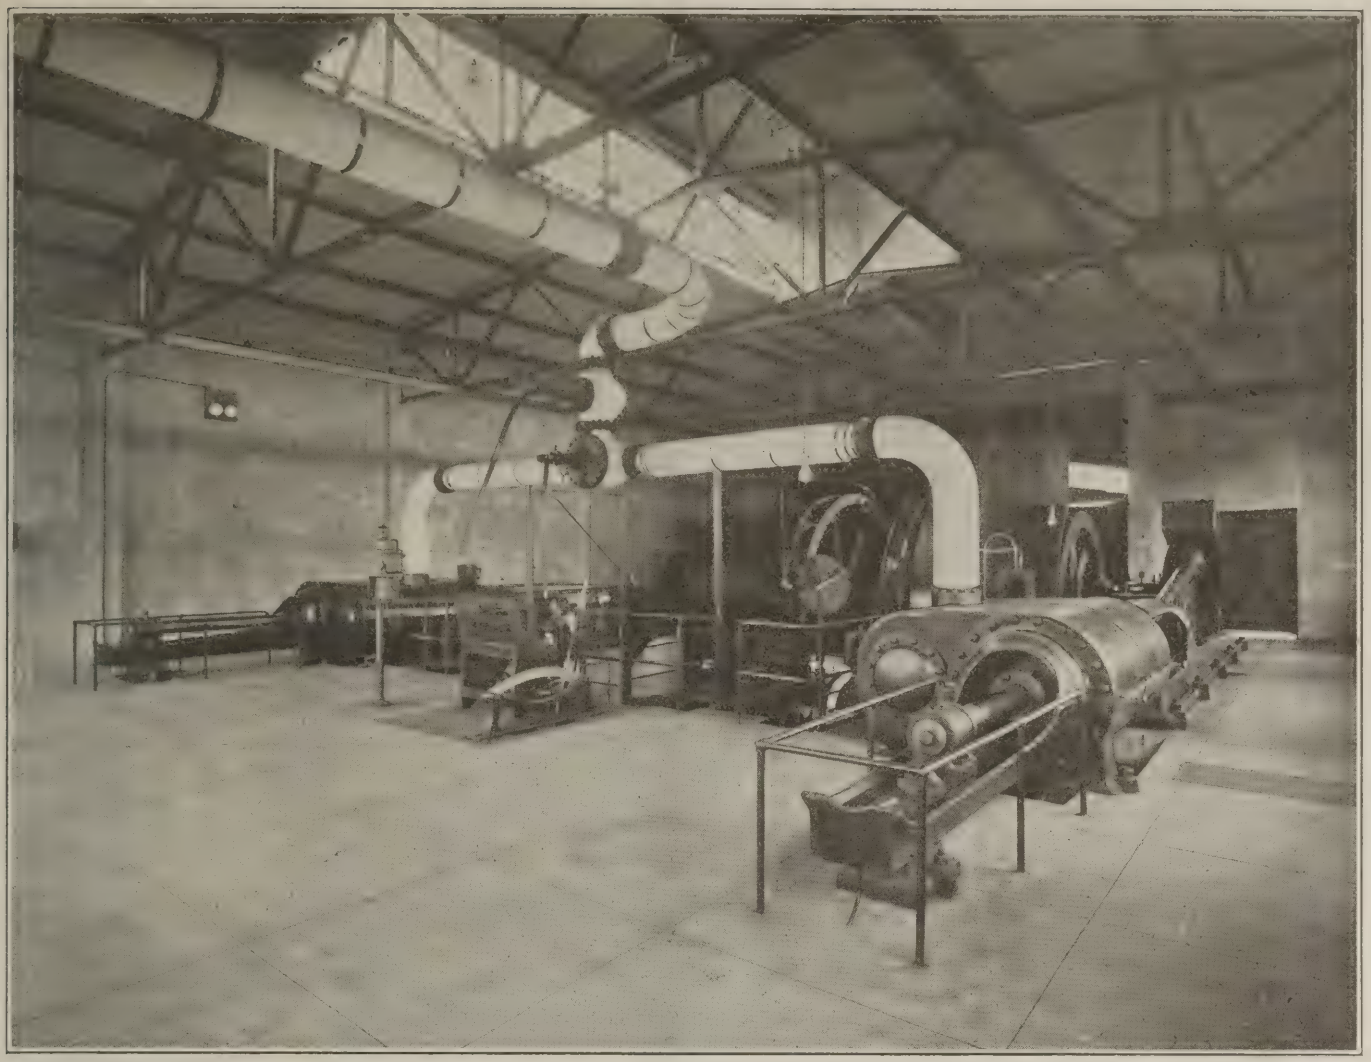

FIG. 1. STEAM HOIST, 30 x 60 IN., LEHIGH COAL AND NAVIGATION CO.

frequent stoppages for various reasons during the working time, it will readily be seen that the generator set would be operating continuously, whereas the actual work done by the hoist would be very little. The other disadvantage of the Ilgner system is its high first cost, the hoist costing about 60 per cent. more than an induction hoist. It was therefore decided to use a slip-ring induction-motor system. Its disadvantages of poor efficiency, low power factor and high load peaks in starting were offset by the fact that when the hoist is not working, no current is used for the hoisting system excepting the small amount necessary to run the pump for the liquid rheostat, which may be shut off at the will of the operator.

At all the company's operations, synchronous converters are used in connection with the mine haulage. It was found that there was sufficient converter capacity connected to the supply line to permit of a great deal of power-factor correction.

The next important feature connected with this hoist was to design and make a proper control system. The usual control for electric hoists up to that time consisted of a slow-down device at a predetermined point in the travel, or a device that would automatically operate the controller and apply the brake at a predetermined point. The overwind features were also included.

From experience with steam hoists, it was felt that this type of control would not do for electric hoists, on account of fluctuating loads. Many times loaded cars are hoisted without balance, and loaded cars are lowered at various times, and, what is more important, from 75 to 100 trips a day are made for raising or lowering men. To meet these varied conditions, the company insisted that the following features should be embodied in the control of this hoist:

1. Hoist must not over-travel in either direction.
2. It must be impossible for the operator to start hoist in wrong direction at either limit of travel.
3. Hoist must not back away, due to failure of power or overload.
4. Protection must be provided against overspeed, due to any cause whatever in any position of travel.
5. Emergency brake must set and power be interrupted if operator fails to retard hoist approaching landings. This value to be graduated and to be adjustable to meet conditions.
6. Hoist must not start return of power if operator has carelessly left lever in "on" position.
7. If control circuits become grounded, hoist must stop.
8. If operator fails to keep power brake in proper adjustment, emergency brakes must set and power must be interrupted, to remain so until operator has readjusted brake.

9. Hoist must be brought to rest and brake applied on loose drum before clutch can be disengaged.

10. It must be impossible to release brake on loose drum while clutch is disengaged.

11. Pawl must be provided, interlocking with clutch engine lock, this pawl to engage in loose drum before clutch can be released.

12. It must be impossible to operate hoist unless clutch is full "in" and locked.

13. Air reservoir must not be drained by emergency stopping of hoist.

14. There must be no delay in operation of hoist due to emergency stopping.

15. It must not be necessary for operator to call assistance in case of emergency stop, over-travel or otherwise.

16. For operating hoist, multiplicity of levers must be avoided; two will be allowed—namely, brake and control.

17. Hoist operator must not be endangered by flying levers in emergency stopping of hoist.

18. No safety features must be dependent on the will of the operator.

19. Switch must be provided on operator's platform for an emergency stop, if necessary.

20. Travel limits and speed range must be adjustable.

21. Current input and acceleration of hoist motor must be governed automatically.

22. Hoist must start from rest gradually without excessive jerks and come to rest smoothly, and must be under control of the operator at all times.

23. The speed of the hoist must be varied by cutting the resistance into or out of the rotor circuit. The rheostat must be of the liquid type and of ample capacity to meet all operative conditions.

All the foregoing features were met in every particular, and it will be found that this type of control for slip-ring induction motor hoists has been made standard by the larger hoist manufacturers.

This hoist was placed in operation on Apr. 16, 1915, and to date has operated with no delays and very little upkeep. During 2½ years, the only repairs necessary to keep the hoist in operation have been a few contact tips for the reversing switches, and packing for the brakes and rheostat pump. The average power used for hoisting a car of coal 266 ft., including line and transformer losses, is 2.59 kw.-hr., which at 8 mills per kilowatt-hour amounts to $0.0207 per car, the average weight of coal in the car being 8960 pounds.

In connection with the electrification of the hoist, it was decided to electrify both inside and outside the mines. The electric haulage system was already installed inside, but the fans, pumps and air compressor were steam driven. The fan, which was situated on Sharpe Mountain, was about 100,000 cu.ft. per min. capacity, being driven by an 18 x 36-in. slide-valve engine.

FIG. 2. ELECTRIC SLIP-RING INDUCTION HOIST, NO. 11 SHAFT, RAHN COLLIERY

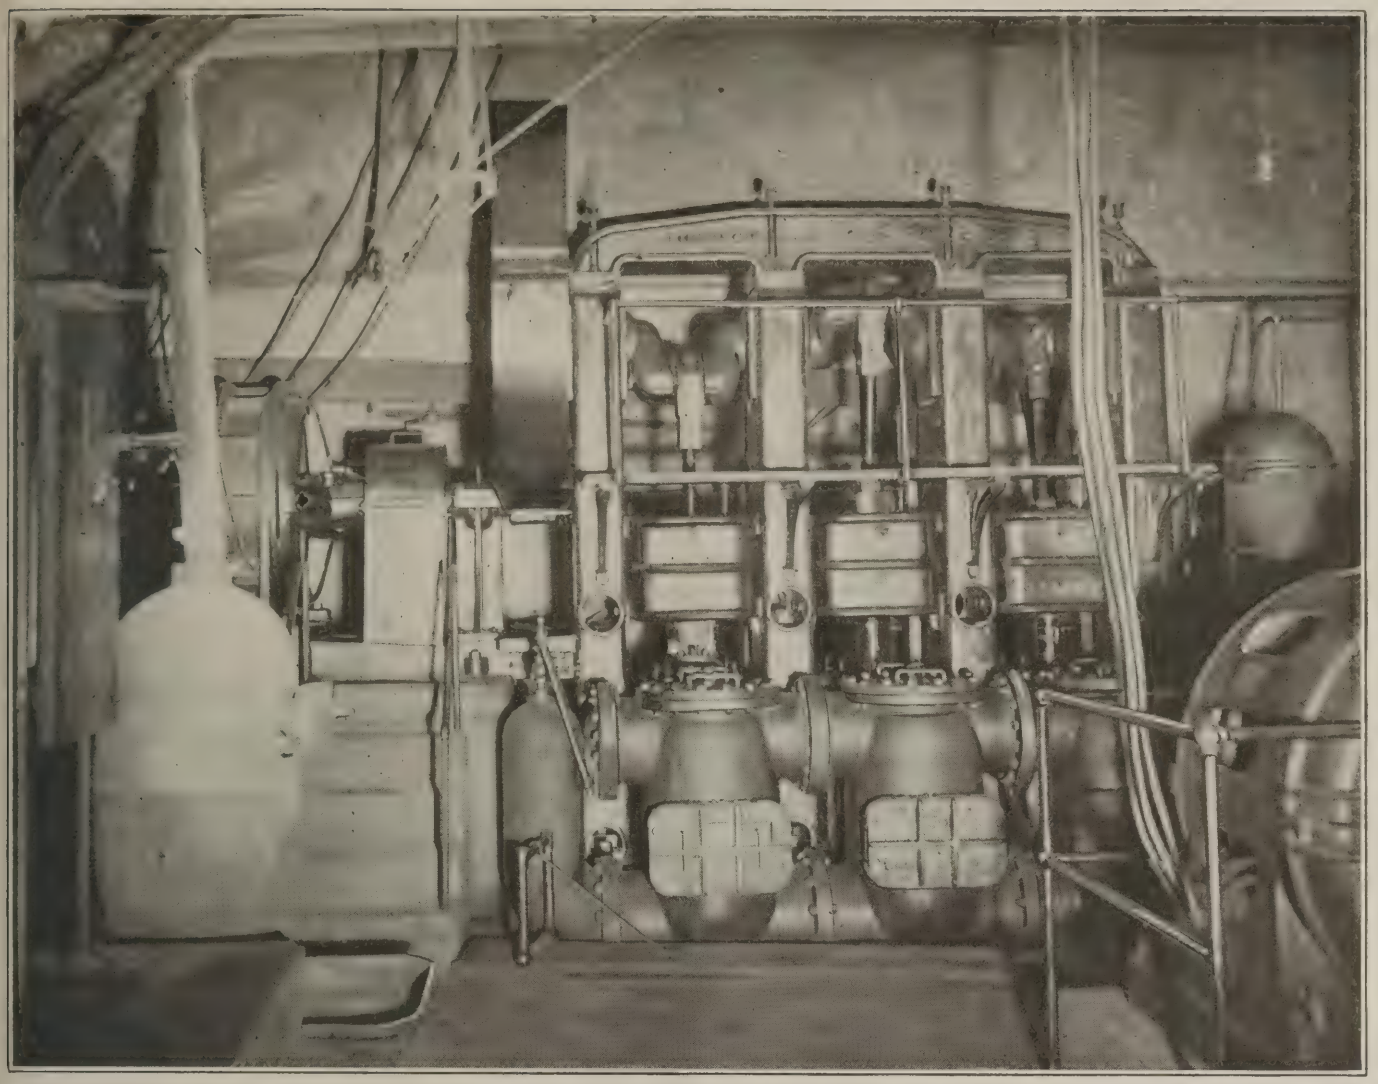

FIG. 3. TRIPLEX PUMP, NO. 11 SHAFT, RAHN COLLIERY

The hoisting engine and air compressor were situated near the fan and close to the boiler plant. The development of the new No. 11 shaft allowed the abandonment of the 30 x 60-in. hoisting engine, as the new electric hoist would operate from the same level as the steam hoist. In place of the 900 cu.ft. per min. steam-driven air compressor, we erected one of 1500 cu.ft. per min., electrically driven by a 250-hp. synchronous motor. A 200,000 cu.ft. per min. fan, driven by a 150-hp. slip-ring induction motor, was installed to take the place of the steam fan, and a small steam plant was built for heating.

The steam pumps were located in a pumphouse south of the bottom of the old No. 11 shaft. As this shaft was to be abandoned, it might be interesting to explain the various features of the electric pump installation in the mines. No detailed figures are available on the steam costs of operating the mine pumps, as at that time separate costs for the different units taking steam from the central boiler plant were not kept. The old pumping plant consisted of one 42 x 20 x 72-in. duplex pump, and two 16 x 48-in. single pumps. At various times, in flood seasons, it was necessary to install water tanks in the coal shaft either to prevent drown-outs or hoist the water from the mine in case of a drown-out.

The sump for the old pumphouse was situated about 50 ft. south of the old shaft, so it was decided to drive a small sump tunnel from the old sump into the shaft sump. The old sump was also extended westward about 300 ft., making the opening into the sump on a pitch, so that a car could be run into the main sump for cleaning purposes. One 1500-gal. per min. triplex, one 1500-gal. and two 3000-gal. all-bronze centrifugal pumps were ordered for this pumphouse. The triplex and the 1500-gal. centrifugal pumps were placed south of the shaft, and the two 3000-gal. centrifugal pumps were placed north of the shaft. The tail pipes of the 1500-gal. and the two 3000-gal. centrifugal pumps were run into the shaft sump, while the tail pipe of the triplex pump was run into the main sump. A ditch of large capacity was made on the west side of the pumphouse, entering into the main sump. Gates were installed to allow the water to be diverted into the shaft sump, if necessary, and a gate was installed in the sump tunnel, which dammed off the main sump from the shaft sump. By this method, it is always possible to clean either sump, and it is not necessary to wait for a dry season, with the added expense of installing dams for this necessary cleaning.

All of the centrifugal pumps are horizontally split, being all bronze, with a full-load speed of 725 r.p.m. The reason for specifying this low speed was that the mine water is acidulous and gritty. All pumps are hydraulically balanced, none of them depending upon thrust bearings.

A very important thing to consider in the specification for a centrifugal pump is to have a proper metal for acidulous water. The specification for the bronze in these pumps was 75 per cent. copper, 15 per cent. lead and 10 per cent. tin. All screws, washers and dowel pins should be eliminated from the seal rings and diffusion vanes. In fact it is believed better to buy pumps without diffusion vanes, as this part of the pump is very apt to give trouble. I do not approve of labyrinth rings for mine pumps. The seal rings should be wide, straight rings, the one on the impeller being shrunk on, the stationary ring being held from turning by means of a tongue resting on the bottom split of the casing.

pumps, and steam heat, the cost of the boiler plant for the year April, 1914, to April, 1915, was $46,992. This figure included the cost of fuel and handling, wages of firemen and ashmen, maintenance of boilers and pumping of water for the boilers. During the same time, the shaft produced 343,665 tons of coal, or a steam cost of $0.137 per ton.

For the year November, 1916, to November, 1917, the electric power cost was as follows:

Hoist	$3,300.16
Fan	3,270.63
Air compressor	8,845.39
Pumps	6,174.08
Total	$21,590.26

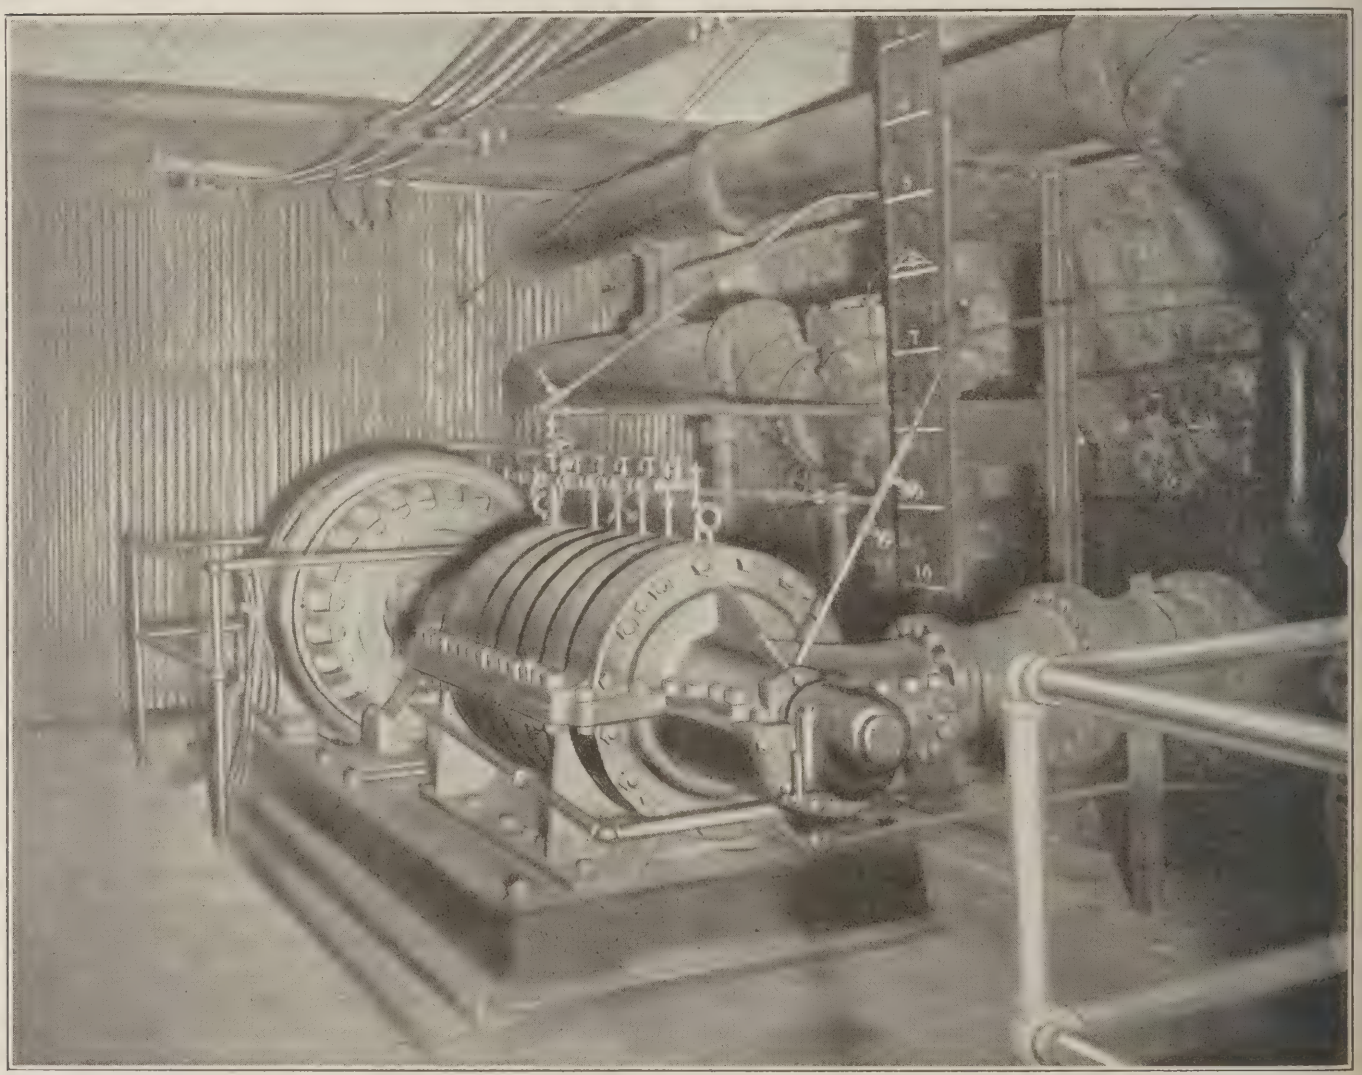

FIG. 4. CENTRIFUGAL PUMP, 3000 GAL. PER MIN., NO. 11 SHAFT, RAHN COLLIERY

It is a question whether the hydraulically balanced pump will operate under all acid conditions. However, the 8-in. six-stage pumps operating in No. 11 shaft have not given any trouble in this respect since they were placed in operation. The cost for operating these pumps, including transmission line and transformer losses, on a 266-ft. lift, is 1.545 kw.-hr. per 1000 gal., which, at a rate of 8 mills per kw.-hr., amounts to $0.012 per 1000 gallons.

When operating the old boiler plant at No. 11, which furnished steam for the No. 11 shaft hoisting engine, one steam fan, one 900 cu.ft. air compressor, the inside

To this figure should be added the cost of the heating plant, making a total power cost of $30,290.26. During this period the shaft produced 435,073 tons, with a power cost of $0.0696 per ton.

It can therefore be seen that this shows an actual saving per annum of $16,702, but as the use of electricity permitted more efficient work and less loss of time from repairs, drown-outs, etc., the tonnage hoisted increased from 343,665 to 435,073, and the cost of power per ton produced decreased from $0.137 to $0.0696, a saving of $0.0674 per ton, which for the output of 435,073 tons amounts to $29,149 per annum.

Some Data on Sperm Oils Used for Burning in Miners' Safety Lamps*

By A. G. BLAKELEY and E. A. REILLY
Philadelphia & Reading Coal and Iron Co., Pottsville, Penn.

THE representative of a big oil company was once asked if he could supply 10c. oil. "Certainly," was the reply. "I can give you oil for any price you may name—oil is simply a question of mixture." If oil can be mixed as to price, why cannot it be sold on specification? And why should it not be quoted to meet certain requirements? To the "lay reader," the tables accompanying this article may not mean much at first glance. However, the comments on them by those explaining the tests are interesting and to the point. They show by the results of these tests just which oils are satisfactory and where others fall short. The data given should prove valuable for reference—for comparison with reports which are made on oils from time to time.

This matter calls attention anew to the advisability of having specifications to cover the principal supplies purchased by coal-mining companies. For a number of years steel and cement have been purchased on specification and, to some extent, coal. The Federal Government has set the pace in this respect for coal for several years. If a small company does not care to incur the expense of the refinement of exhaustive tests on materials, it can in many cases apply a few simple tests which will answer all practical requirements. This is actually being done with some materials. Different kinds of reports are made by experts to suit the demands and purse of their clients.—EDITOR.

A CONSIDERABLE quantity of sperm oil is used as a burning oil in miner's safety lamps of the Davy type. Some trouble experienced with a shipment of supposedly pure sperm oil led the writers to conduct an investigation, the results of which are given in Table I.

The flake test indicates the temperature at which occurs a separation of solid matter. This test corresponds to the "cold test" of the sperm oil manufacturer. The cloud test indicates the temperature at which the lower half of the sample becomes opaque. The pour test indicates the temperature at which a sample of oil in cylindrical form of specified diameter and length will just flow under specified conditions.[1]

TABLE I. RESULTS

[1] Low acidity. (a) Sample representing shipment. (b) Oil which gave trouble.

The iodine values were determined by the Hanus method. The melting points were determined by the ordinary capillary tube method. No glycerol was found in any sperm oil tested.

Samples R1, R2 and R3 (received Dec. 1, 1916) were supplied by the same manufacturer. The manufacturer stated that the oil was probably taken from one or two different lots of Atlantic Ocean sperm oil. The oil was all from the sperm or cachalot whale. The head and body oils were thoroughly mixed. The "boats catch this oil in moderately warm waters, say from about as far north as the Azores to as far south as the coast of Brazil." Samples R2 and R3 were entirely satisfactory as burning oils. Sample R1, the natural winter oil, was not satisfactory for burning.

Samples F1, F2 and F3 (received Dec. 11, 1916) were all supplied by a second manufacturer. The oils were from the sperm or cachalot whale, and were mixtures of head and body oils. No further information was available. Samples F2 and F3 were entirely satisfactory as burning oils. Even sample F1, the natural winter oil (containing 2.28 per cent. free oleic acid) gave fairly good results, although showing a slight tendency to incrust the wick.

Samples N1, N2, N3 and N4 (received Jan. 4, 1917) were supplied by a third manufacturer. The manufacturer stated that the oils were all from the same cargo. The oil is bought from the whalers in original casks which, in refining, is put into a press, and in one pressing there may be three or four different casks of oil. These casks may contain head and body

*Reprinted from the Journal of Industrial and Engineering Chemistry, Vol. 9, No. 12, page 1099, December, 1917.

[1] Proceedings of the A. S. T. M., 15 (1915), Part 1, pp. 281-282.

oil from two or three different whales. The cargo from which the four samples were prepared consisted of some 16,000 gal. of oil of "very fine quality." The oil is all strictly pure sperm oil from the sperm or cachalot whale. Sample N1 represents the natural winter oil. Sample N2 represents the same oil after "caustic" bleaching to reduce free acid. Sample N3 represents sample N1 bleached by filtering through fuller's earth to make it of light color. Sample N4 represents sample N3 "caustic" bleached; that is, this sample had been treated both to reduce color and to reduce acidity. Samples N3 and N4 gave entirely satisfactory results in burning. Sample N2 was satisfactory but inferior to samples N3 and N4. Sample N1, the natural winter oil, was fairly good as a burning oil.

Sample S1 represents an oil submitted by a fourth company. No information was furnished with this oil. It gave satisfactory results as a burning oil.

Sample F4 represents an oil shipment which was entirely satisfactory. Samples T1 and T2 are from two different barrels of the shipment which caused considerable trouble. These oils encrusted the wicks very badly and were altogether unsatisfactory.

The nature of the adulteration in the unsatisfactory oils has not been determined. The table shows abnormal figures for refractive index (saponification value) and iodine value of the oil as well as for iodine values of fatty acids and alcohols, and for melting point of alcohols.

Results for the constants of the genuine sperm oils agree, in the main, with results given in the literature. For some constants, the writers have found a somewhat wider variation than is generally noted in the technical literature (see Table II).

In connection with the writing of specifications for sperm oil it has been the general custom to include requirements as to the maximum percentage of free acid allowed. In order to determine the effects of free acid upon the burning properties of sperm oil, experiments

TABLE II. CONSTANTS OF GENUINE SPERM OIL

	Data Given in Literature	Data From Authors' Tests
Sperm Oils:		
Refractive index (15.6° C.)	1.4664 to 1.4673	1.4649 to 1.4669
Fatty Acids:		
Specific gravity (15.6° C.)	0.899	0.893 to 0.899
Neutralization value	183 to 199	186.8 to 216.2
Titer test, ° C.	11.1 to 11.9	6.2 to 13.6
Alcohols:		
Iodine value	64.6 to 65.8	63.9 to 74.1
Melting Point, ° C	25.5 to 27.5	20.0 to 27.0
Saponification value of acetate	161 to 190	189.5 to 216.0

were made with sperm oil to which had been added varying amounts of pure oleic acid. The oil was in each test burned in a Davy miners' safety lamp. It was found that sperm oil containing 1, 2, 3 and up to 4 per cent. added oleic acid caused a slight crust to form on the wick, but that oil with even 4 per cent. oleic acid gave fairly satisfactory results. The addition of 5 per cent. oleic acid caused heavier crust, while the addition of 6 per cent. made the sperm oil entirely unsatisfactory for burning in a Davy safety lamp.

In judging the suitability of a sperm oil for burning purposes, one would do well to consider the iodine value and refractive index as well as the other constants and the free acid.

Some of the work above tabulated was done by Mr. Donald Thorn, to whom the authors would acknowledge indebtedness.

Coal Mining in Alberta During 1917

By J. T. Stirling
Chief Inspector of Mines, Edmonton, Alta., Canada

During the year 1917 there were in operation in Alberta 283 coal mines, one copper ore mine and two shale mines. Of these 48 were opened, 11 reopened and 38 abandoned. The output of coal for the year was 4,863,414 tons, exceeding that of the year 1916 by 214,810 tons, notwithstanding that the production was considerably interfered with owing to labor troubles and lack of railway facilities in certain districts.

If the mines had worked steadily throughout the year with the present labor employed and the present amount of development, the amount of coal produced would have been nearly 8,000,000 tons or over 3,000,000 tons in excess of what was actually produced.

The importance of this will be understood when it is remembered that over 3,000,000 tons of imported coal were consumed in the Provinces of Manitoba, Saskatchewan and Alberta, a territory which could be more than supplied entirely by Alberta mines.

Notwithstanding these facts it may well be asked why it should be necessary to import into Western Canada, at the present time over 3,000,000 tons per year from the United States, particularly at a time when the operation of munition plants and other essential industries in the United States and Eastern Canada are being seriously interfered with owing to lack of fuel. And the thing that strikes one who has tried to familiarize himself with the situation is the absurdity that such a condition should be allowed to exist. More than sufficient fuel can be produced from the Alberta mines to supply all the demands existing or likely to exist in the Provinces of Manitoba, Saskatchewan and Alberta, and in addition that part of the United States immediately to the south of us. It is being fully demonstrated every day that railway locomotives, steam plants and buildings of all kinds and sizes can use Alberta coal in Saskatchewan and Alberta with very satisfactory results, so that there appears to be no reason why the same fuel cannot be used in Manitoba.

The statement has been made on various occasions that Alberta coal will not store, and while this may be true to a certain extent regarding 25 or 30 per cent. of the output produced, it is not true of the remainder.

Satisfactory progress is still being made in connection with training in mine-rescue and first-aid work, three mine-rescue cars and six stations being now in operation. Whenever possible these cars and stations are placed under the charge of returned soldiers who have previously been engaged in mining, the result obtained by these appointments being very satisfactory.

The average number of persons employed in or about coal mines during the year was 2263 above ground and 6047 below ground. The total number of persons employed above and below ground on Dec. 31, 1917, was 9812. This shows an increase of 1213 over the number employed in December, 1916.

Safety lamps of the Wolf type, which have been in use in practically all the mines where safety lamps are required, are gradually being replaced by electric cap lamps of the Edison type.

A number of mine operators, particularly in the Crow's Nest Pass, have erected inert dust barriers. These barriers extend from 175 to 200 ft. in length and consist of shelves 18 to 24 in. wide and 24 in. apart. There is no doubt that these barriers would have the effect of minimizing the effects of an explosion should one occur.

The coal-mining industry in the Province is assuming large proportions, and if all fuel consumed in the Provinces of Alberta, Saskatchewan and Manitoba was supplied from Alberta mines as it should be, the output would be nearly doubled. It is confidently expected that this condition of affairs will obtain in the near future.

The following table gives particulars respecting the amount of coal actually produced in each district in Alberta during the year 1917, and also the amount which could have been produced in each of these districts if the mines had been in operation fairly steadily without increasing the present amount of development or the number of men employed.

OUTPUT OBTAINED AND POSSIBLE OUTPUT OF MINING DISTRICTS IN ALBERTA, CAN., DURING 1917

District	Output Obtained, Tons	Possible Output, Tons
Crow's Nest Pass	1,193,313	1,779,888
Pincher Creek	6,804	12,891

Nature and Distribution of Peat Deposits

Peat is a dark-brown or black residuum produced by the partial decomposition of mosses, sedges and other vegetable matter in marshes and like wet places. Most of the peat deposits of this country occur in depressions and poorly drained areas in regions where the temperature of the air and the soil is low in summer and the humidity of the air is high. The most extensive peat beds are found in New England and around the Great Lakes, where the climate and the topography are favorable to the accumulation of partly decomposed vegetable matter. Many deposits are found also in the Atlantic Coastal Plain, from New Jersey southward to Florida. In regions of heavy downfall along the Pacific Coast peat bogs occur wherever the drainage is so greatly interrupted that the soil becomes permanently saturated with water.

The Second Annual Report of the Public Utilities Commission of Maine contains descriptions of many peat bogs in that state. Detailed information relating to the occurrence of this material in Maine and a map showing the location of workable deposits in that state can also be found in United States Geological Survey Bulletin 376, which, though no longer available for free distribution, may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 20c. a copy.

It is estimated that more than 11,000 square miles of swamp land in the United States contains peat beds of good quality, and that the total available fuel in these deposits would amount to more than 12,000,000,000 tons, a quantity that, if it could be distributed, would furnish heat and power for the entire country for many years. Much of this material is in states that have no known deposits of coal and that on account of their cold climate and their manufacturing industries consume large quantities of fuel, a constantly increasing percentage of which has to be brought by rail and water from distant mines. According to a recent estimate made by Prof. E. K. Soper in a paper on the peat deposits of Minnesota, published by the Minnesota Geological Survey, more than 6,000,000,000 tons of air-dried peat fuel can be obtained from deposits in that state alone. The utilization of these deposits would augment the local fuel supply and incidentally would relieve the strain on our transportation facilities by furnishing fuel to an area where coal is now brought by the longest haul.

Coal and Coke Production in Canada During 1917

The preliminary report of the coal production of Canada during 1917 by the Canadian Department of Mines shows a total production of 14,015,588 short tons of coal valued at $47,643,646, as compared with 14,483,395 tons of the value of $38,817,481 in 1916. The provinces of New Brunswick, Saskatchewan, Alberta and the Yukon showed a total increase of 281,781 tons. The total decrease in Nova Scotia and British Columbia was 752,588 tons. The Nova Scotia production fell off 587,456 tons or 8.5 per cent. as compared with 1916. Alberta increased 164,085 tons, notwithstanding the serious loss in output due to strikes while British Columbia production fell off 165,132 tons.

The total imports in 1917 included 15,537,262 tons of bituminous coal, valued at $42,452,771, as against 13,009,788 tons valued at $17,073,303 in 1916, and 5,320,198 tons of anthracite valued at $28,109,586, as against 4,570,815 tons, valued at $22,216,363 in 1916.

The total output of oven coke in 1917 was 1,231,865 tons, made from 1,978,893 tons of coal, of which 1,379,038 was of domestic origin. In 1916 the total output was 1,448,782 tons. Nova Scotia showed a decrease of 8767 tons; Ontario, 77,488 tons; Alberta, 11,352 tons and British Columbia, 119,310 tons. At the close of the year 1657 ovens were in operation and 875 were idle. Imports of coke were 970,106 tons, valued at $6,517,260, as against 757,116 tons, valued at $3,229,078 in 1916. Of the total output of coke 914,466 tons was made in by-product recovery ovens and the recovery of byproducts included ammonium sulphate, 9941 tons, and tar, 8,277,078 gal., as against 11,040 tons of sulphate of ammonia and 9,012,202 gal. of tar in 1916. There was also an important recovery of benzol, toluol, naphtha and naphthalene.

Cement Gun in Mining Work—II*

By GEORGE S. RICE
Chief mining engineer, Bureau of Mines, Pittsburgh, Penn.

SYNOPSIS—*A review of the use of the cement gun in the Leonard mine at Butte, Mont., in the mines of the Philadelphia & Reading Coal and Iron Co., the Consolidation Coal Co. and the H. C. Frick Coke Co. Some figures on the cost of cement-gun work.*

FOLLOWING the first tests made in 1914 of cement coating with the gun at the experimental mine, I and my able assistant, the late L. M. Jones, began a campaign among mine operators to urge the trial of the method in mining operations. We advocated the application of a coating to the roof and sides to prevent weathering and also to render ventilating and fire stoppings air-tight. In regard to the latter, it frequently happens that while the stopping itself is tight the ground surrounding it is permeable. Often the air passes freely through the coal strata around the end of the stopping. This is largely prevented by the use of a closely adhering cement coating such as can be put on by the cement gun, not only adjacent to the stopping but for a number of feet back along the sides of the opening.

The matter progressed rather slowly for a time, but within the past year much testing has been done, and I have brief statements from a number of concerns which show the present widespread application. Among other things the cement gun has been used for fireproofing shafts which had wood linings, wire mesh being placed over the wood, such fireproofing or other alternative being required in Illinois.

In the fall of 1916, the writer, in visiting the Leonard mine of the Anaconda group at Butte, Mont., was struck with the difficulty in keeping the extensive fire areas sealed off. These fires were fed by timber and rich sulphide ores. I suggested to the superintendent who accompanied me the important advantages that might accrue from the use of the cement gun for the repeated coating of the stoppings. These had to be renewed from time to time because the heat would crack them. I suggested also that the cement gun could be used to advantage to seal the cracks in the adjacent broken ground. The patching work had been done by hand and was very laborious and difficult on account of the heat. The cement-gun method was tried and found to be of such an advantage that now nine guns have been purchased by the Anaconda company and, according to an article in the *Mining and Scientific Press* of July, 1917, the work is accomplished in one-fifth of the time required by hand work. The article states:

> The finished work shows that the mixture of sand and cement has been shot into every crack and fold of the rock until it can hardly be distinguished from the rock itself. In some instances, on account of fumes, it was necessary for the nozzle-man to wear a compressed-air hood . . .
>
> In preparing the ground for these bulkheads, no other work than picking out the loose rock on the bottom, sides, and back was done. The loose rock in the bottom extended from 16 to 24 in. below the track level.
>
> In some cases there were large loose boulders in the back which it was not feasible to remove. They were held in place by stulls, and cement was shot in the crevices between them. When this had set, the stulls were removed and the bulkheads built from the floor up to meet them.
>
> In some cases, after the completion of these emergency-bulkheads, cement was shot on the entire back and sides of the drift on either side of the bulkhead for a distance of 16 to 18 ft. in length. This sealed all seams that were likely to bypass fumes around the bulkhead. Heavy blows will not cause this coating to sliver off nor to show any line of cleavage. The only result is a powdering of the cement directly under the hammer-head. Immediately above the passageway in these bulkheads, pipes were cemented in to allow of passing air, water, and electric-wire through the bulkhead.

It is learned, through the courtesy of W. J. Richards, president, and Charles Enzian, mining engineer, that the Philadelphia & Reading Coal and Iron Co. now has eight guns distributed through the mines of that company. It is stated that

> The use of the machines so far has been confined to lining tunnels, pointing and facing retaining walls and gob stoppings, lining reservoirs, etc. We hope to try fireproofing shafts, etc., as labor becomes available for such work.

Douglas Bunting, chief engineer of the Lehigh & Wilkes-Barre Coal Co., states that his company has used the gun for lining a gangway driven in top fireclay, also for coating a short tunnel in fireclay rock and for covering the underside of Hy-Rib used in connection with steel timbering. As yet, the experience has been too recent to determine how serviceable the gunite will be.

John G. Smyth, chief engineer of the Consolidation Coal Co., says that his company has used the cement gun in coating headings at its mine No. 155, Van Lear, Ky., and at mine No. 125 at Somerset, Penn. In the latter mine there was a rock slope driven across the measures. It was first expected to use massive concrete arching to line these slopes, but later it was thought that if the action of the atmosphere could be kept away from the strata it might stand. In the main slope 675 lin.ft. were gunited, and in the manway slope, 300 lin.ft. Similar treatment was given to 1786 lin.ft. of air course driven through the coal bed, where 12 to 30 in. of slate of uncertain character were taken down. This work was begun in May, 1917, and continued at intervals to September, 1917.

Mr. Smyth states:

> From our experience with gunite underground the serious question is the action of the gunite under atmospheric changes during winter and summer, and of course the job in question has not been in place long enough to pass any judgment on this feature. It may be found necessary to use a reinforcing wire mesh in the gunite to take care of the expansion and contraction. On account of the irregular nature of the side walls and roof the application of reinforcing will be tedious and the increase in labor cost will be quite an item.
>
> The work in question was done in a very thorough, workmanlike manner. The conditions were such that we feel that this job will settle the question in our minds as to the permanency and value of gunite in underground work, particularly to protect the roof and side walls from disintegration.

The Consolidation Coal Co.'s first work of this character was done in November, 1916, in the coating of

*Paper read before the Coal Mining Institute of America at its Pittsburgh, Penn., meeting, Dec. 6, 1917, and entitled "Weather-proofing Mine Roof and Walls and Making Tight Stoppings With Cement Gun."

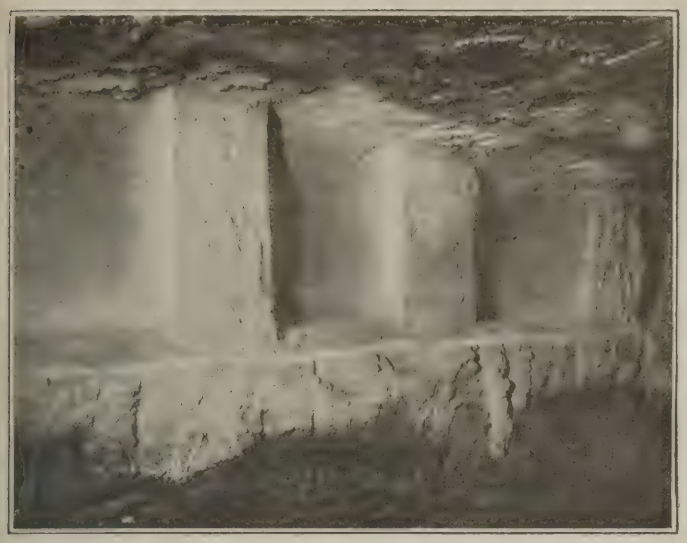

FIG. 5. DRAWSLATE AND TILE BLOCK GUNITED

The drawslate in the United States Experimental Mine had weathered back over the coal. To support the roof tile blocks were erected on the top of the coal and the blocks and drawslate gunited as shown so as to prevent further deterioration of the drawslate.

FIG. 6. RAIL BEAMS COVERED BY GUNITE

In this section of the United States Experimental Mine a heavy fall took place before the roof was gunited. Rail beams were put in to carry the burden, roof and beams being covered with gunite for protection against further weathering. In the rear is a massive concrete stopping.

the roof and ribs of mine No. 155 at Van Lear, Ky. It is stated by Mr. Collier of the Cement Gun Co. "that the thin coating put on stood through the first year, then dropped off in patches, but the roof had not come down, while in the parallel entry without treatment the roof had slacked off to the amount of many carloads." He added that though some repairing of the patches in the cemented entry would need to be done, this would cost less by far than what was needed to repair the other entry.

The Clearfield Bituminous Coal Corporation, according to J. William Welter, chief engineer, purchased a cement gun, but have only just begun to use it. It is interesting to state the condition; namely, that the purpose was to place a coating on the exposed surface of a fire-clay roof. Mr. Welter writes:

> As is characteristic of fire clay, this material slacks when the air comes in contact with it. . . . It was necessary for us to make considerable preparation, such as removing all loose particles from the roof . . .

The Rock Island Coal Mining Co. employed a cement gun in their No. 10 mine, Hartshorne, Okla. It is understood that 350 lin.ft. of entry was covered as an experiment, and that it has withstood the heavy slacking of the past summer.

As an offset to some of the promising results, one of the earlier tests, which followed the testing at the experimental mine, has recently been reported as unfavorable, although at first it looked as if it would be a success. This test was made by the H. C. Frick Coke Co. in 1914. The then chief engineer, J. P. K. Miller, wrote the author on Jan. 15, 1915, as follows:

> The cement gun has been used at two points near the shaft bottom and the superintendent is well pleased with the character of the work it is doing, which consists of coating the roof, after it has been properly treated. The work is being done with a view of preventing any further falling of roof. We intended at one time to arch the roof, but hope that now it will not be necessary.

Thomas W. Dawson, writing Dec. 1, 1917, says:

> The results [of the cement gun] were not satisfactory, but, in our opinion, this was due to the fact that in a number of places the covering of the cement applied was very thin; the whole covering being of variable thickness.

Mr. Dawson quotes from a report from Mr. S. Mack, the mine superintendent, that:

> For about two years it [the gunite] looked as if it was going to be very satisfactory. Shortly after that it began to crack off in small pieces, and I find that there are a number of places where it has spalled off where before it looked solid. It seems that the spalling starts where the cement is thin and then extends to the thicker parts.
>
> Of course this work is all experimental but I believe that if all the roof that is loose is taken down and the space thoroughly washed and a coat not less than ¾-in. thick applied it will last for quite a long time but it must be done right.

Mr. Dawson reported that the mine foreman advised that:

> After an interval of about one year it began to show signs of failure by some cracks appearing. He did not know whether these cracks were due to movement in the roof or sides or due to the slacking of the rock and coal, but when this covering was tested it sounded hollow, showing that the bond between the cement and the rock and coal had been broken so that it would seem that the failure was due to the slacking of the rock and coal behind the cement covering.

In spite of this unfavorable evidence, I do not feel that this testimony should be regarded as condemning such a coating. I do not know fully the conditions of this particular test, for instance whether the ribs were also covered. If they were not then with the usual tendency of the coal of the Pittsburgh district to spall off and crack so that air is admitted, weathering might continue upward and over the cement coating. The test was a difficult one, as it is understood the entries were wide. One must also weigh the first cost plus the cost of annual repairs against the annual cost of timbering and cleaning up falls over a number of years.

Undoubtedly if a roof is of a nature that it can be "brushed" so that its cross-section will be in the form of an arch it will assist in making the coating self-supporting, and as a final resort a light wire mesh resting in a shallow groove in either rib at the springing line of the arch and a heavier coating about 2 in. thick could be employed. This would make the coating self-supporting and it would not then have to be held up by the roof to which it is caused to adhere. The rib coating does not need reinforcement, so the final

cost should not be great. In the long run it is believed that this additional cost would be justified, and certainly such work would be much cheaper than massive concrete lining or brick arching.

The Consolidation Coal Co. of Iowa, the Valley Camp Coal Co. of Pittsburgh, Penn., the Cambria Steel Co. of Johnstown, Penn., the Cameron Coal Co. of Marion, Ill., the New River Co. of MacDonald, W. Va., and many other companies, are all experimenting with the use of the gun in underground work. Therefore in the near future there will be available a large amount of information on the success or failure of weatherproofing roof by cement coating.

Cost of Cement-Sand Coating

The cost of applying the cement-sand coating varies widely with conditions. It has been rather difficult to get figures. Some of the companies do not care to disclose them and others have not kept them in precise shape. In the first work done at the experimental mine the figures were as follows:

For coating 378 ft. of entry averaging 5.9 ft. in height and 9.15 ft. wide, the cement averaging about 2 in. in thickness on the ribs and ½ in. thick on the roof, the costs were as follows:

Labor and Repairs:		
Labor	$138.86	
Supervision	23.04	
Cleaning and repairing gun	10.74	$172.64
Material:		
Cement 280 sacks, or 70 bbl., at $1.10 per bbl.	77.00	
Sand 42 tons at 89c. per ton	37.38	114.38
Total		$287.02

The cost per lineal foot of entry averaged 76c., and the cost per square yard of surface averaged 32c. This job took ten days and the speed was 4.7 lin.ft. per hour, or 11¼ sq.yd. per working hour. In a subsequent job the total cost per lineal foot of entry was 93c. and the average cost per square yard was 40c.

Tested by the explosions in the experimental mine the coating on the ribs remained intact, but the roof coating shelled off from time to time. It did not always separate from the shaly material of the roof, for the two occasionally came down together. In these places and in other parts of the mine we attempted to get a stronger job by drilling holes in the roof as keys for the cement. At the same time we put in reinforcing wires. Also where the roof was naturally very weak some rails were put in for support. The total cost of repairing 6600 sq.ft. of roof and sides, including the railing reinforcement, was $617.95, or 85c. per sq.yd. The cost of applying the gunite averaged alone 42c. per square yard.

In a certain Western mine the cost of the coating put on by the cement gun is given as follows: Labor, $21.50; and material, $17.80 for a total of 190 sq.yd., or 20.6c. per sq.yd. This cost is very low and the figures cover apparently only the application, the coating being ½ in. thick.

One of the companies in Pennsylvania reports that the actual cost was $3 per lineal foot of heading. The section of heading averaged 22 sq.ft., making the cost about 13.6c. per sq.ft., or $1.22 per sq.yd., of gunite deposited. This cost is based on cement at about $2.20 per bbl. and sand at $2 per ton at the site. The thickness was about 1 in., no reinforcement being used, but it was most carefully done and the estimate includes all costs.

At a mine in the Connellsville district, the cost of cementing 5929 sq.ft., which was accomplished in 12 days, the daily cost was as follows:

One demonstrator	$2.86
One nozzle man	2.85
One machine tender	2.15
Two laborers at $2.15	4.30
One-half time teamster at $2.00	1.00
Total	$13.16

The total labor cost was $154.02.

Material:	
325 sacks cement	$125.12
600 bu. sand	36.00
50 ft. mining machine hose	17.50
Total	$178.62
Grand total	$333.44

The cost per square foot was therefore 6.38c., or per square yard 57c. It will be observed that these figures vary widely, but it is thought that under average conditions, with men fully trained in the use of the cement gun, that work can be done for at least 50c. per sq.yd. on the basis of wages prevailing prior to 1917.

It may be pointed out that the gunite not only protects

FIG. 7. SHOWING THE EFFECT OF GUNITING

The coal face as shown on the left, like all natural faces, is provided with ledges on which coal dust can accumulate. On the extreme right is the gunited coal, without ledges, with the insulated wire covered and so protected from injury. Note also how the gunite aids to lighten the heading.

FIG. 8. GUNITE SURROUNDS THIS STOPPING

In this instance the roof and the floor near a massive concrete stopping has been carefully gunited. This prevents the air from leaking through the rib or the roof to the area beyond. In case of a mine fire this is a most valuable feature and assures a more rapid extinction of the conflagration.

the roof and sides from weathering, but also assists in the illumination of the passageways by reason of its light color. It also lessens the hazard of coal-dust explosions.

The ordinary timbered entry has innumerable projections and there are many recesses on the coal ribs which serve as places on which coal dust may collect in dangerous quantities. Comparatively little dust can collect on the surface of a cement-coated heading and what does collect can be readily washed down without damage to the roof or ribs.

The conclusions are:

1. By compressed air a cement-sand coating can be successfully applied to the weak roofs of entries and tunnels in coal mines.

2. By the use of the above means the ribs and a weak roof in coal mines promise to be satisfactorily weatherproofed.

3. Steel timbers in entries and shafts can be protected from rusting and wood timbers fireproofed.

4. The method is of the greatest advantage in fireproofing wood overcasts and stoppings and in making them air-tight. By facing gob stoppings with this material they can be made tight.

5. Fire stoppings can be made gas-tight and are quickly built and repaired.

The last four purposes alone justify the employment of the cement gun method, regardless of what machine is used with the accomplishment.

Eastern Kentucky Pioneer Towns

A few years ago the pioneer towns were no credit to the mining industry. The argument was that when you went into a country with "sagers" who had not had any domestic comforts except those of a log cabin inherited from three or four generations back—a cabin that was in the last stage of disrepair, the chimney of which smoked unconscionably—you could safely put up any kind of a crib and call it a tenant house and invite the people to occupy it.

But we do not do it that way today. No towns today are better than these pioneer communities. The operator is trying to get skilled mining labor from older camps; he is trying to get the better indigenous labor, and then also he has a pride in making the camp a village and not a mere shanty town. He looks for a longer life for the village than was customary years ago. Such towns as Jenkins, McRoberts, Burdine, Dunham, Seco, Fleming, Haymond and Hemphill in Kentucky show how far the new pioneers have advanced from the old idea that a pioneer town should closely resemble the town a squatter would build when he, in his forty-niner wagon, found a stream with pay gravel.

CHURCH AND SCHOOL BUILDINGS AT JENKINS, KY.

Most of the big operating companies in eastern Kentucky maintain playgrounds, rest and reading rooms, newsstands, where many of the best newspapers and magazines are on sale, Y. M. C. A.'s, motion-picture shows, churches and, of course, good schools. It is said that during the first year of development work in Jenkins and the surrounding territory the company spent over $100,000 in Y. M. C. A. work alone, including the construction of a $40,000 building in Jenkins and branch buildings in McRoberts, Burdine and Dunham. The Elk Horn Coal Corporation has also spent large sums in maintaining this work in Fleming, Hemphill and Haymond.

AT JENKINS, KY., THE CONSOLIDATION COAL CO. HAS A SPLENDID HOSPITAL

Eastern Kentucky gardens are comparable with those anywhere. The mine workers are finding that gardening brings them in large returns. From the first the Consolidation has had 8 to 10 acres in gardens and a 500-acre dairy with adequate high-grade stock.

Miners May Join Army Engineers

Miners who are classified for active service in the coming draft are eligible for enlistment in the First Replacement Regiment of Engineers, which was organized at Washington Barracks, D. C., on Dec. 14, 1917, for the specific purpose of keeping all engineering units of the army at full enlistment strength during the period of this war. Engineers are called upon to perform such a wide range of work that practically every man with any technical training or mechanical ability can find a place in this organization. Every male citizen in the United States who is physically fit, and between the ages of 18 and 21, and 31 and 40, is eligible to join the regiment by voluntary enlistment.

To be assured of assignment to this regiment, the applicant for enlistment should write to the Commanding Officer, 1st Replacement Regiment Engineers, Room 107, Headquarters Building, Post of Washington Barracks, D. C., for application blank. If the blank shows the man to be eligible, an enlistment card is filled out and sent to the recruiting officer nearest to the applicant's place of residence, with instructions to enlist the man for service in this regiment. Transportation and meals will be furnished by the recruiting officer and the man will be instructed to report at the post for duty.

Mining Engineers Consider Industrial Relations—IV

By R. DAWSON HALL
Associate Editor, "Coal Age"

SYNOPSIS—*The members of the American Institute of Mining Engineers discuss the losses of industry due to frequent changes in personnel. Thomas T. Read urges that every large company should have an employment manager who should be regarded as a leading official in the corporation. Short account of banquet and trip to Princeton University.*

THE address on "The Employment Manager and the Reduction of Labor Turnover" by Thomas T. Read followed the paper by H. M. Wilson and the discussion on the relative hazards of untrained men and chance-takers. A few aphorisms and statements from this paper may be profitably quoted.

"Intensive study has shown that faulty methods of hiring and discharging men are the most important factor in labor turnover.

"Centralized hiring does not impair the authority of the foreman; he hires his men from the employment office and discharges them back to it, instead of from and to the street.

"The introduction of the employment manager, who is a direct representative of the employer, tends to restore the former relation of direct intercourse between employer and employee that was helpful in avoiding friction between them. Employment managers have invariably reduced labor turnover so that it is now, in some cases, as little as one-tenth of what it was formerly.

Physiognomy Not a Safe Guide for Selection

"Many people think they are good judges of character, whatever that may mean, but it has been scientifically demonstrated that the determined chin, thoughtful brow, sensitive mouth and so on of fiction writers has no basis whatever in fact, and in general that there is no connection between physical features and the characteristics and aptitudes of men. About the only thing that can be told about a man by looking at him is that if he weighs 110 lb. he would not be a good man to put at lifting heavy weights, and if he is 5 ft. 2 in. tall he would not be adapted to a job where he had to reach high.

"The employment manager should have either at his own command or among his associates all the languages spoken in the company's working force.

"The employment department of the Saxon Motor Co. is credited in the first year of its operation with reducing the labor turnover of that organization to 40 per cent. of what it had been. The Hayes Manufacturing Co., of Detroit, diminished its labor turnover one-half the first year and another one-half the second year, while the output per man increased 30 per cent. The Solvay Companies, of Detroit, reduced the labor turnover rate from 10 per cent. per month in May, 1916, to 2.4 per cent. per month in December. Fayette R. Plumb, Inc., of Philadelphia, reports that employment management reduced its labor turnover 48 per cent., enabling it to decrease its working force 10 per cent., to reduce the working time 9 per cent. and at the same time increase its total shop production 10 per cent. In such an organization as the Bethlehem Steel Co. labor turnover probably costs at least $3,000,000 a year.

"A man's rank in the organization inevitably depends largely on his salary. No one who works low in the organization can do effective work as an employment manager because he is not in position to make his views prevail. The failure of the first British campaign in Mesopotamia proved to be due, not to the inadequacy of the medical department but to the fact that the medical officers did not rank high enough to insist that the necessary preparations be made and precautions taken.

Experts Buy Supplies; Anyone Can Buy Labor

"An employment manager is that member of a modern industrial organization who is charged with the specific duty of hiring men for the whole organization. The recent growth of corporate industry has led to the hiring of men in such numbers that the work becomes a task of first-class magnitude; in some cases twenty to fifty thousand men are hired in a year. No organization would think of buying supplies on such a scale without creating a special department to see that it was done in the most efficient and economical manner, and it is remarkable that industry has waited so long before putting the purchasing of so complex a thing as labor on a scientific basis.

"I have said the purchasing of labor; it would be more accurate to say the selling of employment, for the demands of industry at the present time are such that the workman no longer has to go with his hat in his hand asking for a job: the representative of the employer has to go to the workman and endeavor to get him to accept employment. This is an additional and powerful reason why the employing of workmen for a given industrial organization should be put in the hands of one who can bring special skill and knowledge to bear on the work.

"Labor represents more than half the cost of the finished product and it is more essential that labor shall be bought (or employment sold) by a man having special knowledge, skill, and aptitude than it is to have a purchasing department for raw materials. There are many other specific reasons why centralized hiring is desirable and profitable. In the first place, if hiring is done by foremen and the workmen are chiefly foreigners, it frequently transpires that the foreman is grafting on the men he employs, especially if labor is plentiful. Decentralizing hiring also builds up racial or religious cliques in a department that will make themselves felt in trouble later. This is inevitable, since the only source of supply that a foreman has is through his friends and the friends of the men on his gang."

It may be added that the paper gives forms for the conduct of the office of employment manager—the requisition of the foreman asking for help, the application of the applicant for work, the medical examination card, the medical report, the hiring slip, the employee's attendance card, his transfer card from job to job and his leaving slip.

The afternoon session on employment problems was enlivened by a short talk from I. C. Henderschott, of the New York Edison Co., executive secretary of the National Association of Corporation Schools, who said that Frank A. Vanderlip, the president of the National City Bank of New York, stated that a billion dollars a year was lost in strikes, two billion dollars in the incapacity of working men and two to five billion dollars in labor turnover.

Lawrence Veiller, of the National Housing Association, declared that one company spent ⅛ of 1 per cent. of its payroll in improving its houses and found that it was amply repaid by the lessened loss from labor turnover.

In the absence of Maj. Frank M. Gilbreath, the authority on motion study and fatigue, his wife spoke for him—the first time a woman had spoken at a technical session of the institute, the results being wholly encouraging to an extension of the experiment. The subject was "The Crippled Soldier in Industry."

Mrs. Gilbreath urged employers to note and record all jobs around plants which could be filled by crippled men. Some one remarked that he felt as much urged now to search out jobs for crippled men as he had felt urged before to keep cripples out of his organization. Much of the selection of workmen in the past has resulted in the pauperization of those rejected. The war will make a lot of cripples, and it will be a crime if no place in industry can be found for these men.

Most Vital Need in Industry Is Brains

The paper of F. C. Stanford, of Ishpeming, Mich., was largely a review of the school work of the Cleveland Cliffs Iron Co. of which he is chief electrician, but some of his remarks are well worthy of reproduction for coal-mining engineers.

"The average of knowledge is not equal to the average needs of the present time, but continually fails to keep pace with it. It has been aptly said that the really essential need of the period is for more brains; if we only had sufficient knowledge and sagacity we could not only solve all difficulties, but prevent them from arising.

"This generalization holds good for an industrial organization. The most vital need of the management is for more brains. The logical course for an engineer in charge of an industrial organization is, therefore, to direct whatever forces may be at his command toward the development, training and guiding of all the brains in his organization.

"This is easier said than done, for it involves the carrying on toward two objectives, the maximum of productive work, and the development of the individuals who perform it. This is essentially like the rebuilding and enlarging of a plant, keeping it in full operation the while. On the other hand, if the aim is merely for maximum production from an organization, without offering opportunity for development, the final outcome will necessarily be like that of a plant that is driven at full capacity without stopping for repairs and improvements; it eventually becomes so run down that either a complete rebuilding or abandonment is necessary. If the best results are to be obtained in an industrial organization it is imperative to make provision for the development of the individuals composing it.

E. E. Bach's paper on "Social and Religious Organizations as Factors in the Labor Problem" defies any attempt to abstract it. It gives a somewhat complete account of the work at the Ellsworth Collieries, and Mr. Bach's comment added much to the interest.

The evening was given over to the annual banquet which took place at the Hotel Biltmore. The menu was said to be a "Hoover" menu, but if that be true it proved how little Mr. Hoover has done to take the joy out of life even on a wheatless day. In a letter to the secretary of the institute, Bradley Stoughton, Herbert Hoover said:

"I am glad to hear that the Conservation Division of the Food Administration is to dine in spirit with the American Institute of Mining Engineers. Be cheerful about this dinner; every year the War goes on the butter pot will shrink in size—but it has disappeared in Germany. Some year or other, when we are living on the German ration—they will crack."

Banquet in New York and Visit to Princeton

The speakers of the evening were W. O. Hotchkiss of the War Minerals Committee, Bainbridge Colby, of the United States Shipping Board and President-elect Sidney J. Jennings. The retiring president, Philip N. Moore, who acted as toastmaster was somewhat deftly rebuked by Bainbridge Colby for saying in his introduction that our War Department was in the hands of a temporarily reformed pacifist and the Public Information Bureau in charge of a temporarily reformed muckraker. Quite a large number of persons who believe in keeping their wisdom under their hats, especially in the presence of foreign guests, protested in private against Mr. Moore's outspoken remarks.

The trip to Princeton, N. J., which closed the evening though made on one of the chilliest days was a most enjoyable termination to a notable meeting. Lunch was served in Proctor Memorial Hall of the Graduate College, and President John Grier Hibben, of Princeton University, addressed the visitors. The guests then walked or rode by automobile to the aviation field and later visited the Museum, Nassau Hall, the Library and Holder Hall. In the Museum was a piece of New Jersey coal. The small chunk of mineral came from a quarry near Princeton and looked like the real article though doubtless the state will never be a coal producer.

Coals having different composition require different sizes of combustion space. The chemical characteristics that are most likely to affect the size of the combustion space required for a given set of conditions are the quantity and quality of the volatile matter. The quantity of the volatile matter is shown by its percentage as determined by the proximate analysis. The quality of the volatile matter is indicated approximately by the ratio of volatile carbon to available hydrogen, and probably also by the oxygen content of the coal on a moisture and ash free basis.—*Bureau of Mines Bulletin No. 135.*

Licensing Plan for Jobbers

Fundamental changes in the regulations governing coal jobbers will be put into effect by the Fuel Administration on Apr. 1. A licensing plan has been devised which, it is believed, will protect the legitimate jobber and will make impossible abuses which had sprung up under the previous regulation.

It is the belief of the Fuel Administration that the jobber should receive remuneration for service only. Just as a professional man has nothing to sell other than service, it is the intention of the new regulations to limit the income of the jobber to actual service performed.

The new regulations have been worked out with much deliberation. The advice of representative jobbers has been sought at every turn. In the light of last year's experiences, it is believed that a plan has been worked out which will be fair to the operator, fair to the bona fide jobber and fair to the consumer. It is believed that this is the first instance in which a system has been worked out which will permit a retailer to buy, at his option, of the producer or the jobber. In eliminating unnecessary middlemen, the Fuel Administration believes it will point the way to the elimination of middlemen in other industries.

The complete text of the new regulations follows:

Rule 1. A licensee who, as owner or selling agent for another, sells coal or coke without physically handling the same on, over or through his, or its, own vehicle, dock, trestle or yard, shall not ask, demand or receive for such coal or coke more than the price fixed by the President or the United States Fuel Administrator for such coal or coke f.o.b. cars at the mines or ovens, and in effect at the date of the sale thereof, plus 5c. per ton of 2240 lb. of anthracite coal, when such licensee incurs the expense of rescreening such coal at Atlantic or Lake ports for transshipment by water.

Rule 2. A licensee who acts as purchasing agent of coal for and by authority of a retail dealer or consumer without becoming the owner thereof, may charge a purchasing commission not exceeding (a) the sum of 15c. per ton of 2000 lb. of bituminous coal, (b) 5 per cent. of the delivered price of smithing coal when certified in writing by the retail dealer or consumer that such coal is to be used for smithing purposes only, (c) the sum of 20c. per ton of 2240 lb. of anthracite coal when delivery of such coal is to be effected at or east of Buffalo, or (d) the sum of 30c. per ton of 2240 lb. of anthracite coal when delivery of such coal is to be effected west of Buffalo, provided that such licensee may add to such purchasing commission 5c. per ton of 2240 lb. of anthracite coal when such licensee incurs the expense of rescreening such coal at Atlantic or Lake ports for transshipment by water. The combined purchasing commissions of any number of licensees who act for a retail dealer or consumer in the purchase of a given shipment or shipments of coal shall not exceed the commissions herein allowed for one licensee. No licensee shall charge any purchasing commission as purchasing agent of coke for a retail dealer or consumer. Any coal or coke purchased by a licensee for any consumer or retail dealer may be charged and invoiced to such licensee as agent.

Rule 3. No licensee shall ask, demand or receive any commission, charge or profit as broker or purchasing agent from any consumer or retail dealer for the purchase of any coal which is owned by such licensee, or in which he or it has any direct or indirect interest, or for selling which such licensee is entitled to receive any commission or compensation as selling agent or otherwise, or which was produced from a mine controlled, directly or indirectly, by such licensee, or by the controlling owners of such licensee, or from a mine whose owner or the stockholders, members, or partners who control such owner also control directly or indirectly such licensee.

Rule 4. No licensee shall rebate or pay to any owner of a mine producing coal or to any person directly or indirectly interested therein, either as stockholder, partner, member of association or otherwise, any part of any commission, charge or profit received by such licensee.

Rule 5. No person exclusively employed as salesman by a single producer or exclusively employed as purchasing agent by a single consumer, shall be required to procure a license for the performance of his duties as such salesman or purchasing agent.

Rule 6. Contracts relating to bituminous coal made before the President's executive order of Aug. 21, 1917, and contracts relating to anthracite coal made before the President's executive order of Aug. 23, 1917, which are bona fide in character, and enforceable at law, shall not be affected by Rule 1 hereof, but coal purchased or sold under such contracts shall be governed by Paragraphs 8, 9, 10 and 11 (as modified by the order of the United States Fuel Administrator, dated Nov. 8, 1917), of Publication No. 9 of the United States Fuel Administration.

Rule 7. Every license shall be in such form and shall contain such terms, provisions, limitations and restrictions as the United States Fuel Administrator may from time to time prescribe, and the same shall be subject to modification and revocation by him, and shall be issued and held subject to these and such further rules and regulations as he may from time to time establish.

The foregoing rules and regulations approved and promulgated this 15th day of March, 1918, to become effective 7 a.m., Apr. 1, 1918.

In his proclamation authorizing the licensing of jobbers, the President says in part:

All persons, firms, corporations and associations (except those specifically exempted by said act of Congress, producers and miners of coal and manufacturers of coke, distributing exclusively their own product, and retail dealers, as defined in the United States Fuel Administrator's order of Oct. 1, 1917, Publication No. 7, engaged in the business of distributing coal or coke as jobber, broker, selling agent, purchasing agent, wholesaler, or in any capacity whatsoever, are hereby required to secure a license on or before

Apr. 1, 1918, which license will be issued under such rules and regulations governing the conduct of the business, as may from time to time be prescribed by the President of the United States or by the United States Fuel Administrator acting by virtue of the authority heretofore as aforesaid, or hereby, delegated to him by the President.

Fuel Administration's Zoning Plan

After months of work the Fuel Administration announced Mar. 22 a zoning plan which will revolutionize coal distribution in this country. While every state will be affected to a more or less degree, the principal effect of the order is to restrict Eastern coal to Eastern markets and make it compulsory for the Middle West, as well as other sections, to use coal produced near-by. Expectations of the Fuel Administration in this regard are indicated by the following extract from the Fuel Administration statement:

In addition to the saving in transportation the system will provide for the possible retention of something like 5,000,000 tons of coal for the eastern states which heretofore has gone west all rail. This tonnage can be readily utilized in the East. As an indication of the saving to be effected by the system, it will eliminate the movement of more than 2,000,000 tons of Pocahontas coal to Chicago and other western points over a haul of about 660 miles. Chicago can obtain this tonnage of coal, and under this system must obtain it from southern Illinois mines with an average haul of 312 miles. Allowing for the differences in quality in the two coals there will be thus saved 11,400,000 car miles or very conservatively figured 285,000 car days. This will permit 14 additional round trips of 20 days each from West Virginia mines to zone destinations, permitting an additional production of at least 700,000 tons of Pocahontas coal.

Coal of particular quality needed for the making of byproduct coke, the manufacture of gas, for metallurgical purposes or like uses, will not be restricted to the zone in which it is produced, but will move under license. Permits will be issued to the individual consumers having need for this special-purpose coal where a supply is not available in the producing districts which are permitted to ship into the consuming zone where the consumer is located. Applications for permits must be made to the Zone Permit Bureau of the United States Fuel Administration in Washington.

With regard to lake cargo coal, the Fuel Administration makes the following statement:

The present indications are that it will not be possible to furnish as much lake cargo coal during the coming seasons as was moved during the season of 1917. Therefore, to make up for the decreased amount of lake cargo coal, consumers in the Northwest must obtain a greater supply of Illinois coal.

The plan does not prohibit the movement of lake cargo coal from any of the mines located in the Pittsburgh, Connellsville or Westmoreland Pennsylvania districts; in the Altoona, Meyersdale or northern Pennsylvania districts; in the Fairmont, Kanawha or Kenova-Thacker high-volatile West Virginia districts; in the New River or Pocahontas low-volatile West Virginia districts; in the eastern Kentucky districts located along the Chesapeake & Ohio Ry., the Sandy Valley Elkhorn Ry. and the Louisville & Nashville R.R. (Hazard and McRoberts fields); in the southern Kentucky districts located along the Louisville & Nashville Ry. and the Cincinnati, New Orleans & Texas Pacific Ry.; in the Ohio districts as a whole.

The plan does not take into consideration the movement of coal to the lower Lake Erie ports for vessel fueling purposes. This tonnage during the past lake season amounted to approximately 1,650,000 tons.

In discussing the effect of the order in Pennsylvania, West Virginia, Virginia, Maryland, Delaware, New Jersey, New York and the New England States, the following statement is made:

With the exception of the Pittsburgh district, the consuming territory in all of these states requires movement of coal eastbound in the same direction as the preponderance of railroad traffic for export or inland delivery; and because of the congested conditions on all of the eastbound railroads in these states, it has been found unwise as yet to circumscribe the markets to be reached by coal produced in one portion or another of the producing field described, for, in order to move the maximum tonnage, it is necessary to preserve the greatest possible flexibility in the number of sources of supply for and the available routes of transportation to the consuming markets.

Weekly Coal Production

By producing 11,228,000 tons of coal during the week ended Mar. 9, the mines of the country made a better showing than in any other seven-day period since the week ending Nov. 24. Anthracite shipments were 42,207 cars. Beehive-coke production was 733,000 tons. Byproduct coke production aggregated 446,371 tons. These marked increases are accounted for almost entirely as being a result of an increased car supply. The figures are those of C. E. Lesher, the statistician of the U. S. Geological Survey.

To Consider Hall-Zimmerman Case

Appointment of a committee to consider the situation in connection with the Hall-Zimmerman case, which involves the placing of cars assigned for railroad fuel, has been authorized by the directors of the National Coal Association. The committee is authorized to employ counsel and to determine what participation, if any, the National Coal Association should take in the case.

Brief Washington Notes

The recent increase in price granted to a part of Preston County, West Virginia, has been made to apply to the entire county. Operators not included in the original order were able to show that similar mining conditions exist throughout the county and that transportation costs are the same.

Dr. H. A. Garfield, the fuel administrator, is being urged from many quarters to make a tour of the states most affected by fuel regulation. It is believed that a clearer understanding of the objects sought to be gained by the Fuel Administration will be had if Dr. Garfield finds it possible to make a series of speeches in those states where coal matters are of great moment.

Brewers in the United States expect to reduce their output 30 per cent. during the period between Apr. 1 and July 1. Action to this end has been undertaken

in compliance with a suggestion from the Fuel Administration. This is another step in the interest in promoting the conduct of war industries to the fullest possible extent by curtailing fuel consumption among the industries which are not so essential.

J. Howard Magee, of Cumberland, Md., has been appointed assistant district representative of the Fuel Administration for Maryland; D. M. Carl, also of Cumberland, has been made assistant district representative in the coal field consisting of Mineral, Grant and Tucker Counties, West Virginia, and in the Maryland fields; J. M. Cover, of Cumberland, another of those appointed, is assigned to certain operations in Somerset County and in the Indian Valley district.

A three-day diversion of practically all coal from the Pocahontas and New River fields to tidewater has had the effect of meeting the bunker situation and supplying a certain reserve. The order was cancelled at midnight Mar. 14. To meet the requirements of the United States Shipping Board, however, all operators in the two fields, whose mines are adjacent to the Chesapeake & Ohio and Virginia railroads, will continue to ship to tidewater. The only exception to the order is coal for the making of byproduct coke.

Certain increases in the freight rate on anthracite coal proposed by the Norfolk & Western R.R. have been allowed by the Interstate Commerce Commission. The increases approved are those of 15c. or less per long ton. It is provided that the rates between points in official classification territory shall not be increased by more than 15c. It also is provided that where a through rate between two such points is made by combination, appropriate provision will be made so that the aggregate increase shall not exceed 15c. per ton.

New Prices in Somerset Field

New prices for the Somerset field of Pennsylvania have been announced as follows: Run-of-mine, $2.60; prepared sizes, $2.60; slack or screenings, $2.60. The prices which they supersede are run-of-mine, $2; prepared sizes, $2.25; slack or screenings, $1.75. The Somerset field has been enlarged by adding to it the territory tributary to the Baltimore & Ohio between the Somerset County line and Indian Creek.

Contracts Limited to 65 Per Cent. of Mine's Capacity

That not more than 65 per cent. of a mine's production be contracted for is asked by the Fuel Administrator. By leaving the remainder to move on current orders and instructions from the Fuel Administration, there will be little interference with the normal movements of coal and the usual relationships between consumers and producers, Dr. Garfield believes. "Large consumers, including railroads who contract for their fuel requirements," he says, "should not contract for more than 65 per cent. of the output of any one mine or coal-mining company."

Legal Department

PASSING ACROSS SHAFT BOTTOM AS CONTRIBUTORY NEGLIGENCE—A section of the Iowa mining statutes reads: "At the bottom of each hoisting shaft there shall be constructed a safe and convenient traveling way around the shaft for employees and animals, and it shall be unlawful for any person to pass across the shaft bottom in any other manner than by the traveling way herein contemplated; except such employees as may be necessary to perform the work at the bottom of the shaft or those engaged in making repairs." Applying this section in the case of Dennis vs. Gibson, 165 Northwestern Reporter, 1030, the Iowa Supreme Court denied the right of plaintiff to recover damages for injury sustained by him in being struck by a descending cage while he was crossing the shaft. The court holds that neither custom nor an emergency to prevent cars from piling up, nor considerations of convenience will excuse violation of the statutory injunction. The exception in the statute of employees working at the "bottom of the shaft" is limited to those who work in the actual bottom of the shaft and excludes employees engaged in loading and unloading cages.

RELIANCE UPON MINE FOREMAN'S ASSURANCE—The Kentucky Court of Appeals has affirmed judgment in favor of plaintiff in the case of Deskins vs. Consolidation Coal Co., 199 Southwestern Reporter, 779, growing out of injury to plaintiff through a fall of slate while pulling coal stumps under direction of his foreman, who ordered him to remove them notwithstanding plaintiff's suggestion that that might be dangerous. The court said: "Though the safe-place doctrine might not have been applicable if plaintiff of his own volition had proceeded with the work, such is not the case presented. According to plaintiff's evidence, he would have stopped work on the pillar had it not been for the foreman's command. Hence, if no command had been given, he would have been subjected to no further danger. In obeying the command he had the right to rely upon the superior judgment of the foreman and assume that the foreman would not subject him to any unnecessary peril, and to proceed with the work, unless the danger was so obvious that an ordinarily prudent person in his situation would have refused to encounter it. Under these circumstances, the mere giving of the command, if negligently done, was of itself sufficient to impose liability on the company, although no other evidence was shown. . . . On this question the evidence was sufficient to take the case to the jury."

Coming Meetings

AMERICAN ASSOCIATION OF ENGINEERS will hold its fourth annual convention May 14 in Chicago, Ill. Secretary, A. H. Krom, 29 South La Salle St., Chicago, Ill.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS' annual convention June 26-28 at Atlantic City, N. J. Secretary, F. L. Hutchinson, 25 W. 39th St., New York City.

AMERICAN INSTITUTE OF MECHANICAL ENGINEERS will hold its spring meeting June 4-7, at Worcester, Mass. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

INDIANA RETAIL COAL MERCHANTS ASSOCIATION will hold its spring meeting Apr. 10 and 11, at the Hotel Severin, Indianapolis, Ind. The meeting will be a strictly business affair, most of the time being given to discussion of retailers' problems. Secretary, R. R. Yeagley, 703 Fidelity Trust Building, Indianapolis, Ind.

Plant a Garden

and Save Food for the Soldiers

THE dates given for planting in the seven zones into which the eastern part of the United States has been divided are considered to be the best for planting. Earlier and later plantings often can be made, however, with fair chances of success.

Zone	Group One	Group Two	Group Three	Group Four
A	Jan. 1-Feb. 1	Feb. 1-Feb. 15	Feb. 15-Mar. 1	Mar. 1-Mar. 15
B	Feb. 1-Feb. 15	Feb. 15-Mar. 1	Mar. 1-Mar. 15	Mar. 15-Apr. 1
C	Feb. 15-Mar. 1	Mar. 1-Mar. 15	Mar. 15-Apr. 1	Apr. 1-Apr. 15
D	Mar. 1-Mar. 15	Mar. 15-Apr. 15	Apr. 1-May 1	May 1-May 15
E	Mar. 15-Apr. 15	Apr. 15-May 1	May 1-May 15	May 15-June 1
F*	Apr. 15-May 1	May 1-May 15	May 15-June 1	May 15-June 15
G*	May 1-May 15	May 15-June 1	May 15-June 15	(†)

*For the crops grown. †Season too short for this group.

GROUP ONE (may be planted two weeks before last killing frost).—Early cabbage plants from hotbed or seedbox, radishes, collards, onion sets, early smooth peas, kale, early potatoes, turnips and mustard.

GROUP TWO (planted about the date of last killing frost).—Beets, parsnips, carrots, lettuce, salsify, spinach, wrinkled peas, cauliflower plants, celery seed, onion seed, parsley, sweet corn, and Chinese cabbage.

GROUP THREE (should be planted two weeks after last killing frost).—Snap beans, okra, and tomato plants.

GROUP FOUR (cannot be planted until ground is well warmed up, about a month after last hard frosts).—Lima beans, pepper plants, eggplant, cucumbers, melons, squash and sweet potatoes.

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

There are two outstanding features in the news of the week. The first is the threatened split in the union and the second the determination apparent on the part of the miners to absorb by increased wages all the increases in the price of coal granted by the Fuel Administrator.

The anthracite region has always questioned the advantage of its labor connection with the bituminous field. The operators have declared against what they regarded as the dictation of the soft-coal mine workers. The anthracite mine workers have believed that the anthracite labor interests were only the tail of the dog to be wagged at his pleasure.

THREATENED SPLIT IN ANTHRACITE REGION

It is useless to deny these declarations, for the anthracite industry is convinced that they are true, and, being a closely-knit district, argument is impossible. Besides, are not all the leading men in the organization from the soft-coal regions and is not the greater part of the money spent in those same bituminous fields? Of course most of it is raised there, but in far greater proportion is it spent there. Area after area has been unionized or its unionization attempted at great expense to the organization. It is only necessary to name a few fields thus assisted to prove this contention: Colorado, western Kentucky, eastern Kentucky, eastern Tennessee and Alabama. The anthracite region in recent years has not seen any such long strikes, and it has never been involved in lawsuits such as those in Arkansas with the Coronado Coal Co. and the Pennsylvania Mining Co., and those in West Virginia with the Hitchman Coal and Coke Co.

Probably the trouble will blow over as it has in the past and no new organization will be formed. However, the rumor from Shamokin was to the effect that mine workers from Northumberland, Schuylkill and Columbia Counties met Sunday week and at least discussed this subject if they did no more.

COLORADO UNION MEN ARE BADLY DIVIDED

The trouble in Colorado is another thorn in the flesh of the international board. What little unionization has been effected in that state is in danger of being swept away. The signatories to the contract in that state are the Victor-American Fuel Co., the Routt Pinnacle Coal Co., the Black Canon Coal Co., the Curtis Coal Co., the Elk Creek Mining Co., the Colorado and Utah Coal Co., the Wolf Park Leasing Co., the Gibson Lumber and Fuel Co., the Monument Valley Coal Mining Co., the Bear River Coal Co., the Louisville Coal and Land Co., the Alliance Coal Co., the Black Canon New Maitland Coal Co., the George McNally Coal Co., the Rapson Coal Co., the International Fuel Co. and the Evans Fuel Co. The Victor-American is the only concern of prominence. The reader will note that the Colorado Fuel and Iron Co. and the Rocky-Mountain Fuel Co. are not on the list. Nor is the Puritan Mine, which John R. Lawson declares signed up with him before the split.

The unionization is therefore quite incomplete and already a new union has sprung up. All this and no more is the outcome of the expenditure of six million dollars since the year 1910. One cannot regard the defection as negligible even though it be true, as Robert H. Harlin says, that there were only 34 delegates at the rump convention representing 11 local unions, four of which repudiated the action of their delegates at the next local meeting. There were, however, according to the same authority only 70 delegates at the regular convention. The defection seems to be quite important in view of the small size of the field and its moderate degree of unionization.

The other development to which reference has been made is the determination of the mine workers to overlook the fact that the Fuel Administration is raising coal prices in order to make production possible at all the operable mines of a given district. On Mar. 15 B. M. Clark, the president of the Executive Board of the Association of Bituminous Coal Operators of Central Pennsylvania, refused to meet the mine workers to discuss the increase in wage for which they are asking.

OHIO SERVES NOTICE OF INTENTION TO STRIKE

News comes from Martins Ferry, Ohio, to the effect that in the closing meeting of the twentieth annual session of sub-district No. 5, John Moore, the state president, declared that the operators of Ohio were trying to get an increased price for coal and he added that if they got the increase he "would be after a piece of it for the miners" even if it was necessary to have a strike equal to that of two years ago, which lasted 14 months.

Lee Hall spoke to the delegates about the importance of clean coal, but he declared that the reopening of old mines was partly to blame. He said that "unless there is an improvement in the mining so that clean coal is produced no one will want Ohio coal in the future."

The strike threatened in Preston County, West Virginia, at the mines of the Kingwood Coal Co. did not materialize. The district officials insisted that the men remain at work. The Fuel Administration is to solve the problem whether the Kingwood Coal Co. should be compelled to buy powder and sell it to its miners at less than cost. Selling anything at less than cost is an anomaly and should be done away with. However, those concerns which have hitherto never sold powder are given an advantage now that the powder has to be sold at a loss. The price presumably is fixed high enough for the operators to sell powder at a loss or otherwise those who do not would be put out of business.

The returns from district No. 24, Michigan, indicate that former President John Crutchfield, one of the radical socialist element, has defeated Robert Gaffney by an overwhelming majority in the election for international board member. William Muir becomes president. He had 16 more votes than Frank O'Donnell and the race was so close that for a long time it was thought that O'Donnell had the job cinched. William Stevenson becomes vice-president and Fred Dando is reëlected secretary-treasurer. O'Donnell and Gaffney were both men who desired to keep the mines working steadily throughout the duration of the war.

KENTUCKY MINERS WANT A UNION POORHOUSE

Despite the fact that the United Mine Workers are opposed to the idea of building homes for aged and disabled mine workers the mine workers of western Kentucky at the recent session voted, at the suggestion of President W. G. Duncan, in favor of building a $20,000 home at Central City, Ky. The general sentiment has been that the mine worker would prefer a pension and to pass his declining years with those who are near and dear to him. Only recently John Mitchell, the former president of the United Mine Workers, issued a statement opposing the erection of a home for the aged and infirm.

The mine workers also recommended that the Government intervene to secure that powder be sold them by the operators at a lower cost. At the present prices no one but operators will sell the miners powder, but that is not enough, they want the operators to accept an even larger loss in handling powder than that which they now sustain.

A stand was taken at this session against the practice of mine operators in making contracts with railroads to supply them with the full output of the mine. These mines get all the cars and the other mines have to divide up what are left and so run irregularly. The men perforce have to leave the mines that have no output contracts.

Conditions in the Drumheller field, Alberta, Canada, are somewhat hard to determine. Between the days when the Rosedale men won't work—or rather when some of them won't work—and days when there are no cars, but little work is done. On Mar. 12 the mine operators of British Columbia made a protest against Bill 27 (Coal Mines Regulation Act.), which provides for an 8-hour day from bank to bank for all employees at mines. The operators complain that wages have increased 35 per cent. since 1907 and the cost of production $1.10 a ton. They declare it is impossible to replace Chinese with white laborers for at the mines on Vancouver Island 52½ per cent. of the employees are Chinese and the proportion throughout the entire province is 28½ per cent.

Possible Anthracite Labor Split

It seems that the risk of a split in the ranks of the United Mine Workers which will cleave the anthracite and bituminous contingents from one another is more possible than was at first thought. The anthracite men keenly resent the fact that the bills for which they are to be assessed are, by chance, incurred by bituminous mine workers and not by their own men.

One can only wonder at this point of view. If the men at the anthracite mines believed that the action of the union was wrong in the Coronado Coal Co. case and if they thought that the union should refuse to permit the formation of a local at an operation like the Hitchman Coal and Coke Co., which made contracts with each individual mine worker precluding him from joining a union, then their action could be understood. But breaking up for a mere geographical reason is absurd. Or is the argument more mineralogical? Anthracite is more mineralized than bituminous coal; therefore the miner of bituminous coal is a person of no interest to the anthracite miner. Was ever argument more flimsy?

But, like many arguments, the worse they are the more convincing they seem, and Frank J. Hayes, the president of the United Mine Workers, has felt compelled to send telegrams to several national organizers to take charge of a situation which James Matthews, the district president of the Schuylkill region seems unable to control. The mine workers are determined not to pay the 50 per cent. increase in dues levied by the international convention at Indianapolis in January, which increase is effective Apr. 1.

The union officials are certainly badly scared by the developments. They have even issued an order that the increase in dues shall be kept in the anthracite region instead of being sent to the national treasury of the organization. It is announced that 20 per cent. of the money that each local union would send into the national treasury, with the increased dues, will be returned to the district and local treasuries. Instead of getting 55c. from each union, the national organization will only receive a net amount of 40c., while the district treasury and local treasury will receive 5c. each.

Bernice Mine Workers' Decision

There are only two large corporations in the Bernice field, of Sullivan County, Pennsylvania. That field lies off by itself at some distance from the area commonly known as the northern anthracite field. These two concerns are the Northern Anthracite Coal Co. and the Connell Anthracite Coal Co. The mine workers in both of these recently presented grievances before the Anthracite Conciliation Board which, unable to agree, turned the matter over for decision to Charles P. Neill, the umpire of the board. The men in both cases ask for payment of a 10 per cent. increase under the terms of the agreement of May 20, 1912. The companies had granted only 5½ per cent. The mine workers were not organized until recently and had been unable to make their demands articulate.

The arbitrator found that the Northern Anthracite Co. was a party to and was therefore bound by the decision delivered by the Strike Commission in 1902 and also by the terms of the agreement of May 20, 1912. This later agreement provided for an increase of 10 per cent. over and above the rates established by the award of the commission. The umpire decided that the employees of this company were entitled to this increase and directed that it be paid.

The umpire also said that the Connell Anthracite Co. was not organized until after the award of the commission and so was not in any way bound by its terms. He decided that the increase of 5½ per cent. that it paid to its employees was a voluntary act on its part. For this reason he did not sustain the grievance and denied that the employees were entitled to any additional increase under the old agreement.

Kansas Patriots Sweep Howat Aside

A correspondent recently wrote as follows:

Alexander Howat, president of the mine workers in the Kansas district, failing to induce the men to recognize his authority and listen to his arguments in favor of contract breaking, has recently issued what purports to be a supplement to the biennial contract. This incorrect reprint misleads the miners as to contract conditions and is causing unwarranted discontent in some fields.

The practice with reference to contracts and supplemental agreements is for the operators to print and issue copies to their members, and for the union to print and issue other copies for the use of the union membership. Heretofore there has never been any variation in these versions, exact reproductions being published, so that the men knew just what the agreements were.

Late in February, however, a book was issued at Pittsburg that appeared in all respects to be the text of the agreement signed in Kansas City last spring as supplemental to the biennial agreement. On the title page is the statement that the book contains the agreement made by the Southwestern Interstate Coal Operators Association. The last page bears the names, as signatures, of the association's officers. But the agreement as printed varies radically from the true contract and its supplement.

In the section pertaining to the Osage field, for instance, the scale is given 50c. higher than that actually agreed upon. This higher scale as printed was operative under orders from Dr. Garfield between Jan. 19 and Mar. 1, but it is no longer in force. The Osage miners being in possession of these apocryphal agreements, are up in arms to compel the fulfilment of the terms of this pseudo-record. As might be expected much trouble is brewing.

There are many instances, similar to the one quoted, where the contract of the book varies from the contract actually signed. The operators are studying it, comparing the terms in it with the original agreements as actually accepted, and they are publishing the facts broadcast for the information of the mine workers and the general public.

Suspicions against the patriotism of the Kansas miners have long been harbored in some quarters. But it has recently been proved that if they can shake off the demoralizing influence of unscrupulous leaders they will prove just as good citizens as mine workers anywhere.

All but one of the mines in Kansas that had been shut down in violation of the contract have reopened. In every case Alexander Howat, the president of the Kansas district, has appealed to the mine workers and ordered the strike to go on, but without avail. In fact the open revolt against the authority of Howat is the most gratifying development in the Kansas labor situation that has appeared for many months.

The Smith, Scott & White Contracting Co.'s mines were shut down on Dec. 28 because of the refusal of the mine workers—as individuals—to report for work. Howat had advised this action, and he insisted throughout the suspension that there was no strike and nothing whatever that

called for arbitration. In fine, he said, that Tom and John and Pete were not coming to work for reasons of their own, but whenever they felt so disposed they would return.

It was, however, quite well understood that if the operators would refrain from assigning men to jobs which the miners did not want to do, the miners would return to work. As the matter of striking was quite fully covered in the contract, the miners could not strike as a body without violating its terms and without being subject to a heavy penalty. Hence Howat's "individualistic" method of quitting work.

When thus on strike, or "sulk," or whatever you may term it, the miners held several meetings at each of which Howat pleaded with them to stay away from work. The last meeting was held Feb. 26. For hours the men listened to the pleading of their president, but they had listened even longer to their loyal instincts, and they decided to go back to work.

Returned as They Had Quit—As If Unorganized

There was no announcement that the strike was at an end, but the men all went back to the strippings on Mar. 1, not as a union but as individuals. However, the subject in controversy will now be taken up in the manner provided by the contract. The men have lost $35,000 in wages, and the country has lost about 50,000 tons of coal, and that at a time when the shortage of coal was most acute. No one gained anything but the pro-Germans.

The strike at the Jackson-Walker Coal and Mining Co.'s mines was a real farce. The outcome was the same, but it came sooner. The men found out that they were being used for somebody's ulterior purposes, and they decided that they would abide by their contract and the principles of the saner of their leaders.

The resumption of work Mar. 1 at the Jackson-Walker mines marks the early demise of the abortive National Bookkeepers and Company Weighmasters Union of which Alexander Howat was the organizer, and first and only national president.

It was formed, it is said, with the express purpose of circumventing the Washington penalty provision. If the mine workers could not strike without violating their pledge and paying a fine, this new union, unpledged and too small for official cognizance, could strike at its pleasure and give the mine workers the opportunity for remaining idle that they might happen to covet or have coveted for them by Alexander Howat.

But the bookkeepers were not so anxious to serve the ends of the mine workers as to raise their own wages. They struck though they have received two advances during the past year. Their places were quickly filled, so the great scheme did not work. In consequence it was necessary for the mine workers to strike, and this they did in sympathy with the union bookkeepers.

Howat, President of Bosses and Bossed

The operating companies naturally regarded this new development of unionism with disapproval, for not only did it attempt to circumvent the contract but it aligned the weighmasters with the mine workers, whereas the mine workers are supposed to be kept in check by the weighmasters. With the weighmasters hand in glove with the miner, the operator felt much as the miner would feel if the check-weighman he paid and appointed were to join some operators' association and put himself subject to its rulings. As the new order of things threatened to put it within the power of two or three men to close the works down, the operators felt justified in looking for new men when the strike occurred.

The miners in two of the mines stayed out ten days, and then voted to return to work, resuming operations Feb. 27. The other three mines did not resume until Mar. 1. When the bookkeepers and weighmasters saw that the miners were not going to stand back of them, and that the clever plan was failing, they met and adopted resolutions of extravagant loyalty to the Government and declared that to avoid any appearance of seeming to interfere with the production of coal at a time when the country needed it, they would temporarily suspend their demands. But the jobs of the members of the new union, even after they had divorced themselves from it, were no longer open.

The two labor difficulties above outlined were ended largely through the efforts of representatives of the United Mine Workers, who were able to make plain to the miners how dangerous a course it was to follow the unethical suggestions of the Kansas president. In consequence of the strike the Jackson-Walker miners lost $41,000 in wages, and the country 18,000 tons of coal.

Low Tonnage Is No Fault of Miners

The mine workers of Illinois at their meeting in Peoria, Ill., tried hard to absolve themselves of all blame for the coal shortage. It is true that the output has been so restricted by lack of equipment that the many strikes in the state during the past year did not greatly reduce the output of the whole state or country, though that cannot be conclusively proved.

The mine workers' attempts to defend their action shows how strongly they feel now the necessity for steady work. Where labor is concerned, the public has a ready power of forgetting. If the Illinois mine workers continue in their present diligent attention to the country's needs, in a few months they will have absolved themselves more completely than can be done by any vigorous protestations.

Miners Apologize for Taking Time to Talk

There is even a note of apology from them regarding the number of men made idle by the conference. They feel, in their patriotic enthusiasm, that now is the time to work and not to talk, and they are in a defensive mood like patriots discovered in what is, on its face, not a creditable business. They explain that ordinarily between 800 and 900 mine workers would be withdrawn from productive labor by such a conference for about two weeks, and the railroads would have to provide that number with transportation.

But this time the number is reduced one-half. The basis of representation is changed so that now each delegate acts for 100 miners instead of 50, as heretofore. The reader will please note the spirit of these Illinois men. It was perhaps of slow growth, but it seems to have attained an intensity with which few regions can compare.

President Frank Farrington, in his annual report, declared that if cars were provided the Illinois miners could produce 59,000,000 more tons annually than they are producing. He backed up his statement with figures, showing the production since 1915. "For the fiscal year ending June 30, 1916," he said, "Illinois mines worked an average of 163 days and produced 63,673,530 tons of coal. This was sufficient to fill the demand of the time. The railroads then had adequate facilities to move the requisite tonnage.

Mine Workers Always Waiting on Somebody

"No one had then any reason to complain, except the miners themselves. It was they who had suffered by being given just a little more than half-time employment. Then the abnormal demand began to hit the country. To move the tonnage taxed the railroads to the point of breaking down. In that period, the fiscal year ending June 30, 1917, Illinois attained her maximum production and mined 78,983,527 tons of coal. And still the mines worked an average of only 179 days, or 134 days less than full working time. Had the mines operated for full time during this period and maintained the same ratio of production as obtained during the days of actual operation, Illinois miners could and would have mined 138,110,093 tons of coal; but due to a lack of transportation facilities to move the tonnage from the mines, they were able to produce only 78,983,527 tons, or 59,126,562 tons less than their potential capacity."

Farrington bitterly denounced the Industrial Workers of the World. "The declared policy of the Industrial Workers of the World," he said, "is to destroy the United Mine Workers of America. For years we have allowed them to tear at the very vitals of our union. Emboldened by our indifference, they are becoming more and more active."

We Need These Boys at the Mines

A Big Opportunity is Open to the Boys Around the Mines to Get Back of the Government and Help in the War

PERCY S. BULLEN *writing in the* New York Times *recently showed the good work Boy Scouts can do under stress of war conditions.*

"On a recent visit to England I found that the Boy Scouts were in the zenith of their career of national usefulness. They had been the means of releasing many thousands of men for service at the front. You found them everywhere with their standards of manhood, integrity, and chivalry to girls and women, acting as civil guards on all sorts of occasions, policing the streets for processions, safeguarding property, bearing ambulances, and acting as dispatch carriers. The usefulness of the organization in America during the war and its great possibilities of expansion, judged by what has been accomplished elsewhere, have not yet been fully brought home to the public and more especially to parents who might well be proud to have one or more Boy Scouts in the family."

Boy Scouts in America are selling Liberty Bonds, and War Savings Certificates; they are aiding the Food Administration and even helping the Fuel Administration. We need their enthusiasm and their services.

Bandar-Log or Bee?

FROM the time a monkey opens his eyes in the morning until drowsiness overpowers him at night, he is pretty much a law unto himself. He does anything he wants to, when he wants to, and as long as he wants to. A whimsical individualism sums up his philosophy of life. The day's end finds him just where he was in the morning. The tribe—bandar-log, Kipling calls them—respond to any leader of the moment and as quickly quit him to follow another or to fetch up individually with a brand-new, suddenly-caught and all-absorbing idea.

Like any other philosophy, it is a charming one if you like the net results of it. The monkey does. On the contrary, the bee doesn't. The bee insists on organization by functions. His philosophy is self-sacrificing, vigorous and stern—a Spartan philosophy applied to production. "Beefficiency" is the Taylor system raised to the *n*th power; and the bee doesn't get the honey.

If the bee had sense, he'd maintain his present organization a few hours a day—which would easily supply his wants—and be a bit bandar-logish the balance of the time. But he cannot. The reason is because he doesn't think. He's a machine that is a part of a bigger machine. On the other hand, if he did think, he'd immediately tend to become individualistic, and the moment that happened the organization would begin to wobble. There would be argument about how the comb should be built, who should build it, who should boss it, how much honey should go to each; societies for the prevention of this and that would be formed. Social workers must eat; so must bosses; so must societies for the prevention of things.

Nature did not see fit to devise a species having the merits of both bandar-log and bee—a sort of bandar-bee.

A bandar-bee would help us a lot just now. It would be the real super-thing. It would be highly coöperative for a few working hours and highly individualistic the rest of the day. It would accept the notion that working together bee-fashion is the answer to the question of maximum production in minimum time; but being a super-thing, it would reject the notion that the honey gathered should all get into the hands of a few crafty speculators to be sold back at the speculators' price. It would control distribution with the same bee-like coöperative efficiency that it used in production.

It would accept the axiom that self-expression is necessary to a thinking super-thing—that monkey play in a monkey way is after all the best fun in life. It would approve the bandar-log system, in which the individual in his idle hours may sit on a limb and philosophize, or try a new way of weaving twigs, or join the bunch in a frolic, or play with the kids.

Obviously the bandar-bee would be a clear and direct thinker. He would be an intense individualist—so intense an individualist that in order to have the maximum number of hours a day for individualism, he would sink his individualism when he came to his production and distribution hours, and be an intense coöperator. He would treat as wasters those superbees who would work themselves and others without any thought of the monkey play, merely to amass a personal pile of honey. There would be piles of honey, adequate personal piles, but not huge ones.

Individualism and self-interest are about the same thing. The date when the bandar-bee will appear on the earth depends upon the amount of hammering which mankind must undergo, to pound into it a realization of the fact that in the long run self-interest can be most permanently promoted by intense and unselfish coöperation in production and distribution.

Why Raise Only Raw-Material Rates?

NO ONE will ever applaud the Interstate Commerce Commission, not even when it is interred, which interment a large section of the public hopes will come soon. It has just increased railroad rates. That seems hopeful. When one hears it one is prone to believe that the commission has become reasonable and really appreciates railroad conditions and the difficulties which their administrations—private or Governmental—have to confront.

But the commission had, nevertheless, to do wrong. It places the increases on raw materials, on which the rate is high, rather than on manufactured goods which are carried at too low a rate. Of course, this may not do the harm under Governmental supervision that it might do under private management. The Government should, and probably will, scorn profits and show a preference for the handling of such raw materials as the country most needs.

But it is surprising that the rates on raw materials are chosen for increase when everyone knows that the advance in rates should not have been so placed. It would have been bad enough to have put an equal increase on all classes. It is essentially wrong to correct first an evil which is the least crying. Raw materials had at least a good argument for an unchanged rate, but manufactured articles never possessed even the very shadow of a right to that contention.

The attempt being made to sidestep that responsibility and put the blame for rate increases on the demand of the railroads made when under personal management is deplorable. Everyone knows that the present managements desire the increases or they would not be granted. There is no new need for increased rates for railroad transportation. The regulation of the price of coal has actually made it less necessary. The only reason why it is granted now and was refused before is because the ox has a new master.

The ox is now paddocked in Washington, D. C., and it is recognized that all Washington cattle must be pro-

tected. No one ever cared what happened to the ox when it was at Wall Street, New York City. There it was gored far more cruelly. There it became a mere mangled corpse and was denied veterinarian aid. Now, by Government regulation of coal prices, its precious hide is protected, yet nevertheless its new master is most solicitous about its condition, and the veterinarians who refused medicine before are ready with their potions.

No one can regret that rates are raised, even though they are the wrong rates. Higher rates were necessary. They could not come too soon. However, we are permitted to regret that the wrong rates were raised—that the unfairly proportioned raw-material rates were changed first and may, perhaps, be the only ones that are to be changed. We may also be allowed to regret that many of the increases were in the freightage rates of primary necessities, anthracite, live stock, fresh meats, petroleum, grain, cement and lumber, the high cost of which so many people are deploring. But no matter where the railroads get their operating money it is a source of rejoicing that the revenue is to come in.

We have always contended that the producer of essentials should be allowed the bigger profits, for his is the greater service. No one can deny the logic of this. The only answer is that it is more important that the cost of essentials shall be low, that the public may live. Now the Government steps in. It has its chance to make profits on nonessentials, and immediately it jacks up the cost of essentials over which beforetime it exercised such a careful ward. Was there ever more inconsistent action?

Green Hands vs. Chance-Takers

THE problem as to which kind of employee was the greatest menace to a mine and to himself—the green hand or the chance-taker—received consideration at a recent meeting of the American Institute of Mining Engineers. Those who discussed it did not presume to say that they had the matter solved, but even when the problem is answered one way or the other it will perhaps make little difference for the work of safety will be best secured by the same methods no matter whether a green hand or an old hand is most to blame.

Take an illustration from the field of crime and penology. We know there are men who are hardened in evil and our hope has always been not so much to correct these men as to prevent the young men who are continually replacing these old offenders in the work of each generation from starting out wrongly in the battle of life. The public schools and the institutions for the recreation of the young are expected to do a work of character formation more effective than any work of character reformation.

Likewise in the matter of the dangers to green hands and old hands there is in the future a surer solution to be found in the training of green hands than propaganda among chance-takers can ever afford.

The green hand, well coached at the first by trained men, properly convinced that a careless, reckless miner is a bad miner, will be careful from the very beginning, and good habits, once learned, are apt to persist. The hope is in emphasizing safety when the man is hired and especially when he is hired for the first time. The workman must be given not merely a sort of inchoate dread of his work, but a definite system of safety practices to be followed unerringly.

As it is we put the men in the mine to work with men whom we know practice unsafe methods, with men who habitually run risks. We place them in the mine entirely untrained, and we leave it to a chance visit of the mine foreman at an opportune moment to work the reformation. But the seeds of carelessness and slackness have perhaps by this time already been sown by an old and reckless miner.

Have You Plans for Next Liberty Loan?

WE ARE not asking if you are planning to buy bonds, because, of course, you are. You will buy all you can. But that is not enough. How many are you going to *sell?* To what extent have you laid plans to sell them? Lay your plans carefully so that when Apr. 6 comes every man at your mines will know that you are a patriot and a citizen ready and willing to help in the three-week drive that is going to put over the biggest loan that we, the world's biggest people, have ever floated.

The Kaiser is not a side issue in our lives. He is the main issue. We cannot let the Prussians win, and we cannot prevent them from winning unless we make their defeat the main purpose of our lives till the war is ended. On Apr. 6 the immediate interest of everybody will be to see that the great loan is subscribed and oversubscribed. Every manager, superintendent, mine foreman, fireboss and miner will be a Liberty Loan seller and a Liberty Loan buyer, first; and a worker in the industrial army, second. Everybody will be thinking Liberty Loan from the time he hears the alarm clock in the morning till the moment he lifts the window sash before retiring—and in the watches of the night also.

If you have any stories as to how Liberty Loans have been sold in your community and as to the manner in which you purpose to sell the bonds let us hear from you. Perhaps we can help, and we know your suggestions will help others.

Fidelity, Industry and Intelligence

IF A man is faithful, industrious and possesses average common sense, he has the three chief requisites to success. The coal industry has several hundred such men, who through the exercise of these simple virtues have advanced from insignificant positions to posts of responsibility and importance. Nothing is more inspiring to those who are struggling against heavy odds than the story of some other fellow who has persisted and eventually won out. He does not necessarily have to be the president or the general manager—a man who has raised a family, sent his sons through college, and owns his own home, is to that extent successful. We want a number of such stories for our Success Number, which is to be issued Apr. 13. Pick out your subject today and let us have the sketch by the first of April. If you can furnish a photograph, we will be pleased to print it with the article. This is one way to help the coal-mining business by heartening some of the men in it.

DISCUSSION BY READERS

Prohibition and Labor

Letter No. 1—My attention was strangely arrested by the full-page cartoon that appeared in *Coal Age*, Mar. 9, p. 463, showing miners drinking in a saloon. The scene there portrayed brought a train of thoughts to my mind.

Before attempting to discuss the relation of prohibition to labor, however, let me say that I very much regret that Samuel Gompers, president of the American Federation of Labor, has seen fit to array himself against the adoption of the Federal Prohibition Amendment in New York State. It would seem that the class of workers whom Mr. Gompers represents, in his official capacity, is composed of those who are most injured by the prevalence of the liquor traffic. For this reason he, of all others, should have stood firm for prohibition.

No argument is needed to make clear the fact that the laborer who indulges in liquor to excess loses not only a portion of his earnings, but, likewise, to a large degree, his ability to earn. Drinking to excess is necessarily followed by a period of enforced idleness when the man must sober up before he can return to work. If he should return, however, and start to work when under the influence of liquor he would not only endanger himself but his fellow workers by reason of his irresponsible acts.

To Protect Men Against Themselves

To protect a man against himself is reason enough for the enactment of prohibition, but there is yet another element that requires equal consideration. It is a duty that rests upon society requiring it to act in its own defense against the social evils that become rampant in its midst wherever liquor holds sway. There is, again, the duty incumbent upon every community to safeguard its homes against the degrading acts of those given to the drink habit, who by word and example persuade the young to travel the same downward road they themselves have followed to their ruin.

Every year makes it more apparent that the drink habit is a prevailing evil and its authorization by Government sets up an institution that violates the personal rights and liberties of the individual guaranteed by the Constitution. It is the individual's right to protect himself and his own from the inroads of evil and to intervene for the betterment of humanity. Every citizen has the right to live and build his home in the community where he earns his bread and to demand that the standards of that community shall be such as not to undermine the home.

There is, again, another side to this question of prohibition. Whatever affects labor affects the entire social life of a community and its productiveness. At the present time, labor is being urged to do its utmost to produce coal, food, steel, ships, airships and motors; while, at the same time, the draft is thinning out the forces of labor in the country. We are told that this is no time to attend to other matters, but that the war and its requirements are of the most vital importance.

Wars are won by clear brains and strong bodies, which are needed not only at the firing line but must be in the possession of every one of the great army of workers to whom the boys at the front are looking for support and encouragement. Clear brains are not the product of the saloon. There is, therefore, today, no greater menace to the successful prosecution of the war than the presence of the saloon in our mining camps and industrial centers. Food is required to win the war, and it should not be wasted or used in the manufacture of drink that is a hindrance to production.

It has become a popular saying, "A quarter a day keeps the Kaiser away." Let every drinker ask himself whether it will not be better to spend his quarters for thrift stamps instead of for beer. Loyalty to the cause permits of but one answer.

Reply to Samuel Gompers

In reply to Mr. Gompers, who says, "Aren't we asking about enough of our German and Austrian citizens to give their loyal support to this Government, against that of their own, without injecting an enactment that will forbid them gratifying their normal tastes?" Let me answer, unconditionally, No! Not when those "normal habits" conflict with and destroy the effectiveness of American citizens.

When the German, Austrian, Englishman, Frenchman, Italian, or Pole, comes to this country to establish a home, we ask him to become Americanized; and loyal American citizenship may demand, as it does today, the destruction of an industry that is and always has been an enemy to good citizenship.

In that case, the so styled "normal habits" of citizens of foreign extraction must give way to the higher demands of the country. This demand has been growing greater and stronger every year, until it is now overwhelming, and national prohibition will soon be welcomed throughout the land. GEORGE N. LANTZ.

New Straitsville, Ohio.

Coal Production and Booze

Letter No. 6—I was much interested in the letter of John Buggy, *Coal Age*, Feb. 9, p. 300, regarding the damage done to the production of coal by the tolerance of the saloon in mining camps and districts. I must admit, however, that I was somewhat amused at the suggestion offered as a means of curtailing this great evil.

Br. Buggy suggests that the Government limit the shipment of liquor to each mining district, allowing only a prescribed percentage of the accustomed consumption. This, he says, would provide but a small amount that each man could receive and thereby prevent

drunkenness. He asks that the Government issue orders requiring saloonkeepers and bartenders to furnish tickets to their regular customers, which would restrict the number of drinks a man could obtain.

My own idea is that the Government, having already stopped the mannfacture of whiskey in the state, should go further and do the same in regard to all drinks that use articles of food in their preparation, and serve no good purpose but render men unfit for work.

While I am no temperance man, it does seem strange to me that the Government should permit articles of food to be used in the manufacture of liquor, which does not serve the purpose of food and has never been known to help anyone who was given to the habit of drinking. On the other hand, any man who has reached 26 years of age can not fail to have observed many occasions when someone who has imbibed too freely has caused much harm by his irresponsible acts.

It is my firm belief that, should the Government enact a law prohibiting the manufacture and sale of all intoxicating drinks, the effect would be to increase the efficiency of the miner fully 10 per cent.

Eldorado, Ill. MINE MANAGER.

Letter No. 7—I agree most heartily with everything that S. D. Hainley has said in his letter, *Coal Age*, Feb. 16, p. 346, in regard to how the booze habit affects the coal production in the country's present crisis when the demand for coal has been so great that many sections of the country have been unable to obtain an adequate fuel supply.

It is not my habit to put up a hard kick in the interest of temperance; but I can see no good growing out of the confirmed habit of many men, who repeatedly drink themselves drunk, until they are unfit for work. If I should spend $1 in two months, for drink, I would feel it was too much, especially where I have mouths to feed and a family to clothe. When a man can secure but three days a week for work it requires the strictest economy to provide these necessities.

Our town has about 300 inhabitants, and I am frank to say the consumption of beer, in this place, surpasses anything I have seen before. For example, at one house where there are but four boarders there were delivered 35 quarter-kegs of beer in one evening, which is not an uncommon amount of liquor supplied to many other houses in the place.

How Drink Affects the Operation of a Mine

The effect of drink on the operation of a mine has not been exaggerated in the letters previously written. When a mine foreman wants to start he finds that he must run empty handed as the "booze hoisters" always fail to show up when needed. Not infrequently there is no machine runner on hand and the miners must go home because there is no coal to load. He is reported to be at home sick.

A motorman fails to show up, and the foreman puts a less experienced man in his place to run the machine. Before long there is a wreck and the mine must now lay idle for several hours or the balance of the day. Like the machine runner, this man is reported sick when, in truth, both are drunk and unfit for work.

I can indorse the suggestion made by John Buggy to the effect that the Fuel Administration give its closest attention to the production of coal and eliminate these causes that are more than any others responsible for the short supply of coal. As Mr. Buggy asserts, the way to do this is to limit the shipments of liquor to mining districts and camps to a small percentage of the usual consumption. They will then not be able to get enough drink to harm them or render them unfit for work and every man will be on the job.

Injustice to Steady Workers

It would seem that the general attitude of operators toward their men who lose much time by reason of drink is not what it should be, while men who are always in their places are forced to run machines and drive motors when it is their desire to cut coal.

When first starting work in this mine I was given a job of spragging and, later, was asked to assist the motorman. I was not fitted for the work because the coal was low; but the foreman refused to give me a place to dig coal until I spoke of quitting. He then gave me a wet hole where half a dozen men had quit before me; first, however, making me promise to help him out when he needed a spragger. This was done to punish me for not being willing to continue to fill the places of men who failed to show up because of drink.

A similar case was that of a friend who wanted to dig coal, because he could make more money so doing than by driving a mule. The boss replied to him, "All right, Bill, pick yourself out a place that will suit you; but when I am in need of a driver I want you to help me out." These instances show that many good workers who never drink suffer through the drink habit of others, whose places they are called upon to fill.

Waterman, Penn. A MINER.

Mine Cars

Letter No. 4.—Referring to L. B. Paul's letter, *Coal Age*, Feb. 16, p. 346, one is reminded that the chief consideration, at the present time, is the reduction of operating expenses, and that this depends, in a high degree, on attaining the greatest mechanical efficiency possible in mining equipment. This is particularly true in respect to mine haulage, which must be put on a highly efficient basis.

Besides the many points relating to efficient mine haulage, such as grades, curves, clean roads and well ballasted roadbeds, there still remains an important factor that is not given the consideration it demands. Today, operators are beginning to realize that bearing friction is the one factor that can be put on a high efficiency basis without interfering with the daily output of the mine.

There is no need to dwell at length on the fact that roller bearings of the proper kind and properly installed on mine cars greatly increase the length of trip a mine locomotive will haul; or that peak loads are greatly reduced and occur with less frequency than where the old type of plain bearings are in use. The reduction of peak loads means a longer life for the locomotive, especially if this is of the storage-battery type, which is rapidly growing in popular favor for gathering hauls.

In the use of plain bearings on mine cars, a heavy item of expense is the lubrication of the wheels, which

is a matter that requires the daily attention of a "greaser." The quantity of oil spilled at the tipple or on the shaft bottom where the cars are greased, and the larger amount that is wasted along the track, by the oil running out of the hub, call for a large expenditure for oil, to say nothing of the wages paid the greaser. This question of lubrication is one of the first items, in connection with mine haulage, that would engage the attention of an efficiency expert.

In contrast with this expenditure when operating with plain bearings, it should be observed that properly designed roller-bearing wheels require lubrication but once in about three months; and every drop of lubricant placed in the wheel is utilized for the purpose it was intended and does not drip along the haulage road.

I heartily agree with Mr. Paul in his conclusion that the installation of properly designed antifriction roller-bearing equipment means a saving of many dollars to the company. Experience has convinced me that roller-bearing equipment is a money-saving investment. Where the old style bearing must be replaced gradually with the new type, it is a fact that every ten cars equipped with the new bearings cause a drawbar pull not exceeding one-half of what it was when those cars were equipped with plain bearings, and the upkeep for the cars is far less than formerly. N. G. HERBERT.

Huntington, W. Va.

Letter No. 5.—I quite agree with L. B. Paul, who states in his letter, *Coal Age*, Feb. 16, p. 346, that there are a number of anthracite mines using mixed roller stock, and refutes the idea advanced by H. M. Crankshaw, in his article, Jan. 26, p. 191, that it is inadvisable to mix roller-bearing cars with those having plain bearings in the same mine.

To my own knowledge, there are many collieries in the anthracite region, and I doubt not in the bituminous region also, where the cars are mixed, those having roller bearings being operated with others mounted on plain bearings. There seems to be no mechanical reason why this cannot be done; and, on the contrary, there are many reasons why it must be done where a mine equipped with the old type of plain-bearing cars desires to change to roller bearings

ADVANTAGE IN A GRADUAL CHANGE OF EQUIPMENT

By changing the cars gradually from the old plain-bearing type to the new and more efficient roller bearings, a colliery can take advantage of the fact that a certain number of the cars used in the mine are going through the shops for repairs, each month, and the change of bearings can be made with less expense and delay at that time and the old equipment will be replaced when it is worn out.

While it is true that a great advantage will be gained by changing the equipment from plain to roller bearings where a colliery is using a thousand or more cars; at the same time, it must be acknowledged that to discard the old gear for the new, at one time, would not only lay the mine idle for a considerable period but would necessitate the investment of a considerable capital to be charged in bulk to the equipment account.

The cost of installing good roller bearings on mine cars is much in excess of the cost of plain bearings, but the former have a longer life and cost less to maintain. For this reason, it is good policy to make the change, but this should be done in a way that will not interfere with the regular operation of the mine or embarrass the company financially.

It was the practice of the railroads, a few years ago, to handle items of this nature under the charge of "betterment expenditures" and finance the investment from the earnings rather than drawing on the capital. This required that such expenditures should be distributed over a period of time, as determined by the earnings of the company.

I have observed more or less of the same practice adopted by some collieries. In a few instances, collieries have started to equip with roller-bearing cars at least two years ago, and the change is not complete today but is progressing steadily. However, as a colliery nears the completion of such a change, I have observed that the tendency is to hurry the matter, because of the marked advantage shown by the adoption of the new equipment. In none of these cases has there seemed to be any difficulty in the operation of a mine owing to mixed rolling stock. H. P. GIRARD,

Kingston, Penn. Engineer.

Relative Size of Intake and Return Airways

Letter No. 7.—The question of mine ventilation is only second to that of safety, to which it is closely allied. In opening a mine, either a drift, slope, or shaft, the first thing to be considered is timber and then air, for it is certain one cannot advance far underground without both of these.

In regard to ventilation, let me say here that I have always preferred to install a blower rather than an exhaust fan for several reasons: (1) The blower appeals to me as the stronger ventilator. (2) It can be installed at an opening provided with a manway and this, in my opinion, should always be the intake opening, so as to afford air for the men going to and coming from their work. (3) When using a blower the haulage road is the return air-course, and this avoids the annoyance and trouble due to snow and ice obstructing the haulage road in winter, which is the case when that road is made the intake for the mine.

In regard to the question of which should be the larger, the intake or the return airway, I answer that, for practical reasons, it has always been my preference to make the return airway the larger of the two and use it as the main haulage road.

LOADED TRIPS SHOULD MOVE WITH THE AIR

By adopting that system the loaded trips all move with the air current, while the empty trips must be hauled against the air. However, it is clear that the empty trips moving against the air will create less resistance than would result when the haulage road is made the intake, which requires that the loaded trips be hauled against the air.

Again, it is always considered the best practice to have the grade of the haulage road favor the movement of the loaded cars. In that case the empty cars ascending the grade will move slower and cause less resistance to the air current against which they are traveling.

These considerations, together with the arguments already advanced by other writers, convince me that the best practice is to make the return airway the larger, unless some particular conditions require the contrary.

The plan suggested by W. H. Clark, *Coal Age*, Feb. 23, p. 387, providing one main intake airway of ample size and two main return airways, one for each side of the mine, in addition to the haulage road, would be an expensive undertaking in our low seams. However, the Pennsylvania Mining Law, art. 6, sec. 4, requires the adoption of such an arrangement in mines generating gas.

The law provides further that, in a nongaseous mine working a considerable area, with main entries 5000 ft. or more in length, the operator must either haul the men to and from their work, or provide three main entries, one of which shall be used exclusively as a traveling way. S. D. HAINLEY.

Osceola Mills, Penn.

Letter No. 8.—Kindly allow me to say a word in reply to the letter of John Rose, *Coal Age*, Feb. 9, p. 299, who seems to think that the return airway of a mine should always be larger in sectional area than the intake airway. Like Mr. Rose, I have always held this opinion and answered such a question, when given in a mine foreman's examination, by saying that the sectional area of the return airway should be the larger.

It is my belief, however, that the conditions existing in the mine must govern this matter. If a mine is very gaseous and the main haulage road is made the intake of the mine, it may be necessary to increase the sectional area, in order to provide a sufficient amount of air at the working face to meet the requirements of the law.

Mr. Rose asks that someone figure out and tell us whether the intake or return airway should be the larger, in that case. In my opinion, it is not a question to be answered by figures, but must be judged from a practical standpoint. For example, in a mine where the haulage road is the return airway it should, in practically every case, have a larger sectional area than the main intake air-course. On the other hand, in a mine where the main haulage road is made the intake, the question of the relative size of the intake and return airways can only be decided by a competent man of wide experience who has charge of the mine.

In general it may be said that a haulage road, under good roof, can seldom be driven too wide, for the considerations of the health and safety of the miners. There will then be little trouble experienced from the resistance offered by the moving cars to the passage of air, whether the haulway is the intake or the return airway of the mine. CLAUDE CARRUTH.

Collinsville, Ill.

Electrically Driven Mine Pump

Letter No. 2.—The inquiry of John Martin, *Coal Age*, Jan. 26, p. 214, relative to the troubles he experienced in operating an electrical mine pump located at the bottom of an 800-ft. slope having a 25 per cent. grade, recalls a similar incident in my own experience with an electric pump.

Practically the same difficulties were encountered in the operation of this pump, as those described by Mr. Martin. He states that his pump worked badly, at times bending the piston rod or breaking the castings of the belt-wheel journal, besides burning out the armature on certain occasions.

It was suggested in the reply to this inquiry that the difficulty may have been due to a lack of adjustment in the controller of the motor, whereby the pump was started too suddendy and unable to overcome the inertia of the water. Allow me to suggest that the pump may have been operated at too high a speed.

In my own case, the difficulty was overcome by reducing the speed of the pump by using a smaller pinion. It appears that Mr. Martin's pump is belt-driven, but, in that case, it should have been equipped with a properly adjusted compensator or controller to regulate the speed.

Again, perhaps the power of the motor was not sufficient to work against the discharge head; or, it may be that the power was taken from a direct-current circuit delivering current to a number of haulage motors. While it is possible to run some small pumps with direct current and give them little attention, larger pumps require constant watching, under these conditions. With so little data at hand, however, it is hardly possible to give a conclusive answer to the question asked.

Thomas, W. Va. W. H. NOONE.

Miners and the War

Letter No. 7—The present coal shortage has excited the greatest interest in the mind of every loyal citizen of this nation, whose natural resources and man-power are not equalled in any other portion of the globe. This being true, there should be no shortage of coal such as exists in the country today.

Almost a year ago President Wilson made his appeal to the coal miners of the United States to do their utmost to produce coal, explaining that the efforts of the Government and the brave men sent to the front would be of no avail if the coal miners did not do their part. Looking about us for evidence of successful coöperation in the matter of producing and transporting coal to the points where it is needed, one fails to find any united efforts of the miners, operators and railroads to promote the fuel supply.

There is an old saying that might well be adopted as the slogan in this country. It is, "United we stand, divided we fall." For the sake of humanity and to maintain our own sacred rights there should be unity of effort, without which we shall fall under the mailed fist of that autocratic government that has sought to rule the world.

A short time ago there was an editorial published in *Coal Age* [Dec. 8, p. 981] comparing the efficiency of miners under the day-labor and piecework systems. As there stated, "the union and piecework . . . have combined to reduce efficiency in the mining of coal." It would seem a practical impossibility to establish, as the union has done, a uniform wage scale that will be equitable and just to every worker. Too many mine workers are possessed of the I. W. W. ideals, and it is a crime to regard the work of such men as constituting a good day's work in mining.

Only last summer, a few other men and myself were sent into the mine, as a nightshift, to extend a certain motor road. Two or three of us did our best to perform a good day's work, to which the others took exception, claiming that we would receive the same pay whatever work was performed. They would not listen to reason and even threatened to bring charges against us, as working in the interests of the company instead of supporting the Brotherhood.

Uniform Day Wage Unjust and a Failure

In my opinion it must always prove a failure to attempt to establish a uniform day wage, by which the same amount is paid to every man whether he does a good day's work or lays down on the job. Merchants and manufacturers compete with one another in the superiority of the goods they produce at a given price. Why should not the same principle apply to the work performed in the mines, so that each man would be paid according to his efficiency.

It would seem that the attitude of the miners' union on the one side and of the coal operators on the other is very much like that of the cat and the dog. They continually refuse to work in each other's interests, although those interests are common; namely, the production of the largest possible daily tonnage, for which the miner would receive an increased pay and the operator an increased profit on the output of his mine.

Let me say, in closing, that the war makes every month, every day and every hour valuable, and each miner must do his utmost and labor with his best skill and ability to produce the needed coal. Let us, as miners, do our honest share to stand behind the boys fighting at the front. War is a cruel business, but it purifies the soul. A Humble Miner.

———, Ill.

Letter No. 8—The relation that the coal miners of this country bear to the war will no doubt admit of a wide range of discussion, but I desire to offer a few remarks that will be confined to the more simple aspects of the question.

To increase the production of coal and assist in its equal and prompt distribution to points where it is most needed, the Government has assumed control of the situation. At this early stage of the undertaking, it would be mere speculation to attempt to forecast what advantages will accrue to the coal-mining industry, throughout the country, on this account. We can only hope that the result will be successful and that the problems of coal supply and distribution, together with the more perplexing questions that arise in regard to labor and prices, will be satisfactorily solved.

As Thomas Hogarth has said in his letter, *Coal Age*, Dec. 22, p. 1067, "America is at war," and I would add that the great army of mine workers in this country must not lose sight of the fact that her enemy is powerful and resourceful. If it is true, as is claimed, that the winning of the war depends primarily on the production of coal, then it is a fact that the miners of the country constitute a tremendous factor in prosecuting the war to a successful issue. The responsibilities that rest on their shoulders are indeed great. To what extent our miners will stand up to their part in this world drama remains to be seen.

While the loyalty and patriotism of the great mass of coal miners, in this country, cannot be questioned, it is still true that there are some among them who have little or no regard for the nation's interests, but are more concerned in taking a selfish advantage of the present situation to get for themselves more wages and shorter hours. They are not interested in increasing the output of the mines, except as they can profit thereby.

While believing that coal miners, as a class, are as patriotic as any other industrial workers, it has proved a sad spectacle to witness an army, amounting in the aggregate to 10,000 mine workers, laying down pick and shovel, at different times and places, for causes that are trivial in comparison with the one great aim before us.

Disposition and Habits of Many Miners

In his letter, Jan. 12, p. 70, W. H. Luxton cites an instance where the miners refused to proceed to work one morning because the train that was to take them to the mine was three minutes late, though it is most likely the delay was unavoidable.

An experience of more than thirty years among miners makes it difficult for me to agree altogether with the statement made by "A Miner," in his letter, Feb, 2, p. 259, which reads, "The public should cast aside the idea that the miner is thriftless and extravagant." If the average miner was as much concerned in saving his money as many are in making it, the most of them would have substantial bank accounts.

It is a common occurrence for miners to work hard and make big money and yet have not a dime three days after pay day. When times are good, it is easy for the miner to believe that these conditions will continue and he gives little heed to laying by a store. The man who earns $5 a day and yet, by frugal living, saves some of it, is of greater service to the country than one who earns $8 a day and squanders it.

Miners Need To Practice Economy

There is no class of workers who need to be counseled more in regard to practicing economy than miners. It is important that they should remember, as stated in the last letter to which I have referred, that "the process of increasing prices and then increasing wages to meet them, it is certain cannot go on forever." This miner takes the correct view. Reaction in war prices will sooner or later take place, and, as he points out, retrenchment will surely come.

As one considers the tremendous possibilities in the savings of miners, the need of such a movement appears the more urgent. Suppose, for example, 100,000 of our half million coal miners saved enough to invest in a $200 Liberty bond and another 100,000 purchased a $100 bond, while still another like number invested in a $50 bond. There would result, from this source alone, a total investment of $35,000,000.

What a monument that would be to the patriotism of coal miners! The efforts put forth by these men, in saving their earnings, would be as much to their own benefit as it would assist in the prosecution of the war. The present need would thus prove a blessing in disguise in providing many a miner with a competency that would be a great help to him later.

Dayton, Tenn. John Rose.

INQUIRIES OF GENERAL INTEREST

Seasonal Freight Rates

In connection with the discussion of seasonal freight rates and the interesting letter that appeared in *Coal Age*, Feb. 23, p. 386, suggesting a more equitable adjustment of freight rates in the transportation of coal, it has occurred to me that it is important to know the actual difference in cost of transportation, or the relative operating expenses of railways per ton-mile, for the summer and winter seasons of the year.

I would like to ask if there is any information of this nature available at the present time, or if it can be secured from any reliable source.

As stated in the letter to which I have referred, the rating of freight charges, for the transportation of coal, in accordance with the conditions prevailing at different seasons of the year, would make possible and amply justify the storage of large quantities of coal by dealers and consumers, and would tend to equalize the burdens resting on the railways throughout the year.

The proposition gives rise, however, to an important question, as the suggested rating of freight charges involves a consideration of the operating expenses of railroads, as the season changes from summer to winter and *vice versa*. I believe that this information will assist in the intelligent discussion of the question.

Philadelphia, Penn. EFFICIENCY ENGINEER.

This correspondent has drawn attention to an important factor in the matter of securing a more uniform and equable production and distribution of coal to large consuming centers. As is well known, when conditions in the country are normal the demand for coal increases with the advance of the winter season.

The seasonal demand for coal not only imposes an unnecessary burden on the carriers, calling for the transportation of a larger tonnage during the inclement seasons of the year; but has the effect, besides, of throwing many mines idle during the summer and producing a shortage of coal in the winter, at a time when it is most needed.

The question is a broad one, involving many considerations, and we hope that it will be intelligently discussed by coal operators, coal consumers and dealers, and railway interests, with a view not only to keep the mines running regularly throughout the year but to insure a never failing supply of coal at a reasonable cost.

It may be well to mention here that the principle of reducing the price of coal to domestic consumers in the spring and advancing it each month till the fall is a wise provision, as it tends to equalize the distribution of domestic coal throughout the summer, when each household should lay in its winter supply, as far as practicable. This principle need not apply, however, to steam plants and other large consumers for industrial purposes.

Replying to the question of the relative cost of the operation of railroads, on a ton-mile basis, in the winter and summer seasons, it may be stated that there is no information of this nature now on record, as far as our knowledge goes. That such a comparative tabulation of costs would be interesting and valuable cannot be doubted, and we hope that the *Railway Age* and others in a position to secure or furnish the necessary statistics from which this information can be deduced will take the matter up as being of equal interest to railways and coal producers.

None but railway men appreciate fully how much the cost of transportation in winter exceeds that in the summer season. This is not wholly due to the necessity of removing snow from the tracks and the increased difficulty of making track repairs at a time when the roadbeds are frozen and rails are more frequently broken. The increased cost of operating is largely the result of the effect of sleet on the rails, which decreases the tractive force of the locomotive and compels it to haul lighter loads or operate with double-headers.

As an offset of this increased expense in winter, however, extension work and other track improvements are pushed more urgently in the summer season when such work can be performed at a less cost. Further discussion of this question is urged by *Coal Age* as being of the utmost importance to the coal industry.

Methods of Working

Kindly permit me to present the following proposition to the readers of *Coal Age*, asking for their suggestions as to the best method of working the seam to obtain the largest possible extraction of coal at the least cost.

The seam has an inclination of 15 or 20 deg. and outcrops near the surface, which is practically level. The coal may be said to have a thickness of 10 ft., and is overlaid with a soft sandy shale that makes a weak roof and will require to be well timbered. The floor of the seam is a sandy shale.

I want to ask what plan of working and system of haulage would be best adapted to develop this seam. Assuming that the rooms are driven 15 ft. wide, what thickness of pillar should be left between them? It should be stated that the surface is traversed by numerous large streams and the seam is subject to many irregularities and faults or "pinchouts."

———, Ky. SUPERINTENDENT.

This is a practical question in coal mining, and we hope that it will receive careful attention from those whose experience will enable them to offer helpful suggestions. The plan of working suggested should be illustrated by rough sketches, showing the system of haulage employed and the method of timbering and ventilating proposed.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—A hemp-center, wire rope, 1 in. in diameter, with 114 wires, has a breaking strain of 50,000 lb. If 19 wires in this rope are broken, what should be the safe load on the rope?

Ans.—This is evidently a catch question, which the alert candidate will answer that there is no safe load for a wire rope having so many broken strands. On the other hand, the unwary candidate will estimate that if the breaking strain for 114 wires is 50,000 lb., the breaking strain on each wire would be $50,000 \div 114 = 438.6$ lb. Then, since there are $114 - 19 = 95$ wires still remaining unbroken in the rope, the breaking strain of the rope would be $438.6 \times 95 = 41,667$ lb., and allowing a factor of safety of, say 5, the estimated safe working load would be $41,667 \div 5 = 8333$ lb., or somewhat greater than 4 tons. It is never safe, however, to rely on a wire hoisting rope having many wires broken, because the strain on the remaining wires cannot be correctly estimated, and the rope is liable to give way suddenly.

Ques.—What will be the weight of water in a boiler 48 in. in diameter, by 168 in. in length and having forty-eight 3-in. tubes? Calculate the number of gallons of water in the boiler.

Ans.—The depth of the water in the boiler not being given, the total capacity of the boiler will first be calculated thus: Assuming the dimensions given are the internal diameter and length of the boiler, respectively, its cubic contents, disregarding the tubes, would be $168(0.7854 \times 48^2) =$ say 304,000 cu.in. The cubic displacement of forty-eight 3-in. tubes, in this boiler, is $48 \times 168(0.7854 \times 3^2) =$ say 57,000 cu.in. This makes the total capacity of the boiler when full, $304,000 - 57,000 = 247,000$ cu.in.; or $247,000 \div 231 =$ say 1070 gal

Ques.—When the diameter of a valve, the steam pressure, the length of the short arm and the weight are known, what is the rule to find the place to hang the weight?

Ans.—The question should state that the steam pressure is the maximum allowable pressure, and ask for the place to hang the weight so that the boiler will blow off at the given pressure. However, assuming that the "short arm" means the distance from the fulcrum to the valve-stem, the rule for finding the distance from the fulcrum to the weight, so that the valve will blow off at the given pressure, is as follows: Multiply the area of the valve in square inches, by the steam pressure expressed in pounds per square inch, and that product by the distance from the fulcrum to the valve-stem, also expressed in inches. Finally, divide the last product by the weight, in pounds, and the quotient will be the distance from the fulcrum to the weight expressed in inches.

For example, taking the diameter of the valve as 3 in., its sectional area is $0.7854 \times 3^2 =$ say 7 sq. in. Then, if the distance from the fulcrum to the valve-stem is 4 in. and the weight of the ball 60 lb., the desired blowoff pressure being 90 lb. per sq. in., the total pressure on the valve when it is lifted by the pressure of the steam is $90 \times 7 = 630$ lb. The moment of this pressure acting on the valve is $630 \times 4 = 2520$ in.lb. Finally, dividing this moment by the weight of the ball gives, for the distance from the fulcrum to the point that the ball should be hung on the lever, $2520 \div 60 = 42$ in.

Ques.—How would you find the capacity of a water cylinder of a steam pump in gallons?

Ans.—First, find the piston displacement, when the pump is running, which is equal to the continued product of the sectional area of the piston expressed in square inches, the length of stroke, in inches, and the number of strokes the pump makes per minute. It is customary to assume an efficiency of 85 per cent. for the water-end of the pump. On this basis the capacity of the pump in gallons is found by multiplying the piston displacement, expressed in cubic inches, by 0.85 to obtain the actual volume of water handled per minute, and dividing by 231, which will give the capacity of the pump in gallons per minute.

Ques.—What are the necessary supplies that should always be on hand at a mine, for the safe working of the same; and what is your duty in the case when your supplies are not on hand when needed?

Ans.—In addition to the necessary supplies of timber, ties, rails, cap-pieces, brattice boards and canvas, tools, powder, fuse or squibs, oil, hay and other feed, together with the necessary nails, spikes, rail-splices and bolts, there should also be a first-aid outfit, including two or more sets of breathing apparatus, oxygen tanks, pulmotor, safety lamps of an approved type, stretchers, blankets, and water-proof coverings. A suitable ambulance should also be available for use in time of need.

Should any of these supplies be lacking at the mine, it is the duty of the mine foreman to notify the superintendent or order what is required himself.

Ques.—How should a person be treated who is suffering from mine burns?

Ans.—Exclude the air by applying a thin paste of baking soda (bicarbonate). Vaselin, olive, oil, fresh lard or cream are all good. Severe burns should be treated by a physician.

Ques.—If you were inspecting a place after an explosion and found that near the floor or bottom the lamp would go out, while half-way between the top and bottom the lamp burned normally, and near the roof the flame became lengthened, what would be the three mixtures?

Ans.—The indications of the lamp flame would lead to the conclusion that there was an accumulation of blackdamp at the floor, and a body or layer of methane at the roof, while pure air occupied the center of the entry.

COAL AND COKE NEWS

Harrisburg, Penn.

Joseph B. Dickson, of New York, who with S. D. Warriner, president of the Lehigh Coal and Navigation Co. and W. J. Richards, president of the Philadelphia and Reading Coal and Iron Co., comprise the distribution committee on anthracite just appointed by Dr. Garfield, outlined, on March 15 the committee's plans. "The duties of our committee, subject to the direction of the United States Fuel Administration, will be to stimulate production; that is, to produce the greatest amount of anthracite coal by keeping all the mines operating to the fullest possible extent continuously throughout the year; to supply the requirements of the Government and apportion the balance among the various states and communities in a manner that will be fair and equitable to all and subject to the direction of the director general of railroads; to advise as to the routing and distribution of coal from the time it leaves the mines until delivered in the various states and communities, and we hope that by carefully watching this movement of coal over the railroads, using water and rail routes when practical, preventing more or less cross-hauling which has taken place in the past, to not only increase car mileage, but in doing so to enlarge production and increase deliveries to various states and communities.

"We also feel certain that with a close working arrangement and a complete understanding with the various state administrators that all sections of the country will be fairly and equitably treated in receiving their just proportion of the anthracite produced. It is not the province of this committee to either direct or distribute coal to the householder, this being absolutely cared for and attended to by the various state administrators."

To urge the making of the Susquehanna River navigable from Pittston, Luzerne County, to Baltimore, Md., instead of resurrecting the abandoned Pennsylvania canal, was the decision made at a meeting of the Pennsylvania Canal Boatmen's Association, business men, coal operators and manufacturers from all over eastern Pennsylvania held on Mar. 16. Hundreds of thousands of tons of coal and merchandise could be hauled annually, the boatmen explained, and they declared that it would not only relieve the railroads but would help much of the existing congestion during these war times and in the future.

It was pointed out that the opening of a waterway or channel in the Susquehanna would not be in competition with the railroads, as they cannot begin to handle the fuel and manufactured products now necessary to be carried from points of production.

That the rehabilitation of the old Pennsylvania canal, much of which has been filled in, with bridges and locks gone and miles of right-of-way used for railroad tracks, is out of the question was agreed to.

By the building of a series of dams 10 ft. higher than the low water mark at Sunbury, Berwick and Nanticoke, old boatmen asserted, and by dredging at low points, such a waterway could be constructed at a minimum of expense as to give a navigable stream for light draft boats of the type used on canals for the whole distance from the hard coal fields to tidewater.

Petitions will be presented to each Congressman along the right-of-way of the abandoned canal, and every effort will be made to secure the required legislation that will result in boats plying on the Susquehanna.

The state fuel administrator has suggested to the director general of railroads that resumption of operation of the Pittsburgh & Susquehanna R.R. could easily be accomplished by the New York Central operating this short line. The Pittsburgh & Susquehanna has not been operated since Feb. 18, when a payroll of about $5000 became overdue. More than 500 miners are employed at the 31 mines of the line, with a weekly production of 15,000 tons.

The Public Service Commission has announced a decision directing that the New York Central R.R. install a switch at the property of the West Branch Coal Co. in Clearfield County, saying that the railroad company must install the connections at its own expense and the remainder to be paid by the coal company. In case the parties cannot agree the commission says it will make an order.

The annual examination for applicants for certificates as mine foremen and assistant mine foremen in the anthracite region will be held at Harrisburg on April 23 and 24.

Fairmont, W. Va.

The coal operators of the Fairmont district, which includes 12½ counties of northern and central West Virginia as designated by the Fuel Administration, are on record as being opposed to the "assigned car" policy. The number of cars which should come into this region (Monongah district of the Baltimore & Ohio) is 1500 a day. The capacity of the mines at present, however, is not over 1000. The Baltimore & Ohio promised the office of the director-general of railroads to provide these, but the Baltimore & Ohio could not fill its promise either in getting the empties in or moving the loaded cars. There is a lack of motive power on the railroad which seriously interferes with the shipment of coal from this region.

Coal operators of the Fairmont district are expecting an increase in selling price any time. The cost-of-production sheets were filed in Washington last week by C. H. Jenkins, A. Brooks Fleming, Jr., T. W. Arnett, all of Fairmont, and A. C. Beeson, of Worthington, on behalf of the Fairmont Coal Club, and action has been assured before Apr. 1. The "thin vein" operators in several counties in the district have been granted an advance, and similar ventures in Marion and other counties are to make application shortly.

Charleston, W. Va.

Coal shipments from central and southern West Virginia, particularly from the Kanawha field, were tied up nearly all last week, not through the failure to secure cars but through flood conditions. From Wednesday until late Friday the Chesapeake & Ohio was unable to operate even passenger trains over most of its lines in West Virginia, trains being detoured over the Norfolk & Western Railroad. The Coal & Coke R.R. was also out of commission for almost the entire week. High water does not seem to have resulted in any damage physically to the mines outside of causing shutdowns.

Where flood conditions did not interfere, the car supply was the best it had been in several months, several hundred cars having been given the Fairmont-Clarksburg field last Sunday. As a result nearly all the mines in that section were able to work at full tilt at least during the first part of the week.

Operators in the Monongahela field are asking the Federal Fuel Administrator for a 40c. increase in the price of coal. Thirty-six companies were represented at the meeting held at Morgantown, where resolutions were adopted setting forth conditions under which the companies represented operated and requesting the increase referred to.

According to information obtained from the office of the Chief of the Department of Conscription and Enrollment, there are 1100 West Virginia miners in the military and naval service at the present time.

Much indignation has been caused by the tendency of some of the railroads to divert the fuel they obtain for use as railroad fuel to other purposes. Last week F. J. Patton, District Deputy of the National Fuel Administration, commandeered 431 cars of coal ordered by the railroads as fuel, which was over and above their needs. The coal commandeered was sent to steel mills, powder plants and concerns engaged in 100 per cent. war work. According to complaint made by coal operators, the railroads at times secure fuel at a price lower than the actual cost of production and dispose of their surplus where such coal would find a ready market at contract price.

Plans for operation on a large scale of their mines near Morgantown are being developed by the Pursglove-Mayer Coal Co., of Cleveland Ohio. They have a large acreage of Sewickley coal to develop.

As soon as they secure switching connections the Donohue-Shinn Coal Co. will begin to ship coal from their plant at Alexander, W. Va.

Arrangements have been made by the Barbour-Upshur Coal Co. to install a loop line tramway outfit for conveying coal. Such equipment is said to be the second of its kind used in the Fairmont-Clarksburg field.

After having their mines closed down for some time, Smith & Braun have reopened their mines again for the shipment of coal.

Arrangements are being made by Britt & Hornor, of Clarksburg, to open a new mine near Clarksburg.

Extensive repairs are being made to the tipple of Wyatt Bros., near Shinnston.

The Orville Coal Co. at Ojay, in the Guyan Valley Field, of which S. E. Scholl, of Huntington, is general superintendent, is installing a six-phase rotary converter.

The work of installing equipment at its mines on Coal River has been begun by the Maderson Coal Co., of which A. J. Dalton at Omar is general manager.

A 150-kw. rotary converter and other equipment is to be installed by the Fall River Pocahontas Coal Co. at Roderfield. The general manager of the company is C. B. Smith, of Mayberry.

The offices of the Logan & Hazard Coal Co. are to be moved from Cincinnati to Huntington.

The Cheney Coal Co. expects to open a plant at Chesapeake on the Chesapeake & Ohio Ry. in the very near future. J. S. Cheney, until recently general manager of the Stonegap Colliery Co. at Glamorgan, Va., will manage the new operation.

Having been chartered in November, The Laurel Branch Coal Co. will install a power plant and begin mining coal in a short time from No. 2 Gas Seam. Meredith Moore, at St. Albans, has been made general manager.

The Don Coal Co. at Eskdale is building a new tipple for its No. 1 Mine.

W. E. Deegans and associates have purchased the Beckley Vein Co. recently chartered. The company's plant will be located at Pemberton, connecting with both the Chesapeake & Ohio and Virginian railways. The company expects to begin making shipments by Apr. 1.

A substation and other equipment is being installed by the Sewall Valley Coal Co. at Meadow Creek.

Louisville, Ky.

"Big developments are coming fast in the eastern and southeastern coal districts of the state. Attention has lately been turned to the Clay, Ky., district, where a considerable acreage has changed hands recently. It is understood that the Peabody interests have purchased large holdings for future development, which will not come for several years, as the lands are off of the railroads and much developing will have to be done. The Frick interests of Pittsburgh are understood to have purchased additional holdings in the Harlan field, where improvements are expected to start at an early date.

In the Harlan field a number of new mines are getting ready for operation, including the Middleton Coal Co., which will start with about two cars a day; the Cambria Coal Co., two cars; the Harlan-Knox Coal Co., two cars; the Kitts Creek Coal Co., one to two cars. This concern is completing a tipple and will soon be ready to ship. The Clover Fork branch of the K. & V. R.R. will open about 12 mines, most of which will be three-to-four-car mines, and among which are the High Splint and High Point mines.

Development over in the Elkhorn district is going ahead at a rapid pace, and several big mines will be in operation shortly after the completion of the new spurs of the L. & N. Several of these mines will have a daily capacity of from 8 to 10 cars and running up to 20 cars a day, there being about 8 or 10 new companies getting ready.

PENNSYLVANIA

Anthracite

Wilkes-Barre—The 1917 annual report of Thomas J. Williams, mine inspector of the eleventh anthracite district, which includes the collieries in this city, shows that the year's production was 3,559,983 tons, of which 2,931,461 tons were shipped to market. David T. Davis, of the twelfth district, covering collieries in Plymouth, Larksville and Plymouth township, reports a total tonnage of 4,153,402 tons for the year, with 3,683,895 tons shipped to market. Both inspectors report a falling off in accidents in their districts, despite the great speed at which coal mining is being done in the Wyoming Valley.

Freeland—Within a short time extensive developments of mining will be under way. The recent acquisition of the Spring Brook operations by the Lehigh Valley Coal Co. in that section makes available two tracts of virgin coal held by the Coxe estate. These are fairly large beds, and combined with the robbing work that will be conducted in the Spring Brook operations will provide a large field for operation. Plans are also being considered at this time for draining the Old Silver Brook operations that have been filled with water for many years. The project is a most extensive one, however, and may have to wait the coming of more normal times before it is attempted.

Jeanesville—Work has been started on the sinking of a 600-ft. slope at the Spring Mountain colliery. The slope, while of comparatively short length, is of much importance to the development of the mine, as it will permit the tapping of two seams of virgin coal at that operation. The seams are the Lykens and the Buck Mountain. It is estimated that a large amount of coal can be obtained from this operation.

Shamokin—Several giant locomotives, built for the Atchison, Topeka & Santa Fe R. R., have been ordered by the Federal railroad administration for service in coal transportation on the Pennsylvania R. R. lines out of the anthracite region. The first of the engines was sent over the Shamokin division with a train of 75 empty coal cars, doing the work of two of the Pennsylvania engines in daily use.

Tamaqua—To encourage residents of the Panther Creek Valley to plant gardens, the Lehigh Coal and Navigation Co. has engaged Claude Deitrich, a graduate of Penn State College, as horticulturist, with headquarters at Lansford, and will lease all available plots at a nominal fee.

Trevorton—What is said to be one of the finest veins of coal in the middle western anthracite coal fields was cut recently at the Katherine colliery at Dunkelberger station, two miles west of Trevorton. The vein is the Lykens Valley No. 2, 10 ft. thick and reported to be of an unusually high quality. The new vein will increase the colliery output about 150 tons a day.

Scranton—Amicable adjustment of the equity proceedings of residents of Bromley Ave. against the Se-Rob Coal Co. was made in court on Mar. 14, following a hearing in which much testimony was taken. The agreement was approved by the court. Under it the company agrees to clear away all rubbish from the property; a concrete wall will be erected around the surface into the vein, supplanted by an iron rail; mining operations will be carried on under a plan indorsed by Engineers T. Ellsworth Davis, E. F. Blewitt, Harry Myers and W. C. Monroe. For every 28 ft. of coal taken out, 12 ft. of coal in pillars must be left. No coal will be taken through a surface opening. An opening will be made from a lower vein from the inside working and coal transferred through this second vein to the Oxford colliery of the Peoples Coal Company.

Danville—The first coal dredge to be floated on the Susquehanna River here this season was that owned by Charles Forney, who obtained 16 tons of buckwheat coal and three tons of stove coal. Nine dredges are located here. Indications are that many thousands of tons of anthracite will be taken from the Susquehanna between Harrisburg and Wilkes-Barre this year. Because of the high price of coal, dealers have offered an increase of 50 per cent. above last year's prices, and want the entire output of all dredges.

Bituminous

Du Bois—The Rhody & Maurer Coal Co., of Patton, has purchased the mines of the Tozier Coal Co. at Luthersburg, Penn., on the Buffalo, Rochester & Pittsburgh Railway.

Brookville—The Knoxdale Coal & Coke Co. is putting in a new operation known as Coder No. 5 on the L.E.F. & C. division of the New York Central R.R. in Clarion County. This company operates several mines of the Pittsburgh & Shawmut Railroad.

Punxsutawney—Jacob L. Fisher has purchased the entire stock of the Montgomery Mining Co. and will continue to operate the Montgomery mine on the Buffalo, Rochester & Pittsburgh Ry. near here.

Ford City—Three men were killed and four others escaped, one crawling on his hands and knees through dense smoke, when an explosion occurred in the Campbell mine, on March 16. The dead are Robert King, mine foreman, James Gould, and his son, Paul. The bodies of Gould and his son were recovered soon after the explosion by volunteer rescuers who braved the dangers of blackdamp and penetrated the wrecked section of the mine. The body of King was found 40 ft. from the mine entrance. He was just about to enter the mine with the pay for the miners when the force of the explosion caught him.

Knoxdale—A new operation has been begun here by the Green Valley Coal Co., with E. B. and F. B. Henderson, of Brockville, and B. E. Taylor, of Brockwayville, directors. Mr. Taylor will be general manager and general sales agent. The mine is located on the Pittsburgh & Shawmut R.R. and is putting out 250 tons a day, with prospect of 500 tons this season.

WEST VIRGINIA

Morgantown—Twenty cars a day for the use of operators in the Scott's Run coal region have been ordered by the New Haven R.R. for delivery to the Pennsylvania, and through them to the mines on Scott's Run. This important information was contained in a telegram received recently by Raymond Kerr, receiver of the Morgantown & Wheeling R.R., which serves the Scott's Run region. Contracts for the delivery of fuel to the New Haven have been held for some time by local operators, but until now they have been unable to secure the cars in which to make shipments. It would now appear that these cars will be supplied without further delay.

C. B. Bokey and son, R. L. Bokey, have leased a tract of 10 acres of Freeport coal from the Peninsula Coal Co. on Deckers Creek, opposite the Morgantown and Kingwood shops. A force of men is already at work and it is expected that three openings will be working soon. Coal will be run by a chute about 250 ft. to a large bin, from which it will be trucked to cars on the "Y" track. About 15 men will be employed.

Fairmont—The Kingmont mine, which has been operated by pick work exclusively, is to put in a mining machine, there being certain spots which it is almost impossible for miners to reach on account of the water.

Montgomery—During the heavy rainfall in this section last week the Cannelton Coal Co. suffered damages amounting to more than $25,000. The tipples of two or three operations on Smithers Creek were damaged heavily and four or five bridges of the branch line running up this creek were washed out. Mining operations on all other creeks in this vicinity also suffered heavy losses. Two coal tipples were washed out of Morris Creek, these being owned by the Kanawha Rail and River Coal Co.

KENTUCKY

Barbourville—Notice has been given of the dissolution of the Hughes Jellico Coal Co., which is winding up its corporate affairs. A. M. Decker and R. N. Cornett signed the notice as president and secretary.

The wagon-mine operators have been busy holding meetings at Barbourville and Corbin, Ky., this month, in order to file protests against the new Federal regulations which are said to be of a very drastic nature, and discriminatory. At Barbourville 50 wagon-mine operators recently organized the Knox County Wagon Mine Coal Operators' Association. W. B. Bailey was named president and an advisory committee of seven was named to take up with the Government authorities the status of the wagon mine, which it is claimed will be put out of business.

Madisonville—Basil Ramsey and James D. Overall have purchased the No. Clinker Mine from B. C. Mitchell, Harper Gatton and T. E. Hibbs. The new owners will build a tram to the L. & N. tracks. The former owners have since purchased the Ed Best mine.

Work of rebuilding the power house of the Shamrock Mine, of the St. Bernard Mining Co., twelve miles from Madisonville, has started. This power house was dynamited a few days ago, and fire broke out following the explosion. The tipple and other equipment came through undamaged. The power house was valued at about $40,000, and the mine is probably the largest in western Kentucky. It ships about 150 cars of coal a week under normal conditions.

Somerset—The Bauer Cooperage Co., of Lawrenceburg, Ind., which owns considerable cut-over land at Bauer, Ky., near Somerset, is planning to open coal mines at that point and install a mining town to take care of about 500 men. Hugh Wright, manager of the company, was recently at Somerset, Ky., where he discussed plans for starting the work.

INDIANA

Terre Haute—Mine mules have been causing trouble in the mines in this vicinity. The drivers of the West Cleveland Mining Co. asked for a relay herd one day last week because the regular herd needed rest and treatment. Their legs had become infected from the mineral water in the mine. The management insisted upon the mules being continued at work and the drivers struck, throwing several hundred miners out of work. In another mine the men quit work because the mules were not groomed enough. In still another mine 1200 men were out three weeks because a driver was discharged for beating a mule with a scantling. The contention was that the mule was a hardened reprobate who had a long list of injured men to his discredit, and what would have been cruelty to another brute was nothing of the sort in his case. The men returned to work when the driver was reinstated.

ILLINOIS

Lincoln—Efforts to enlist capital for the reopening of the mine of the Lincoln Mining Co., shut down several months ago on account of fire, have been finally abandoned and the machinery and other removable property is being disposed of

Virden—The Montour Coal Co.'s mine here has been ordered closed by the Macoupin County mine inspector until changes he deems necessary for the protection of the miners have been made. It is alleged that the owners have failed to provide adequate fire protection and refuge holes and that the ventilation is bad. Four miners were recently killed by an explosion in another Virden mine, which has resulted in more rigid inspection generally.

Carlinville—The Macoupin County Board of Supervisors met Tuesday, Mar. 12, and accepted the resignation of Samuel Dugan as county mine inspector. After a motion to refer the matter to the miners' union had been tabled, Alex Gray, of Staunton, was elected to succeed him. The other candidates were W. A. Dickerson, of Gillespie; H. C. Knoemoeller, of Staunton; Philip Davis, of Virden, and Edward Potter, of Virden.

Carlinville—Mine No. 3 in this community produced in 260 working days of last year 1,158,796 tons of coal. This is said to be the largest production of any mine in the state. The mine has a daily output of 4457 tons and employs 690 men.

Duquoin—George W. Dowell, former member of the Illinois state court of claims under Governor Edward F. Dunne, has disposed of his holdings in the Paradise and Franklin County Coal Co., of which he is the president, to the Northern States Coal and Mining Co. of Chicago. The mines are located in the Perry County field.

Pana—By an agreement of the operators of the four big mines operated here by the Pana, Penwell and Smith-Lohr companies with County Fuel Administrator Ernest Hoover, of Taylorville, the price at the mines until further notice will be $3 a ton for all grades except screenings and slack, which will continue to be $2.40 and $2.20 respectively. Heretofore the price of lump has been $3.45, nut $2.95 and pea $2.70.

Auburn—Auburn is experiencing a financial and industrial boom as the result of the opening of the new mine north of town. Many new houses are being built.

Springfield—The cases of six men, connected with Citizens' Mine A of the Citizens' Coal Co., charged with violating state mining laws, resulting in an explosion which killed four miners recently, have been continued for a week. The men under charges are Mine Manager John Scatterwood, Mine Superintendent Henry Martini, shotfirers John and William Flynn, and miners I. Ward and Frank Ward.

Belleville—The Ellis & Richmer Coal Co., of St. Louis, purchased the old Oak Dale mine near here and is equipping it and putting it in shape for double its former tonnage during the month of April.

OHIO

New Petersburg—The Buckeye Coal and Railway Co., which owns a large acreage in this section, has opened a large store to serve the miners in this vicinity.

Personals

W. S. Blythe has resigned his position as general manager of the Coal Run Mining Co. and Tide Coal Mining Co., of Indiana, Penn.

Charles Boggess, of Charleston, W. Va., is making arrangements to operate a mine in the New River seam of coal in Webster County.

M. M. Townshend, formerly president of the Pool-Townshend Coal Co., has disposed of his interest in the company to C. E. Pool, of Charleston, W. Va.

Candus Schmid, mine examiner for the Lincoln Mining Co. before the closing of the property of that company, has taken a position at Shelbyville, Ill., as a mine examiner.

Proctor K. Malin, of Ashland, Ky., district counsel for the Kentucky Solvay Co., which has plants at Ashland, Portsmouth and Ironton, has been elected to the presidency of the company.

J. C. Messenger has been appointed superintendent of the Beryl mine of the Davis Coal & Coke Co. at Beryl, W. Va., succeeding William P. Beveridge, who resigned to go into business with his father.

George Evans, for 24 years with the Lincoln Mining Co., which company has suspended business, has taken a position as superintendent of the Latham Coal Mining Co., of Latham, Illinois.

Clarence W. Watson, of the Consolidation Coal Co., of Baltimore, Md., has been given a commission as colonel in the Army and detailed to the Quartermaster corps. Mr. Watson formerly represented West Virginia in the United States Senate.

Andrew Devers, of Port Griffith, Penn., has received from the Carnegie Hero Fund Commission at Pittsburgh a check for $500, half of the cash award granted for heroic conduct. Mr. Devers and six other men, including John Brown, now superintendent at No. 6 colliery of the Pennsylvania Coal Co., were each awarded a hero medal and $1000 in cash for their brave rescue of men who had become overcome or injured in an explosion at the Hoyt shaft on Jan. 10, 1911.

U. B. Williams, until two years ago general superintendent of the Baltimore & Ohio R.R., since that time located at Wheeling and previously at Grafton as division superintendent, has been named to represent the railroads in the Fairmont district, working with the district representative of the Fuel Administration. The plan is to have a railroad man working in every district with the coal man named as district representative. The selection of Mr. Williams is gratifying to coal men in the Fairmont district, who look upon him as well qualified and admirably fitted for the position in every respect.

John Ira Thomas, of Philipsburg, Penn., was appointed on Mar. 12, by Hon. Seward E. Button, Chief of the Department of Mines of Pennsylvania, as mine inspector, to succeed the late Elias Phillips, inspector of the Fourth Bituminous District. Mr. Thomas is 36 years of age, and was highly recommended for the position, having been connected with the bituminous coal industry practically all his life. For many years Mr. Thomas was employed as a mining engineer and then as superintendent in the Central Bituminous District. For the last two years Mr. Thomas has been employed as a mine inspector by the State Workmen's Compensation Board. About 25 years ago Mr. Thomas' father was mine inspector in practically the same district as will be covered by his son. Mr. Thomas will have headquarters in DuBois.

Obituary

William H. Holland, one of the pioneer operators of the New River field of West Virginia, died Mar. 15 at his home in Nuttallburg, aged 77 years. Mr. Holland came to this country from England when a young man, and opened up the Sewell seam of coal at Nuttallburg about the time that John McGuffin opened it up at Sewell. He lived for 50 years along New River at Nuttallburg, and was engaged in the mining and production of coal until the last few years. The mining fraternity has lost a good and faithful man in the death of Mr. Holland.

Industrial News

Cumberland, Md.—At a recent meeting of the Jaffy Coal Co., held at Cumberland, Charles H. Lantz was elected as president; Robert Grant, of Elk Garden, vice president, and W. R. Nethken, of Cumberland, as general manager.

Buffalo, N. Y.—George A. Corson, president of the Corson Byproduct Coal Corporation of Buffalo, with a new mine at Elkhorn City, Ky., has retired, and George J. Brendel, of Buffalo, succeeds him. Mr. Corson announces that he will organize another company and open new mines.

St. Louis, Mo.—Wallace Crossley, Missouri Fuel Administrator, has announced that next winter fuel distribution throughout the state will be directed by the State Administration at Jefferson City and that licenses will be issued solely by the Jefferson City office, instead of by local branch offices.

Cumberland, Md.—Stockholders and directors of the Deep Run Big Vein Coal Co., of Cumberland, have met and elected Noah H. Swayne, of Philadelphia, as president; W. B. Nethken, of Cumberland, as vice president and general manager, and Charles H. Lantz, of Piedmont, as secretary and treasurer.

Frankfort, Ky. — The legislature has passed bills providing for the reorganization of the Department of Mines and Mining, creating the office of Chief Mining Inspector with three assistants, and providing for five rescue stations to be located in the mining regions of the state. The new bill creates a department similar to those in the most advanced states.

Lexington, Ky.—The new Chesapeake & Ohio fuel forwarding bureau at Russell, Ky., is now operating under Federal direction. This bureau represents most of the large operators of eastern Kentucky, and is expected to prove of great aid in expediting movement of coal to the lake region this summer. Coal will be reconsigned at that point to prevent congestion.

Birmingham, Ala. — The Black Warrior Coal Co. has been organized and incorporated with a capital stock of $100,000. The personnel of the company is composed of experienced coal men in both the operating and selling branches. W. J. Penhallegen is president; W. B. Hillhouse, vice president and general manager, and D. H. Brown, secretary and treasurer.

New Petersburg, Ohio—Fred Essex, of Columbus, has leased from the Buckeye Coal and Railway Co. a tract of 365 acres of coal lands near New Petersburg, which will be developed by building a drift mine to have a capacity of 600 tons daily. The seam is No. 7, which is about 5½ ft. thick. The mine will be electrically equipped and will be ready for operation about July 1.

Middleport, Ohio—The Stalter-Essex Coal Co. has leased from the Buckeye Coal and Railway Co. a tract of 200 acres of No. 8 coal on the Kanawha & Michigan R.R. at Middleport, which is located in the Pomeroy Bend district. The work of developing the property will start at once, and a mine with a capacity of 1000 tons daily is planned. It will be electrically equipped.

Cincinnati, Ohio — Increased interest in transportation matters has caused a revival of the discussion of a lakes-to-river canal, of sufficient depth to accommodate large vessels. The old Miami & Erie Canal, which has been abandoned for some years, is the favorite route proposed by engineers and investigators, although it would require much deepening and widening to care for the kind of traffic proposed, 12 ft. being the depth indicated.

Birmingham, Ala.—The civic bodies of this city are endeavoring to secure the 1918 meeting of the American Mining Congress, conferences having been held in Washington with Secretary Callbreath, of the organization. Mr. Callbreath plans to visit Birmingham and attend the dinner to be given Henry Edmonds, editor of the "Manufacturer's Record," at an early date, at which time it is probable that final arrangements will be consummated for the meeting of the mining men here.

Louisville, Ky.—R. C. Tway, president of the James Coal Co., a retail organization, and the Tway Coal Co., a producing and jobbing organization, was indicted on 13 counts by the Federal Grand Jury on Mar. 15, the cases being continued until the October term of the Grand Jury. Tway was held under $1000 bond. The first two counts are on charges of failure to observe Government regulations relative to making reports, etc., the others being on overcharges.

Louisville, Ky.—The Louisville, Henderson & St. Louis Railroad Co., in an effort to facilitate shipping, switching and handling of coal, has placed an embargo on coal that does not carry complete instructions as to consignee and track upon which to be placed on arrival in Louisville from connecting lines at Owensboro and Henderson, and from mines on the company's line. Incomplete instructions have been responsible for much terminal congestion and loss of car mileage. The new arrangement will be a bit hard at the outset, but is expected to eventually improve conditions.

Cincinnati, Ohio—Kentucky stockholders of the Continental Coal Co. won a decision in the United States Circuit Court of Appeals when that court affirmed the ruling of the trial court enjoining Chattanooga interests from carrying out plans to turn the property of the company over to the Federal Coal Co., and appointing receivers to take charge of the property involved. The case was decided only 10 days after arguments were presented, showing great rapidity in reaching the decision. The court held that "the arbiter who gave the 'Chattanooga interests' the majority in the meeting of Sept. 15 was disqualified by interest, and that the proceedings of that meeting were incidental to a deliberate plan for overriding an essential provision of the reorganization agreement."

St. Louis, Mo.—Joseph W. Folk, general counsel of the St. Louis Chamber of Commerce, filed with the Interstate Commerce Commission at Washington, Wednesday, Mar. 20, a petition for the removal of the bridge arbitrary of 20c. a ton which is now charged by the St. Louis Terminal Railway Association for hauling Illinois coal across the Mississippi River to St. Louis. All the railroads constituting the Terminal Association are made defendants. He makes a plea that inasmuch as practically all of the coal for St. Louis comes from the inner group mines, ranging from 8 miles to 72 miles from St. Louis, and a blanket rate is applied to East St. Louis, a blanket rate should also be applied to the St. Louis industrial district. He contends that St. Louis and East St. Louis and the other eastside towns should be considered as one industrial district and receive the same rates on coal.

New York, N. Y.—The manufacturers of electric hoists in the United States have organized "The Electric Hoist Manufacturers Association," comprising the following companies: The Brown Hoisting Machinery Co.; Detroit Hoist and Machine Co.; Euclid Crane and Hoist Co.; The Franklin-Moore Co.; Link Belt Co.; Roeper Crane and Hoist Works; Shepard Electric Crane and Hoist Co.; Sprague Electric Works; The Yale & Towne Manufacturing Co. The association, membership in which is confined to those engaged in the manufacture of monorail electric hoists, holds monthly meetings for the purpose of studying the specific needs of the hoist user and to develop standardized methods of presenting information to him so that guesswork will be eliminated. The officers of the association are as follows: F. A. Hatch, chairman, Shepard Electric Crane and Hoist Co.; F. W. Hall, vice chairman, Sprague Electric Works; C. W. Beaver, secretary and treasurer, The Yale and Towne Manufacturing Co.

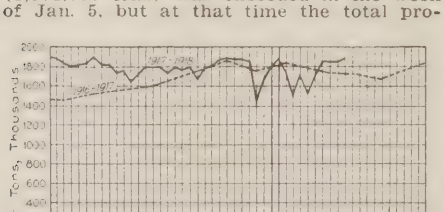
MARKET DEPARTMENT

Weekly Review

Conditions in Coal Market Generally Satisfactory—Domestic Demand Not So Keen as Expected—Rail Movement Again Slowing Up—No Contracting Reported

THE tone of the coal trade is generally satisfactory. With the moderating weather dealers are noticing a tendency toward an easier market. Domestic consumers are not so urgent regarding deliveries, though demand in all lines is still ahead of the supply. In face of the repeated urgings of the Fuel Administration that householders stock their next winter's coal early, the demand from this class of buyers is disappointing. This may be attributed to the fact that the public generally seems to feel that the price of coal will come down on April 1, and therefore hesitates to place orders at the old figure. Also, dealers do not seem anxious to force sales until some sort of assurance is had that they will receive sufficient coal to take care of a strong early demand, as the quantity of coal now in storage is not great.

The improvement in rail movement noticed for the past two weeks has failed to continue. The lines are again congested, and there has been an appreciable falling off in the number of cars supplied to the mines. Few operators report more than a 50 per cent. car supply, with the majority of shippers down to 25 per cent. and lower. This means that the country will be faced with an even more serious fuel shortage next winter, unless the Government takes immediate steps to rehabilitate the motive power on the railroads, whose disabled and inadequate equipment is mainly responsible for decreased production at present.



Consumers will likely have to pay more for their coal during the coming summer than they did the past winter, owing to the fact that the Interstate Commerce Commission has granted the railroads a freight-rate increase of 15 per cent. on bulk commodities, including coal. This increase, which will apply to all shipments east of the Mississippi River and north of the Ohio and Potomac Rivers, will mean an increase of from 18c. to 30c. a ton on the domestic sizes.

J. D. A. Morrow, National Fuel Distributor, has completed an arrangement with the operators producing smokeless coal in West Virginia that will stop the shipment of this high-grade fuel to Western markets and divert this coal to New England after April 1. This is an important move, as it will relieve an acute situation in a territory that is producing the maximum of war supplies. It will also greatly improve the fuel situation in New York and Pennsylvania, as the result of this action will be to lessen the demands on Pennsylvania mines from New England consumers. Curtailing shipments of smokeless coal to Western points will necessitate Cleveland, Cincinnati, Toledo, Detroit, Chicago, Indianapolis and other cities burning the lower grade Central West coals. The West will have to endure smoke in all its cities for the present. A second and no less important result of this new order will be to provide plenty of smokeless coal for transports and naval vessels. This will go a long way toward combating the German U-boat peril. In addition, it is true that with this high-grade steam coal a vessel will travel 16 knots an hour, as compared with a speed of only 12 knots an hour when using a lower grade fuel.

No information is yet available regarding contracts. While quite a heavy contract tonnage will expire within the next week or two, there is no activity on the part of the mines to renew contracts until the announcement is made by the Fuel Administration of new regulations, prices, zoning, etc., which is expected at any moment. The Administration has already made public its plan for licensing jobbers. Instead of eliminating the jobber's commission, the authorities have assured him a reasonable compensation for his services, while at the same time preventing improper practices. The commissions to be allowed are briefly: 15c. on bituminous; 20c. on anthracite in the East and 30c. in the West, and 5 per cent. of the delivered price on smithing coal.

COAL PRODUCTION

Last week's output of soft coal was the largest since Nov. 24. The total bituminous production during the week ended Mar. 9 (including lignite and coal made into coke) is estimated at 11,228,000 net tons. The daily average for the week (1,871,000 tons) was exceeded in the week of Jan. 5, but at that time the total production was reduced by the New Year holiday. The improvement has been made possible by relief of the railroad freight congestion. Anthracite and coke, both beehive and byproduct, reflected the increase in bituminous production.

Preliminary estimates based on railroad shipments place the week's production of beehive coke at 633,000 net tons, or 106,000 tons per working day. Connellsville production, as reported by the "Courier," increased from 285,828 tons during the preceding week, to 314,409 tons.

Anthracite shipments rose to 42,207 cars, the largest since the week of Dec. 1.

For the country as a whole, the ratio of tonnage produced to full-time capacity, during the week ended Mar. 2, was 70.9 per cent. Shortage of cars remained the dominant factor limiting production; losses attributed to that cause amounted to 20.8 per cent. of capacity.

A general improvement in working conditions was reported from Illinois, east to Pennsylvania, and south to Alabama. In Illinois, Ohio, and throughout Pennsylvania, the improvement was effected by the reduction in losses due to car shortage. The only districts in the Appalachian region to report more acute car shortage were the Panhandle, New River, and Pocahontas fields of West Virginia. From the Fairmont district and the high-volatile fields of southern West Virginia, a marked improvement in transportation was reported. In both districts, however, production is still far short of capacity; the Fairmont field operated to 49.3 per cent., and the high-volatile field to 58.2 per cent. of capacity.

The lack of demand from the Southwest and Mountain States was more noticeable during the week of Mar. 2. Thirty-nine operators, representing 53 mines in Iowa, Kansas, Arkansas, Oklahoma, Colorado, Utah, Montana and Washington, lost 100,752 tons because of "no market." The absence of demand was most severe in Utah, where it caused a loss of 40,699 tons. The tonnage sacrificed in Washington was small.

An improved car supply and increased activity in movement by river caused beehive-coke production in the Connellsville and adjacent regions to reach the highest point attained since November. Sixty-one of the principal operators in the Connellsville, Greensburg and Latrobe districts reported a production of 255,325 net tons during the week ended Mar. 9, or 50.8 per cent. of their full-time capacity as reported by the railroads. Losses due to shortage of coke cars fell from 32.8 per cent. of capacity, during the preceding week, to 27.4 per cent. Losses due to shortage of yard labor were reported at 6.4 per cent. An increased supply of coal cars enabled the same operators to ship 168,050 tons of coal.

TABLE II. CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended: Feb. 16	Feb. 23	Mar. 2	Mar. 9
Bituminous shipments, 121 roads	189,984	189,691	197,415*	199,582†
Anthracite shipments, 9 roads	40,661	36,612	39,875*	42,207†
Beehive coke shipments, 4 roads	11,357	11,634	12,911*	12,990†

* Revised from last report. † Subject to revision.

BUSINESS OPINIONS

Marshall Field & Company—The current wholesale distribution of dry goods is greatly ahead of the heavy volume of the corresponding period a year ago. The volume of road sales for both immediate and future deliveries is much larger than in the same week of 1917. Customers have been in the market in greater numbers. The market on domestic cotton continues strong. Collections are excellent.

Dry Goods Economist—Conditions in the dry goods field are improving; the railroad congestion is daily becoming less and the movement of needed merchandise is thereby being expedited. While there is still room for improvement, the situation promises to become easier week by week.

The Iron Age—Steel production with some companies has made a considerable stride forward in the past week, Steel Corporation plants apparently coming closer to normal capacity than the majority of independent producers. A 10 per cent. increase over the February rate represents the average condition. The situation as to cars and motive power is still a serious one and promises to continue so. On the score of securing the largest possible output of pig iron and steel from the available coke, current priority decisions tend more and more to throw smaller iron and steel plants into idleness, and the development of this policy is being watched closely throughout the industry.

Atlantic Seaboard

BOSTON

Uncertainty over program the leading feature of present situation. Rail movement good, but outlook for water coal not so reassuring. If bottoms now in coastwise service are taken away it will be a question of which industries are to be supplied. All kinds of plants including utilities on a hand-to-mouth basis for the present. Boston "L" among those forced to rely upon emergency coal. Shippers cooperate. More or less frantic efforts on part of buyers fail to get results in form of contracts. Much anxiety to be "in line" when word is given. Developments as to status of "jobbers." Because of scarcity of vessels loading dispatch at Norfolk is about normal. Dumpings less than normal. Anthracite outlook also uncertain, and trade awaits definite announcement.

Bituminous—The larger industrials within 50 miles of tidewater continue to rely upon high-priced emergency coal brought here from Hampton Roads on $3.25 freights, the United States Shipping Board rate, and about a week's supply continues to be handed out in each case. The present week the receipts will be less, and it is possible the needs of some mills will be acute enough to cause shutdowns. There is, of course, a considerable tonnage coming forward in customary channels, but on account of steamers being under control of the Shipping Board and therefore subject to assignment by trip, it is difficult for shippers to carry out plans for distribution.

At the same time that New England is kept on the ragged edge of coal famine, about every buyer in the territory is looking most eagerly for signs of anything that looks like "contract." Acting on the advice of the New England Fuel Administrator, all have been trying to effect season arrangements with regular sources of supply, but so far as reported the efforts have been without result, save in a few small insignificant cases. With "zoning" and "assigned cars" still matters of undefined policy, and an uncertainty even as to railroad fuel, it is easy to see why operators are coy of making contracts. With prices, rehandling conditions, and pretty much every other factor still a matter of conference at Washington, history will have to be made fast the next ten days if the trade is to be straightened out for the first few months of next season. The producers are, of course, satisfied so long as demand exceeds supply. A remunerative price being granted it is really a matter of indifference on their part where coal goes, except that the more cars are placed for points near the mines the better will be the general car supply for the district.

A few informal arrangements have been entered into, it is understood, on water coal, but the conditions of sale are so closely bound up with all manner of contingencies that the net result is a matter of good will on the part of the producer. The Government fixes prices and the producer practically decides whether requirements are important enough to justify shipment. The system of deputy distributors, one for each mining region, is likely to continue for the present. The question of additional personnel to supervise preparation, for instance, seems still undetermined.

On water coal, since the need is for bottoms rather than coal, several of the agencies have begun to load certain ships that are at the disposal of the shipping board. The understanding is that while the shippers are likely now to furnish more and more of the coal that is dumped at Hampton Roads for New England the distribution and out-turn of the cargoes will continue to rest in the hands of the fuel authorities. Gradually the disposition of the ships assigned for the coastwise service is also being vested in the New England Fuel Administration and the whole system of distribution will have to be wisely administered in order to accumulate any reserve whatever by the time cold weather returns. Current receipts either by rail or by water are not so encouraging as might seem. Every time a "new ship" is transferred to the coastwise trade the fact is made prominent in the newspapers, but little or nothing is said when another hand of the Government takes one away.

Just now there is plenty of coal at Hampton Roads for the vessels in line. For a fortnight or so the arrivals for different sales agencies have been relatively small, and the coal to their credit has accumulated while the loadings were largely for account of the Navy, the Army, the Shipping Board, or some other Government service.

Anthracite—Rail deliveries so far have averaged better than in March, 1917. By water routes, however, the falling off is marked. There is much interest in the first probable announcement by the anthracite committee. The impression seems to be gaining ground that preference in the spring is to be given the far-away places, up the rivers, and at such points as are less accessible by rail. If such a program is followed there will be less real hardship, for barges and other transportation would be confined in colder weather to service that would require shorter trips. The new ruling as to jobbers seems to have created very little stir. So far as anthracite is concerned, it was pretty well discounted, for it was felt that in distribution the reputable middle houses were performing a service that could readily be justified.

NEW YORK

Anthracite supplies low while demand remains strong. Jobbers discuss Dr. Garfield's announcement of licenses, but await official copy. National Jobbers Association meet in this city. Consumption lighter and dealers have an opportunity to obtain surplus. Bituminous producers anxious for more cars. Local situation not much improved. Supplies low. Bunkering situation much better.

Anthracite—Supplies in this market continue to remain low, and early this week were judged by many to be as small as at any time during the past few months. Conditions, however, showed improvement, as the retail demand has subsided. While dealers were as anxious as ever to get coal, they were not under pressure to make deliveries. As a result most retail dealers are enabled for the first time in many weeks to boast of having a small surplus in their yards.

The uppermost topic of interest in the trade was the announcement of Dr. Garfield regarding the licensing of jobbers. No one was willing to discuss the new regulations pending the receipt here of an official copy, but it is not believed that the tradesmen affected are entirely satisfied. However, they are willing to live up to the rulings of the Federal Fuel Administrator.

The conferences between representatives of the Federal Fuel Administration forces in Washington and the Fuel Administrators of Greater New York, at which plans for distribution and the coal requirements of the Greater City for the coming year were discussed, have ended, and the data have been submitted to Dr. Garfield. The proposition of creating a reserve supply of about 500,000 tons for this city does not meet with the approval of the entire trade, inasmuch as the storage facilities are extremely limited and there would be extra charges for reloading the coal for delivery.

With the weather moderating dealers are noticing a tendency toward an easier market. Consumers are not as urgent regarding deliveries and instead of insisting upon deliveries of at least one ton, they are willing to take half and sometimes quarter ton deliveries. Many orders have already been placed for next winter's supply, but there is no apparent hurry for deliveries to begin, consumers appearing anxious to await better preparation. Complaints of dirty coal are diminishing and dealers believe that the worst is over now that the Federal inspectors are on the job at the mines.

The fact that production is steady does not increase stocks at the Tidewater piers. Everything coming to this market is sold before it leaves the mines, and spot coal buyers are having difficulty in picking up a stray cargo.

Several of the city departments have been authorized by the Board of Aldermen to buy a three months' supply of coal in the open market.

The small anthracite sizes continue to be scarce. Buckwheat No. 1 is practically out of supply, and nothing is heard concerning the making of contracts. Rice and barley are scare, but freer than the larger size. Screenings are in strong demand but not plentiful.

Current quotations, per gross ton, f.o.b Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buckwheat	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—Many local producers and jobbers were at Altoona on Tuesday of this week attending an important conference at which the coal situation was discussed and where it was hoped plans would be formulated for the betterment of the existing conditions.

Locally conditions do not show much improvement. Supplies are short and nearly everything sent to this market is sold before shipment.

While efforts have been made to improve the car supply very little success has been attained. Complaints continue numerous. Operators are unable to increase production and the miners are disgruntled because they cannot work as steady as they would like.

The Wholesale Coal Trade Association of this city in a bulletin to its members estimates that the approximate price alongside in the harbor limits for bunker coal, based on present mine prices and expenses of handling, is $7.533 per gross ton.

The bunker coal situation here is in better shape than it usually is at this season, and the reserve for bunkering of transports is such that orders were given to hold off on shipments for two weeks.

Improvement in the inland coal situation is looked for now that the order diverting practically all eastern shipments from the Pocahontas and New River fields to Tidewater has been canceled. The Tidewater requirements having been met, the low volatile coals from these fields will go a long way toward relieving the situation in other sections of the country.

PHILADELPHIA

Anthracite trade full of uncertainties. Not sure now about April price. Individuals' price, subject of discussion. Freight-rate increase complicates matters. Current retail demand light, but dealers take all coal shipped. Early ordering campaign being waged. Commission men licensed. Bituminous trade stirred by price agitation. Somerset price increased. Rail situation not so good. Car supply fair to poor. No zoning yet. Brokers win their fight.

Anthracite—Uncertainty at this time rules the coal trade, especially among the retailers. The shippers have been unable as yet to assure the dealers that they will receive ample supplies of coal after Apr. 1; neither have they been advised by the Federal Fuel Administration as to the margin of profit to be allowed. In the meanwhile dealers with large storage capacities are glad to accept all the coal they can secure, but the small dealers with limited bin room have in numerous cases been compelled to cancel orders for certain sizes. The retailers who deal largely in independent coal are in a particular quandary. If the smaller operators are to be allowed to charge 75c above the company circular the dealers feel they should know it now. They seem to be in dread of the possibility of being stocked up at the high

rate when the Government may step in and reduce the differential. They point out that they are putting themselves in the position of going into April with coal costing them about $1 a ton more than the April shipments received by company customers. Yet they hesitate to cancel their orders for March for fear shipments will not be resumed the same as if they had not been interrupted.

As to the retail demand, it can be said that during the last weeks of the month the sales have been a disappointment. In the suburban sections where the buyers are more affluent there is some activity, but the dealers who serve the more humble homes are actually complaining. It is the dealers caring for this trade who express some doubt as to whether their customers will place their orders this spring. They will refuse to deliver on credit and are afraid many small buyers will not display sufficient thrift to buy so far in advance. It is this class who for years have been willing to take a chance and who always pay the top prices.

Shipments to this city have been far from free, but the demand has been correspondingly light. Pea coal is scarce, as there seems to be the usual March demand for it. Chestnut is quite active, if only because it is being extensively bought as a substitute for pea. Egg and stove are very draggy, except in the suburbs. On account of this somewhat sluggish demand for deliveries the fuel committee revised its order not to allow dealers to book summer orders before Apr. 1 and changed it to Mar. 20. On that date the new form to be filled out by the customer will be ready. This is an elaborate statement of the consumer's needs, and to meet the cost of administration in connection with the recording of the applications a 2c. stamp has been devised to be placed on each order at the cost of the retailer. Even with the advancing of the date for receiving orders there seems to be no general disposition on the part of the dealers to encourage ordering on account of the uncertainties stated above.

A ruling that has been handed down by the National Administration and that is particularly pleasing to the retail dealers is the one forbidding the practice of selling carloads of coal direct to the domestic consumer. Operators throughout the state have received instructions from State Administrator Potter prohibiting the shipment of coal directly to the consumer. The purpose is to prevent persons of influence from ordering direct from the mines and thus escaping the system of checks and reports predicated on the assumption that coal will go to the consumer by way of the retailer. The practice was greatly abused all last summer and the dealers welcome the opportunity they will now have of serving this trade in the regular manner. It is understood that the Fuel Administration will permit the continuance of the practice of employees of coal-producing companies to purchase their supplies in this manner, which has been the practice for many years, but all such shipments will be subject to the approval of the local fuel committees of the towns to which the coal is consigned.

No information as to contracts is as yet obtainable. There are some in the trade who express the opinion that few, if any, will be made by the shippers. This seems plausible, especially when it is recalled that no contracts will be permitted except subject to the approval of the National Fuel Administration.

The anthracite brokers seemed entirely satisfied with the order of the Fuel Administration which provides for their doing business under a license system. The rule also carries with it a commission of 20c. added to the mines price of the coal. From this it would appear that there would be at least one variation from a fixed mine price for all shippers.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—Local producers have been greatly stirred by the agitation—and they feel convinced that agitators are behind the movement—to secure a reduction of the present price of $3.05 for coal at the mines. It has been intimated that an effort is being made to have the Fuel Administration issue reduced prices beginning with Apr. 1, and that the matter is being given consideration.

As to the general situation, it must be said that the rail improvement as noted last week has failed to continue during the succeeding period, as the lines are now considerably congested, and there has been a considerable falling off in the car supply at most mines. No mine has reported more than a 50 per cent. supply, with most shippers down to 25 per cent. or lower. Despite this the general feeling is one of optimism, and with a continuance of favorable weather conditions it is thought that the next fortnight at least will show much improvement.

BALTIMORE

Better supply of soft coal reaching this territory and even more relief when rail congestion near here is broken. Jobbers and retail dealers preparing to meet new conditions after Apr. 1.

Bituminous — The fuel administrator's office here reports better receipts of soft coal both for tide loading and local business. The shortage in industrial circles, however, has been such that it will take some time to catch up, even in part, and meanwhile the coal arriving is still being apportioned to the most needy cases. Serious congestion exists on the railroads between this point and the mines, however, and there has been much confusion on reconsignment of coal refused at connecting roads because of embargoes. At Brunswick, for instance, at the start of this week there was a jam of over 2500 loaded freight cars, much of it coal, and nearly 1000 of these cars were marked for delivery at the piers here. When this coal gets running the situation will be much relieved both at this point and at the mines, which are unable to get empties or to get laden cars away from sidings in many cases. The soft coal jobbers here, while not entirely satisfied with the readjustment of the order from Washington relating to their commissions, etc., are much elated at the modification of the first drastic ruling. Many are now making contractural relations with firms here under the new management. It will take some time of practical working before it can be said just how far the ruling is to hit the jobbing business.

Anthracite — Almost springlike weather here has caused a sharp drop in the demand for hard coal for domestic consumption. The trade is not expecting much of a demand now until after the new schedule is arranged for sales after Apr. 1. Most of the dealers, if able to get any quantity of coal in the spring and early summer, will urge their customers not to delay laying in supplies.

Lake Markets

PITTSBURGH

Market supplies still light but increasing. Car movement better. Some jobbers well pleased with proposed new license system for jobbers.

Supplies of coal in the open market have been increasing slowly and are still quite small, but progress is being made and large consumers continue to be well supplied, as they have been in the main for three or four weeks past. The Monongahela River mines have aided greatly in improving the situation in the immediate Pittsburgh district. In the past few days mines in the lower pools have been practically idle on account of high water, approaching a flood. There is no disposition to complain, however, as it is really remarkable how the weather has conduced to a free running out of the enormous accumulation of water.

Car supplies at rail mines continue to increase, but the increase is slow and at some mines is hardly noticeable from one week to the next. The improvement thus far is attributed chiefly to quicker movement of cars. Not much seems to have come thus far of the recently predicted influx of cars into the district released from the eastern congestion. Reports are that the number of cars tied up in the East is still very large.

The older and larger coal jobbers express themselves as rather well satisfied with the new system of control for jobbers being developed at Washington, as far at least as the plan has been outlined thus far. All jobbers are to be licensed, and they are given two methods of conducting transactions, only one to be used in a given case. The first is to buy and sell outright, in neither case at above the set price for the operators; but they can make as large a margin as circumstances permit by buying at under the set limit. The second is to act as buying agent for a consumer or retail dealers, in which case a brokerage up to 15c. can be charged as formerly, beyond the set limit. This system, many jobbers feel, will give them a better opportunity to conduct business than they have had heretofore. While some doubts are entertained as to whether it will be possible to buy much coal at under the Government limit, there are some jobbers who expect to do so at certain times in the year. All the details of the plan have not been given out as yet. The length of time a jobber may hold coal in his own name may be limited, but thus far it is not known positively that it will be.

The market continues to be quotable as formerly: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. extra permitted to be charged in sales by jobbers to consumers. These prices run only to the end of the month and the new prices and trading conditions will be announced not later than the end of next week.

TORONTO

Conditions improving, but supply unequal to demand. Local deliveries still much in arrears. City has given up taking orders. Anthracite increased in price.

Conditions have been gradually improving, but owing to the continuance of severe weather the demand is much greater than usual at this season. Shipments are coming forward well and dealers are taking orders, though owing to arrears, which have to be overtaken, local deliveries are much delayed and many customers can only obtain small lots. The pressure has so far lessened that the city has ceased supplying coal to necessitous cases, having since Jan. 1 filled about 8000 orders. The price of anthracite has advanced 15c. per ton, otherwise prices are unchanged. Quotations per short ton for best grades are: Retail anthracite, egg, stove, nut and grate, $10; pea, $9; bituminous steam, $5; slack, $8 to $8.50; domestic lump, $10; cannel, $11, wholesale f.o.b. cars at destination; three-quarter lump, $7 to $7.50; slack, $6.85 to $7.

BUFFALO

Not much bituminous improvement. Jobbers hoping and doubting. Car supply not much improved. Anthracite in fair supply. None for the lakes right away.

Bituminous—The situation has steadily, though slowly, improved so that the consumer is at least getting what he needs from week to week, though he would not be able to put any in storage. As the end of the annual contracting season approaches the trade becomes more and more anxious over the outcome.

Cars are hardly more plentiful than formerly. The Pennsylvania R.R. has shown substantial improvement, sometimes delivering the cars to destination, even at Canadian points, before the weights were received, but the Buffalo & Pittsburgh, New York Central and Erie are not making good deliveries. The Erie is so badly blocked at Hornell that it refuses to take coal for shipment past there.

Anthracite—There is complaint of bad assortment of sizes now, more than of a general shortage. Egg and stove have not been in proportionate supply for a week or more, but distributors report that they have had a fair supply as a whole. The orders for next winter's coal are coming in fast, but shipping agents have had no instructions as yet and do not know what the price is to be. If the proposed 30c. reduction is met by 30c. freight advance, the consumer will get small relief and the producer will pay the amount to the roads.

The lake fleet is fitting out and will be ready to sail in a few days, but the chances are that no coal will be ready here for them to load. The shipping companies state that it will not be possible to get any for that trade awhile yet. As the upper lakes are said to be better supplied with anthracite than we are and have a surplus of bituminous, there need be no hurry in one sense, though it may not be easy to move a sufficient amount for next winter unless the shipments begin before the season is far advanced. The down freight offering is large, so the fleet will have to go after it and not wait for coal cargoes.

DETROIT

Interest of domestic buyers fluctuates with weather changes. Steam trade demand active. Early lake movement predicted.

Bituminous—Changes in temperature now appear to be the controlling factor in buy-

ing for household use. Frosty weather early in the week stimulated a demand among domestic consumers, who had been husbanding short supplies in the hope temperature conditions might moderate to an extent that would enable them to avoid further purchases at this time. The duration of the cold weather was so brief, however, that the renewed demand was short-lived and was not to any noticeable extent carried beyond retail dealers.

Demand for steam coal from manufacturing and industrial plants continues active, and it is observed by some of the jobbers that this class of consumers appear willing to accept fine coal and lump, without demanding three-quarter lump, egg and other sizes that were popular a year ago. The incoming shipments include a smaller proportion of the sizes requiring special preparation, than was the case formerly.

Supply is being maintained in fair volume, though the receipts are not sufficient to leave any free coal on tracks. Most of the stock comes from mines in Ohio and West Virginia fields, and smokeless coal is conspicuous by its scarcity.

Wholesalers are advising their customers to make a start if possible in putting in a reserve supply, arguing that conditions at present are likely to be more favorable than after the reopening of lake navigation early next month.

Anthracite—Little increase in volume of anthracite receipts is apparent. The quantity received seems little more than sufficient to meet current requirements of household consumers, which are widened by the scarcity of coke.

Lake Trade—Shippers handling coal over lake routes are planning to start the business early. It was decided at a conference in Cleveland, a few days ago, to continue handling shipments through the Lake Erie coal pool. Some modifications may be made in the system in use last season. Little inquiry for vessel capacity has so far appeared. Removal from the lakes to the Atlantic of a great number of the smaller type of bulk freighters is expected to increase the difficulty of shipment to small docks.

COLUMBUS

The warm weather has lessened domestic demand appreciably. Steam business is exceedingly strong and preparations are being made for a heavy lake trade.

The coal trade in Ohio continues strong in practically every department. Buying for steam consumption is one of the most important factors of the trade, but there is also heavy buying on the part of retailers. The urging of the Federal Fuel Administration is having its effect on private users, and a larger number are accumulating their coal for the coming winter. On the whole the tone of the market is generally satisfactory and prospects for the future are considered good.

Manufacturing plants are taking advantage of the lull in domestic buying to secure a surplus stock, and many have succeeded beyond their expectations. Other users of steam grades are not buying for the future, trusting to improved transportation facilities to supply the fuel when needed.

The domestic trade is running along smoothly in every respect. Dealers are buying rather heavily, as they want to be in a position to take care of customers who desire stocks for the coming winter. Storage space is being provided and dealers are buying in larger quantities than formerly at this time of the year. There is a strong demand for the fancy grades such as Pocahontas and West Virginia splints, and little of the former is coming into the local market. West Virginia grades are arriving in larger quantities. Retail prices are strong at the levels which have maintained for some time. Domestic coke is expected to advance soon. Anthracite is quite scarce and sells around $10.

Production is fairly good in most of the mining districts of the state. This is especially true of the Hocking Valley and Pomeroy Bend sections. Car supply is fairly good and as a result the output is estimated at 85 per cent. Eastern Ohio is still hampered by car shortage, and the output is about 65 per cent. High water in certain sections of the Hocking Valley is causing idleness among mines.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2 70
Mine-run	2.45	2.80	2 45
Screenings	2.20	2.45	2 20

CINCINNATI

The trade is busy making arrangement for supplying storage demand as well as taking care of immediate consumption. Conditions are improving.

With the entire public—domestic and industrial consumers alike—keenly alive to the necessity of making provision well in advance for the coal supply for next winter, the coal trade will have no difficulty in keeping things moving during the summer. Indications now are that the trouble will be the other way around—that is, to get coal enough to take care of the constant demand. There is now enough regular demand from retailers and jobbers to take care of all of the coal forwarded. If this condition continues, the city will enter next fall in the best condition in its history. Just now, however, consumers are to be strictly limited in their purchases. The unusual spectacle will be witnessed of enforced limitation of orders during the season when the trade is normally unable to secure enough business to keep its facilities employed. Domestic consumers are being required to sign statements showing what their requirements are (as measured by last season's consumption) and what coal they have on hand, and to confine their orders to the difference.

LOUISVILLE

Situation steadily improving, with much better movement from both eastern and western Kentucky fields. Car supply somewhat better. Demand fair for steam and domestic use.

The retail demand has been rather light, fluctuating with the weather, which is unsteady. The steam demand is showing little change, however. The western Kentucky movement is steady and good, the fair supply of cars being received in that section enabling the mines to operate on a five-day average basis. Local retailers have not been making any effort to sell coal and have been busy stocking their yards, with the result that there is a ten-day to two-week supply on hand with most of the local concerns. The car supply in eastern Kentucky is somewhat more encouraging than it was, and a better movement is being shown. The demand for eastern Kentucky coal is strong.

The prinicpal interest in the market at this time is in connection with the Fuel Administration's setting prices at which summer stocking will start, and for contract making. It is believed that if the price is set before Apr. 1, that the heaviest bookings on record will be made, as there appears to be a general movement toward early stocking this season and many inquiries are coming in.

BIRMINGHAM

Domestic buying in abeyance awaiting new price adjustments and regulations. Steam demand continues unabated. Production improves some, but supply is still far from adequate to requirements.

Both domestic dealers and producers are anxiously awaiting the adjustment in prices and changes in classification which are being worked out by the Fuel Administration in Washington, with the advice and assistance of coal men from this district. Therefore the movement of domestic coal is light, there being sufficient stocks in the yards of retailers to supply all current demands. Dealers, however, are desirous of placing contracts for their 1918-19 requirements, and when the regulations and prices are announced by the Fuel Administration a strong buying movement is expected.

The steam trade is strong and susceptible of little change, there being a demand for a much larger tonnage than can be produced under existing operating conditions, and any changes made in price schedules would hardly affect the market, or the output either (barring any drastic reductions). The wide margin between supply and requirements will maintain a heavy demand for some time to come.

Coal production in the district is improving slightly each week, and is expected to shortly reach the normal status which prevailed prior to the interruptions caused by strike troubles several weeks ago.

Coke

CONNELLSVILLE

Coke movement continues to improve. Furnaces better supplied and may be fully supplied shortly. Foundry coke remains extremely scarce. No brokerage allowance contemplated.

Last week's coke movement showed an improvement on the whole, but the week did not end nearly as well as was presaged by conditions in the first two or three days, when, as noted in the last report, there was the largest car supply since October as well as the largest increase from one week to the next. While the Monongahela R.R. Monday of last week had an 80 per cent. car supply, its average for the whole week was only 46 per cent., which would be equivalent to 80 per cent. one day and a daily average of 49 per cent. for the remaining five days. This week opened with 60 per cent. on Monday and 80 per cent. on Tuesday. Supplies elsewhere in the region improved last week and again this week. Shipments may be estimated at fully 350,000 tons last week and somewhat more this week, whereas in the first nine weeks of this year not a week showed 300,000 tons, and the average was only 267,000 tons.

Shipments are now nearly equal to the requirements of the blast furnaces, depending on the region, but the furnaces have not all received coke, as yet, at the increased rate as it takes a week and more for shipments to get through to the average furnace. In the past ten days furnaces have been operating at fully 80 per cent. of capacity, and if the improvement in conditions continues they will soon be operating at 100 per cent. The steel mills, however, are not in position to ship finished product in proportion to increased supply of pig iron, by reason of car shortage and embargoes, and it looks as if pig iron might accumulate to an extent, after having been extremely scarce for a twelvemonth.

Offerings of furnace coke in the open market have not increased much, except that usually some coke loaded in P. & L. E. cars can be had without much difficulty, for the limited number of consumers that can take such delivery. Foundry coke continues extremely scarce and few enquirers get what they want. The market remains quotable at $6 for furnace, $7 for foundry, 72-hour selected, and $7.30 for crushed, over 1-in., per net ton at ovens. There is no allowance for brokerage to be charged to consumers above the set price, and the new regulations, while continuing in modified form the allowance to brokers in coal, will not allow anything in the case of coke.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Mar. 9 at 314,409 tons, an increase of 28,581 tons, and shipments at 334,584 tons, an increase of 37,350 tons.

Buffalo—The supply is called short, but it seems to hold out. Jobbers are so out of this trade that no information is to be had of them. They dropped coke in the days before the high prices, when the consumer was finding so much fault that it was impossible to satisfy him. High prices seem to have stopped complaints. The sale of byproduct coke is brisk, many jobbers being in it. The price is from $2 a ton at the place of production, so the quality is not likely to be high. It practically all goes as a substitute for bituminous coal, so the old complaints do not apply to it.

Middle Western

GENERAL REVIEW

All efforts of operators to increase output held in check by failure of railroads to increase equipment supply.

Weather conditions for the past week were such that mines might have materially increased output had the railroads been able to provide sufficient cars to keep the mines in operation. The only mines that have received 100 per cent. car supply were those with railroad fuel contracts. Others have had to be content with a maximum of 65 per cent. supply, and in many instances running time fell far below this per cent. Many large mines with two and three lines of roads have only worked three and a half days the week just past.

Warmer weather has relieved market tension. The retail trade, although it has not altogether discontinued to take some tonnage, seems to be taking things easy and waiting for developments. One of the puzzling problems is the uncertainty of eastern coal. Dr. Garfield is continuing for an indefinite period the diversion of West Virginia smokeless to the use of tidewater vessels in the United States service, thus rendering doubtful the prospects of a normal supply of this grade in the Western market.

News of the Fuel Administration's clean-coal policy has caused more or less speculation. Many small operators say they

have no facilities for the installation of picking tables and will have to depend on inspection being made on shaking screens or at the bottom of pit and at the coal face.

Scattered throughout the country are many strip and slope mines. These produce a small tonnage which has heretofore been sold as mine-run. These operations possess no screens of any character and will be compelled to depend entirely on underground or face inspection.

The situation with reference to Pocahontas seems to be rather confusing. Some dealers affirm they are getting more of this grade at this time than they did for the corresponding period last year, other dealers in the same locality stating that they are getting none, and that their yards are without any eastern coal. No doubt this difference is due not so much to an actual shortage, but to long established trade relations. During the past week Hocking seems to be more plentiful than for some time, due to easier conditions in Michigan and Ohio.

CHICAGO

Contemplated price change causes light buying. Chicago easy on all grades of western coal.

The reduction of price effective Apr. 1 on hard coal, and a reduced price on Colorado and other coals, has caused dealers and steam users to look for reduced prices on all grades; therefore little buying is done beyond enough to take care of the immediate future. Contracts of all kinds are held up pending word from Dr. Garfield outlining a future sales policy.

During the past week numerous buyers from the Northwest have been in this market trying to get a line on high-grade southern Illinois coal. Particularly is there an eager Northwest market for fine coal under 2 in.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50
Domestic lump	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Egg or furnace	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Small egg or nut	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Stove	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50
Chestnut	2.65@2.80	2.65@2.80	3.00@3.15	2.65@2.80	2.65@2.80	3.35@3.50

MILWAUKEE

Coal dealers awaiting official advices as to future price and delivery regulations. Consumers requested to place order for next season on or before Apr. 1.

Watchful waiting is the order of the day in Milwaukee coal circles. The return of W. N. Fitzgerald, state fuel administrator, who went to Washington to confer with the Federal coal authorities, is awaited with great interest. When he arrives, a meeting will be arranged and an understanding reached. All express a willingness to conform to any Government regulation which may be imposed. This has been the attitude of all the old dock companies and retailers since the fuel agitation began, but there are some mushroom companies which operate dumps alongside side-tracks which have enjoyed war-time profits on Illinois coal. Coal costing $4.50 on track here has been sold right along at $7.50 with the extra charges for delivery. Regulation does not seem to have disturbed them.

The state fuel administration office is urging every consumer to place orders for coal or coke with his regular dealer on or before Apr. 1. The consumer will be allowed an amount sufficient to last until Mar. 31, 1919. Dealers are to deliver two-thirds of the annual requirement of anthracite, and when all consumers have received this allotment, the remainder will be forthcoming. No restrictions are being advanced as to bituminous coal. The general purpose of the regulations is to secure a broader and more equitable distribution of fuel than in the past.

According to officials of the State Council of Defense more wood will be consumed in Wisconsin the coming year than ever before. This is expected to relieve the coal supply materially. All over the state arrangements are being made to heat school houses, city halls and other public buildings with wood.

ST. LOUIS

Local conditions extremely easy, with plenty of coal and a tendency to cut prices in the Standard field. Car conditions extremely bad on the M. & O. and I. C. Practically no steam demand, and domestic coal dragging heavily. Pennsylvania anthracite shipments good, with nothing from Arkansas.

The local situation is one that is causing worry to the operators in the Standard field. Prices of $2.50 and under have been freely quoted this week, although in many instances these quotations have been made at the $2.65 price with a commission paid for buying, so that the sales record would show the Government price. This has been done to some extent on the short-line roads entering St. Louis and on some of the trunk lines.

The L. & N. R.R. is still embargoed against Chicago, and this coal coming in here heavily has demoralized the local market. The Wabash and C. & A., the two principal carriers from the St. Louis market to Chicago, are embargoed on account of having too much coal at Chicago, they claim. The result is that there are several hundred cars of coal held at East St. Louis which were destined to Chicago, with no other place to move them.

The Missouri Fuel Administrator refuses to touch the coal, and the Illinois Administrator ignores the demand of the local roads for relief. It appears as if the Chicago market is too heavy and that in order to keep it firm the railroads are tying this stuff up at the St. Louis end, thereby breaking the local market.

There is little domestic demand locally for Standard coal, and the steam call is not as good as it should be. There seems to be a feeling that the price of coal will come down on Apr. 1, especially in the Standard and Mt. Olive fields, and the buyers are holding off. Conditions in the Mt. Olive field are somewhat similar, although there is no demurrage coal there. What does not move into St. Louis can be moved north, and the embargo will not affect it.

The railroads still continue to draw heavily on these fields, and that is the principal reason why both of these fields have not practically suspended operations.

Conditions are much better in the Duquoin field, and this coal continues to move north and west; but the car supply on the Illinois Central is extremely short.

In the Carterville districts of Williamson and Franklin County there is beginning to be a surplus of domestic sizes, but the steam call is extremely good. Car supply is not good on the Illinois Central, nor on the Iron Mountain, but the C. B. & Q. and C. & E. I. are doing well. Working conditions in a general way are improving.

One St. Louis company, it is understood, has 5000 tons of Pennsylvania anthracite bought, which is to be shipped before Apr 1. This is coming in in good volume, and a few other companies have small tonnages moving in. There is no smokeless booked for this market. A little Arkansas is commencing to drift in, but not in any great volume.

The local market is, per net ton f.o.b. mines:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard

Williamson & Franklin Co. rate is 87½c.; other fields, 72½c.

SEATTLE

Coal operators of state hope for peace pact in early adjustment of mine-price controversy with Fuel Administrator.

Announcement that H. A. Garfield, United States Fuel Administrator, had revised anthracite coal prices to take effect Apr. 1 and had urged consumers to lay in an early supply of coal for next winter, is interpreted by coal operators in the State of Washington to be a forerunner of an early adjustment of the mine-price controversy in this state.

Some of the mines have already felt the effect of a decrease in the demand for coal, and it is expected that consumption will decline steadily from now until fall. A falling off in the coal consumption will make it difficult to hold men at the mines, and a greater use of coal is urged both for the benefit of the mines and their men, and also to ease up on the demands for fuel oil in this territory.

General Statistics

CHESAPEAKE & OHIO

Following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for the month of January, 1918:

COAL

To	January 1918	January 1917
Tidewater (bituminous)	231,455	512,952
East (bituminous)	322,550	273,470
West (bituminous)	839,414	1,185,416
Company's fuel (bituminous)	188,008	207,704
From connections (bituminous)	112,477	168,678
Total	1,793,904	2,348,220
Anthracite	3,470	718
Total coal movement	1,797,374	2,348,938

COKE

To	January 1918	January 1917
Tidewater	.....	.....
East	21,538	15,496
West	18,197	25,512
Total	39,735	41,008
From connections	5,915	6,352
Total coke movement	45,650	47,360

NORFOLK & WESTERN

Below is a statement of the coal and coke shipments over the Norfolk & Western lines during the month of January, 1918, as compared with January, 1917. The figures are in net tons:

Shipments	January 1917	January 1918
Tidewater foreign coal	200,482	76,644
Tidewater foreign coke	2,894	.....
Tidewater coastwise coal	240,286	206,079
Other domestic coal	2,404,817	1,615,312
Other domestic coke	203,983	226,157
Totals	3,052,462	2,124,192

COAL AGE

Volume 13 NEW YORK, MARCH 30, 1918 Number 13

Economic Suicide

Some facts regarding a Dangerous Government Policy that is causing labor unrest, rendering an injustice to coal-mine owners, and saving money at the expense of the public consumer. All industries are vitally concerned.

By FLOYD W. PARSONS

WE cannot win the war unless we mix justice and intelligence into the conduct of our industrial life. The production of coal so far this year has been more than a million tons less each week than the output estimated as necessary to prevent another fuel famine next winter. As a consequence, every action bearing on coal production must be carefully weighed to see that no unfavorable results arise.

In the face of this very serious situation there is discontent and the threat of a strike in that important district embracing the mines of central Pennsylvania. However, the miners can't strike. Frank J. Hayes, President of the Union, said to me in Washington last night: "We propose to insist that in all cases the men shall abide by the terms of the recent Washington agreement. If they demand an increase in one district where the price of coal has been raised, they would have to submit to a wage reduction in some other field where the mine price has been reduced. Any changes of wages now in one district would open the whole question throughout the country, and that we will not permit."

Dr. Garfield yesterday expressed the same thought, and added that he was sure the miners in Pennsylvania would rescind their demands now that they had had an opportunity to examine fully the costs of mining in the affected districts. He explained to them that the increase of 60c. awarded the operators was not an additional profit, but actually a necessary rectification of the earlier price, which had not been based on such an exhaustive investigation and which had been too low to permit many Pennsylvania operators to make any profit at all.

So much for this specific instance. Let us go a step farther. Even though there can be no serious coal strike at present in any of our fields, the men must be happy in their work and the mine owners prosperous if a maximum production is to be attained. The Government is pursuing an economic policy that is certain to defeat the constructive efforts of the Fuel Administration. Here is a summary of the evil practice:

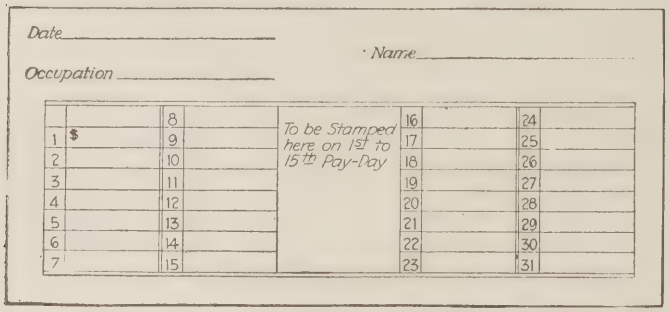
The railroad administration is now, and has been, making contracts with certain mines in every district, agreeing to furnish these specially appointed mines with a full car supply, providing the coal is sold to the railroad at a reduced price. Many operators find it advantageous to enter into such a deal, which insures them plenty of cars and regular work, as against a higher price for coal with only enough cars to work half time, or less

These railroad mines as a consequence double production and draw men from all adjacent collieries. The direct result is dissatisfaction and discouragement on the part of the miners at the idle plants and an increased cost of production for these less favored companies.

Men can't live even on high wages when they work but two or three days each week. The companies can't mine at low cost under such conditions. Presto! Up goes coal prices and wages, and the public pay what the railroads save. No good is accomplished, for the railroads could secure a satisfactory fuel, and plenty of it, through priority, without disrupting uniform car distribution.

If the Government uses its ownership of cars to drive hard bargains with coal producers, will it not soon employ the same methods with steel manufacturers and others and say to them: "Give us a special price, and we will give you cars." Each time this is done the public pays the difference. But the big fact is the unrest resulting from a selfish and ill-advised national economic policy, practiced at a time when absolute justice should obtain and harmony prevail.

IDEAS AND SUGGESTIONS



A Useful Card

BY J. A. SMITH
Albert, W. Va.

The accompanying illustration shows a card which can be made to serve several useful purposes—it acts as an identification card, also as a passbook when drawing store orders, and finally it is taken up by the company issuing it as a receipt showing that the holder has been paid.

In addition to the printing shown on the face of the card, the back bears the following inscription:

This card must be presented to the clerk to have store orders charged thereon, each time a store order is drawn.

CARD SERVES A NUMBER OF USEFUL PURPOSES

It must be presented and stamped when drawing pay for the first half of the month, and will be taken up by the paymaster on pay day for the last half of the month and be held as a receipt showing that the holder has received his pay for the month stated hereon. Take care of this card. In case of loss report it to the office.

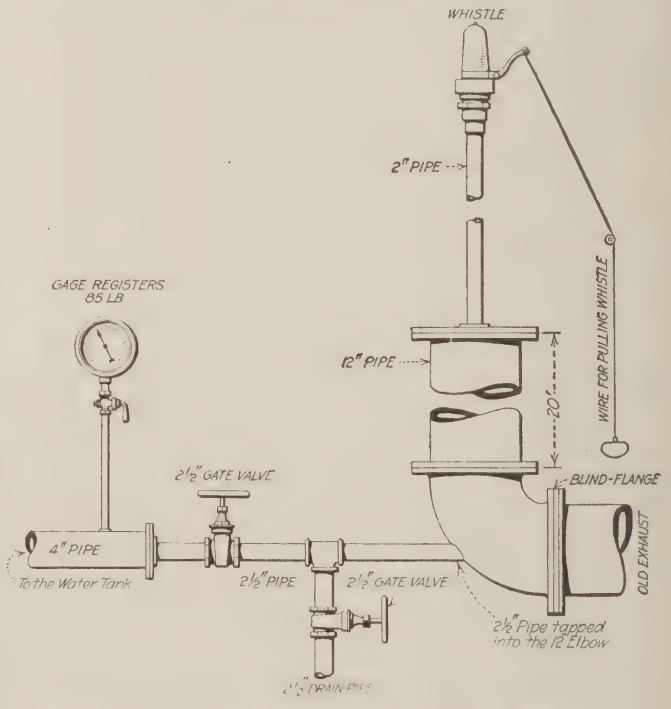
Some time during the month cards are made out for the following month for each person on the payroll. The first time the holder draws an order he is given his card with the amount of the order charged thereon. Each time afterward that a store order is drawn it is charged on the card opposite the date on which it is drawn.

The holder of a card always knows exactly the amount he has drawn to date and for the pay period. The company officials are thereby spared much trouble and annoyance on pay day from employees who claim their store order account is incorrect.

At one plant, before these cards were adopted, it was a common occurrence each pay day to have from 12 to 20 complaints from this cause. As each complaint had to be investigated by looking up the account on the books and order stubs, there was considerable loss of time. Sometimes much ill feeling resulted, as often it was impossible to convince the claimant that a mistake had not been made. Since the cards have been in use complaints from this cause have ceased. On pay day for the first half of each month the card is stamped in the space shown as follows:

Paid 1st to 15th.
(Date of pay day.)
Blank Coal Co.

When the card is presented on pay day for the last half of the month it is kept and filed to show that the holder has been paid.



A new employee when first given a card is instructed to take care of it and in case it is lost, to immediately report this loss to the clerk, when a new card is issued and a record made of the card having been lost. This prevents any person except the owner of the card from drawing store orders or pay, unless the card presented is accompanied by an order from the owner, or unless the party presenting it is a member of his family or an old, well-known employee.

The war continues, therefore your duty also continues. It is your duty to buy a THIRD LIBERTY LOAN BOND, *even if you have bonds of the First and Second Loans.*

Water Whistle

BY FRANK HUSKINSON
Lafayette, Colo.

Central station power was installed at a certain mine. The power house was converted into a substation. As there was no necessity for keeping up steam, the use of the boilers and engines was discontinued. Then it was discovered that the steam whistle which had signaled

DETAILS OF PIPE CONNECTIONS AND WHISTLE

the time of starting and stopping work could not be sounded. I decided to try a scheme of blowing the whistle by means of water and air. The water tank was located upon a hill. The pressure at the boiler house was 85 lb., and we had plenty of water.

Part of the old exhaust line from the engines consisted of a 20-ft. length of 12-in. pipe, which extended vertically from the floor up through the roof of the boiler house. I removed the exhaust head from this piece of pipe and put on a special flange that reduced the 12-in. pipe to a 2-in. opening. Then I took a piece of 2-in. pipe 18 ft. long and secured the old steam whistle to one end of it. The other end I screwed into the opening on top of the 12-in. pipe.

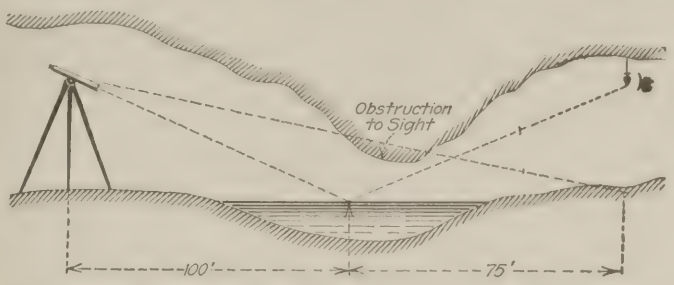
On the bottom part of the 12-in. pipe I put in a blind flange. I also made a connection in the 12-in. pipe for a 2½-in. pipe. Into this opening I screwed a short piece of pipe. Onto this I screwed a tee, then another short piece of pipe and a gate valve. This was connected to the 4-in. water line from the tank. The outlet of the tee was then fitted with a short piece of pipe and a gate valve from which a section of pipe was run outside the building as a drain.

The accompanying diagram shows the details of the pipe connections and whistle. All joints were made airtight. The whistle was of a type that is operated by means of a quick-acting valve. This was opened by pulling a wire. The operation of the "water whistle," as it was called, was simple and quite satisfactory.

The valve for draining the 12-in. pipe was opened, also the whistle valve on top was held open, and all the water was allowed to drain out. Then the whistle valve and the drain valve were closed, and the valve on the water line was opened wide, allowing the water to flow into the 12-in. pipe. This was done about 30 sec. before the whistle was to be blown. Next the wire that opened the whistle valve was pulled, allowing the whistle to blow.

The action of the apparatus was as follows: The draining of the 12-in. pipe with the whistle valve open allowed the pipes to fill with air at the ordinary atmospheric pressure. As soon as water from the main was turned into the pipes, all other outlets being closed and airtight, the air inside the pipes was compressed to the pressure of the water, which is 85 lb. As soon as the whistle valve was opened the air that rushed through the whistle had almost as much effect on it as had the steam used formerly. The water entering the pipe kept the pressure almost constant, and the whistle could be blown for several seconds or for short blasts.

A LIBERTY BOND *will soon become a badge of loyalty.*



Expedients in Surveying Practice

BY MINING ENGINEER
Punxsutawney, Penn.

The practice of surveying is often attended with difficulties that tax the ingenuity of the engineer to overcome without loss of time. The incident I am about to recite occurred recently when making a survey of an old mine. Being one of the party, I was much interested and impressed with the ease with which the transitman overcame what would, but for his ingenuity, have proved a serious and delaying obstacle.

As illustrated in the accompanying figure, at one point in the entry there was a deep swale where water had collected to a depth of 2 or 3 ft. The sudden dip and rise of the entry made it impossible for the transitman and head-sight to see each other. However, taking advantage of the reflection of the head-sight's lamp in the water, the transitman ordered him to hold his lamp immediately behind the plumb bob, which was suspended from the point in the roof. This being done, the transitman sighted his instrument to the reflection of the bob in the water.

The trick set me to thinking and I wondered if it would interfere with the accuracy of the sight if the

SIGHT TAKEN TO OBJECT REFLECTED IN WATER

lamp should be held a little to one side or the other of the plumb bob. The manner in which the survey checked, however, showed that the scheme adopted by the transitman was correct.

Studying over the matter, later, I found that as the surface of the water was level, the line of sight was in a vertical plane passing through the instrument and the plumb bob, and the result would have been the same if the transitman had been able to take his sight directly through the plumb bob. The expedient was, to my mind, an interesting one that is well worthy of mention, as it will often be of assistance to engineers when surveying mines under such conditions.

The boys in the trenches feel more confident if they know the folks at home are backing them.

Loosening the Journals

BY HENRY M. PAYNE
Pittsburgh, Penn.

In severe weather, such as has been experienced this winter, it is sometimes found difficult to move freight cars on sidings both above and below the tipple because of cold journals. This may be overcome by pouring about ½ pint (no more) of ordinary coal oil or kerosene into each journal box. The car may then be started with a pinch bar, and if the grade is sufficient to permit the car to run in summer it will move equally well even in severe weather.

The company with which I am connected has tried this method when the thermometer stood at 15 deg. below zero, and the results were such that car movers, teams, etc., have been done away with. The total cost is about 6c. per car; the saving in time is about 95 per cent.

This treatment does no harm to packing or oil in the car journal and is exactly analogous to using a light oil in an automobile in winter instead of the heavy oil used in summer.

This method of limbering up car journals may not be new, but I never heard of it. We tried it as an experiment and hailed the result with joy.

Montour No. 8 Plant of the Pittsburgh Coal Co.

By GEORGE W. HARRIS
Editorial Staff, "Coal Age"

THE Pittsburgh Coal Co., the largest miner of bituminous coal in the world, has a daily capacity of over 100,000 tons, or 32,000,000 tons each year. This company is the owner and operator of 100 active coal mines in the states of Pennsylvania, Ohio, Illinois and Kentucky. Nine-tenths of these collieries are located in the heart of the Pittsburgh district, and the fields are known as the Youghiogheny and Westmoreland. In this district the Pittsburgh company is the owner of about 190,000 acres of unmined coal, comprising the highest grade of gas, coking and steam fuel.

The seventeenth annual report of the Pittsburgh Coal Co., for 1916—the latest official source of information—states that 18,709,926 tons of coal were produced and handled during that year; the gross net earnings from all sources were $5,592,798.80. Both production and net earnings would likely have been larger had the use of the facilities provided been permitted by the always dominant factors of labor and transportation.

On Apr. 1, 1916, practically a general suspension of work at the mines occurred. This continued for a period of about six weeks, a full month after the heavy Lake shipments usually begin. An unusual scarcity of cars then set in, which continued and was greatly added to by railway congestion with the result that, except during the first quarter, the company had no free shipping month during the year in question.

A map of the bituminous coal region of western Pennsylvania (Fig. 1) shows the location of the Pittsburgh Coal Co.'s mines and the line of the Montour R.R. The company's mines in the Youghiogheny and Westmoreland fields are joined by its own railroad, a line 150 miles in length. Connections are made direct with Lake Erie ports and to all railways east, south and west. Thus the distribution of the concern's product is provided for in such a way as normally to avoid all delay in transportation.

The Pittsburgh Coal Co. has established excellent facilities for loading coal into ocean vessels, for export shipments to South American and other countries, at the ports of New York, Baltimore, Philadelphia and New Orleans. The demands of the south and Gulf of Mexico ports are supplied by shipments down the Ohio and Mississippi Rivers. At the lower lake ports extensive and modern loading plants are operated by the company. Millions of tons of Pittsburgh Coal Co.'s gas and steam coal are forwarded during the summer months via the Great Lakes to its docks on Lake Superior and Lake Michigan, from where it is distributed throughout the west, northwest and Canada.

A large coal company like the Pittsburgh always has construction in the planning or under way. Old tipples require entire rebuilding on account of being worn out from long service, or the method of handling coal may be too antiquated. Then new properties are acquired and developed to increase tonnage or maintain a steady production as old mines become exhausted.

A few years ago the Pittsburgh Coal Co. decided on extensive development in its First Pool section. Old First Pool Mines No. 1 and No. 2 hauled coal long distances to the tipples on the Baltimore & Ohio R.R. just above Willock station, owing to the coal near the tipple being worked out. About this time the Montour plants were projected and No. 8 tipple was designed.

Montour No. 8 plant is about 8 miles from Pittsburgh (see Fig. 1) as the crow flies, on the Lewis Run branch of the Montour R.R., some 2 miles southeast from Willock station on the Baltimore & Ohio R.R. The montour line connects with the Pittsburgh & Lake Erie R.R. at the Ohio River. No. 8 plant was reached by the writer on a mine locomotive traveling through miles of old entries, in which could be seen thousands of tons of the best Pittsburgh seam—a sight that brought with it vivid recollections of coal lines in New York City waiting for their pitiful allowance of 25 or 50 lb. of coal on a bitter winter's day.

Pacific Coast Timber for Tipple

In looking around for building material the Pittsburgh Coal Co. discovered that steel could not be promised for delivery short of 12 months. In this emergency it was decided to use wood, and Oregon fir was adopted, shipments being made from the Pacific coast. This fir somewhat resembles coarse white pine in texture and is slightly pinkish in color. It was adopted by reason of its being strong, straight lumber, free from knots. Long sticks are readily obtainable.

Ordinarily, some objections exist to wood as building material, especially for tipples, their life being estimated at about 20 years when constructed of wood. As is well known, the Pittsburgh company has many fine steel structures. To secure greater permanence and prolong the life of the tipple, a wood preservative was used. Carbolineum was obtained from the Monongahela Wood Preserving Co., with offices in the Fulton Building, Pittsburgh, Penn. The source of this preservative is anthracine oil, a coal-tar product, whose worth has been proved by the test of years of service. The Monongahela company's product is made in America, and is used by many large railroads, telegraph, telephone and mining companies for open-tank and brush treatment.

Carbolineum has many advantages. The company in question guarantees every gallon and states that it contains no tar and is the most economical preservative to use as there is no loss on heating—the sun's heat drives the oil deeper. It is self-penetrating on account of its high capillary attraction in the wood fiber. It is also permanent in the wood, penetrating deeply without forming a film to crack or peel off. It is said to be the least volatile, most toxic to fungi after long exposure, and least soluble in water of all wood preservatives.

The French and the British have nobly stood behind their governments in war loans. Where do you stand?

The Montour No. 8 tipple contains 350,000 ft. B.M. of timber which was treated with 45 bbl. of carbolineum, or 6½ gal. per 1000 ft. B.M. of rough lumber. This preservative was applied hot with 4-in. brushes by hand after the timber was framed. If the timber is dry and in good shape to receive the oil, carbolineum can be applied liberally at close to $1 per 100 sq.ft. of surface, labor and material. This cost is for the highest grade of carbolineum, showing no distillate under 275 deg. C., thoroughly filtered by pressing and containing no tarry or volatile matter. The oil costs from 60 to 70c. per gal. in 50-gal. drums. Two coats of oil are sometimes applied. Usually the framed ends are treated before the timbers are erected, and later the completed structure is painted with brushes or by spraying. Labor in the Pittsburgh district costs about $3 per day for rough painters, who should paint out some 10 squares per day of average climbing work on tipples, with extension brushes, etc. It is well to use with caution various so-called "creosotes" in "improved" forms and untried materials, on account of their inflammability.

Montour No. 8 tipple is shown in perspective in Figs. 2 and 3; the former was taken from the upper side and the latter from the opposite side, while the tipple was under construction. The office work on this tipple

FIG. 1. MAP SHOWING LOCATION OF PITTSBURGH COAL CO. MINES AND MONTOUR R.R.

—design and working drawings—was done by Ernest S. Taylor, the son of the chief engineer of the company. The management in charge of construction of the plant specially comments on the accuracy of the plans, which greatly facilitated the erection of the tipple. The tipple is partly shown in plan in Fig. 4 with the mine tracks leading from mine openings Nos. 1 and 2 to their respective dumps. An elevation with coal-handling equipment in place is given in Fig. 5.

The framing of the tipple consists of 12 x 12-in. posts, caps and sills, to which are bolted two pieces of 6 x 12-in timbers for diagonal and other bracing. The stringers are made up of two pieces of 6 x 16-in. sticks, between which and the caps are corbels. The main timbers are secured by 1-in. bolts, and ¾-in. bolts are used on the bracing.

The coal from each mine is handled by its own dump, that from Mine No. 1 going to dump No. 1 with its own

FIG. 2. MONTOUR NO. 8 TIPPLE—UPPER SIDE

set of chutes and screens; the coal from Mine No. 2 goes to dump No. 2 with its separate or combined equipment for loading cars. The dumps, chutes, screens, etc., with which the tipple is equipped for handling coal from mine dump to railroad cars, was furnished by the Phillips Mine and Mill Supply Co., of Pittsburgh, Penn., with one exception—the lump coal loading booms came from the Jeffrey Manufacturing Co., of Columbus, Ohio.

The course of the coal through the tipple is as follows: After leaving the mine car at the Phillips cross-over dumps, the coal runs into the mine-run weigh baskets which are built over the same dimensions except that the drop door of No. 2 discharges the coal in the opposite direction of dumping. The doors are automatic in operation, being opened by the weight of the coal and closed by means of the back balance weights. The doors are controlled by means of band brakes.

The coal, after passing over the lump screens, runs into chutes or baskets which discharge into radial chutes, these delivering the coal (at right angles to the direction it takes on leaving the mine cars) onto a picking table and loading boom. The radial chute has the advantage over the usual hopper in that the direction of the flow of the coal is not changed by bumping plates, but is turned gradually and easily by the curved chute. The weigh hoppers and all attachments are suspended underneath the floor on a 10-ton hopper scale of the suspension type, which leaves the floor above clear so that the men are not hampered or in danger of being crushed or injured between scale rods and car. The scales are also free from all interference or damage.

In these equipments the coal is spread out over the picking table by means of a weighted plate instead of by a reciprocating feeder. However, a feeder can be used if it is desired. The nut coal can also be delivered onto the picking table by means of a radial chute. As the nut coal is delivered onto the picking table first, it forms a cushion for the lump coal when ¾-in. coal is being loaded. The fly in the top of the lump screen deflects the coal to a conveyor, which carries it to a locomotive coaling pocket when desired.

The cars on the lump tracks are loaded by loading booms with 1¼-in. lump, ¾-in. lump and mine-run coal. To load run-of-mine coal, the screening surface of the lump screens are covered by doors. The third loading track receives nut, nut and slack, or slack, from both No. 1 and No. 2 equipment. Track No. 4 receives slack or nut and slack from both rigs.

Fig. 6 shows a car stop or trip controller back of the dump that gives the man at the dump full control of the cars coming into the dump. After a loaded car has passed through the car stop, it depresses the treadle ahead of the stop, closing the horns of the stop which are automatically locked; the main trip of cars advances until it runs against the car stop. When the dumper is ready for another car, the man in control releases a spring by means of a conveniently located foot treadle; the spring opens the stop, allowing another car to pass through. This device is also manufactured by the Phillips Mine and Mill Supply Company.

Mechanical provision has been made to facilitate moving both empty and loaded cars on the Montour tipple. An endless ⅝-in. rope haulage system moves empties from the tipple to a point where the mine locomotive attaches to the trip. This method of gathering empties is in duplicate on each side of the tipple; each system is independently motor driven. The loaded cars are moved by chain car hauls.

Ample provision has been made to guard against fire. Three-inch pipe connects with a large tank on the top of a near-by hill, giving a head of 120 ft. at the tipple dump. This pipe system also connects with the pump supplying water to the tank, so that there are actually two sources of water supply in emergency. The tipple is well covered by this water system, and valves and hose are located at various convenient points on the structure.

As noted, the tipple is supplied with coal from two openings, one on either side of the valley in which the

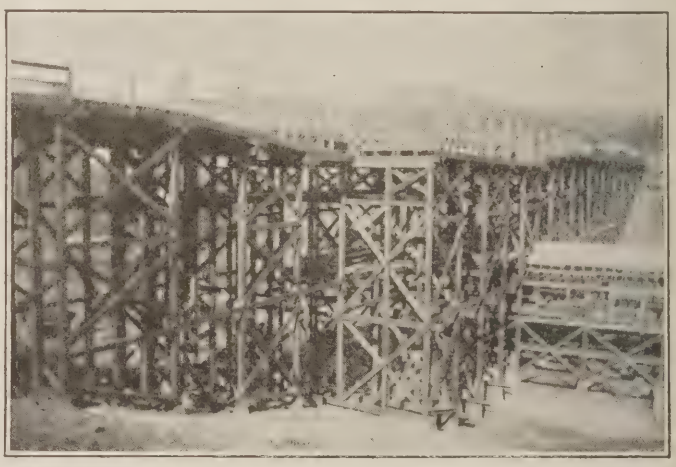


FIG. 3. MONTOUR NO. 8 TIPPLE DURING CONSTRUCTION

plant is located. The Pittsburgh No. 8 seam is mined and here attains a thickness of about 4 ft. 8 in. The "bands" run from ¼ to 1 in. in thickness and are from 14 to 18 in. above the bottom. Over the seam is 8 to 12 in. of fireclay drawslate; then 18 to 24 in. of top coal, over which is the main top rock of soapstone or shale.

Fig. 2 shows the nature of the country in the vicinity of Montour No. 8. The topography includes low hills and numerous ravines. The coal seam has only about

150 to 250 ft. maximum cover and the continuity of the seam is much broken up by the ravines. This "lay of the land" determines largely the mine development. Main or face entries are driven, and from these are pairs of butt entries on about 580-ft. centers. This permits rooms to be driven on the face of the coal, thus facilitating mining. Rooms are 24 ft. wide and pillars 15 ft. A 100-ft. pillar of solid coal is left on each side of face entries as protection. In robbing pillars, one pillar is kept about 16 to 18 ft. back of the adjoining pillar to secure a diagonal break across the workings and protect those doing the robbing.

The mines are electrically equipped and soon all coal is expected to be moved by motors. Four-ton storage-battery gathering locomotives are being installed; two are operating here now, and others will follow until mules are entirely replaced in these mines. Trips of loaded cars are hauled to the tipple by three motors—one Westinghouse and two of Jeffrey make. Sixteen Morgan-Gardner electric machines undercut the coal. Power is furnished from a central station, being transmitted from a distance at high voltage. At substations the electricity is converted and transformed to the usual mine direct-current of 250 volts for machines and 500 for haulage.

In connection with haulage, attention is directed to the plan of the tipple (Fig. 4) and the track layout from the mines to the dumps at the tipple. The three parallel tracks greatly facilitate handling trips. The motor brings in the loads on the track so indicated and readily attaches to the empties, made up in a trip on its siding, by means of the third open track. In Fig. 3 the plan for facilitating the movement of loaded cars near the dumps is shown. This is partly accomplished by increasing the grade over a space of several bents on the loaded tracks. These grades, on either side of the center of the tipple, show in the broken line of the stringers on the floor of the top of the tipple.

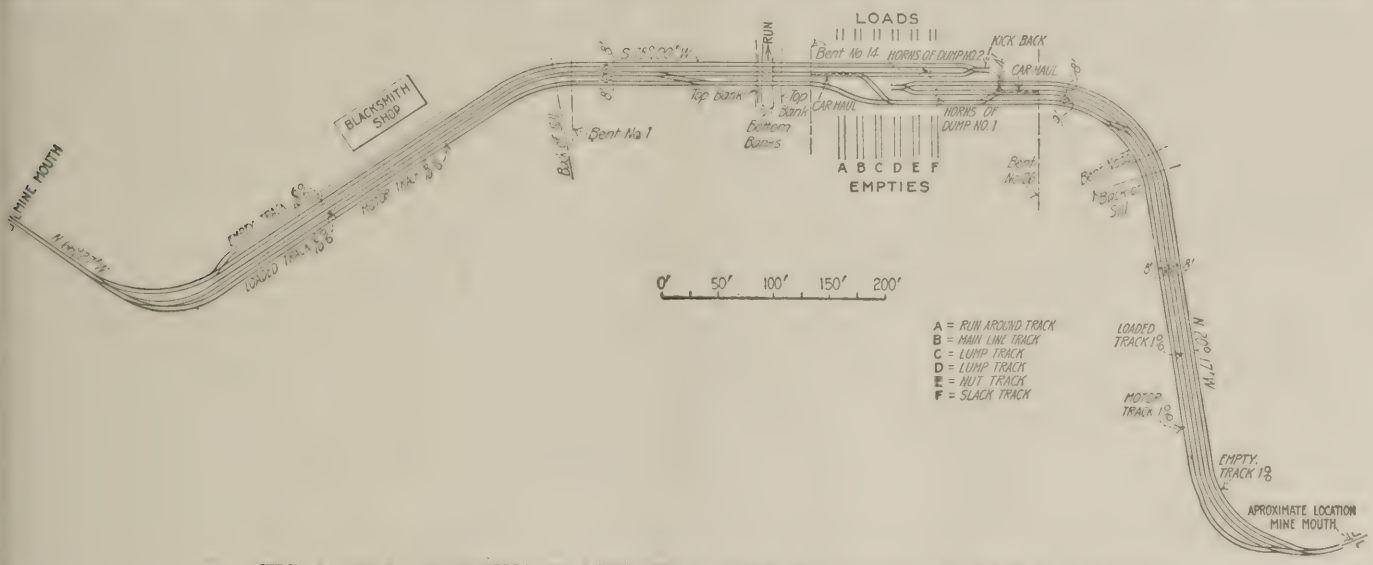

FIG. 4. PLAN SHOWING TRACKS FROM MINE MOUTHS TO DUMPS AT TIPPLE

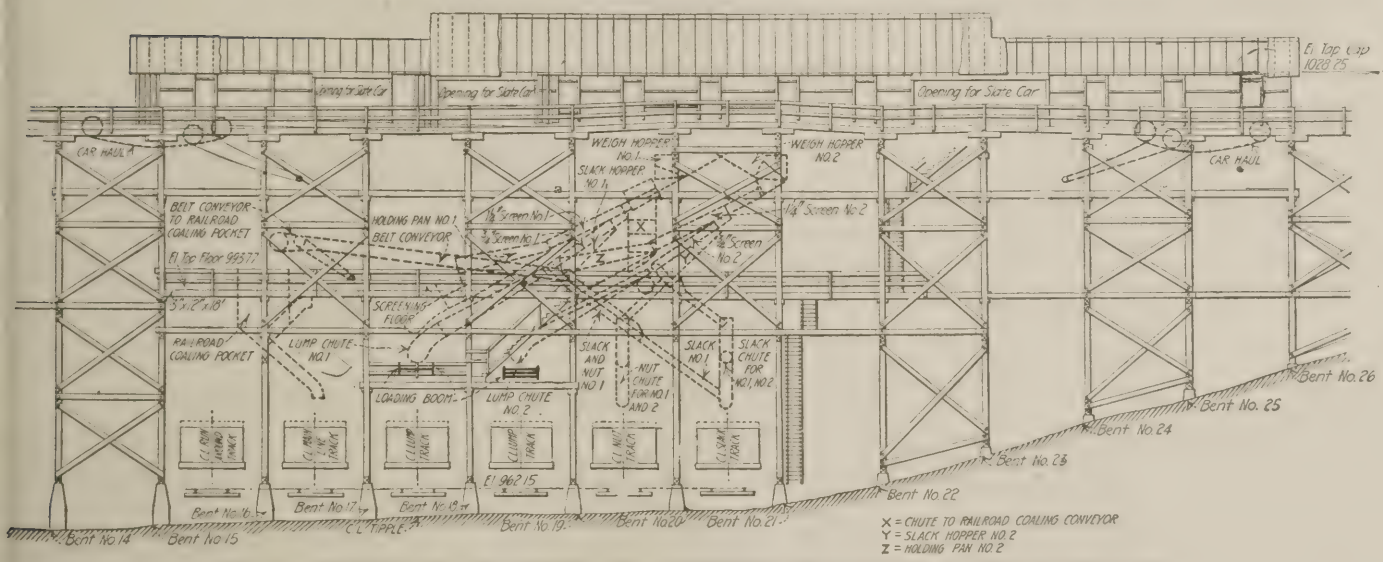

FIG. 5. ELEVATION AT TIPPLE AND LOCATION OF COAL-HANDLING APPARATUS

The capacity of the Montour No. 8 plant depends on the mine development, number of miners, facilities for shoving cars through the Phillips dumps, and railroad cars at the loading chutes. The mines are under development and miners are employed as they present themselves as applicants for rooms. Haulage facilities are being strengthened by the purchase of additional gathering motors.

The two Phillips crossover dumps will easily handle four two-ton cars per minute. Strictly speaking, the capacity of the dumps is not the sole limiting factor in the amount of coal handled over the screens, but rather

the mine-run weigh basket. The Phillips company claims that its dump can readily handle six cars per minute, but to dump, weigh and properly screen the coal, the basket will handle just about four cars per minute. If the coal is not screened, speed of operation can be increased.

The uncertain factors in the matter are labor and transportation. Were it not for these elements, the production of a mine in the Pittsburgh district under average conditions would be almost unlimited. The coal from 1600 acres of new ground is planned to be handled by the No. 8 plant.

In working out the details for the plant just described, the Pittsburgh Coal Co. had in mind further and similar development in the First Pool section. One or more Montour plants are under way or contemplated

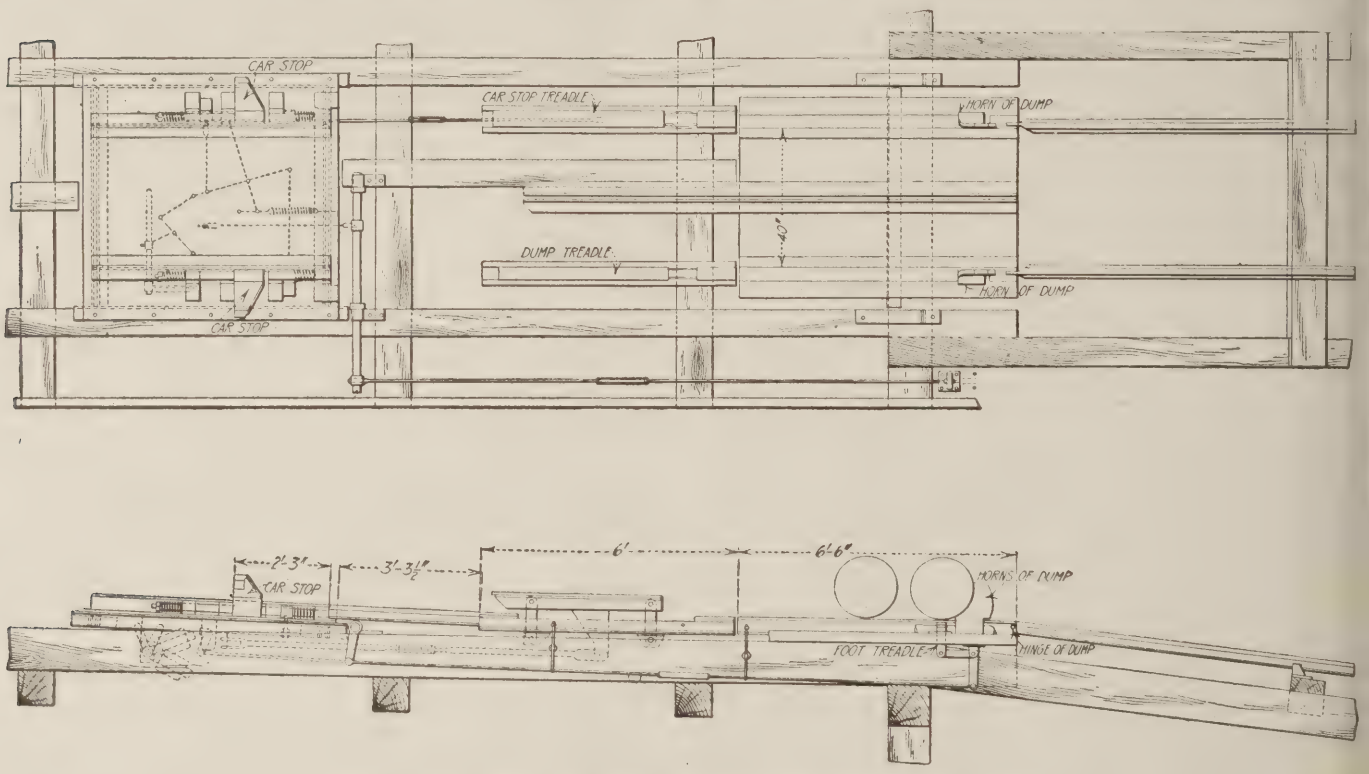

FIG. 6. CAR STOP OR TRIP CONTROLLER NEAR THE DUMP

—a shipment of Oregon fir is expected for another tipple which is to be similarly treated with carbolineum.

In the preparation of this article, *Coal Age* is greatly indebted to E. J. Taylor, chief engineer of the Pittsburgh Coal Co., and his assistants, H. L. Auchmuty and E. S. Taylor, for courtesies extended to the writer facilitating the gathering of information and for the privilege of visiting their plant. At the Montour No. 8 colliery H. D. Thompson, superintendent, and D. J. Ryan, mine foreman, gave every opportunity to inspect mines and tipple and furnished much interesting information. Acknowledgment should also be made to the publicity department of the Pittsburgh company for reports and pamphlets.

Cornstarch-Asphaltum Binder for Briquets*

BY BURKE BAKER
Philadelphia, Penn.

The American Briquet Co. has built a small plant for briquetting coal at 25th St. and Washington Ave., Philadelphia, primarily for demonstration purposes. Its output per hour is 4 tons of 2-oz. briquets, which have been retailed in the vicinity during the year that the plant has been in operation. They have proved very acceptable for use in the ranges, heaters and grates of homes, and in the steam-heating plants of apartment houses and hotels. None of these briquets has been sold for power purposes, although satisfactory tests have been made in this field. Anthracite silt is used and is shipped direct from breaker or washery, the only preparation it receives being the removal of excess moisture by means of a Ruggles-Coles rotary dryer. Care is taken, however, to purchase silt that contains less than 18 per cent. ash.

The method of briquetting is covered by U. S. Patent No. 941,454, issued to Charles E. Hite, and is known as the "emulsion process." The binder, which is the basis of the patent, is composed of 0.5 per cent. cornstarch or wheat flour; 1 per cent. asphaltum or hydrolene, and 6.5 per cent. water, the percentages being based on the weight of coal dust. It is prepared in a tank equipped with paddle agitators and heated by steam jets. The starch and water are first made into a paste and brought to the boiling point by live steam; the melted asphaltum is then introduced and thoroughly beaten into the paste by the agitators. This rapid stirring breaks the hot asphaltum into minute particles

*Discussion of a paper presented at the New York meeting of the American Institute of Mining Engineers, Feb. 18, 1918, and entitled "The Briquetting of Anthracite Coal." This paper was printed in "Coal Age," Feb. 9, 1918, page 278.

Three periods urge purchasing LIBERTY BONDS: *Past, for the gift of Democracy; Present, for our boys in France; Future, for the safety of the world.*

which are distributed through the paste, producing a smooth chemical emulsion. This emulsion, when dried, is not soluble in water.

The binder is mixed with the dry coal dust in a horizontal paddle mixer, 8 parts by weight of binder being used for 100 parts by weight of coal dust. The resultant plastic mass is then discharged into the press, which is of the simple roll type. Since the binder is a liquid and is not sticky or gummy until partly dried, it is readily mixed with the coal dust in a fairly uniform manner.

From the press, the briquets are conveyed to a drying oven. Here they are distributed 6 in. deep over a broad screen-conveyor which passes through a "tunnel" constructed of hollow tile. Through this tunnel and up through the layer of briquets, a current of air is drawn by an exhaust fan at one end of the dryer, the air having been heated to approximately 225 deg. F. by a furnace at the other end. The speed of the screen-conveyor is such that the briquets are in the dryer one hour before they are discharged into an elevator which carries them to the loading chutes. This dryer is similar in design to those used in the textile industry and in the drying of ores.

The briquets thus made constitute a thoroughly satisfactory fuel for use wherever the prepared sizes of anthracite are consumed. They are water-proof and weather-proof; they withstand rain, freezing and thawing, the hot sun, or the heat of a boiler room, or all in succession. They are hard and tough enough to withstand rough handling, and can be piled in large quantities without softening or sticking. They hold their shape in the fire until completely consumed, and do not soften or fuse at any time. They are practically free from odor or smoke, and are entirely free from fumes or gases that hurt the eyes or skin, or injure flues and grates. The emulsion process has certain distinct advantages, which may be outlined as follows:

The total cost of binder, of drying, and of interest and depreciation on additional equipment in the emulsion process, is 65c. per ton of briquets. On the other hand, the cost of the asphaltum binder, estimating 7 per cent. to the weight of briquets and $17.50 as the price of hydrolene, is $1.22 per ton. Thus there is an actual saving in the cost of manufacture of 57c. per ton.

The emulsion binder, with its 1.5 per cent. of outside raw materials, instead of 7 per cent., greatly reduces the dependence upon outside sources of supply, thus avoiding many shutdowns due to delayed deliveries of asphaltum.

An asphaltum of a high melting-point and low penetration is required in the oil process. This is produced by only one or two of the large refineries. In the emulsion process, any grade of asphalt from crude petroleum to that having the highest melting-point can be used, thus permitting the purchase of the lowest-priced product from any refinery. The other raw material—½ per cent. of cornstarch or wheat flour—can be bought in the open market and from many sources.

By using only 1 per cent. instead of 7 per cent. of oil, the objectionable features of smoke, odor and soot are correspondingly reduced. The amount of smoke or odor produced by the 1 per cent. of asphaltum in its emulsified form is almost negligible; and there is no soot whatever.

The emulsion-binder briquets do not soften under heat. They can therefore be shipped in hot weather and to any latitude without danger of sticking in the cars; they can be stored in large quantities in summer without softening, and they do not soften and fuse in the fire, even under forced draught.

The emulsion process is not so simple as the asphaltum process, since the preparation of the binder and the drying of the briquets, although simple enough in themselves, require additional equipment. But this is compensated by the greater ease of mixing the binder with the dust The "masticator" is unnecessary and the need of keeping the flux at the proper temperature is obviated. On the other hand, the lower cost of production and the superior character of the product would seem to mark this as a forward step in the industry.

The American Briquet Co., after having operated its small plant in Philadelphia for a year, and having thoroughly proved the quality of the product and the practicability of manufacture on this small but commercial scale, is now making contracts for the erection of a plant of 50 tons per hour at Lykens, Penn., where arrangements have been made with the Susquehanna Collieries Co. for a supply of the silt produced by the colliery at that point.

The Methanephone

A young Welsh professor in London has recently perfected an invention with which he hopes to relieve considerably the mineworker from the fear of methane gas. The little instrument has been appropriately named the "Methanephone."

It consists of a small wooden box about 9 in. in height, containing an electric battery. At the top of the box is a fuse head cap upon which a tiny light always glows from the battery beneath. As soon as a certain low percentage of methane gas enters the workings its presence causes a tiny explosion in the fuse head, the explosion in turn melting a fine wire filament, which starts a bell to ringing continuously. The men in the vicinity are thus notified that gas has made its appearance and can take the necessary precautions. Officials of the Miners' Federation of Great Britain have witnessed effective tests of the methanephone.

If we help Uncle Sam by buying LIBERTY BONDS, *we help ourselves. The buying of* LIBERTY BONDS *resolves itself into an expression of the highest form of intelligent self-interest. A British sergeant told a cocky young American, just off a troopship, "You aren't fightin' to save France an' you aren't fightin' to save Belgium; you're jolly well fightin' to save your children and your grandchildren." The same line of reasoning applies to the buying of* LIBERTY BONDS, *for in the last analysis you aren't buying them to help a mythical old gentleman in a be-starred swallow-tailed coat and striped trousers who is having a lot of trouble purchasing ships and shoes and sealing wax; you're jolly well buying them to help yourself.*

Drifton Breaker of the Lehigh Valley Coal Company*

By EFFINGHAM P. HUMPHREY
Assistant Superintendent, J. S. Wentz Co., Upper Lehigh, Penn.

THE Lehigh Valley Coal Co. finished the rebuilding of its Drifton No. 2 breaker at Drifton, Penn., in the summer of 1917. The new construction comprises an addition and the complete remodeling of the old breaker. It is of interest to note that the old structure was the first iron breaker erected in the anthracite region. This old breaker was built by the Cross Creek Coal Co., under the direction of the late Eckley B. Coxe, in 1888-89, and was fully described by him in the *Transactions*[1]. The columns were cast iron, 8, 10 and 12 in. square. The floors and partitions in pockets were cast-iron ribbed plates. The struts were cast iron of "H" section; the other members were of structural iron either rolled I-beams or built-up sections. The sizes of the rolled beams varied from 6 to 20 in. deep, while the built-up sections, made of plates and angles, varied from 6 to 63 in. in depth, so that there apparently was no rule to determine the type of section used.

In the remodeling of the old structure, practically everything was taken down except the columns and roof, and such beams as were necessary for temporary construction purposes, and therefore a close inspection of the old structural members could be made and the effect of the acid water on them could be noted. The cast-iron members were but slightly attacked by the water, while the wrought-iron beams, in the wet places, were corroded almost to failure.

The following are analyses of cast-iron, wrought-iron and structural-steel samples taken from the old and the new structure:

	Si	S	P	Mn	C
Old part, rolled structural iron	0.13	0.06	0.29	0.013	0.17
New part, rolled structural steel	0.03	0.04	0.11	0.240	0.26
Old part, cast iron	1.18	0.12	0.93	0.229	....
New part, cast iron	2.41	0.13	0.72	0.280	....

The mine water contained 71.79 parts per million of free sulphuric acid and 320.88 parts per million of total sulphuric acid as sulphates. The temperature of the water was 72 deg. Fahrenheit.

The depreciation of a structural-steel breaker for dry preparation is unknown, but is estimated at 1.25 per cent., while for a breaker using acidulous mine water during preparation I estimate the depreciation at 4 per cent., as determined by the life of the steel in the old Drifton breaker, which was 26 years. This figure may be high, for repairs and replacements to broken beams, due to corrosion, were frequently made in the old Drifton breaker. Water-tight construction of chutes and hoppers, to prevent the water from coming in contact with the iron, would certainly have prolonged its life; but little or no attention was given to this when the old breaker was built; in fact very little water was used then as compared with the quantity now required.

An interesting phenomenon was noticed in the effect of the corrosion where wrought and cast iron were in contact in the presence of the acidulous water. In such instances the corrosion of both pieces was more rapid than separate pieces under the same condition. It may be probable that the action was assisted by a very weak electrolytic action caused by the slight difference in the metals. Slag holes in the casting showed more rapid corrosion than any of the other places, probably due to the same action.

The new addition is a modern fireproof structure built of structural steel with corrugated metal roof and siding, steel window frames and concrete floors. There are 332 tons of structural steel, or 1.35 lb. per cu.ft. of breaker volume, distributed as follows:

	Tons
Columns	67.0
Pockets and beams	192.0
Stairs and treads	8.5
Bracing	16.5
Roof	20.0
Girts	22.0
Miscellaneous, rivets, etc.	6.0
	332.0

The average length of column is 72.5 ft. and the ground area 6730 sq.ft. The cubical contents is 48,792 cu.ft. The roof area is 7400 sq.ft. and the metal sides 18,500 sq.ft. The floors are 3½ in. thick, of concrete laid on deep-rib Hy-rib. The hoppers, chutes and jigs are of wood and waterproofed to protect the iron work from the mine water. The structural steel was painted with two coats of red lead and graphite paint. The arrangement of the jigs along each side of the breaker gives them the maximum amount of light. The machinery and shafting are accessible, and the rope drives are located in one bay, not scattered throughout the addition, as is frequently the case. The building is well lighted throughout and contains 6700 sq.ft. of glass.

The cast-iron columns of the old breaker were practically the only members re-used. New columns, girts, machinery supports, hoppers, chutes and stairs are of wood. Distortion of the old structure and the difficulty of plumbing it prohibited the use of steel except at great expense. The worn-out sheet-metal sides and roof were duplicated, using 16,500 sq.ft. of siding and 5720 sq.ft. of roofing. Its cubical content is 389,000 cu.ft. The window area is 5700 square feet.

The new plant at Drifton was built under the direction of Paul Sterling, mechanical engineer, Lehigh Valley Coal Co., and is designed to prepare 1500 tons of coal in an 8-hour working day. The author was engineer in charge of the entire remodeling and construction.

The new preparation plan (Fig. 1) required more height than was available in the old breaker; additional height was obtained by using elevators, and the addition was erected without seriously interfering with the

*Paper presented at the February meeting of the Institute of Mining Engineers, New York City.

[1](1890-91), 19, 398.

There will be joy in Washington and gloom in Berlin if the THIRD LIBERTY LOAN *is a success.*

operation of the colliery. While the use of elevators to handle prepared coal is not recommended, yet the conditions at Drifton did not warrant the adoption of a plan involving a shutdown, or the expenditure required to replace the entire old breaker by one that was new and costly.

The best daily output to date is 1735 tons, and it is expected that the breaker will be able to prepare and load 2500 tons daily. At present, the average dump is approximately 600 mine cars a day, 35 per cent. of this coming from the Lattimer stripping. This coal is of medium quality, one-half being good big-vein coal, and the other half of poorer quality that is mined from a small vein containing about 15 per cent. of divider rock. Three per cent. of the input comes from the Buck Mountain stripping, and is a very poor grade of coal, shaly and full of clay; the remainder of the breaker input is mine coal, hand loaded and of good quality.

The force on preparation is as follows: One breaker boss, 1 jig boss, 1 picking-table boss, 1 ticket taker and docking boss, 2 dumpers, 4 pickers on platform, 3 pickers on broken coal, 2 pickers on jig refuse, 2 jig runners, 4 machinery attendants (screen men and roll tenders), 1 breaker engineer, 1 oiler, 1 ropeman, 1 breaker cleaner; total 25 men. The force loading coal and charged against loading is: One loader engineer, 4 loaders, 2 runners; a total of 32 men in the breaker.

One man attends the rock crusher in the breaker, but part of his time is charged against the disposition of refuse. The rock crusher is driven by its own engine, so that it may be independent of the breaker, which permits of refuse disposition after quitting time, a necessary measure because rock may accumulate on the picking head when there is an interruption in the operation of the refuse conveyor.

The method of elevating the run-of-mine coal in the remodeled breaker was not changed from that originally devised and installed by Mr. Coxe. There are two

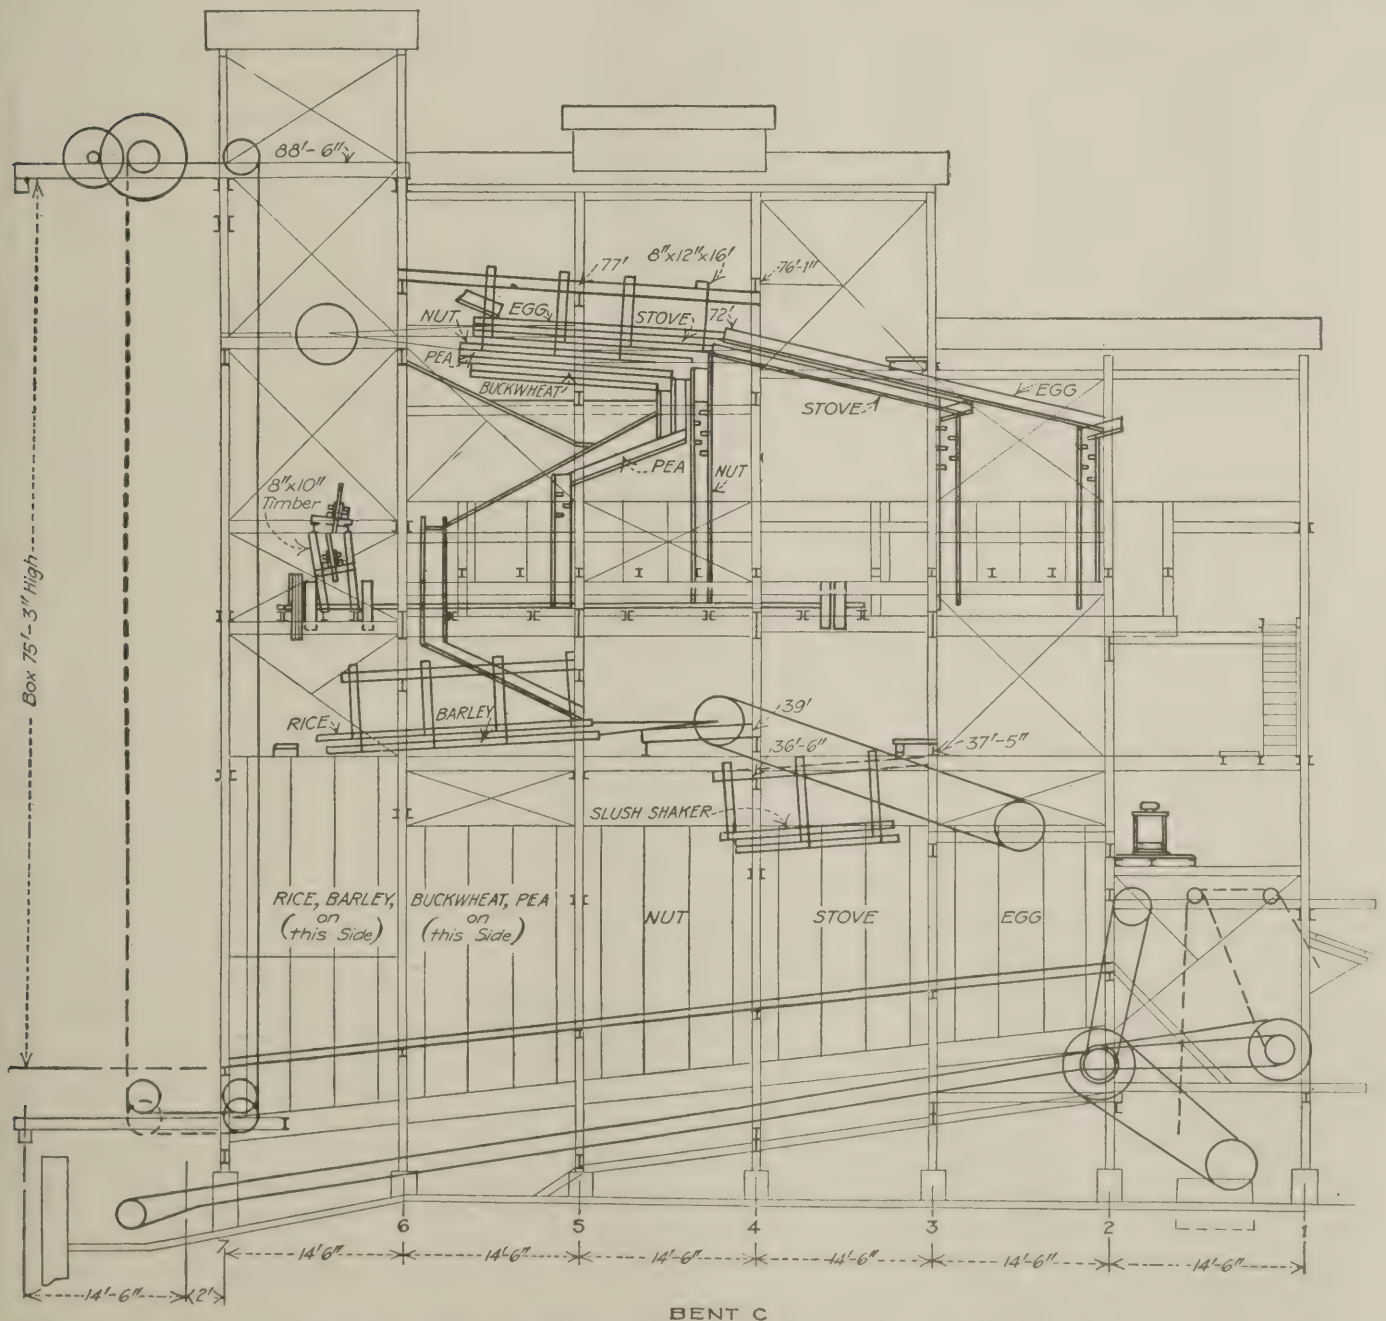

FIG. 1. NEW SCHEME OF PREPARATION, DRIFTON BREAKER

hoists, a single barney-plane hoist from the surface for all coal transported over ground from distant openings and strippings, and a balanced gunboat or skip hoist on the slope which connects a dump in the mines with the receiving hopper in the head of the breaker. The gunboat also serves a surface dump, which is used to handle the cars in excess of the barney-hoist capacity. The receiving hopper is large and permits continued dumping during short stops of the breaker. From this hopper, the run-of-mine gravitates to a reciprocating feeder, which delivers to a bifurcated chute which divides the flow so that it runs onto two banks of mud screen shakers, of four decks each, sizing lump, steamboat, broken and egg. The first two sizes gravitate to their respective moving picking tables. It is intended that pure coal shall be made in the future, but at present all prepared coal is jigged, and the pickers on the moving tables only "skin" the pure-coal product of impurities. No hand chipping is done, all half-and-half or capped pieces are left on the tables. The picked rock and impurities are thrown into a large chute of sufficient capacity to store a day's run, should any delay or breakdown occur to the refuse-handling machinery. This chute delivers to a No. 9 Gates gyratory crusher which reduces the material to about 3-in. lumps, and delivers it to a refuse conveyor to be conveyed to the rock bank.

The lump and steamboat products from the tables flow to a slow-speed No. 1 roll, breaking to steamboat and smaller, with a small percentage of steamboat oversize. The broken-down material flows to two banks of two-deck shakers, sizing steamboat and broken. The former size is broken down in a slow-speed re-breaker, or No. 3 pure-coal roll, to egg and smaller. The broken is inspected, any impurities being removed by hand picking, and then flows to the main broken loading pocket, or is switched to a separate pocket for use on the locomotive.

When there is no sale for broken, it mixes with the steamboat going to the pure-coal roll. The re-broken product from the pure-coal roll gravitates to the pure-coal elevator feeding pocket, of 20 tons storage capacity, to act as a reservoir in front of the fixed-capacity elevators; and is stored there during periods of fast dumping.

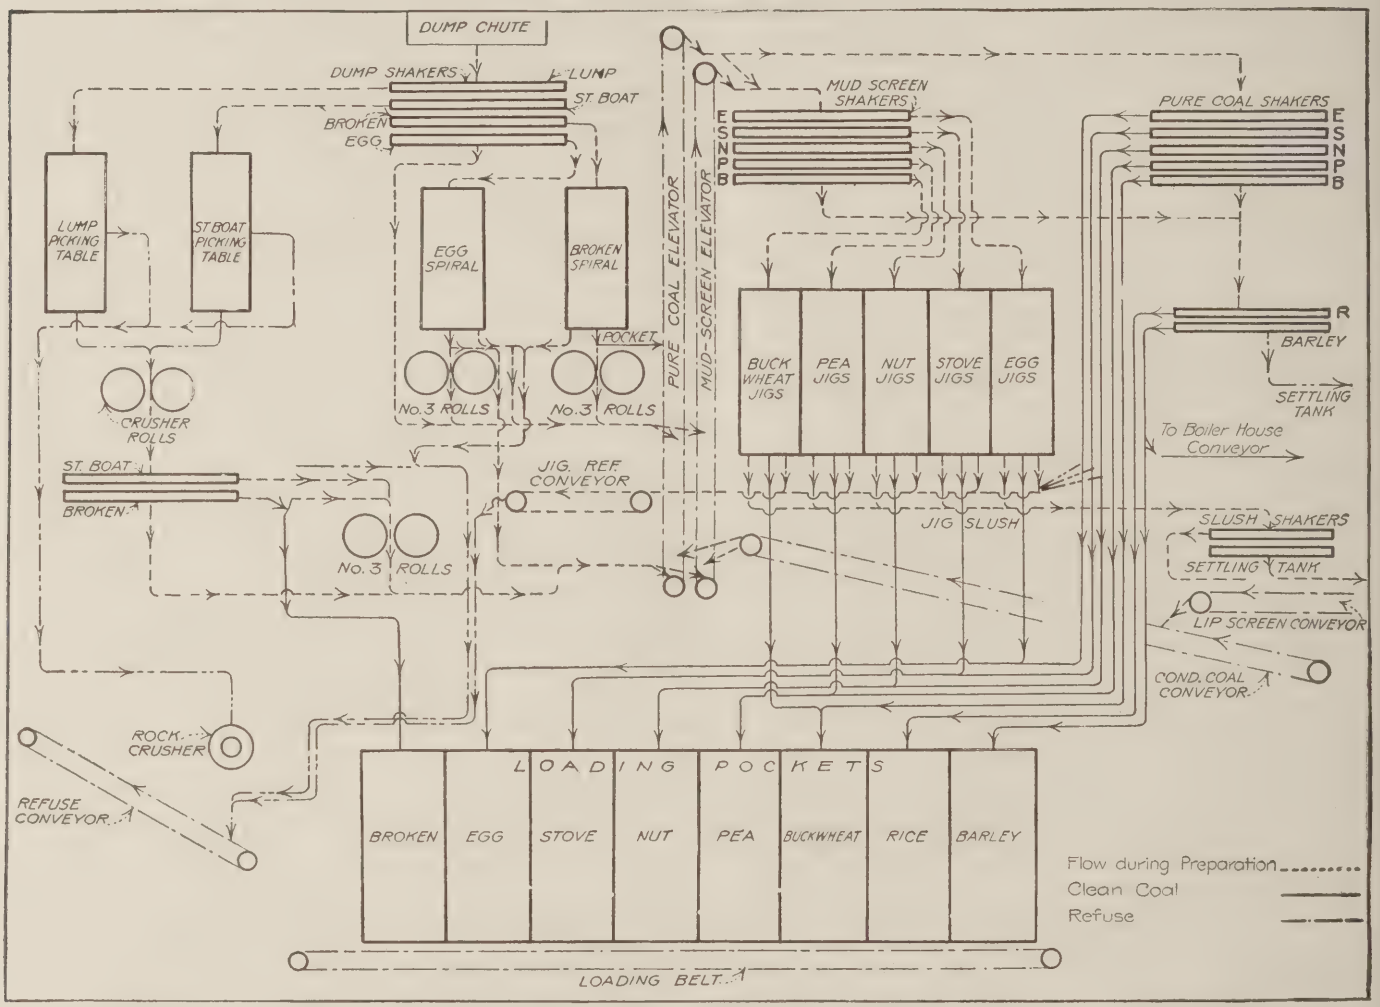

FIG. 2. LONGITUDINAL SECTION THROUGH BREAKER ADDITION

The mud-screen broken and egg is run over anthracite spirals, three for each size. These are adjusted to remove the maximum amount of rock so that one picker on the refuse, from each set of three spirals, can clean the product by hand, picking out the pure coal. The refuse from all spirals flows to the rock-handling machinery. The spirals, in addition to relieving the jigs of handling this refuse material, also protect the re-breaker rolls, receiving the spiraled product, as it has been found that rock dulls the roll teeth more quickly than the coal, thereby reducing the roll efficiency and the prepared sizes.

The spiraled mud-screen broken flows to its slow-

speed re-breaker, or No. 3 mud-screen roll, which breaks to egg, stove and smaller. The spiraled mud-screen egg flows to its No. 3 roll, or, when there is a demand for it, the egg is switched around the roll. The entire mud-screen product from both of the No. 3 rolls, also the egg (when not broken down) is mixed in the mud-screen coal elevator feeding pocket, a duplicate of the one for the pure coal.

Two elevators, one for pure and one for mud-screen coal, lift the products from the elevator feeding pockets to the top of the new addition (Fig. 2). There are four banks of five-deck shakers, arranged parallel. The two outside banks are for pure coal and the inside banks for mud-screen. At present (as already mentioned) no pure coal is made, as it has been found cheaper to remove refuse by jigging. This method of preparation will be continued until the quantity of the run-of-mine is increased to such an extent that it is necessary to make a pure-coal product, or if the quality of the present run-of-mine should change, producing a tremendous quantity of large lumps of pure coal, then the hand-picking force will be increased in order to clean the product on the moving tables.

With the present plan, the elevated pure and mud-screen products are dumped into the mud-screen bifurcated chute delivering to the two mud-screen shakers (the outside, or pure-coal shakers, are not operating). These shakers size egg, stove, chestnut, pea and buckwheat. Each size flows into its respective jig storage pocket. The jig pocket acts as a reservoir behind the jigs, storing up during rush periods and feeding out when no coal is coming. These pockets are equipped with adjustable partitions, arranged so that the capacity of any one pocket may be increased, by decreasing the capacity of the adjacent one. The partitions are changed to accommodate the quantity of each size made, and thereby increase or decrease the number of jigs on any one size, where it is necessary to handle a greater or lesser quantity of any size to meet the varying market demands. For example, when breaking down all coal to stove and smaller, no egg jigs are needed; therefore egg jigs can be run on stove, and vice versa.

The coal from the jig pockets flows to the jigs. These are equipped with automatic starting and stopping devices, actuated by the weight of coal in the chute, connecting the jig pocket to the jig, and operating a belt shifter through a system of levers. By means of this control, jigs will stop when no coal is coming and the jig pocket is empty, and will start up as soon as the feed starts again.

The clean coal from the jigs gravitates to the loading pockets, while the refuse is conveyed to the refuse-conveyor line. The coal is loaded into cars by a belt conveyor, which system was first used in the anthracite region by the Lehigh Valley Coal Co. The pocket gates differ from those previously used in being located at the end of the chute leading to the belt instead of several feet up the chute, at the point where the chute enters the loading pocket, thereby reducing the initial breakage resulting from the sudden rush of coal down the chute when the gate is opened, and permitting the use of a lifting check gate rather than a cutoff gate. The latter gate requires more power to operate than the former and was steam operated on previous installations of the company. The latter is opened by the weight of coal against the gate, when the operating chain is raised and closed by the belt loader operator, who pulls a chain connected to the gate.

The rice and smaller from the buckwheat shakers flows to two banks of two-deck shakers, sizing rice and barley. The material falling through the lower deck flows to settling tanks. The chutes from the rice and barley shakers are arranged so that both or either size may go to its respective loading pocket, or to the boiler-house conveyor line.

The jig slush or hutch product is delivered on a single-deck shaker, the material passing over is conveyed, together with the lip screenings, to a screening storage pocket. The product falling through goes to the settling tanks. Condemned coal is dumped into a hopper connected to the foot of the elevators by a conveyor. This conveyor will deliver to either the pure or the mud-screen coal elevator, by changing a switch in the discharge chute. Coal condemned for impurities can be switched to the mud-screen elevator, while coal condemned for screening can be sent to the pure-coal elevator. The condemned-coal conveyor also handles the lip screenings from their storage pocket. When the pocket is full, the conveyor is started and operates until the pocket is empty. When it is necessary to make a pure-coal product, the pure-coal elevator will discharge into the pure-coal bifurcated chute leading to the outside pure-coal shakers. The sized coal from the shakers will mix with the clean coal from the jig and flow to the loading pockets.

No controls to handle the coal in the old breaker have been installed, as usually the product is unsized and the breakage is practically nil. Abrupt turns and high drops are avoided as much as possible.

Elevator breakage is minimized by proper feed at bottom and proper discharge at the top. In the addition, White chute controls are used where thought necessary and vertical stepped telegraphs for lowering into jig and loading pockets. Spiral chutes are installed to lower pure coal. A movable pocket-filler chute is used on broken. Loading gates are as previously mentioned. The adjustable boom on the end of the belt conveyor, with curved chute, prevents a high drop into cars and assures a fairly uniform distribution of any screenings through the loaded car.

Water for preparation is required in the addition only. It is pumped direct from the mines to a 6000-gal. wooden storage tank, placed in the top of the old breaker. A cast-iron distributing main is connected to the bottom of the tank; branch lines run from this main: (1) to the pure-coal and mud-screen shakers; (2) to the jigs and (3) to the lip screen. Outlets are placed throughout the breaker for hose connections for

Would you have the "In" taken out of American "Independence?" The Kaiser would do it with his sword if he could. That is why you should buy a LIBERTY BOND.

The boys at the front need your assistance now as they did in the Second and First Loans. Do not fail to buy another LIBERTY BOND *because you already have one.*

Do you want to have a mortgage on your body from birth? Militarism does that. We are fighting to prevent such things. Buy a LIBERTY BOND *and help the good work.*

washing down, and for fire; cutout valves are placed on each branch line. At present, an outlet is furnished for each jig, but this is to be changed to an automatic jig-filler trough. This arrangement consists of a trough running back of the jigs with a 3-in. cast-iron connecting pipe leading from the bottom of the trough to each jig.

A connection will be made from the distributing main to the trough, with an automatic float valve on the end arranged to maintain a constant level of water in the trough. The trough will be filled with water up to a height to balance the water in the jigs through the connecting pipe. If the height of water in any jig falls below the proper level, water in the trough will flow into the jig and the automatic float valve will open and the water fill the trough until the balance is reached, when the automatic float valve will close. This arrangement maintains a constant water level in the jigs and results in better jigging due to the uniform conditions. It should also result in a saving in the quantity of water used by the jigs, as compared to the amount used when inefficiently controlled by hand.

CHANGES IN METHODS OF PREPARATION

The machinery in the old structure was the subject of an article by E. B. Coxe[2], 1890. It is interesting to note the changes in the methods of preparation. The more modern plants have more machinery and less men for the same tonnage even though the quality of the coal in many cases is poorer.

In the Drifton breaker shakers are made of 3 x 6-in. wood sides with 3½ x 3½ x ⅜-in. cross-frame angles, suspended by 1 x 6-in. hanger boards. They are driven by 3-in. throw eccentrics at 150 r.p.m. connected to the shaker by 3 x 6-in. Parrish flexible wood arms. The shakers are 4 ft. and 4 ft. 6 in. wide by 15 to 24 ft. long.

Rolls are of the slow-speed type, 36 x 36-in., compound geared with cast-iron chilled teeth built up in segments. The peripheral speed is 300 ft. per minute and they have a capacity of about 300 tons an hour.

The jigs are the Simplex pan type, running at 137 r.p.m. with automatic slate gate and automatic starter. There are 20 jigs placed back to back in two rows of 10 each, facing opposite sides of the breaker, affording excellent light for refuse and coal inspection. At present there are five jigs for egg, four for stove, four for nut, three for pea and two for buckwheat. Jigging results for the month of October, 1916 (189.5 working hours), were as follows:

Size	Tons	Tons per Hour per Jig
Egg	5,212	5.5
Stove	7,342	7.7
Nut	5,152	6.8
Pea	2,038	5.4
Buck	3,773	9.9

The delays for "no coal" for the same month were 24¼ hours, but these are not considered in the results given in the foregoing table.

[2]Transactions (1890-91), 19, 398.

The average percentages of coal and chipped coal in the refuse for the same month were as follows:

Size	Per Cent. Coal	Per Cent. Chipped Coal	Average Per Cent. Pure Coal for Prepared Sizes	Average Per Cent. Pure Coal, All Sizes
Egg	1.00	0.89	1.14	1.25
Stove	1.12	0.50		
Nut	1.50	....		
Pea	2.90	....	3.38	
Buck	3.75	....		

The only hand pickers on refuse from the jigs were two boys on egg coal. During that month one car of chestnut was condemned for stained coal and one-half car of chestnut for screenings.

The number of tons per jig per hour for the best day (1735 tons total) with no coal condemned and 1 hour delay for "no coal" was as follows:

Size	Tons per Hour per Jig
Egg	7.4
Stove	7.5
Nut	11.7
Pea	11.0
Buck	14.7

On this day there were four jigs for egg, six for stove, five for nut, two for pea and two for buckwheat.

All the conveyors have 6 x 18-in. flights with 9-in. pitch Keystone chain. The elevators have 22 x 25 x 12-in. buckets at 18-in. centers with two strands of 9-in. pitch heavy pattern Keystone chain. The elevators travel 90 ft. per minute and have a capacity of 200 tons an hour.

The moving picking tables, 4 ft. 6 in. wide, are of the overlapping pan type and run at about 30 ft. a minute. Each table is equipped with a friction clutch for starting and stopping and a moving apron discharge chute.

The breaker engine is an 18 x 36-in. double reversible Corliss valve type, noncondensing, running at 100 r.p.m. belted to the main lineshaft by a 24-in., 10-ply rubber belt. The average indicated-horsepower is 272 loaded and 165 when running light. This power is distributed approximately as follows:

1	Feeder	2
2	Banks dump shakers—8 single shakers	16
1	Crusher roll	12
2	Tables	8
2	Banks pure-coal shakers—4 single decks	8
2	Sets No. 3 re-breakers	18
2	Elevators	65
2	Banks shakers, two of 2 decks, two of 3 decks	20
18	Simplex jigs	72
3	Sections of refuse lines—174 ft.	19
2	Banks rice and barley shakers—4 single decks	8
1	Bank slush shakers—2 single decks	3
1	Condemned-coal line—200 ft.	29

The above figures are the indicated-horsepower for each machine at the engine and include the friction of lineshafts and drives.

Several of the drives from the main lineshaft are equipped with friction clutches. These drives are arranged so that combinations of machines may be operated while other combinations are momentarily stopped for attention or repairs. Generally speaking, all rope sheaves are 60 in. in diameter for 1½ in. manilla rope, and belt pulleys are 48 in. in diameter. In the addition rope drives are used exclusively between the main lineshaft and the main countershafts.

The feeder is built like the shakers, but is fitted with

I'm buying LIBERTY BONDS *because every instinct, every heart throb, every drop of blood in my body, every waking and sleeping thought, the still small voice of conscience all cry out to me to do it.*

Do you want German Kultur forced down your throat in the end of a sword? You may get it if the Hun wins this war. A LIBERTY BOND *purchased is the best way to stop it.*

blank plates and is driven by adjustable-throw eccentrics in order to vary the feed.

The loading belt conveyor is a 36-in. by 6-ply ½-in. rubber-covered belt, running on Robins troughing and return idlers. The speed ranges from 300 to 500 ft. per minute, according to the size of the coal handled, and is adjusted by hand control of the 8 x 10-in. driving engine; the larger the size of coal, the slower the speed.

A gravity return system is used for steam heat, the returned condensed steam being wasted. The pipe radiator coils consist of 15,300 lin.ft. of 2-in. pipe, or 155 cu.ft. of breaker contents per foot of 2-in. pipe. Exhaust steam from the breaker engine is used when operating; live steam at other times.

The addition was erected over the old loading tracks, and clearance was provided for admitting the cars through the addition during the operation by omitting some of the structural steel. A new loading track was built in front of the addition, and the loading belt conveyor erected. New holes were cut in the bottom of the loading pockets in the old breaker and chutes were run to a common point to deliver to the loading belt conveyor. When this work was completed, the change from the old method of loading to the present one was made over a Sunday. This did away with the old loading track and permitted the completion of the addition without interruption.

In the meantime, as the addition was being finished, one elevator was installed and as soon as the new part was complete, by a temporary chute arrangement the coal was carried into the addition and prepared there, thus allowing the removal of all machinery in the old part except the rolls, dump bars and picking head. These rolls were set to pass nothing larger than broken, and by putting an extra broken deck on the shakers, in the addition, this broken was removed and cleaned by hand picking and run to a temporary loading pocket.

New rolls, tables, shakers and elevator were then placed in the old breaker and gradually put into service. The remodeling was finally completed without any serious loss in production due to erection delays.

During construction, much overtime and Sunday work were necessary to change and install the temporary chutes for connecting old work with new, which usually had to be torn out or replaced by permanent construction as the work proceeded. The greatest difficulty was found in supporting old machinery in the old structure, because of the corrosion of steel beams, which in many cases were held in place by old chutes, hoppers, etc. When these were removed, the steel member frequently fell out or came loose, adding to the danger. By safety-first methods at all times, the job was completed without serious accident of any kind.

American citizens should buy LIBERTY BONDS, *because they are the bulwark of defense, keeping from the women and children of America the horrors which Germany visited upon the women and children of Belgium.*

Hints on the Storage of Coal

Coal should be stored in small quantities as near to the point of consumption as possible, says a recent statement of the Bureau of Mines on the subject of stocking coal in piles. Small coal piles rarely ignite from spontaneous combustion. Coal should be stored near the point of use to avoid rehandling, extra transportation and the degradation of size which follows each rehandling. For these reasons the bureau would advocate storage, so far as possible, in the bins and yards of the ultimate consumer, thus dividing the risk of loss from spontaneous combustion. If large storage piles are necessary, certain general principles must be borne in mind. The generation of heat is the result of slow oxidation of the coal surface. The oxidation is much more rapid from freshly mined coal or from freshly broken surfaces. The oxidation rate increases rapidly with increased temperature. Different coals have different oxidizing rates. These facts lead to the following recommendations:

Where there is choice of coal to be stored, that having the lowest oxidizing rate should be chosen, if known.

Between two coals, that which is least friable, and therefore which presents the least total coal surface in the pile, should be selected.

The method of handling should be such as to produce the least freshly broken coal surface.

The coal should be as cool as possible when piled. Piling warm coal on a hot day is more likely to produce spontaneous combustion.

The coal must be kept from any extraneous source of heat.

Alternate wetting and drying of coal during piling is to be avoided if possible.

The fine coal, or slack, which furnishes the larger coal surface in the pile, is the part from which spontaneous combustion is to be expected. Piling of lump coal where possible is therefore desirable.

In the process of handling, if the lump coal can be stored and the fine coal removed and used immediately, the practice prevents spontaneous combustion in coals which would have otherwise given trouble.

The sulphur content of coal is believed by many to play an important rôle in spontaneous combustion. The evidence on this point is still conflicting, but to play safe it is desirable to choose coal having a lower sulphur content, when choice is possible.

There is a current belief that dissimilar coals stored in one pile are more liable to spontaneous combustion. The evidence on this point is also conflicting, but, to play safe, it is advisable to store only one kind of coal in a pile.

The ground on which a coal pile is built should be dry.

The foregoing recommendations are all derived from the factors affecting the heating of coal.

There should be no spontaneous combustion, whatever the heating rate, provided the heat is carried away as rapidly as produced. This fact brings about the following recommendations:

Coal piles should be so made that there is ready movement of air for ventilation throughout all parts of the coal pile. This is the condition when the entire pile is made of coarse lump coal. With ordinary coal piling this is difficult. Surfaces of coal piles should be exposed to allow the pile to cool; or else the coal should be so stored that air circulation within the pile is very small. When the air circulation is reduced to a minimum, as in an air-tight bin with no opening in the bottom, the oxygen of the air is soon removed and the mass of the coal lies in an inert atmosphere, except for small local circulation near the surface. Air-tight bins are usually impracticable, but the following practice is recommended to approximate these conditions.

In making a coal pile of mixed sizes, the coal should be so handled as to make a homogeneous pile and prevent the segregation of coarse and fine coal. This frequently determines the most desirable machinery for unloading coal.

It is common practice to limit the height of a coal pile, this for two reasons: A pile too high crushes the lower layers of coal, producing more fines; the larger the pile the less heat-dissipating surface there is exposed in proportion to the heat generating capacity of the pile. Twelve feet in height is a common limit.

Whatever precautions are taken in choice and handling of coal, provision should be made for keeping track of the temperature rise in a coal pile and for rapid rehandling of portions of a pile in case of excessive heating. In a coal pile covering a considerable area, it should be so subdivided that in case of spontaneous combustion of a portion, the heat will not be transmitted to the whole pile, thus accelerating the heating of portions of the pile which normally would have remained cool.

To keep track of the temperature of coal piles, it is recommended that ½-in. iron pipe be driven vertically into the pile at distances of 15 or 20 ft. apart. A maximum thermometer lowered into the pipe to varying depths will indicate the temperature of the pile opposite the thermometer.

A survey of the pile and a survey of the temperature of all parts of the pile should be made twice a week during the first three months after the pile is made, and once a week thereafter until the pile has evidently ceased to heat. As soon as any portion of the pile reaches a temperature of 150 deg., provision should be made for removing that portion of the pile. Actual removal need not begin until the temperature has reached 180 deg., but at these temperatures the rate of oxidation is dangerously rapid. The object of rehandling the coal is to allow it to cool below a dangerous temperature. Any method of rehandling which does not allow of cooling will only transfer the difficulty from the old pile to the new one. It is usually useless to employ water in an attempt to cool a coal pile.

Lack of provision for rapid reloading, cooling and repiling of coal is the cause of serious loss from spontaneous combustion.

New England Coal Dealers' Association Meets

Retail Dealers Hold Best Meeting in Sixteen Years—Many Interesting Papers Read—James J. Storrow, the Principal Speaker of the Meeting, Pays High Tribute to Coal Dealers—Animated Discussion Followed Mr. Storrow's Remarks

THE annual meeting of the New England Coal Dealers' Association, which was held at Springfield, Mass., Mar. 20-21, was easily the best in the sixteen years that the New England retail coal dealers have been organized. The Auditorium, in which the sessions were held, has a seating capacity of 4000, but the coal men with a registration of nearly 500 made a respectable showing when Mayor Stacy extended them a cordial welcome. The first day was taken up with reports and other routine matters, having special regard, however, for dealers' local problems. William A. Clark, of Northampton, Mass., in his report as president of the Association, paid a high tribute to Harry A. Garfield for his painstaking effort to be fair with retailers and other human factors in the distribution of coal. When the United States Fuel Administrator was shown that mistakes had been made he quickly corrected them and was always in the position of one endeavoring to the utmost of his ability to deal with difficult problems. Mr. Clark showed that some of the mistakes had been made before Mr. Garfield went into office.

There was the usual dinner in the evening, 426 being in attendance, the largest thus far. R. C. Faulkner, of Poli's circuit, delighted the company with his rapid-fire talk, together with impersonations of President Wilson, and through the evening the entire gathering joined in singing. One of the popular songs was "Coal-less Days," written for the occasion by a Springfield coal man and set to the music of "School Days."

Thursday forenoon the meeting settled down to the business in hand. A resolution was adopted calling upon the Fuel Administration, both Federal and state, to insist that coal be marketed through retail dealers, except when destined strictly for manufacturing purposes. Speakers suggested that regular customers be favored, that dealers instruct their trade as to the value or otherwise of substitutes for coal, and that emphasis be placed upon conservation.

The election of officers was followed by short papers which were exceptionally good. George E. Copeland, of Worcester, urged serious consideration of the decrease of labor supply, a situation that will make more difficult any increase in production next winter. The obligation of a coal dealer to his community is to fight for coal. Yet the coal business has been the football of misinformation during the past winter. The reserve storage should be in the cellars of consumers first, and then in community storage piles as suggested in the press, but not in the community piles first. Mr. Copeland's paper was warmly received.

C. R. Elder, of Amherst, Mass., spoke on "Having Backbone in the Coal Trade," with special reference to retail prices. Frank A. Whiting, of Holyoke, Mass., asked the dealers for a better application of the Golden Rule as between dealer and customer, but, said he, it should be applied to regular customers first and then to others if possible.

F. H. Johnson, of New Britain, Conn., accounted in general terms for the shortage and then added that the coal dealers, as a whole, appreciated Mr. Garfield's selection of advisers from among men familiar with the industry and that he would continue to have their loyal support.

Maurice F. Reidy, of the Worcester Fuel Committee, advised that all connected with the coal business, whether dealers or administrators, profit by the experi-

Bondholders, don't shout until you are out of the war woods. The danger is still here. Buy bonds until the war is over.

ence of the past season. He told in detail of the careful plans of his Fuel Committee to work in close harmony with local retailers. Only in that way could unfortunate complications be avoided.

The important feature came on Thursday afternoon, when James J. Storrow addressed the meeting, giving a summary of his work and plans as Federal Fuel Administrator for New England. Mr. Storrow was enthusiastically cheered and could not have left the meeting without feeling that the retailers appreciate and approve not only his labors of the past year but his strong efforts at Washington and elsewhere this season in the interest of more coal for New England. Mr. Storrow's remarks were followed with the closest attention, and there were repeated bursts of applause as he outlined the difficulties of the present situation.

"Where does the Government intend to stop?" Mr. Storrow asked in emphasizing the commandeering of ships. "We have lost so many ships that at the present time New England is menaced with a shortage of steam coal which will be much worse than last winter. The limit of our steam coal this year will be the limit of the carrying capacity of our ships. This is plain talk, but it is the plain truth, and the people of New England are entitled to know it."

In his address Mr. Storrow paid a high tribute to the coal dealers for their loyal help in the acute period just passed. "The people do not yet realize," he continued, "how narrow was the margin last winter. Remember that during the entire months of January and February there was at all times more coal on cars at our four New England gateways, waiting to be pulled in to us, than our New England railroads could haul. By constant intercession with the coal companies we kept this coal in ample supply at the gateways, but New England railways could not pull it in as fast as we needed it."

Mr. Storrow rather took the breath away from many of the anthracite men present when he referred to deliveries by July 1 to consumers up to two-thirds of their yearly consumption, but aside from that there was marked approval. At the close of his formal address Mr. Storrow invited questions and further showed his hold upon the members by the way they greeted his prompt answers. Thomas W. Russell, Connecticut Fuel Administrator, also participated in the discussion. The impression made was strong, particularly when Mr. Storrow emphasized his belief that distribution should follow just as far as possible the normal channels, the useful services of dealers and "jobbers" alike included, and stated frankly his opinion that municipal coal yards would not be likely to improve upon the methods employed by retail dealers with their experience and their desire to give the public necessary service.

In the basement of the Auditorium was an exhibit of mechanical contrivances for the use of coal dealers. The visitors were especially interested in conveyors and wagon loaders, although a kerosene air-type thawing outfit attracted a good deal of attention. There never was a season when it was so hard to unload cars. Next year the association will meet in Worcester.

Purchasing a LIBERTY BOND *will mean helping insure these United States against depredatory powers for ages to come.*

Utah Leads in Production per Man

The United States Geological Survey has just published a table showing the coal produced per man employed in 1916. To it we have added columns II, IV and VI showing the order in which the states stand in days worked, in average tonnage per year and in average tonnage per day per man employed.

Utah leads in daily and annual tonnage per man, though it is only thirteenth in its regularity of work. Texas is last in both daily and yearly tonnage per man, though it is next below Utah in its regularity of work. Utah has thick coal, whereas the Texas coal

COAL PRODUCED PER MAN EMPLOYED, 1916

	—Days Worked—		Average Tonnage			
		Number	Per Year		Per Day	
State	Order	of Days	Order	Tons	Order	Tons
I	II	III	IV	V	VI	VII
Alabama	(3)	262	(15)	715	(19)	2 73
Arkansas	(24)	184	(20)	528	(16)	2 87
Colorado	(12)	233	(13)	800	(12)	3 43
Illinois	(21)	198	(8)	876	(4)	4 42
Indiana	(23)	187	(11)	838	(3)	4 48
Iowa	(20)	202	(21)	503	(21)	2 49
Kansas	(19)	204	(18)	567	(18)	2 78
Kentucky	(17)	208	(12)	813	(8)	3 91
Maryland	(5)	256	(14)	792	(13)	3 09
Michigan	(16)	216	(23)	466	(24)	2 16
Missouri	(18)	207	(22)	491	(22)	2 37
Montana	(8)	244	(6)	961	(7)	3 93
New Mexico	(1)	292	(10)	839	(15)	2 87
North Dakota	(9)	244	(7)	889	(11)	3 64
Ohio	(22)	197	(9)	839	(6)	4 26
Oklahoma	(25)	178	(24)	463	(20)	2 60
Pennsylvania:						
Bituminous	(4)	253	(4)	548	(23)	2 17
Anthracite	(6)	259	(19)	1,012	(9)	3 91
Tennessee	(10)	239	(16)	666	(17)	2 79
Texas	(14)	218	(25)	444	(25)	2 04
Utah	(13)	228	(1)	1,140	(1)	5 00
Virginia	(2)	272	(5)	993	(10)	3 65
Washington	(15)	217	(17)	633	(14)	2 92
West Virginia	(11)	237	(2)	1,198	(2)	4 68
Wyoming	(7)	248	(3)	1,090	(5)	4 40

is quite thin. Utah is a state with progressive ideas in mining; Texas is somewhat backward. It is interesting to note that West Virginia stands so high both in the yearly and daily production per man. Indiana and Illinois come next in the average daily production.

New Mexico led in regularity of work. To do this it works practically every day except Sundays and holidays. Oklahoma has the lowest running record of all the states—only 178 days per year.

The reader will also note that the production per man even in Texas averages 2.04 tons, which would look a big tonnage at the best of mines in Europe, where, however, there is more conservation and where, moreover, the mining conditions are usually none too favorable.

Germany's Fuel Predominance

In 1916, before Germany assisted in the preservation of order in Russia by coolly annexing large parts of its territory, O. Simmersbach wrote in *Stahl und Eisen* that Germany's reserves represented 54 per cent. of the whole available coal supply in Europe whereas Great Britain and Ireland's supply represented only 24.17 per cent. In this estimate, the coal stolen from Belgium and France by unjustifiable invasion was not included. As the British coal is being worked at a rate 45 per cent. greater than the coal of Germany, Great Britain is justified in having some apprehension when she notes that a country which has always regarded her resources as material of war will soon outstrip her as a producer of minerals. Fifty per cent. of the German coal in Westphalia and more than 40 per cent. in Upper Silesia.

Storage Battery Locomotive from Manufacturer's Standpoint

By R. L. Heberling
New York, N. Y.

Mine locomotive service presents an entirely different problem to the storage battery manufacturer than any other form of service. I do not know of any service where storage batteries are used, where abuse need not be figured on, regardless of the opinion of manufacturers and operators of apparatus using such batteries. This abuse should be expected and provided for by the battery manufacturer or it is evident that success will not be met.

Before beginning the manufacture of locomotive batteries, the Philadelphia Storage Battery Co. detailed me to investigate the service and observe the operation of locomotives equipped with various types of batteries. The first thing noticed was the need for extremely high capacity and a policy was immediately put into effect under which no batteries could be installed unless they had sufficient capacity to finish a hard day's work with 20 per cent. reserve. This was accomplished by standardizing on a high capacity type of storage battery and insisting upon its occupying all of the space that was available.

In supplying a battery with more than enough capacity to do a hard day's work, the worst abuse, that of over-discharge, was automatically eliminated. Breakage of rubber jars was eliminated by furnishing extremely heavy jars of extra high-grade compound, assembled in heavy trays, and fitted with special molded covers to absolutely prevent sloppage of acid. These covers are designed so it is easy to fill the battery with water without overfilling. While it is only necessary to fill a battery of this type about once every week or ten days, overfilling, even slightly, causes rotting of the trays, with consequent breakage of jars and connectors, if the acid can splash out.

In addition to designing a battery which would have all of the features described above, it was thought necessary to assemble the battery in such a way that it would be easy to keep clean. This was done and it is only necessary to turn the hose on the battery, or flush the tops of the trays with water, in order to clean them.

The matter of installation and service was the next problem. This work was placed directly in the hands of competent sales engineers who were responsible for not only service, but sales as well. There are so many places where storage-battery locomotives can be used to advantage that it certainly does not pay to recommend their use for any sort of service for which they are not adapted.

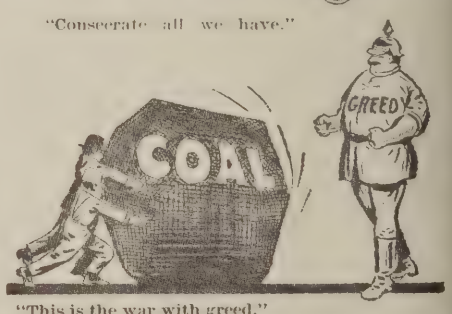
It was felt that it was necessary, to some extent, for the storage-battery manufacturer to assume the responsibility for installing the proper battery equipment, as they are, or should be, in better position than the operator to know what equipment will do the work properly.

A $100 Liberty Bond *will clothe a soldier or feed a soldier for eight months, or purchase 5 rifles or 30 rifle grenades, or 43 hand grenades, or 25 lb. of ether, or 145 hot-water bags, or 2000 surgical needles. A $100 and a $50 bond will clothe and equip an infantry soldier for service overseas, or feed a soldier for a year. Two $100 bonds will purchase a horse or mule for cavalry, artillery or other service. Three $100 bonds will clothe a soldier and feed him for one year in France, or buy a motorcycle for a machine-gun company. Four $100 bonds will buy an X-ray outfit. One $500 bond will supply bicycles for the headquarters company of an infantry regiment.*

The Opportunity

By BERTON BRALEY

NOW is the time to prove
The worth that is in you.
Now is the time to move
With spirit and sinew,
Body and heart and soul
In your occupation,
Making of trade in coal
But a consecration.



Aye, let us consecrate
To the Nation's service
All that we have. No fate
From our task shall swerve us.
Not for the sake of pelf
Shall we plan and labor,
Each shall forget himself
As he aids his neighbor.

THIS is a war with Greed
And we fight to win it.
Coal is the nation's need
Every hour and minute,
Coal for the ships that steam
On their daring missions,
Coal to keep up the stream
Of the war's munitions.

Let us not fret or muse
On the wealth bereft us;
For, if this war we lose,
There will naught be left us;
So let us do our share
Of the work that's given—
Fighting for all things fair
In the world we live in.

"Consecrate all we have."

"This is the war with greed."

LOAN

How Some Companies Pushed the Sale of Liberty Bonds

AS WE go about our daily tasks in peace and safety men are dying every minute on the battlefields of Europe to save civilization. Our own gallant soldiers are shedding their blood in France and our sailors engulfed in the waters of the Atlantic as they go in defense of America's rights and honor.

Upon our performance of the work committed to us depend the lives of thousands of men and women, the fate of many nations, the preservation of civilization and humanity itself; and the more efficient and prompt we people of America are in doing our part, the more quickly will this war come to an end and the greater the number of our soldiers and sailors who will be saved from death and suffering and the greater number of the people of other nations released from bondage and saved from death.

To work, to save, to economize, to give financial support to the Government is a duty of the Nation and to the world and it is especially a duty to our fighting men who on land and sea are offering their lives for their country and their countrymen to further this duty. We reproduce below extracts from letters received from a number of concerns in answer to the question of what plans were followed in the drive on the Second Liberty Loan. The workingmen of America have a tremendous interest to serve, a vital cause to defend, a work of surpassing importance to accomplish. What is vital to them is vital to America and to the world. How they will see their duty and how the great mass of them will perform it depends in large measure on what you—the employer—does to drive home the fact that this Third Liberty Loan must be oversubscribed.

Found Personal Solicitation Necessary

Personal solicitation by each foreman in his own department followed and our experience is that it is the one great factor which sells Bonds. We have found that no matter how much advertising we do, the personal solicitation is necessary.

Daily Charts Showed How Different Departments Were Responding—Thus Arousing Competition

The loan was brought to the attention of the employees by a poster on the bulletin boards and principally by personal solicitation. The signatures were secured on application blanks printed by our company and each man was solicited by a member of the general committee. The biggest advertising that the Loan got was through daily charts posted up showing the various standings of the different plants. The subscriptions were taken in person.

This Firm Promised To Redeem Bonds at Par Any Time Employees Desired

Each employee was solicited personally, and where we could secure subscriptions, we arranged that they could pay cash, which some of them did, and we arranged a great many of them for weekly payments. We helped the matter along as far as we possibly could by agreeing to take the loans off their hands at any time they were dissatisfied and to return their money to them at par. . . . Practically all of our men receiving good wages, they each subscribed for one or more of the bonds.

Permitted Employees To Pay Weekly

We assembled the employees of the company in one large room and had our Works Manager give them a short talk explaining in a few words what should be done. After that the members of the Loan Committee made their address and immediately started to take subscriptions themselves. These subscriptions were later turned over to us and we purchased the bonds outright in the company's name allowing the employees to pay for them weekly on the basis of $1 for each $50 of the loan subscribed.

Posters and Shop Talks Brought Response from 60 Per Cent. of Force

Large posters were distributed in all parts of the shop and short talks were given to the men at various times by Liberty Loan Committee of this city. The foremen were interviewed personally by the writer, and urged to talk to the men to buy bonds with result that about 60 per cent. of our force made subscriptions.

Eighty Per Cent. of This Firm's Employees Were Germans—the Way They Subscribed Was a Surprise to All

The writer personally used every influence with the men to get them to subscribe. We had a rather peculiar situation here as probably 80 per cent. of our men are Germans, or of German descent. We were very agreeably surprised at the results. Some of our men bought bonds outright and also subscribed on the installment plan. Most of the men subscribed at the rate of one or two dollars a week.

Called Each Employee Into Office and Spoke the Matter Over

We called each employee into the office, talked the matter over with him, advised the savings features connected with the same as well as the patriotic side of the loan and we agreed to buy the bonds for them, taking from their weekly wages what they felt they could afford to pay. We to carry the bonds for them until payment is made complete, when the bond would be turned over. We also gave them to understand that if anything happened to them whereby they could not meet their payments we would gladly take the bonds off their hands.

Push the sale of LIBERTY BONDS. *If this issue is not oversubscribed, this country would deserve to get everything the Kaiser chose to hand it. Back our boys' bayonets with bonds.*

This Plan Brought 300 Per Cent. More Suscriptions Than Were Received for the First Loan

About one week previous to the day on which the Liberty Loan salesmen from the Local Board of Commerce were to go through our plant, we distributed folders which we ourselves prepared, explaining in detail just what the bonds were for, their various denominations, the reason why all should buy, and in fact gave a full explanation of such a nature that the man in the shop would understand all about the Loan, and this in a way prepared his mind before the day of the drive arrived. We, of course, had the plant placarded with attractive posters and the whole atmosphere throughout our organization before the week mentioned, was thoroughly Liberty Loan. On the day appointed, we had a great meeting which every employee attended. We had a number of speakers, provided by the Board of Commerce, some speaking in English and others in Polish. Immediately after the general meeting, which was at noon, we had a meeting of all of the foremen and department heads and went over the proposition with them. We then had the Liberty Bond salesmen go through the various departments with the foremen of those departments and secure the applications. The result was that we secured 300 per cent. more subscriptions than for the first loan, which, while handled systematically, was not taken care of as thoroughly as the second one.

Asks Sixty-Day Extension on Contracts for Railroad Fuel

As the railroad fuel situation has not been threshed out as yet, railroad officials are asking coal operators to extend existing contracts for a temporary period not to exceed 60 days. A. H. Smith, the regional director of railroads in the East, has sent the following letter to the president of each railroad under his jurisdiction: "The matter of renewal of railroad fuel contracts is now under consideration. Pending determination in regard thereto, you are authorized to arrange with mines at present supplying your company with fuel coal to continue supply on basis of existing contracts expiring Apr. 1, for temporary period not to exceed 60 days. If this cannot be done, please advise, with your recommendation as to meeting temporary needs."

Weekly Production Statistics

Coal specialists in Washington are at a loss to explain a decrease of more than half a million tons in the coal production during the week ended Mar. 16. Production for that week is estimated by the Geological Survey at 10,686 tons. Beehive coke production increased. The week's output was 644,000 tons. A slight increase also was registered at the byproduct ovens. The amount of coke produced there was 461,846 tons. Anthracite shipments continue to increase. The week's record was 42,265 cars.

Senator Jones Answers Critics of Fuel Administration

In answer to Senator Lodge's recent arraignment of the Fuel Administration, Senator Jones, of New Mexico, reviewed the coal situation which existed when Dr. H. A. Garfield was appointed to the position of Fuel Administrator, in a speech delivered in the United States Senate.

Indicating that Dr. Garfield was an experienced business man, and that he possessed an intimate knowledge of the coal-mining industry through connection with a large corporation which developed a number of coal mines in the Piney Fork district of Ohio, the Senator went on to show that the order closing down industry was not the "reckless" ruling some consider it.

"What was it worth to bring to full capacity the manufacture of steel plates, projectile steel and war munitions?" asked Senator Jones. "What was it worth to bring to the shipyards ample supplies for the building of ships? What was it worth to increase the output of clothing for the armies in France and the armies assembled in the cantonments? What was it worth to say to the soldiers in France the first consideration at home is their welfare and their support? What was it worth to the mothers of our country to say to them that their boys, who are making the supreme sacrifice, shall be sustained? What was it worth to bring to the business interests of this country a keen realization of the actualities of war? What was it worth to say to France, Italy, Serbia, Belgium and England that their sacrifices for the preservation of world civilization shall not be in vain? What was it worth to say to them that when we pledged the whole of our resources to the conduct of the war that we meant what we said? What was it worth to say to Imperial Germany that the whole of America is willing to stand at attention, cease ordinary industry, and in patriotic fervor watch the increasing glow of furnaces, listen to the ceaseless movement of trains, watch the departure of ships, all for the purpose of sustaining this war and convincing the imperialistic autocracy that civilization shall not be crushed and that democracy shall endure? A balance sheet showing only debits and credits in dollars is incomplete. There are some things which cannot be valued in dollars."

May Insert Clause To Cancel Existing Contracts If Price Is Changed

A ruling of the United States Fuel Administration relative to the interpretation of certain provisions of Publication No. 16, entitled "Order of the United States Fuel Administrator Regulating the Making of Contracts by Operators, Producers and Jobbers of Coal and Coke," makes it possible for either party to a contract to provide for its cancellation in the event that prices are raised or lowered. The ruling is as follows:

Paragraphs 2 and 3 of the "Order of the United States Fuel Administrator regulating the making of contracts by operators, producers and jobbers of coal and coke," dated Dec. 24, 1917, and effective Dec. 29, 1917, do not restrict or otherwise affect the right of the parties to any contract of the kind mentioned in either of said paragraphs to include in such contract a provision reserving to the operator or producer the power to terminate the same in the event of a reduction in the Government price after the execution of the contract, or such a provision reserving to the consumer or purchaser named in such contract a power to terminate the same in the event of an increase in the Government price after the execution of the same.

New Coal Prices Announced

New coal prices, effective Mar. 23, were announced by the Fuel Administration last week as follows:

Ohio and West Virginia—No. 8, or Pittsburgh seam, including Hancock, Brook, Ohio, and Marshall Counties, West Virginia, and Jefferson, Harrison, Belmont, Carroll and Monroe Counties, Ohio: Run-of-mine, $2; prepared sizes, $2.25; slack or screenings, $1.75.

Pennsylvania—Pittsburgh field, including the Counties of Washington, Green, Fayette, Westmoreland and Allegheny, except (1) that portion of Allegheny County from the lower end of Tarentum Borough north of the county line; (2) the territory in Westmoreland County from a point opposite the lower end of Tarentum Borough north along the Allegheny River to the Kiskiminitas River and along that river eastward to the Conemaugh River to the county line of Cambrai County; (3) operations on Indian Creek in Westmoreland County; (4) operations in the Ohiopyle district of Fayette County: Run-of-mine, $2; prepared sizes, $2.25; slack or screenings, $1.75.

Illinois—District No. 1—Including Mercer, Bureau, Kankakee, Lasalle, Grundy, Will, Putnam, Marshall, Livingston, Woodford and McLean Counties: Run-of-mine, $2.65; prepared sizes, $2.90; slack or screenings, $2.40.

District No. 2—Including Rock Island, Henry, Warren, Knox, Stark, Peoria, Hancock, McDonough, Henderson, Fulton, Tazewell and Schuyler: Run-of-mine, $2.40; prepared sizes, $2.60; slack or screenings, $2.10.

District No. 3—Including Menard, Logan, Dewitt, Champagne, Vermillion, Sangamon, Macon, Pratt, Christian, Moultrie, Shelby, Green, Macoupin and Montgomery Counties, and Madison County north of the latitude of Alton, also all mines included in other rulings: Run-of-mine, $2; prepared sizes, $2.20; slack or screenings, $1.70.

District No. 4—Including Bond, St. Clair, Monroe and Randolph Counties, and Madison County south of the latitude of Alton and Clinton, Washington and Perry Counties, not including mines along the line of the Illinois Central between Vandalia and Carbondale: Run-of-mine, $2; prepared sizes, $2.20; slack or screenings, $1.70.

District No. 5—Including Jackson County, not including mines on the Illinois Central between Carbondale and Duquoin: Run-of-mine, $2.40; prepared sizes, $2.60; slack or screenings, $2.10.

District No. 6—Including Marion, Jefferson, Franklin, Williamson, Johnson, Hamilton, Saline, White, Gallatin and mines along the main line of the Illinois Central between Vandalia and Carbondale in Clinton, Washington, Perry and Jackson Counties: Run-of-mine, $2; prepared sizes, $2.20; slack or screenings, $1.70.

Virginia and West Virginia—Pocahontas District—Operations on the Norfolk and branches west of Graham, Va., to Welch, including Newhall, Berwind Crane Brake, Hartwell and Beechwood branches, also operations on the Virginian R.R. and branches west of Rock to Herndon: Run-of-mine, $2; prepared sizes, $2.25; slack or screenings, $1.75.

You buy LIBERTY BONDS *because they help to arm, outfit and feed the soldiers and sailors who are fighting Democracy's battle under your flag.*

District Representative Appointed for Illinois and Indiana

F. C. Honnold, secretary of the Franklin County Coal Operators' Association, has been named district representative of the Fuel Administration for Illinois and Indiana. His headquarters will be in Chicago. C. G Hall, of Terre Haute, will be deputy district representative from Indiana. In Illinois, the following assistant representatives have been appointed: O. G. Scott, Springfield; P. H. Greenlaw, St. Louis; J. A. Fenelon, Galesburg; T. R. Carty, J. L. Keirlin and Charles O. Ostrom, Chicago. In Indiana assistant district representatives were named as follows: Jonas Waffles, Terre Haute; C. G. Fletcher, Indianapolis; H. W. Little, Evansville, and Eugene Wardlaw, Brazil.

Arthur Fancher, of Bay City, has been appointed district representative from Michigan.

"When innocent blood from the four corners of the world cries out for justice," what will your answer be? Speak through the THIRD LIBERTY LOAN.

Reduction in Hard Coal Shipments to West and Northwest

A reduction in anthracite shipments to the West and Northwest has been announced by the Fuel Administration in connection with an order placing the supervision of anthracite distribution in the hands of J. B. Dickson, S. B. Warriner and W. J. Richards. They will act as district representatives in Pennsylvania under the general direction of J. D. A. Morrow. The coal year beginning Apr. 1, 1916, will be used as the basis for distributing after Apr. 1.

Do It Now!

THERE'S not much time left before April 13—the date on which the Annual Success Number of Coal Age makes its appearance. We have already received a number of splendid articles for this issue, which promises to be much superior to any Success Number we have published in the past. If you are working on a success story, or are still thinking of writing one, don't delay. Get to it immediately and mail it this week, with the necessary photographs or diagrams.

Brief Washington Notes

Jobbers who have made application for licenses prior to Apr. 1, but who have not received their licenses on that date, will be allowed to continue business as usual.

A survey of the production and consumption of all paper and pulp products is being made by the Federal Trade Commission at the request of the Fuel Administration. Pending the outcome of this investigation, the restriction in the use of fuel by the manufacturers of box board has been suspended.

In order to relieve operators from unnecessary work in their accounting departments, the Federal Trade Commission has decided that hereafter those petitioning a revision of mining prices may furnish sworn cost sheets showing combined operating results from Apr. 1 to Aug. 1, 1917, and month by month from Aug. 1 to date of application.

Canada will continue to be granted the same treatment in coal matters as is accorded a state of the United States. Permits are being issued to a large number of operators allowing exports to the Dominion. The matter is being handled in a way which will prevent any abnormal flow of coal into Canada.

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The "Every man for himself" movement that has ruined Russia is lifting its evil head in America. It desires now to break up the United Mine Workers of America. Some of the union men are already preaching "self determination." They do not like higher dues; they do not approve of affiliation with the bituminous mine workers; they want to determine for themselves what their action shall be. They are disruptionists in every union, the union with the small "u"—the United Mine Workers of America—and the union with the big "U"—the United States of America.

Now it is local 1594 at Tresckow that has decided on self-determination. This little body of men in the Hazleton region of Pennsylvania has voted to each individual in the union the funds that are in the local treasury, and the union is disbanded. The union men have been instructed that they must restore those funds as the personal use of local funds is unconstitutional.

THIRTY-SEVEN LOCALS REPUDIATE THE UNION

At least 37 local unions in the anthracite region have voted against the payment of the 50 per cent. increase in monthly dues. In consequence the leaders of the movement against the increase have determined to send out circular letters into districts Nos. 1 and 7 to ascertain the sentiment in favor of a separate organization of anthracite mine workers.

What makes the difficulty more delicate to cope with is the fact that the mine workers are bitterly opposed to the 86 international organizers who have been brought in to preserve the union. The miners resent this incursion of "white-collared" men drawing $6 to $7 a day and expenses.

While the men in the anthracite region are trying to throw off their allegiance to the union because the union is too large and membership in it involves helping in some movements in which the mine workers of the anthracite region are only indirectly interested, the mine workers in the Sydney field of Nova Scotia are preparing to enter the union to secure protection against the introduction of Chinese labor.

AMALGAMATED MINE WORKERS SEEK ADMISSION

The mine workers of Nova Scotia were unionized in a local organization known as the Amalgamated Mine Workers of Nova Scotia, formerly known as the Provincial Workman's Association. There are about 10,000 men in the Nova Scotia mines, and it is said that in some of the largest locals the vote for amalgamation with the larger organization reached 100 per cent. and where the opposition was strongest 94 per cent. voted for union. The vote as a whole is said to have stood at 98 per cent. for affiliation with the United Mine Workers of America.

Several years ago some Nova Scotia mine workers broke away from the Provincial Workman's Association and joined the United Mine Workers. A bitter strike, which then took place, was not participated in by the P. W. A's. The U. M. W. of A. spent about a million dollars trying to win the strike, but, not being in control of all the mine workers, that organization failed in its effort and so lost its whole standing in eastern Canada.

National feeling had something to do with the matter, but that feeling has largely died since the United States entered the war. When Neil J. Ferry of Hazleton, Penn., and Andrew Steele, of Novinger, Mo., both of the International Executive Board, advocated union they found the Nova Scotians ready to accept it, and it is likely that the Inverness and Pictou fields, also in Nova Scotia, will add their mine workers to the others, in which event the United Mine Workers will receive into union some 4,000 more men. The mine workers had reason to believe that Chinese would be brought in, announcements by both Fuel Controller Magrath and Mark Workman, president of the Dominion Iron and Steel Co., of which the Dominion Coal Co. is a branch, having been in advocacy of this unpopular course.

And now as to strikes; when will we be through with the record of them? In the anthracite region the Reliance mine of the Philadelphia & Reading Coal and Iron Co. which struck on Mar. 8, because the company refused to put on an extra fireman per shift, and later returned to work, struck again on Mar. 18.

STRIKE AGAINST FUEL ADMINISTRATION ORDER

On Monday, Mar. 18, there were several strikes in the Kanawha district of West Virginia against an order of the Fuel Administration dated Feb. 19. This order required some of the mines in the district to begin work at 1:30 in the afternoon pending repairs to the plant of the Virginian Power Co.

The mine workers in 11 mines on Cabin Creek were the first to refuse to go to work. The men demanded that the whistle blow at 7 a.m. The next day the mine workers employed in the plant of the Kanawha & Hocking Coal and Coke Co. refused to go to work for the same reason. On Wednesday five mines of the Kelly's Creek Colliery Co. followed suit. The Federal Fuel Administrator was promptly apprised of the situation and sent a special investigator into the field. The strike ended on Friday, Mar. 22.

In Illinois, 200 miners have struck against the United States railroad administration. The miners were employed by the United States Fuel Co., at Bunsenville, Ill., to the southwest of Danville. A change in the time table of the only railroad running through the mining village closed out the miners' way of reaching the mine and in consequence they went on strike. There are plenty of houses at Bunsenville but the mine workers prefer to live in Danville and to go to and from their work on the railroad.

DR. GARFIELD PROVES HIS POINT ABUNDANTLY

The situation in central Pennsylvania is interesting and perplexing. The Fuel Administration after careful investigation concluded that the price of coal should be raised 60c. a ton so as to make it possible for all the operable mines to continue their production. The mine workers without any investigation came to the conclusion that they were entitled to that increase and demanded it. Fortunately the district officials, who form the policy committee, have been willing to submit the matter to the Fuel Administrator before a vote in conference is taken as to the advisability of a strike. An agreement will in all probability be reached.

Central Pennsylvania is most important in itself, but the matter is broader by far than central Pennsylvania. Dr. Garfield had to decide on prices for coal immediately after his appointment, and he did so without any really adequate investigation. No one, certainly not Dr. Garfield himself, would deny that the prices as set were not based on the ascertained costs of production. They were in some cases set quite low. The result was not disastrous, because all the companies were selling most of their coal on long-term contracts. With these Dr. Garfield did not interfere.

Since that time Dr. Garfield has been getting real costs of production. In some cases he has found that injustices have been done or rather would have been done had Government prices alone been procurable. He is rectifying prices where these injustices occur, but certain mine

workers do not recognize the justification for these corrections. They say a patriotic man would stand for a slight loss, but where are the miners who are willing to dig coal and pay for the privilege of digging it?

On Mar. 10 the British Government announced that on Mar. 21 it would proceed to the enlistment of 50,000 miners. The miners actually thought that it should not be done. They thought that the miners who have given less than their proportion should be exempted, not because miners were more needed than soldiers, but because the miners declared themselves self determining and so free from conscription. Lloyd George, the Premier, put the matter in his happy way on Mar. 22:

"I am utterly at a loss to know where the men are to be found if first the engineers and then the miners say we will not find the men. Other trades will quickly take the same course. That would mean anarchy, not government.

"I have just had news that the Germans have attacked us on a front of nearly sixty miles with overwhelming forces. I am amazed that it should be considered debatable whether the miners and engineers are going to make their contribution to the defense of the country.

"If the sanction of the community is going to decide whether a law should be obeyed, then, believe me, you will have a condition of things where the people who will suffer most will not be the people at the top, who are generally able to take care of themselves, but the poor devils at the bottom. It has always been so in the history of the world.

"It is better to talk plainly, and I am speaking with a great deal of feeling because I have just heard of this overwhelming attack brought about by the failure of the Russian democracy to have its orders obeyed. If the attack succeeds, the Germans might be at Calais, and the only answer we can give is a vote of the Miners' Confederation saying that they are not prepared to fight. You cannot give that answer."

The outcome, as might have been expected, was that the executive board of the federation adopted a resolution advising the men not to resist the combing-out process.

Our boys in France are as anxious as the Germans to to know whether you have bought your THIRD LIBERTY LOAN. *Which will you disappoint?*

Central Pennsylvanians To Be Patriots

Let no one believe that the central Pennsylvanians are going on strike for more wages just when the nation needs all the coal it can get and the administration is regulating the price at which coal shall be sold. The Pennsylvania mine workers are inquiring as to the right course to follow and are getting duly informed, and so long as they do that they are not likely to go far wrong.

Before they called a convention of delegates to find whether a strike should be called as a protest against the operators' refusal to pay more wages, the policy committee held a meeting at Clearfield, Penn., and there decided to have a conference with the Federal Fuel Administration. The subcommittee chosen for that conference consisted of President John Brophy, Vice President Charles O'Neill, Secretary-treasurer Richard Gilbert, Frank Waite and Edward Swartzenstruver. To these the National Board Member William Donaldson was added.

The subcommittee met Dr. Garfield on Tuesday, Mar. 26, and he made a convincing argument for peace and order. He said that there must be no strikes anywhere and that the terms of the Washington Agreement must everywhere be complied with. All adjustments of price, upward and downward, were based on the wage under the Washington Agreement. If the increases in central Pennsylvania were a cause for increased wages, then the decreases in Colorado might equally be shown a reason for decreased wages. The Fuel Administrator demonstrated by charts and figures that the price now provided allows only a fair profit.

A LIBERTY BOND *gives you a look into the future, but defeat in the war will keep you tied to an unfortunate past.*

Labor Quits Mines Believed Unsafe

Unsafe mines are becoming a factor in the labor situation in Illinois. It is said that the high pressure under which the mines have been operated during the past winter has led to laxness in the matter of safety precautions, and as a result there have been several explosions, in which a number of lives have been lost. Reports that certain mines are unsafe have made the miners uneasy and there is a good deal of talk about quitting the mines for the farms.

The state employment agency at Springfield has received a number of communications from miners inquiring about farm work. It has been found that these come from employees of mines about the safety of which there is some doubt. How much of truth and how much of false rumor there is in the reports of the condition of the mines is not known. The reports are substantiated in a measure by the fact that there have been a number of disasters. Advantage may have been taken of this fact to spread unfounded reports. It is probable that the situation will lead to a more rigid inspection and that steps will be taken to compel operators to make their mines safe wherever their safety is questioned. Complaints were filed a few days ago against a mine at Virden, and it was ordered closed until certain safety precautions had been taken.

It is better to wear a LIBERTY BOND *button on your coat than the print of the Kaiser's heel on your neck.*

Miners' Attitude to Legislative Problems

The coal miners of Illinois were urged by State President Frank Farrington, in his biennial report, to lay aside commonplace aims and give the fullest measure of service in the war to crush autocracy. "Our immediate and fundamental problem," he says, "is to win the war. Commonplaces must be laid aside for the time and we must so design our action as to enable us to give the fullest measure of service and devotion to this all-absorbing issue. When the war is over we shall take up the commonplace, strengthened and helped by our devotion to duty, and fight on and on to the end that industrial justice shall prevail."

The report shows that during the year ending June 30, 1917, 207 men, or one out of every 391 men employed, were killed. This was one death for every 381,563 tons of coal mined. The number injured was 1634, or one for every 50 in the state. Each miner hurt represented 48,338 tons.

The legislation to be sought in 1919 is outlined as follows:

1. Further improvements in the workmen's compensation act, and especially one providing a penalty for employers who delay the payment of compensation claims.

2. The elision from the act of the waiting period of one week in compensation cases where the disability extends over a period of weeks.

3. Providing some form of guarantee behind the compensation awards so that when they are made one may be assured of their payment.

4. An old-age pension law.

5. Improvements in the mining laws, looking particularly to the prevention of gas and dust explosions in the mines.

The campaign for the THIRD LIBERTY LOAN *is a spring drive in which every American is summoned over the top. And let us all be shock troops. If we purpose to make the attack we must be prepared to make the sacrifices.*

Missouri's Midsummer Idleness Starts

The Missouri Coal War Board, consisting of members of the United Mine Workers of America and representatives of the Southwestern State Coal Operators Association, District 25, met in Kansas City Mar. 18 and issued a statement as to the reasons for the suspension of work in several Missouri mines. This coal war board is an excursion in coöperation into which the operators and miners in Missouri have entered. It has received and considered the important complaints of the miners and solved many of them and it has done so without resort to the usual courses of arbitration and strikes.

When, several weeks ago, warm weather came and the demand from the railroads slackened, domestic consumers ceased to buy for their winter needs and did not purchase fuel for fall and next winter because of the hint that the fuel administration might set lower prices. The miners in the field soon noted that operations in the mines were slowing down. The miners who were laid off did not understand why this should take place, and miners in other sections were wondering whether their mine would not be next. Newspaper publicity on coal mining has given the impression to everybody that the mines must be kept working all the time to supply the fuel necessary, and to prepare for the 62,000,000 excess tons that must be mined in 1918.

Many miners seem to have an impression that the coal operators have something up their sleeves. In Missouri the miners did as they have been doing all winter, they took these doubts and suspicions to their local efficiency committee which immediately took them up with the Missouri Coal War Board. The statement of the Coal War Board is being transmitted to the coal operators and to the miners and is having the effect of reconciling the miners to the situation.

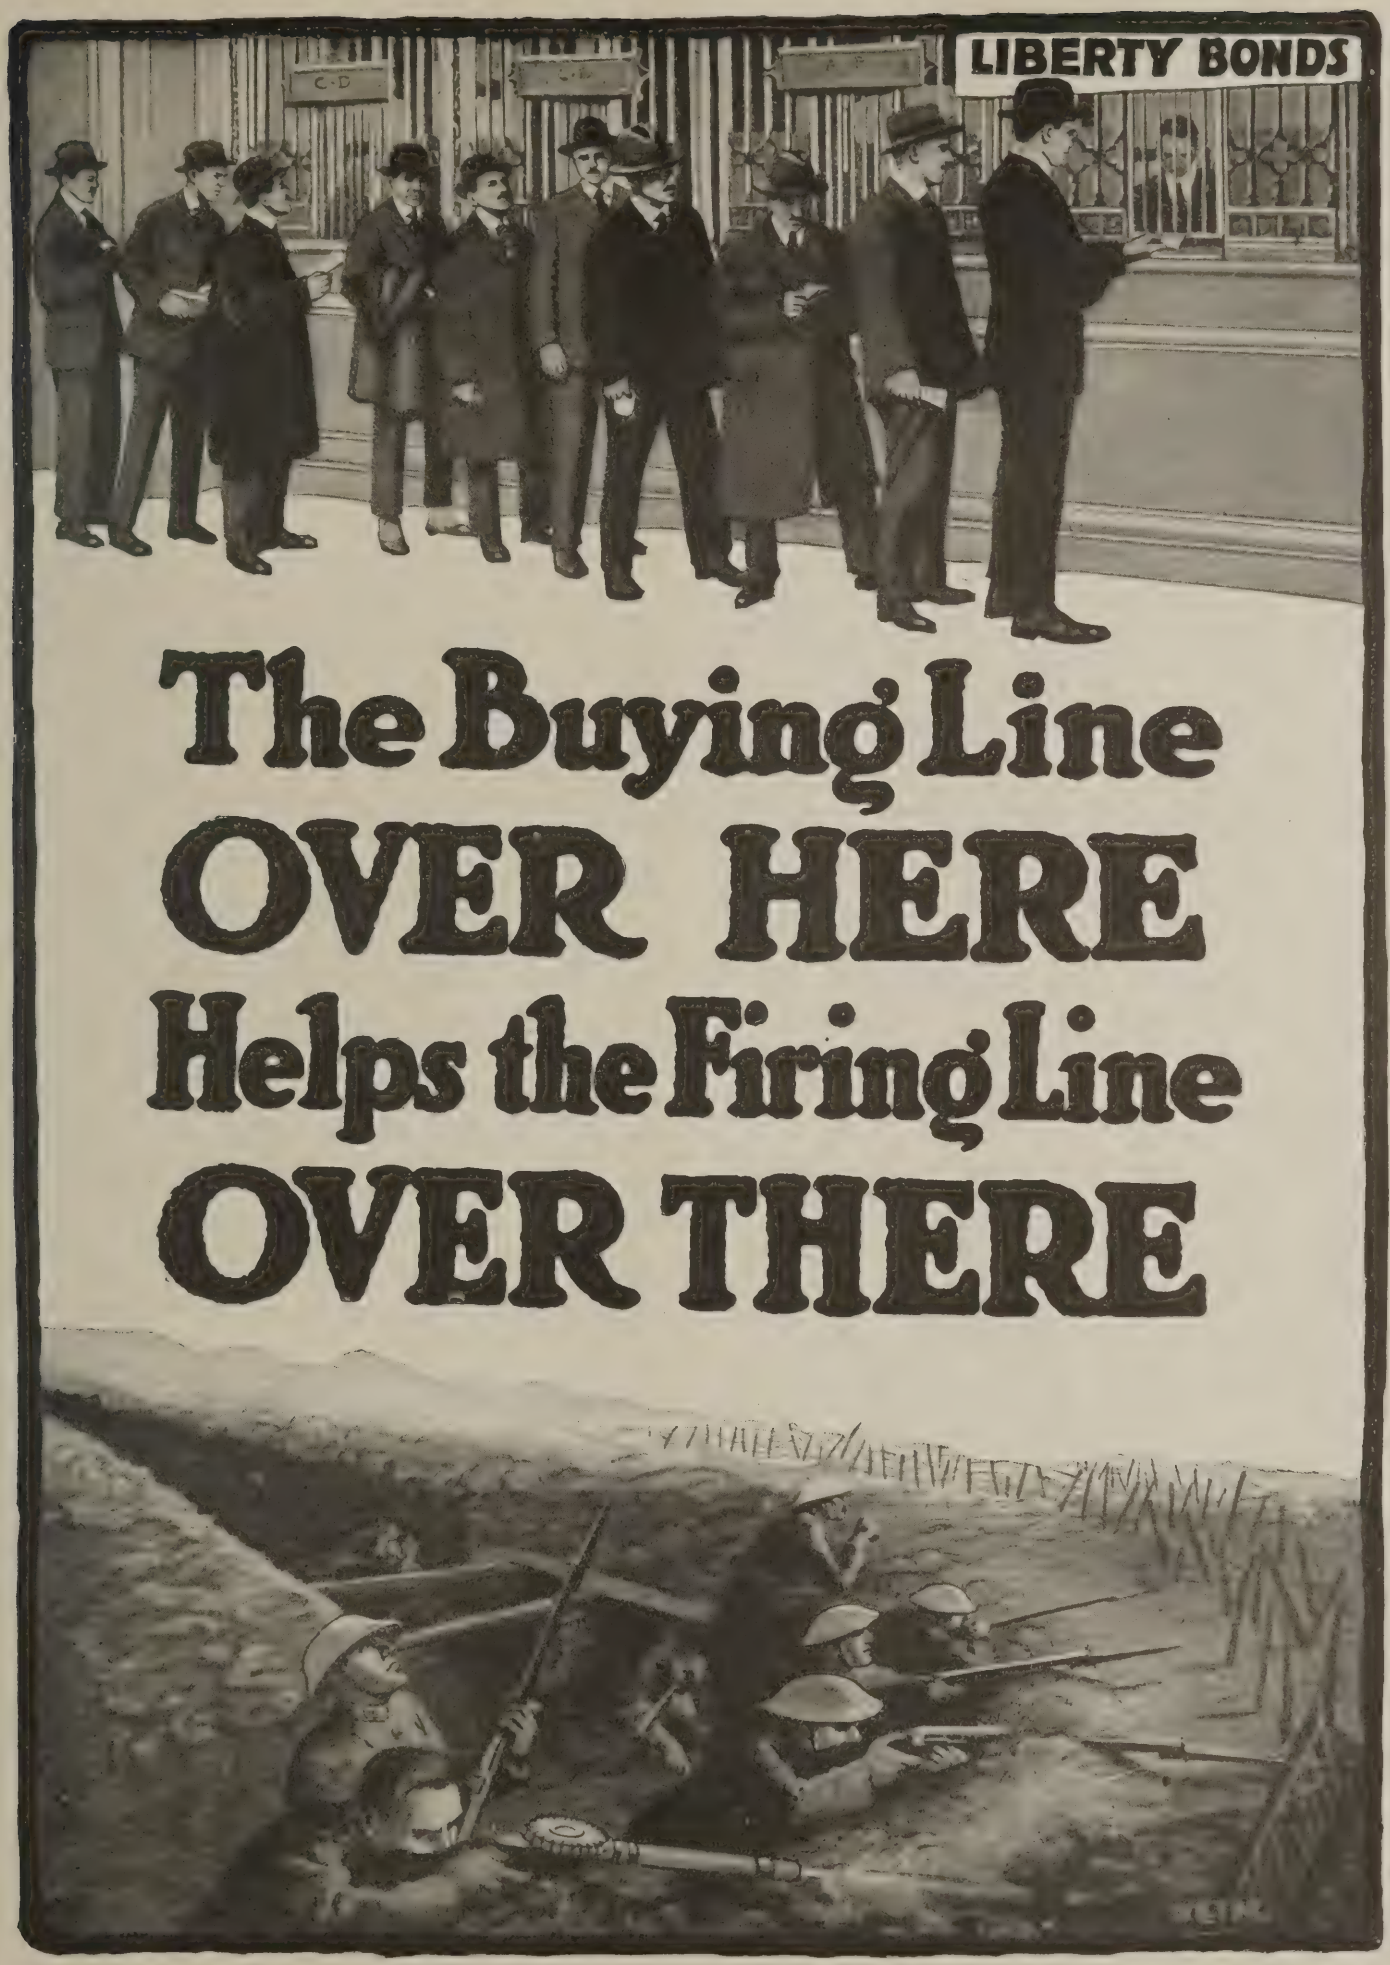
The miners and operators have paid the local efficiency committees for the time spent in committee meetings; this expense is temporarily suspended until July 1, 1918, in order to relieve the burden on the local unions where work has been discontinued temporarily.

Missouri has about 8000 miners; perhaps 15 or 20 per cent. of these are in comparatively small mines which ordinarily work only in the winter and which will have difficulty reassembling their forces if the mines are not operated this spring and summer. The miners' officials are doing their best to hold the miners together in the hope that arrangements can be made for the moving of the coal from the mines and its disposition so that the shafts can be kept in operation continuously this summer.

Every LIBERTY BOND *you buy is safe financial investment in the future happiness and self-respect of your children. Buy as many as you can and let them inherit as good a country as you did.*

Pay By the Ton or the Carload

The mine workers in West Virginia are still agitating in favor of payment by weight and not by measure. A large number of men are now paid by weight and that method of appraisement is certainly preferable, especially as it is the normal manner of payment in most states of the union, though there are exceptions in many of the states.



The convention of state sealers of weights and measures in West Virginia has advised that scales shall be installed on a solid foundation, of concrete where practicable and possible; that the foundation should be separate from the tipple; that all weighing shall be done within 200 ft. from the drift mouth of the mine and 2000 lb. shall constitute a standard or legal ton; that six additional state inspectors of weights and measures shall be provided to inspect mine scales; that justices of the peace shall have jurisdiction in trials for violations of weights and measures laws; that county sealers in counties of the first class shall be paid a minimum salary of $150 a month and legitimate expenses; that counties of the second class the salary shall be $100 a month and legitimate expenses; that the appointment shall be made compulsory on the counties and that the appointees shall be placed under the civil-service rules.

Lawrence Dwyer, international board member of District 29, says that the operators of the Winding Gulf region last November gave the miner an 8c. advance per car of three tons, whereas the requirement of the Washington agreement was for 10c. per ton, or 30c. per car. He also adds that the operators are getting a 45c. increase per ton as compensation for the 8c. advance to the miner and the increases granted to the other mine workers at the same time. In this biassed statement Dwyer overlooks entirely the large and more important increases given to the day men.

Of course, the provision for weighing coal close to the mine mouth while it has its points of reason is objectionable unless it can be done mechanically. There are frequently several drift mouths to a mine, each producing a little coal. It would be inadvisable to require a man at each drift mouth to weigh the coal. We may be sure the miners would not want to pay for that number of check weighmen. The operators look to the weighman to be boss at the tipple and frequently to do the docking also. How can he dock the miner for dirty coal if inspection is denied him? So to the many new weigh bosses and checkweighmen necessary a dock boss would have to be added, and all this to protect the miners against the loss which occurs between mine mouth and tipple. This is unfortunately often considerable, and it does seem that at mines with steep planes the miner is entitled to have the weight taken at the top of the plane before the company spills his coal. But in most cases the uncertain loss from the bumping of cars in a trip would not pay the many check weighmen for which the state scales are indirectly asking.

When you buy a LIBERTY BOND *you do two good turns—one to yourself and one to your country.* LIBERTY BONDS *are the best investment and they help have lives.*

Do We Really Want To Win the War?

IF WE really want to win the war we shall have to go a somewhat different way about it than we have gone hitherto. When a man decides to open a mine or build a house he does without this and that and scrapes the money together to get it. But now that we go to war, we do not show any such devotion. We hope to do just what we have always done, buy just as much as ever and purchase Liberty Bonds on the side, if there is anything left with which to do it.

This war is our leading interest and comes first. We cannot buy ships, munitions, an army, a navy, aëroplanes, railroad equipment and guns if we are investing as much as ever on ourselves. Something must be given up. The war cannot be won by the money we borrow to lend to the Government. It cannot be won by selling stocks and bonds and so obtaining money to lend to Uncle Sam. It cannot be waged by foreclosing mortgages and handing over such ill-gotten money to the nation, nor can we win it by uncovering hoarded money.

It is necessary that we should provide the money by present-day saving. He who does without and pays the money to the Government: (1) Releases labor for the Government service (2) releases material for the Government use and (3) gives the Government money to buy the released labor and material. If you go on buying just as ever, the Government must compete with you for labor, it must bid against you for material, and it must try to do it with the paltry sums of money you will be able to provide.

Spend meagerly and Uncle Sam can spend generously. Save manfully and the Government will be sustained by your savings. A billion dollars means $10 per person; about $50 per family. We must average a Liberty Bond per family for every billion dollars the Government demands. Three billion dollars will mean $150 per family and five billion dollars $250, or five Liberty Bonds.

Unfortunately we do not understand this. We formerly were in the habit of regarding billions as immeasurable quantities of money, but now we go to the other extreme and fail to realize how much privation they will mean to us who try to provide them. We put a button on our lapel—that is good for one billion dollars. We need one on every member in the family if we are going to do a full part to the purchase of a Liberty Loan issue.

Let us look at it another way. The gross income of the United States is only about forty billion dollars. A loan of a billion dollars represents 2½ per cent. on one's yearly income; a loan of three billion dollars is 7½ per cent. Just visualize it. It cannot be raised with housekeeping as usual, luxury as usual, comfort as usual, hours of labor as usual. It can be made only by a new life and a new purpose—a life and a purpose that might not be feasible, needful or perhaps even desirable for ever, but a purpose feasible, needful and desirable so long as the war lasts.

This is the meaning of the war to us. If we really want to win it, we must really want to provide the sinews of war. The country has fewer to do that work than it had before it sent the boys away with its blessing. We shall have to work hard and keep steadily before us what the war demands mean. It is our duty also as citizens to let other people know what it means. It is obligatory on us to preach and teach it everywhere to the end that the Third Liberty Loan will be oversubscribed like the two that have preceded it.

American citizens should buy LIBERTY BONDS, *because they are for the purpose of maintaining the principles of the Declaration of Independence and the Constitution of the United States.*

Miners Active "Over There"

FEW people know the important rôle being played by miners on the Western front. When the front-line trenches settle into the customary deadlock that has prevailed in France and Belgium for more than three years, mining operations are aggressively started by both sides, and the one that gets started first has the advantage and usually comes off victorious.

While it would not be politic to give current figures on this subject, some idea of the magnitude of the operations can be judged by the fact that 1 per cent. of the entire British forces were engaged solely in mining work some time ago. Assuming that the British Army totaled 5,000,000 men, this would mean that we would have to strip the State of Ohio clean of all the men engaged in the mining industry to equal this number.

In the real pioneer work in the front-line trenches the miner is substantially the most important personage there is in the engineer corps. It is no secret that 75 per cent. of the engineers' work at the fighting front is mining. This does not mean three-fourths of all the engineers in service, but only of the pioneer troops in the trenches.

In this class of work the miner is at home. The oppressive darkness of the underground galleries holds no terrors for him. He will recognize the mine-rescue station along the Western front and all the other appurtenances that have become a part of this highly developed phase of the Great War.

Mining organizations are being formed to meet the growing demand "over there," and will be one of the branches for which the First Replacement Regiment of Engineers at Washington Barracks, D. C., will receive recruits. This regiment has been organized for the express purpose of keeping all the different branches of the engineers abroad up to their full authorized strength. Applications for enlistment in this regiment should be addressed to the Commanding Officer, First Replacement Regiment Engineers, Washington Barracks, D. C.

Need for Providing Steady Work

THE working man must feed and clothe himself whether he works or not. Somehow he must spread his wage so that his annual needs are taken care of. It is therefore essential that he should work almost every day. Lack of cars, strikes, lack of orders, sickness, breakdowns and shutdowns need to be eliminated. No changes are more desirable than those which stabilize industry.

The report for the year 1916 just received from the United States Geological Survey shows that Oklahoma mines worked only 178 days in the year and Arkansas 184 days. This fact is an indictment on our methods of doing business. For some reason there is no adequate flywheel to keep business working regularly.

What we need is a greater differential between winter and summer prices, and it would appear that all the elements in coal service should be regulated so as to spread the production, transportation and delivery of coal more evenly over the whole year.

There was a time when the miner was willing to receive a lower rate of pay in summer than in winter. He might be willing to do that again. We do not advocate any real lowering of pay, but when a new scale is arranged why not put the bulk of the burden or all the burden on the winter months?

The railroads find the winter a trying time for railroading. The removal of snow is, of course, a heavy burden, but that has to be met in any event so there is not, for that reason, any purpose in reducing the amount of winter traffic. In fact the more traffic the better the managers, if not the investing public, are pleased, for where there is much traffic there is more tonnage over which to distribute the charge for snow removed. Still as stated the winter's snow has to be removed in any event whether the removal is paid out of summer or winter earnings.

But the railroads find that it is harder to haul trains in cold weather. The rails are slippery, the winds are high, the lubricant in the axle boxes is sluggish and the train crews are less efficient. The New York, New Haven & Hartford R.R. Co., using electric locomotives, estimates this loss in hauling ability per locomotive at 0.65 per cent. per degree below 55 degrees Fahrenheit.

The railroads have a direct interest in having the work of transporting coal either evenly spread or at a maximum in the summer months. They certainly cannot gain anything from the excessive activity of the winter season with its overcrowded switches, its delays and its embargoes. They could therefore well afford to ask that the bulk of the increases in the rates charged for transportation should be put on the winter business. We do not suggest lowered rates at any time, only an increase in rates confined to the winter schedule.

The operator has likewise an interest in summer operation from the fact that 100 per cent. business is better than 75 per cent. Not only does steady work give more satisfied men, it saves stand-by losses, all the losses of overhead; it cuts down pumping charges per ton of product. But it is unnecessary to argue the differential with the operator. He is the only wise man on the chain of coal handlers. He is always ready, if not willing, to forego his summer profits for the purpose of stimulating business in that season.

The jobber and retailer have a far greater interest in a brisk movement of coal in the summer. It is then that haulage in motor trucks and wagons is easy. It is then that the coal does not freeze. The barges are not interfered with in the summer. The summer work is the most satisfactory that is done. Moreover it is work that is not hurried and can be done therefore in the most efficient manner.

Everyone is interested in getting what the differential will provide, but only the operator is willing to provide it. Why, no one can tell. This is certain, however, that no one will provide storage unless he is reasonably certain it will pay him. The miner has an idea that the consumer ought to store coal, but when did any miner do anything for which he was not paid? Let us endeavor to get away from the idea that the consumer of coal will do in the name of patriotism and coöperation what the miner has never been willing to do.

No miner will work for wages to be delivered to him six months hence. Not one of them is willing to buy coal in the summer for the winter's use unless there is a differential. Why should the consumer pay for his coal in the summer and wait six months for the benefit unless there is a profit in his long wait? No miner would dig a cellar for another man to use. Why should a consumer dig one in which to store the miner's coal so that the miner will be able to work in the summer? The differential is the only cure for the present condition of unsteady work. The consumer should be willing to pay it in the winter, and miner, operator, railroad, jobber and dealer should be ready to accept it in the summer months.

Time enough to beat the sword into ploughshares after the Kaiser is beaten into submission. The THIRD LIBERTY LOAN *is an effective weapon against him.*

Improve Our Transportation Facilities

IT has become perfectly evident to all observers that the capacity of the nation for production of war material is enormously greater than its capacity for shipping it to Europe, and that we must at once not only balance this production, but slow it down in order to prevent such a choking of our Eastern ports as may produce an impossible condition. The answer comes that if we are making too much war material we had better turn some of our activities into the manufacture of articles of peace. Immediately we run into the financial situation, which at present seems to seriously hamper new undertakings.

It would seem that the claim of the railroads that they need $1,000,000,000 worth of improvements should at this juncture be considered. Here is one organization now devoted exclusively to the service of the community, which, being under the control of the Federal Government, can be financed directly by that Government, and there would seem no reason why the production programs of war material should not be limited, and a certain amount of the energy now being expended in that direction turned at once toward the improvement of our transportation facilities.

DISCUSSION BY READERS

Composition of Natural Gas

Letter No. 1—A short time ago there appeared in *Coal Age* an interesting bit of correspondence with regard to the composition of natural gas and it inclined me to think that the following reference to an unusual gas analysis would be of interest. The full text of the report on this gas is to be found in the 1918 Year-Book and Souvenir Program of the Spokane Mining Convention, on page 87, under the title:

EXPLORING FOR WASHINGTON OIL

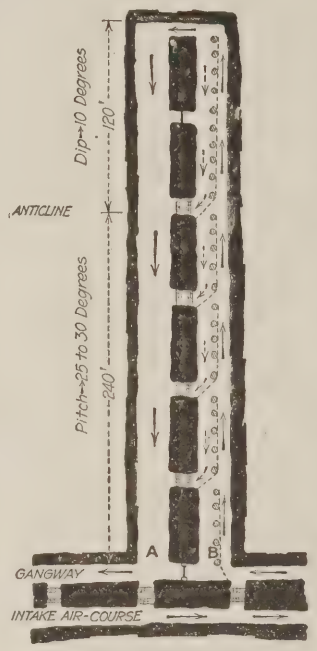
"National gas and oil fields have not been developed to any extent in the Pacific Northwest, but there are indications of both oil and gas . . . . In at least one district natural gas has been found in quantities that suggest important possibilities and the probability, also, of oil deposits of value. This district is Beaton County, Washington, near the center of the state.

"The Spokane-Benton Natural Gas Co. are the operators and they propose to pipe the gas to Spokane, a distance of 120 miles. One well is producing one million cubic feet of gas per diem, from a depth of 706 ft. A pond of water on the anticline keeps at one level all the time and has a scum of petroleum oil always showing on the surface.

"The analysis of the gas is the remarkable point, this analysis gave methane 76.6 per cent., ethane 12 per cent., propane 7.20 per cent., butane 8.80 per cent. and oxygen 0.40 per cent."

It may be remembered that in my previous communication on this subject I referred to the occurrence of other gases than methane, and also of hydrogen. I am satisfied that if other gas-well products were examined and reported on we might have very valuable information in regard thereto. It is the belief that the gas reported above is a wet gas. JAMES ASHWORTH,

Vancouver, B. C., Canada. Mining Engineer.



A LIBERTY BOND *will pay you interest on the future of America. Defeat will make you pay compound interest on the future of Germany.*

Experiences in Gas

Letter No. 1—The account given by Jacob Riley, *Coal Age*, Feb. 9, p. 302, of the plan he adopted to remove a body of gas from the face of a heading, recalls an instance in my own experience that required considerable perseverance in order to successfully remove the gas from a couple of chambers driven to the rise of a gangway.

In this case, the chambers had been driven up a pitch of 25 or 30 deg. for a distance of 240 ft. from the gangway, where an anticline in the measures caused the seam to dip at about 10 deg. for a distance of 120 ft. to the face of the chambers.

As I have shown in the accompanying sketch, these two chambers were connected by six crosscuts. The first four of these crosscuts had been walled up with good stoppings, while No. 5 was closed by a brattice and No. 6 crosscut at the face remained open. In addition to the pitch and dip of the chambers that I have mentioned, there was a cross-pitch of about 6 deg. from chamber *A* to the one marked *B*. At the time of my story, these chambers were found to be full of gas from the face to the gangway. In the sketch, the arrows show the direction of the ventilating current, which was conducted to the face of the air-course or heading and returned to chamber *B* where it was deflected to the face by a door on the gangway and returned through chamber *A*.

REMOVING GAS FROM PITCHING CHAMBERS

These two chambers having filled with gas, owing to a temporary derangement of the circulation, it was found that when the air current was restored it proved not strong enough to remove the gas. Most practical firebosses will agree that the place to start to remove the gas from these chambers was at the mouth of chamber *B*.

As shown in the sketch, a brattice was erected at the corner of the gangway stump so as to deflect the air into chamber *B*. By extending this brattice one length at a time, the gas was removed as far as the first crosscut where further progress was arrested, the gas then proving too strong for the air. Increasing the current by every means available did not alter the situation, and the experiment was tried of opening No. 1 crosscut by breaking a hole through the wall.

As indicated in the figure, a canvas was started from the corner of this crosscut and carried across the chamber to where a line of brattice could be extended up the pitch along the opposite rib. This had the desired effect and the gas was removed as far as the second crosscut, by extending this brattice one length at a time as before, the gas passing out through the hole in No. 1 crosscut.

The hole in No. 1 crosscut was now closed, and a similar hole opened in No. 2 crosscut. The same plan was then carried out and the gas removed from the chamber up to No. 3 crosscut; and then, by the same plan, No. 4 crosscut was reached, which was at the anticline. Beyond this point there was no further trouble in removing the gas by extending the brattice

down the dip to the face, setting the posts and hanging the canvas 2 or 3 ft. from the rib.

What made the gas difficult to remove, in this case, was the fact that, owing to the pitch of the formation, sidewise, from chamber *A* to chamber *B*, the gas tended to drift from chamber *A* to chamber *B*, which made it difficult to work the air against the gas in ascending the pitch to the anticline. Beyond the anticline, the tendency of the gas to rise from the face to that point assisted the work of its removal from the chambers.

The work, of course, was all done with safety lamps, and no men were permitted to remain in the mine except those engaged in removing the gas. Believing that the method adopted here would prove of interest to other firebosses when working under similar conditions, I have tried to describe the plan adopted as clearly as possible. L. R. THOMAS.
